The banking syndicate's representative at the meeting with the Fords and Alfred Lucking, the Ford attorney, expressed the sincere hope that the company would be able to weather the storm without financial help for the good effect it would have on the industry insofar as the attitude of the public is concerned. It was stated by the bank's representative that the depression had given rise in the public mind to a feeling that the automobile industry had gone to smash.

This naturally was accentuated by the reports that the Ford company was in financial straits. Successful operation of the big organization without help would be the best tonic that could be given the industry, it was urged. The New York bankers naturally are heavily involved in automobile financing and their representative stated frankly that they would be gratified if Ford could operate successfully on his own hook for the stimulus afforded the industry as a whole.

GIRL RE-ELECTED C. G. HEAD

KALAMAZOO, MICH., March 12—The first annual meeting of the C. G. Spring Co., held Friday, March 11, resulted in the re-election of Christian Girl as president for the ensuing year. J. G. Utz, consulting engineer of Detroit, was named as vice-president. Judson Clary is secretary and Charles Gettler, treasurer. These four and Fred R. Eaton comprise the board of directors.

The plant in Kalamazoo is operating on about 40 to 50 per cent basis. Two service stations, one in Chicago, the other in Detroit, have been established. C. C. Homan, one-time purchasing agent for Willys-Overland, is in charge of the Chicago branch.

Legislative Season Brings Many Bills

Revisions Upward in Licenses to Meet Road Costs Major Part of Burden

NEW YORK, March 15—Automobile legislation which has been introduced in the 40 State legislatures which began their sessions early this year is being sorted out and assimilated. Thirteen of the legislatures already have adjourned. It is estimated that approximately 1500 bills have been introduced in the 40 States. Almost the same number were introduced last year in less than half as many States.

Increases in registration fees have been proposed in 34 States. Generally speaking, they apply to commercial vehicles rather than passenger cars. In most States these fees are used for the maintenance of highways, but in a few cases it is proposed to expend them for actual building of roads. The increases proposed vary widely, but the industry has been gratified to note that in several States they follow closely the tax suggested in the proposed uniform motor vehicle law. Automotive interests are not disposed to combat seriously what they consider a reasonable increase on the theory that, while they will benefit directly through improved highways, all the taxpayers in the State will benefit indirectly. It is significant of the trend of legislation, however, that there is a tendency to increase fees each year.

Other subjects dealt with most generally in proposed legislation are size, weight and speed restrictions, obligatory equipment, indemnity bonds as a prerequisite to registration, stoppage at grade crossings, licensing of automobile mechanics, the classification of freight and passenger carrying motor lines as common carriers, and a tax on the consumption of gasoline.

As a general rule, gasoline taxes, indemnity bonds and grade crossing stops are not meeting with general favor. Gasoline taxes were proposed in 12 States, but already have been killed in four or five and have not much chance of passage in the others.

Measures providing for indemnity bonds have been introduced in 15 States, but have been killed in several and are making little progress in the others. Measures for the licensing of automobile mechanics have been introduced in 10 States, but have been killed in four.

TRAFFIC MANAGER KILLED

DETROIT, March 16—Roger Hurley, traffic manager of the Maxwell plant of the Maxwell-Chalmers Co., killed himself accidentally yesterday while examining the revolver of an acquaintance. Hurley was 46 years old. He was widely known as a traffic man, having been general agent of the Michigan Central and Cloverleaf railroads before he joined the Maxwell organization three years ago.

Congress Prepares to Halt Dumping

Tariff to Equalize Price Differences

Leaders Agreed on Tentative Program—Will Fix Duties by Valuation Here

WASHINGTON, March 16—Congressional leaders have adopted a tentative legislative program for the extra session which will include enactment of an anti-dumping bill with teeth in it. It will be designed to prevent unfair competition by foreigners and undoubtedly will be so phrased that it will put a serious crimp in the plans of Europeans who have proposed to sell in the American market many millions of dollars worth of American made motor vehicles and automotive equipment.

This material was sold by the War Department to the British and French governments with the understanding that it would not be sent back to the United States but it has since been sold to private individuals who propose to take advantage of the present laws and reimport it, duty free, to undersell the American market.

France alone has $65,000,000 worth of these materials. The Slough Trading Co. of England owns 10,000 American made motor vehicles and has begun their importation into this country. The Keystone Tire & Rubber Co. has bought up nearly all the American army tires in France. A French company also is shipping back American made trucks to be sold at auction. A Portuguese merchant has an option on $50,000,000 worth of automobile parts and accessories.

Leaders Committed to Action

The anti-dumping law which it is proposed to enact would at least require payment of duty on the difference between the purchase price of this material abroad and the market price in this country. Senator Penrose, and Chairman Fordney of the House Ways and Means Committee, already have committed themselves to such a measure.

The effects of the dumping law already have been discussed in AUTOMOTIVE INDUSTRIES which was informed two weeks ago by Senator Smoot that the bill passed by the House at the first session of the last Congress and amended materially in the Senate would cover the reimportation of motor vehicles.

Congressional leaders had little knowledge of the menace to American industry involved in the reimportation evil until their attention was called to it by the Washington bureau of the Class Journal Co. They grasped the situation quickly and their attitude has been entirely sympathetic.

While the anti-dumping bill may be re-introduced in its present form, several Senators and representatives stand ready to offer amendments from the floor. Senator Smoot believes it is essential to stop reimportations at prices less than production costs. It is possible the bill may specifically cover surplus army stocks sold abroad.

Amendment Adds Teeth

Senator Penrose and Chairman Fordney of the House Ways and Means committee will supplement the measure with an amendment to the tariff law assessing customs at American valuation. Effect of the revision of assessment policies as proposed by Senator Penrose upon the automotive industry is easily noted. For instance, it is reported by the Federal Trade Commission in its report on farm implement trade, that mail order houses have been selling spare parts for automotive products at prices which defy dealer competition.

It is known that certain large mail order houses have their agents operating among foreign manufacturers. These American importers find it possible to obtain prices which, with ocean-freight and duty added, remain below production costs here. The valuation is made at port of shipment and the customs officials abroad have little chance to contest the figures as the manufacturers would have their instructions in this respect. With American valuation restored to the books, importers would be assessed on the wholesale prices of the goods in this country instead of abroad.

A committee comprised of C. C. Hanch, vice-president of the N. A. C. C. and chairman of the taxation committee; R. A. Branigan, counsel, and Pyke Johnson, manager of the Washington office, conferred with legislative leaders here this week on the taxation question. They found a sharp division of opinion as to tax proposals and much uncertainty as to what plan should be considered first.

The committee ascertained that State officials had advised their congressional representatives to consider the effect that a national levy on automobiles would have on State revenues and highway programs. With the various States insisting on State rights and jealously guarding their sources of revenue, it is expected that the Houston proposals for a horse-power tax on automobiles will meet strong opposition in Congress.

May Try Canadian Tax Plan

Few legislators would commit themselves to the proposed increase in excise taxes. Senate and House committee leaders are split over the sales tax levy. The Hanch committee was advised that the Canadian two-point tax, which hit the manufacturer and wholesaler, was under consideration.

Washington Amused at Barrett Attack

Farmer Representative's Charges of "Assistant Government" Fall Short of Mark

WASHINGTON, March 15—Official Washington evinced little surprise at the attack of Charles S. Barrett, president of the National Farmers' Union, against local representatives of the National Automobile Chamber of Commerce, the American Automobile Association and other large organizations. The contention that these representatives were "a new and powerful 'assistant' government" fell short of its mark because Barrett has been haled before special committees of Congress investigating the activities of professional farmer-lobbyists.

Barrett did not give details as to the activities of the Washington office of the N. A. C. C. though he did cite the real achievements of the A. A. A. He contended that "automobile owners have not neglected an opportunity to assist the government in making laws which are designed to make more pleasant and perhaps more profitable, the business in which they are engaged. Under the name of the American Automobile Association, the owners have established themselves in a big office building and have placed A. G. Batchelder, a former newspaper man, in charge. This organization was largely instrumental in securing the passage of the bill providing for Federal aid in road building and many hundreds of millions of dollars have already been expended for this work."

No Pleaders for Industry

Batchelder, executive secretary of the A. A. A., like all other individuals mentioned by Barrett declined to take him seriously. He pointed out that in the promotion of good roads and Federal aid the farmer had been the greatest beneficiary.

Pyke Johnson of the N. A. C. C. explained that Barrett had been misinformed as the Washington office was purely an information bureau maintained for the automotive industry. He declared that no special pleaders were employed and that legislative committees selected from the membership spoke for the industry and not salaried men.

Senators and Congressmen who have investigated have found that the entire membership of the National Board of Farm Organizations, represents less than one per cent of the registered farmers, yet presume to speak for the agricultural industry.

Larsen Plane Tests Show Instability

Army Air Service Condemns Control and Pilot's Seat—Fire Hazards Eliminated

WASHINGTON, March 11—Summary of results of the official performance tests conducted by the Army Air Service with Junker airplanes sheds light on the numerous and baffling accidents which resulted in casualties to air mail pilots. The reports submitted to-day after a series of flights show that the airplane is spirally unstable, due to the large fin area toward the tail, causing a lifting of the rear of the fuselage in the event of a side slip.

The pilots reported that the flying qualities of the Junker planes appear new and different when originally flown by pilots familiar with conventional types. The rudder and elevator of the JL planes appear and feel too small. The Army test pilots agree in part with the Post Office Department as to the fact that the JL planes are economical and efficient and have features of construction having valuable possibilities.

The aviators have little criticism to offer for the engine, but the arrangement of the controls and pilot's seat are condemned. The pilots suggested the abolishment of the notched push-rod type of throttle and the substitution of a standard engine throttle. The oiling system is regarded as adequate, but the shutter control works poorly. The Army test pilots eliminated fire hazards to a large extent by installing air intake pipes leading from the tank under the crankcase to the outside of the plane below the engine, thus directing backfires outside the fuselage.

The airplane tested was of the commercial type with an engine developing 1445 r.p.m. on a mixture of half benzol and half gasoline. The Postal Service has suspended use of these planes pending further tests.

Canada Plane Barrier to Be Effective May 1

NEW YORK, March 12—The Manufacturers' Aircraft Association has been informed that the Canadian Air Board has set May 1 as the time limit in which American army and navy pilots may fly over Dominion territory. Civilian aircraft and pilots from the United States are barred. The action was taken under the terms of the International Air Convention, which provides that pilots of aircraft entering other countries must be registered and licensed in their own country.

All the powers have subscribed to the convention, including the United States, and all governments excepting that of the United States have established departments with jurisdiction over aviation. At the request of the American State Department the Canadian authorities permitted army and navy fliers to enter Federal machines on official business only "pending the organizing of a body in the United States having authority to issue civilian aviation certificates and licenses in accordance wth the internatonal air convention." It evidently is the expectation that such a body will be created before May 1.

Higher Operating Cost Causes Goodrich Deficit

NEW YORK, March 15—Despite sales by the B. F. Goodrich Co. for 1920 of $150,007,345, a new high record, there was a deficit of $921,248 before payment of taxes, inventory depreciation and dividends. After payment of dividends on the common and preferred stock the deficit was $5,371,792, compared with a surplus after dividends of $12,657,813 in 1919.

A comparison of the income account for 1920 and 1919 follows:

	1920	1919
Net sales	$150,007,345	$141,343,419
Mfg. expenses, etc.	142,250,719	121,579,265
Balance	7,756,626	19,764,154
Total income	8,732,972	20,340,214
Depreciation, etc.	6,021,686	3,035,401
Net profits	2,711,286	17,304,813
Preferred dividends	2,688,840	2,247,000
Balance	22,446	15,057,813
Common dividends	3,604,200	2,400,000
Deficit	3,581,754	*12,657,813
Prev. sur.-adj.	41,203,046	33,894,923
Total surplus	37,621,292	46,552,736
Final surplus after reserve, etc.	22,706,498	41,203,046

*Surplus.

B. G. Worth, president of the company, in his remarks to stockholders, said in part:

"In view of the decline in the market values of crude rubber and fabrics, directors have deemed it advisable to appropriate out of surplus the sum of $8,000,000 which added to the reserve for contingencies of $2,000,000 provided out of profits in prior years, leaves a total reserve on Dec. 31, 1920, of $10,000,000 to cover possible losses on future commitments and contingencies.

"Directors feel that, taking into consideration the depression in the rubber industry during the last half of 1920, operating results shown are satisfactory and the financial position is excellent.

"Plants are in a thoroughly efficient working condition, prepared for any emergency, and it should therefore not be necessary to incur any further expenditures during current year for additional expansion of fixed properties."

FORM NEW FINANCE COMPANY

OTTAWA, March 12—The Canadian Metropolitan Securities Corp. has been formed with a capital of $1,250,000 divided into $500,000 8 per cent preference cumulative shares and $750,000 common shares, both $10 par value. The new company will act in connection with the Confederative Investment Corp., Ltd., the latter being fiscal agents for the new company. The Ritter Commercial Trust of Cleveland has guaranteed the preferred dividend for ten years.

Modified Contract Urged in Georgia

Dealers Solidify Sentiment Looking Toward More Equitable Terms From Factory

ATLANTA, March 14—Contending that the contracts under which the dealers operate are arbitrary with regard to the rights of manufacturers, but that they show slight regard for the interests of the dealers, the Georgia Automotive Dealers' Association has inaugurated an intensive campaign that has as its objective an improvement in this condition of affairs. The association is co-operating with the national organization in this movement.

Within the past month four sectional meetings have been held in various parts of the State, together with a meeting of the State body in Atlanta, March 10, at which time the contract matter was thoroughly discussed and resolutions adopted advocating the five important items as objectives in the national campaign. These items are outlined as follows:

First: For the automatic renewal of contracts on the basis of fair and faithful representation of the manufacturers by the dealers.

Second: For contracts binding both parties whether the manufacturers be one of the parties directly participating or through distribution.

Third: For the termination and cancellation of contracts upon a just cause only.

Fourth: For concession of the right to the dealer to order and receive automobiles as he needs them only and to refuse acceptance of all automobiles not so ordered by him.

Fifth: For cessation of contract deposits required of dealers by manufacturers.

An increase in the discounts now allowed dealers by the manufacturers was also advocated at the various sectional meetings and at the State meeting in Atlanta.

Liberty and Chandler to Finance Dealers

NEW YORK, March 15—To a greater extent than ever before motor car manufacturers are having impressed upon them the necessity of financing their dealers, especially in the smaller towns, either directly or through automobile financing companies. The list of those which have undertaken this work is steadily expanding.

Among the latest to go into this field is the Liberty Motor Car Co. of Detroit, which has begun the financing of its dealers on what is known as the floor plan.

The Chandler Motor Car Co. recently entered into an agreement with the Continental Guaranty Co. of Chicago to finance its dealers and a similar arrangement was made several months ago by Dodge Bros. with the Bankers Commercial Security Co. of this city.

The Maxwell Motors Co. has been financing dealers for two or three months

INDUSTRIAL NOTES

Times Square Auto Supply Co., Inc., will change its name to Consolidated Distributors, Inc.

Gardiner Motor Co. has re-elected all directors and officers at the annual stockholder and organization meetings.

Deere & Co. has reduced production in its wagon factory in Moline, Ill., because of stagnant buying tendencies.

Chappelow Advertising Co. has leased 10,000 feet of floor space for the location of a modern advertising office in St. Louis.

Masters Motors Co. has moved its Indianapolis plant and office equipment to Lafayette, Ind., where it will combine its forces.

Green Bay Drive Calk Co., Green Bay, Wis., has started work on a forge shop and storage building to replace buildings destroyed by fire.

Kelly-Springfield Tire Co. has re-elected all retiring stockholders, with the exception of Van H. Cartmell, who is succeeded by Theodore G. Smith, a vice-president of the Central Union Trust Co.

Standley Skid Chain Co. has made arrangements with Mattauch & Strong Co. of Des Moines for the manufacture and marketing of the Strong transmission band adjuster.

Skelton Motors Name Changed by New Owner

ST. LOUIS, March 12—W. F. Traves, head of the Talbott Reel Mfg. Co. and an official of the American Knockdown Bottle Case Co., Kansas City companies, has taken over the interests in the Skelton Motors Corp. which he purchased from Dr. L. S. Skelton shortly before the latter's death.

The general offices of the Skelton company have been moved so that they now share quarters with the Premier distributor, and the Murphy Machinery & Equipment Co. Both retail and wholesale work will be done there. The name of the producing company has been changed to the Traves Motors Co., Successor to the Skelton Motors Corp.

Mr. Traves states that the former officials will be retained including W. A. Chapman, general manager; J. A. Schroeder, chief engineer; and George Sherwood, production manager. The name of the product, Skelton, will be retained for the present.

Wharton Motors Builds Combination Tractor

DALLAS, TEXAS, March 11—A two plow tractor that can also be used as a cultivator and which is to sell at about $1800 is being manufactured by the Wharton Motor Co., Inc., of this city. The outstanding feature of the machine is that it is a three-wheel type with drive on all wheels. The tractor has a rating of 12-20 h.p. and is equipped with a four cylinder Gray engine of 3¾ in. bore by 5 in. stroke, running at 1000 r.p.m. Lubrication is by a gear pump and ignition by an Eisemann Magneto. The carburetor is a Kingston 1¼ in. Gasoline is recommended for fuel but kerosene can be used. The fuel tank has two compartments, of 15 and 3 gal. capacity, respectively. The cooling water is circulated by pump and a fan is mounted back of the radiator.

The belt pulley measures 10 in. in diameter by 7 in. face and its shaft is mounted on roller bearings. The clutch is a Borg & Beck, while the transmission is of the Wharton Company's own design and manufacture. Three forward speeds are obtained, the reductions being 152, 109 and 77 to 1, respectively. The three speeds given by the above reduction ratios in combination with the 60 in. driving wheels are 1½, 2½ and 4 m.p.h. respectively. The final drive is through worm and wheel and bull gear and pinion. This tractor has a wheelbase of 82 in. and turns in a 7 ft. radius Its minimum clearance is 24 in. and its total weight, dry, 3800 lb. The rear driving wheels are adjustable on the axle, which enables the operator to cultivate rows of any spacing from 30 to 48 in.

G. M. C. Directors Board to Act on Dividends

NEW YORK, March 16—Directors of the General Motors Corp. are expected to take dividend action the latter part of this month. There is no intimation whether or not the dividend will be paid but it is expected to depend largely on the showing made in the next two weeks. If there are indications that the present upward trend in business will continue permanently the payment probably will be made.

It is not probable immediate action will be taken by the corporation on the proposal to fund its bank loans of approximately $75,000,000 through the issuance of new securities although the plan has not been abandoned definitely. The position of the company has been materially improved by the large reduction made in its inventory. It can be stated positively that no large additions or improvements to any of the General Motors plants are contemplated.

Renard, Ballot Driver, Killed in Collision

PARIS, Feb. 27—(*Special Correspondence*)—Fernand Renard, Ballot race driver, and mechanician to René Thomas in the last Indianapolis race, was killed instantly to-day when he collided with an automobile truck in the suburbs of Paris. Renard, who was entered to drive a Ballot car in the next French Grand Prix, was carrying out carburetor tests in company with the chief engineer of the Zenith Carbureter Company when the driver of the truck suddenly swung across the road. The racing car was little damaged, but Renard struck his head against the body overhang of the truck and was decapitated.

BRIDGEPORT RECEIVER NAMED

BRIDGEPORT, CONN., March 16—Edward K. Nickolson has been appointed receiver for the Bridgeport Motor Truck Co. His bond has been fixed at $25,000.

METAL MARKETS

WHATEVER improvement is making itself felt in the automotive industries is eagerly seized upon to generate a more optimistic atmosphere in the iron and steel markets. A Cincinnati pig iron interest, whose market letters since the beginning of the year have been dyed in the most sombre hue of unrestrained pessimism, says in its report for this week:

"It is especially encouraging to realize that a revival in the automobile industry is apparent. Several well-known manufacturers of passenger cars in Michigan have resumed operations. Some are back to 50 per cent of their normal output. The cars have been sold and are being shipped out as made. This allows the foundrymen to liquidate stocks of castings which have been held in storage for many months, and in turn affords them the opportunity to specify more liberally for shipments against their contracts for pig iron and coke. Thus blast furnaces will be given some relief from the heavy burdens they are carrying for the benefit of their customers."

The steel market may be said to have entered upon a new phase. Heretofore we have had steady declines in the prices named by "independents," whereas now we have unprecedented irregularity in quotations, some of the producers, convinced that the tide has turned, being unwilling to cut prices further, while others appear to be anxious for every ton of steel they can get on their order books. The latter incline to the belief that, when Judge Gary returns from his vacation, which will be next month, the Corporation's price policy will undergo readjustment. By that time, it is expected, the preliminaries for changing from the twelve-hour to the eight-hour day in the Corporation's mills will be out of the way, and it will be seen whether, as a result of this rearrangement, it will be possible to avoid complications with labor and at the same time readjust production costs on a lower level.

In the non-ferrous metals, of chief concern to the automotive industries, the outstanding feature is that aluminum prices are expected to reflect more and more from now on the growing certainty of the passage of an emergency tariff measure.

Pig Iron.—Although occasionally transactions in resale iron would make it appear as though the market was still on the toboggan, automotive castings manufacturers are specifying much more freely against old contracts, and, with merchant furnace output at the lowest in many years, the supply of bargains is likely to lessen.

Steel.—Mills catering especially to the automotive trade, such as those specializing in cold-rolled strip steel and cold-finished steel bars, report more activity all around. Releases against old orders are gratifying and new inquiries and orders on the increase. New price levels, however, are still in a formative stage and await the placing of more representative business. Cold-finished bars will likely sell at 3c. Finished sheets for automobile use have been selling at 5.85c. So far as can be learned, the 1000-ton sheet order which a Detroit automotive interest is asking bids on has not yet been placed. No. 28 black sheets have been sold at as low as 3.85c. by Valley mills, although the sheet market generally is at 3c.

Aluminum.—One- or two-passenger car builders have begun to sound the market. The sole American producer continues to quote 28.50c. for virgin ingots. Importers are somewhat firmer in their price views.

FINANCIAL NOTES

Lee Tire & Rubber Co. reports net profits, after all charges and Federal taxes, of $326,-638 for the year ended December 31. This is equivalent to $2.11 a share earned on the 150,000 shares of common stock of no par value, and compares with $471,805, or $3.14 a share, earned in the preceding year. Assets of the company totaled $5,934,118, of which $362,123 is cash and $3,101,870 inventories. The surplus of the company is shown as $652,335.

International Motor Co.'s report for 1920 shows gross sales of $34,071,365 and net profits of $4,583,151 before write-off for inventory depreciation. After inventory deduction and tax reserves the profit available for dividends is $2,644,013, equal to $5.32 a share on the common stock. The regular quarterly dividends of 1¾ per cent on preferred stocks will be paid April 1.

Peerless Truck & Motor Corp., for the year ended Dec. 31, shows net profits of $1,063,306 after all charges, including Federal taxes. This is equal to $5.31 a share on the 200,000 shares of common stock (par $50) outstanding. In 1919 the company earned $872.154, or $4.36 a share. Net sales for 1920 were $14,919,065, compared with $12,928,601 in 1919.

Republic Rubber Corp. is negotiating for additional funds, and for that reason has deferred the presentation of its annual report. The annual meeting of the company has been postponed until April 14, at which time stockholders will be asked to approve financing plans arranged.

Stewart-Warner Speedometer Corp. reports net income for 1920 as $3,092,383, which compares with $3,161,634 in 1919. Surplus after dividends for 1920 is $615,928, which compares with $1,063,575 in 1919. The profit and loss surplus totals $8,041,938, as compared with $7,514,455.

Simms Magneto Co. reports net income for 1920 as $71,661. This compares with $94,998 earned in 1919 and $74,414 in 1918. The balance after deductions for preferred dividends was $1.661, as compared with $22,748 in 1919.

Badger Foundry Co. of Racine, Wis., which specializes in automotive and agricultural implement castings, has increased its capital stock from $100,000 to $200,000 to handle a larger volume of business.

Auto Body Co., in a balance sheet as of Dec. 31, shows total assets of $2,674,906, of which $32,863 is cash and $1,232,648 inventories. The surplus is $48,035.

Mason Tire & Rubber Co. reports a 10 per cent increase in sales for February, 1921, over the same month 1920. The entire plant is again on a 24-hour basis.

Hupp Motor Car Corp. will pay a quarterly dividend of 1¾ per cent on the 7 per cent cumulative preferred stock on April 1.

Gardner Motor Co., Inc., has had listed on the Boston Stock Exchange 155,000 shares of no par common stock.

Timken-Detroit Axle Co. has passed its common dividend, due March 15, to conserve its cash resources.

PATTERSON EXTENDS HOLDINGS

GRAND RAPIDS, MICH., March 16—E. C. Patterson, president of the Patterson-Warner Co. of Chicago, has acquired a substantial interest in the Auto Indicator Co. of this city, and has been made one of the directors in the company. The Chicago company was organized four years ago by Patterson and A. P. Warner of Beloit, Wis., originator of the Warner speedometer, to manufacture and sell the Warner-Lenz.

The capital stock has been increased to $1,500,000, which will provide for the company being financed on a basis to handle the increased business of the company resulting from the sales and advertising policies shortly to be put into effect. The board of directors has been increased to seven, the additional member being C. B. Hamilton of the Brearly-Hamilton Co. of this city. The present officers of the company are Joseph Renihen, president; R. W. Brown, vice-president and V. I. Gilley, secretary-treasurer.

Immel Reorganization Approved by Creditors

COLUMBUS, March 12—The preferred stockholders' committee of the Immel Co., of Columbus, makers of closed automobile bodies, which has been in the hands of a receiver for several months, has prepared a plan of reorganization which is receiving the sanction of the creditors. The creditors hold claims of approximately $450,000 against the company. It is proposed to organize a new company and purchase the property, including the plant, and pay 50 per cent of the claims in cash, giving first mortgage notes bearing 8 per cent interest for the remainder of the claims.

It is proposed to issue $250 000 second mortgage 8 per cent notes, payable in three years, to furnish capital for operation. All preferred stockholders are asked to agree to the plan and aid in the reorganization which will maintain the plant as a going concern. Replies received both from preferred stockholders and creditors show that the plan is being approved generally.

CLEVELAND RE-ELECTS OFFICERS

CLEVELAND, Mar. 13—At the annual meeting of the Cleveland Automobile Co. the same board and officers were re-elected, as follows: F. C. Chandler, chairman of the executive committee; Samuel Regar, chairman of the finance committee; J. V. Whitbeck, president; Sid Black, vice-president; J. I. Krall, secretary and treasurer. Although no statement was given out, Krall said profits for the first full year were satisfactory from the time operations started in August, 1919, up to Dec. 31, 1920. The company has manufactured 19,000 cars, of which 16,000 were made during 1920. Present production is rather light, but it was stated that it is the aim of the company to resume normal production in a few months. Last August the company retired 5 per cent of its $1,400,000 8 per cent preferred stock.

NEW BRITAIN ON FULL WEEK

NEW BRITAIN, CONN., March 15—The New Britain Machine Co. is now operating the tractor division on a 55-hour week schedule. Indications point to an early increase in the working force and overtime operation in order to meet the production requirements.

Bank Credits

Written exclusively for AUTOMOTIVE INDUSTRIES *by the Guaranty Trust Co., second largest bank in America.*

NEW YORK, March 17—In spite of the fact that March 15 is one of the biggest days in the routine of the United States Treasury, the shifting of funds incident thereto had little outstanding effect on the money and security markets last week. On that date about $500,000,000 of certificates of indebtedness matured, and there was due $76,-000,000 interest on the Third Liberty Loan, and, in addition, there will be payments of $200,000,000 due the railroads at about the same time, under the provisions of the Winslow Act.

Moreover, the Treasury has announced the issuance of approximately $400,000,-000 of new certificates of indebtedness at rates fractionally lower than has been the case in the recent past. It had been variously estimated that the tax receipts on that date would amount to from $300,-000,000 to $700,000,000, the new Secretary of the Treasury's estimate being near the maximum. The only assured thing about the tax receipts is, however, that they will undoubtedly be much smaller than for the corresponding date a year ago.

There was a slightly firmer tone in the local money market last week. Offerings of call money were fewer, at rates ranging from 6 per cent to 7 per cent, and with a ruling rate of 7 per cent. Time money, the greatest demand for which was for the shorter maturities, advanced to 7 per cent for sixty and ninety days, and four months' paper, and 6¾ per cent to 7 per cent for five and six months' paper.

The Federal Reserve System continued the improvement of its position which has, with only one interruption, steadily become stronger all the year. The same factors which have been chiefly responsible for the improved reserve ratio again were the main elements in the betterment in the past week; that is, gold reserves increased $24,816,000, and the Federal Reserve notes in circulation decreased $36,771,000. In spite of an increase in net deposits of $68,392,000, and substantial increases in total earning assets and total bills on hand, the ratio of gold reserves to Federal Reserve notes in circulation, after setting aside 35 per cent against net deposits, increased from 59.3 per cent to 59.9 per cent.

GRIGGS SELLS TRAILER STOCK

DETROIT, March 16—J. B. Mansfield heads a syndicate which has purchased a controlling interest in the Detroit Trailer Co. from S. A. Griggs. Plans are announced for an addition to the plant, 55 x 135 ft., which will be completed May 1. The new structure will house show rooms and finished stock. At the annual meeting, Mansfield was elected president; Griggs, vice-president; E. B. Newton, treasurer, and F. L. Tully, secretary.

Men of the Industry

David F. Edwards, formerly assistant general manager of the Chrysler plant of the Willys Corp. at Elizabeth, N. J., has been elected vice-president and treasurer of the LaFayette Motors Co. at Indianapolis. Edwards, who was graduated from Harvard, became an instructor in the Graduate School of Business Administration at Harvard University, specializing in industrial organization. In 1911 he came to Detroit as one of two assistants to the president of General Motors and became comptroller and later vice-president of Olds Motor Works at Lansing. Leaving the Olds organization, he joined the Gier Pressed Steel Co. of Lansing and remained with that concern until joining the Willys organization.

R. W. Schuette, for many years Rolls-Royce distributor for the United States and of late New York branch manager, has resigned with the object of taking an extended trip through Europe, to be gone several months. J. S. Inskip, formerly of the sales department of the New York branch, Locomobile company, has been appointed New York manager, succeeding Schuette. J. Roy Hiltz, for a number of years with the Locomobile and recently with Hare's Motors of New England, has resigned and accepted a position on special sales work, making his headquarters at the American Works, Springfield.

Sir Dugald Clerk, the noted British gas engine expert, will come to this country in May and will deliver an address on, "The Internal Combustion Engine for Motor Cars," before the Society of Automotive Engineers at its summer meeting. Sir Dugald has long taken an interest in gas matters, and will discuss matters of thermal efficiency with leading American gas engineers. He is also chairman of the Conjoint Board of the Scientific Societies' Committee on Water Power in the British Empire and will look up matters connected with the water powers of the United States and Canada.

Fred P. Steele, for many years associated with the automobile industry, has joined the Stutz Motor Car Co. of America, Inc., and will represent the factory in the Atlantic Coast district. Homer R. Horsfall, formerly identified with the automobile business in St. Louis and for the past five years with the Overland, is now connected with the Stutz Motor Car Co. of America, Inc., with sales supervision over the Western and Pacific Coast territories. Fred Wilson is now located with the Stutz Motor Car Co. of America, Inc., in the capacity of assistant sales manager.

H. Y. Grassl has been appointed director of service of the Republic Truck Sales Corp. and will be in charge of the company's comprehensive system. He has been connected with the service department of the Republic company and supervised the installation of standard service records. Practically all of Grassl's business career has been devoted to the mechanical and engineering field. Before joining the Republic organization, he was with the Master Truck Co. for two years and supervised the production of its first truck model.

George E. Bruner, manager of the service department of the Goodyear Tire & Rubber Co., has been announced as successor to Robert S. Wilson as truck tire manager. E. J. Samuels, manager of the organization division, will go to New York to become manager of inside sales. Bruner has been with Goodyear for over five years. He will be succeeded as manager of the service department by W. H. Sorn, at present assistant manager. Samuels has been with Goodyear since 1911.

George H. Strout has been appointed manager of the Eastern department of the Apperson Bros. Automobile Co. Strout has been in the Apperson family for many years. He has complete charge of the territory comprising the New England States, Eastern New York State and Northern New Jersey. Strout is also, and has been for some time, in complete charge of export business.

James T. Aubrey, western manager for the *Cosmopolitan Magazine* with headquarters in Chicago, has been selected to succeed H. H. Holmes as advertising manager of the Packard Motor Car Co. and will assume his duties April 1. He has had long experience in the advertising field and joined the Cosmopolitan staff upon his discharge from the army.

Lincoln T. Kauffmann has organized a company to act as selling representative for manufacturers of automotive equipment. Associated with him is Lewis M. Schwartz, who for ten years was advertising and sales manager for the Emil Grossman Mfg. Corp. of Brooklyn.

Alfred Reeves, general manager of the N. A. C. C., addressed a meeting of New England dealers at Boston, Tuesday night, on business prospects for 1921. He spoke before the Buffalo Rotary Club at noon to-day and will address the Buffalo Dealers' Association to-night.

Homer Hilton has been elected vice-president and general sales manager of the Winther Motor Truck Co., Kenosha, Wis. Hilton up to this time has been managing director of the National Association of Motor Truck Sales Managers.

J. C. Johnson has resigned his position in the purchasing department of the Maxwell Motor Co. Johnson formerly was in the purchasing department of the Briscoe Mfg. Co. in this city. He has not announced future plans.

R. W. Stanley has been engaged by the receivers of the Owen Magnetic Motor Car Corp. as production engineer in charge of the Wilkes-Barre plant. He was formerly connected with General Electric Co.

James C. Griven has recently joined the forces of the Miller Rubber Co. as special Eastern representative, with headquarters in New York. Griven's connection with the rubber business dates from 1909.

R. F. Ohmer, sales manager of the Recording & Computing Machines Co., Dayton, Ohio, manufacturers of Ohmer Ignition, has organized a distributing sales company, with headquarters at Dayton.

Ralph Leavenworth, advertising manager of the Standard Parts Co., Cleveland, left that connection, March 15, to take the position of director of personnel with S. L. Weedon & Co., Cleveland.

Robert W. Boys has resigned as superintendent of the Goodyear Mills, Inc., subsidiary of the Goodyear Tire & Rubber Co., to accept a similar position with the Manhasset Mfg. Co., Putnam, Conn.

E. J. Herrmann has been appointed sales manager for the territory handled from the Indianapolis plant of the Martin-Parry Corp. Mark E. Hamer has been appointed advertising manager.

George E. Merryweather, president of the Motch & Merryweather Machinery Co., has become a member of the board of directors of the Davenport Machine Tool Co., Inc., Rochester.

L. J. Kramer has joined the sales force of the United States Motor Truck Co., Cincinnati. He has been connected with the truck business for some years, serving with Master and Republic.

George W. Ellis of the Supplee-Biddle Hardware Co., Philadelphia, has been appointed chairman of the Automobile Accessories Branch of the National Hardware Association.

Herman Alperin, formerly with the Cyphers Incubator Co. at Buffalo, has been made sales manager of the King Motor Car Co., recently purchased by C. A. Finnegan and his associates.

A. C. Immel, former superintendent of construction for Ford Motor Co., has joined the Columbia Body Co. of Detroit in the same capacity.

J. A. Cowles has severed his connection with the McVicker Engineering Co., Minneapolis.

S. Gordon Hyde has resigned as advertising manager of the Buda Co., Harvey, Ill.

Chicago Finds Sales Very Brisk in City

CHICAGO, March 11.—The number of actual deliveries of new cars sold at retail during the first two months of this year was equal to that for the same period a year ago, and there appears to be no let-up in the demand for new cars by city buyers. The same condition does not hold in the wholesale trade—cars sold by the distributors to country dealers. There is little trade in the country and little hope of improvement until the farmers get to work.

But trade in the city is so good that dealers are asking if it is going to last—whether it does not constitute in a measure the business left over when the slump came last August. There were many prospects at that time in the mood for buying who were frightened off by general conditions and who, with the cut in Ford prices the following month, felt that they might as well wait a while to see how far prices would be cut.

The used car market is good; probably as good as it was in the first two months of last year.

The truck market is not good. Chicago profited slightly from the good roads show, but until business conditions throughout the city show a more appreciable improvement truck distributors do not see that there will be any forward movement in their lines.

SELLS 30 TRUCKS IN OHIO

DETROIT, March 16—Substantiating optimistic reports of improvement in the truck industry, the Commerce Motor Car Co. reports that one roadman brought in this week orders for 30 trucks from the Ohio territory, including 13 from Cleveland, nine from Columbus and six from Toledo. Factory production schedules are being increased daily and officers of the company declare prospects are bright for restoration of a normal pre-war business by May 1.

Calendar

SHOWS

Mar. 19-26—Detroit, Annual Automobile Show, Detroit Automobile Dealers' Ass'n, Morgan-Wright Building.

April 3-9—Denver, Annual Automobile Show, Auditorium.

April 4-9—Seattle, Annual Automobile Show, Seattle Motor Car Dealers' Ass'n, Arena Hippodrome.

FOREIGN SHOWS

Mar. 22-28—Witwatersrand Agricultural Show including machinery and motors sections.

April, 1921—Sofia, Bulgaria, Tractor Trials, under the Bulgarian Ministry of Agriculture.

Apr. 20 - May 5 — Mexico City, Mexican Automobile Show, National Theatre Bldg.

May 28, 1921 — Czecho-Slovak International Automobile Exposition of Cars, Trucks, Tractors, Motorcycles and Equipment. Prague.

May 28-June 8—International Automobile Exhibition, Basle, Switzerland.

June, 1921—Reykjavik, Iceland. Agricultural Exhibition—Agricultural Machinery—Icelander Agricultural Society, Reykjavik, Iceland.

Oct. 5-16—Paris, France, Paris Motor Show, Grand Palais. Administration de l'Exposition Internationale de l'Automobile, 51, Rue Pergolèse, Paris.

Nov. 4-12 — London, British Motor Show, Society Motor Mfrs. and Traders.

CONVENTIONS

May 4-7 — Cleveland, National Foreign Trade Council.

May 17-19—Buffalo, Convention of Factory Service Managers, Auspices of Service Committee, N. A. C. C.

May 24-28 — West Baden, Ind., Summer Meeting Society of Automotive Engineers, West Baden Springs Hotel.

Oct. 12-14, 1921—Chicago Twenty-eighth Annual Convention National Implement & Vehicle Ass'n.

RACES

June 18—Uniontown, Pa., Speedway Events.

July 24—Grand Prix, Le Mans.

Labor Day—Uniontown, Pa., Autumn Classic.

S. A. E. MEETINGS

Buffalo section—April 19—Paper on "Carbureter Performance," by F. C. Mock.

Dayton section — March 22 — Symposium on Post War Aeronautical Progress.

Dayton section—May 3.

Detroit section—March 25—Discussion of "The Relation Between the Industry and the Department of Engineering Research of the University of Michigan," by Prof. E. A. White. Detroit Board of Commerce.

Metropolitan section—April 14—Paper on "Low Grade Fuel Carburetion," by A. H. Beach.

Minneapolis section — April 6 — Discussion of repair equipment.

Washington section—April 1—Aeronautical Engineering Session.

Obregon Takes Position as Mexican Show Head

NEW YORK, March 14—The presidency of the forthcoming automotive show in Mexico City, which will be held in the new National Theater from April 20 to May 5, has been accepted by General Obregon, president of the Mexican Republic. General Obregon, in accepting the honor, came out strongly in favor of the good roads movement which is being inaugurated by the dealers and automotive interests of Mexico.

Information reaching New York, both from Mexico City and from the manufacturers of automotive equipment in the United States, lends weight to the belief that the exhibition will be satisfactory from every standpoint. Many manufacturers of cars, trucks, tractors, accessories and equipment, have signified their intentions of being represented and in the last few days a number of special exhibits for the show have gone forward.

The importance of the show is twofold. Mexico at this time is one of the few foreign countries which has not suffered seriously in the present business depression. Secondly, the Mexican show is among the first in the Spanish-American countries in which the manufacturers of North America have co-operated strongly. Several other showings have been held in South America but they have received but scant attention from manufacturers.

To Make Special Survey of Bethlehem Affairs

NEW YORK, March 16—Edward F. McGuire, vice-president of George W. Goethals & Co., an experienced automobile and industrial organizer, has been appointed to make a fresh survey of the affairs of the Bethlehem Motors Corp. He will act with Clinton E. Wood, the receiver. If McGuire deems it advisable he will undertake a vigorous selling policy looking toward the liquidation of the trucks on hand within the next three months and will report back to the creditors his conclusions as to the most advantageous course to pursue in reference to the future conduct of the company.

A committee of Bethlehem Motors stockholders, headed by B. W. Jones, has sent a letter to stockholders urging them to deposit their stock under a protective agreement in the hope that if conditions in the industry show a marked change for the better in the near future and that if adequate working capital can be obtained, a reorganization or adjustment will improve materially the present situation of the stockholders.

Mid-West Section S. A. E. Studies Ansted Engine

CHICAGO, March 12—At the meeting of the Mid-West Section of the S. A. E., Chester S. Ricker and John Moore, consulting engineer and chief engineer, respectively, for the Lexington Motor Car Co., presented a paper on the design of valve gear and engine design as applied to the new Ansted engine used exclusively in the Lexington car. The paper was supplemented with moving pictures showing the unique production methods used in the construction of the engine. The "rocking chair" valve motion for the operation of the overhead valves was explained by the use of an animated moving picture.

The results of a complete set of tests on the road and re-run on the dynamometer under duplicated road conditions were also presented with the aid of graphic charts. One consideration, the presence of several humps in the vacuum lines showing manifold depressions, was the cause of a long discussion. Mr. Purdy of the Rayfield Carbureter Co., proposed several possible reasons, but by a series of illustrative examples showed that these reasons were without grounding, and therefore valueless.

The meeting was one of the best attended that the Mid-West section has ever had, about 125 members and their friends being present.

Wood Accepts Challenge for Motor Boat Cup Race

DETROIT, March 15—"Gar" Wood has accepted the challenge cabled by the Royal Motor Yacht Club for the Harmsworth Trophy. This guarantees the holding of the foremost motor boat racing fixture during the coming season. For the first time in the history of international motor boat racing the contest will be held on inland waters, as the Motor Boat Club of America, the recognized club in the United States governing B. I. T. matters, has awarded the contest to the Detroit Yacht Club. The race will be held in the protected waters of Lake St. Clair or on the Detroit River on Sept. 3, 5 and 6.

The British International Trophy event will follow the American Power Boat Association's race for the Gold Cup and One Mile Championships of North America, which will be held on Aug. 27, 29, 30 and 31. At the same time will be held the first of the new Wood-Fisher Trophy races for displacement boats under 32 feet in length equipped with any type of motor of a piston displacement not exceeding 2150 cubic inches.

Atlanta Show Brings Southern Sales Spurt

ATLANTA, March 12—At least 150 sales were made in Atlanta this week, many of which resulted directly from the automobile show. Of this number about 50 were retail sales while many of the others were sales to new dealers secured throughout the southeastern territory by Atlanta distributors exhibiting at the show. The most important feature of the show lies in the fact that it has brought the dealers back to optimism not only because of the actual sales that were made, but because the public displayed real interest for the first time in months and hundreds of prospects were obtained. Hundreds of dealers from the smaller towns visiting the show left imbued with greater enthusiasm.

AUTOMOTIVE INDUSTRIES
THE AUTOMOBILE

VOL. XLIV — NEW YORK—THURSDAY, MARCH 24, 1921 — NO. 12

Things To Consider If You Would Sell Trucks

There is much more to the selling of trucks than the mere obtaining of dealers, sending salesmen to see prospects, and getting the name on the dotted line. There still remains the huge problem of establishing a motor transportation industry.

A MAN who has given more than 20 years of a busy life to the study of the motor truck and its problems said recently:

"It is my belief that 75 per cent of the motor truck sales to-day have been misfits."

Rather startling comment!

It might be well to follow this motor truck student in his reasoning:

"Salesmanship has so far been based upon the motor. Every manufacturer, and consequently his salesmen, have been anxious to place their motors in the hands of the men who can use them. This desire has been so overmastering that little thought has been given to the methods.

"In recent years some salesmen have studied the problems that the trucks were called upon to do, but still they have considered that problem almost entirely from the view of the motor.

"It is my thought that the truck user should be sold on the body, or in other words, on the economy and convenience of handling his particular merchandise problem. Once the salesman sells him on this problem, the buyer will not care much about the motor, except to be assured that it is a worthy piece of machinery and is suitable to move the bodies that he needs to handle his freight."

The above is condensed from the beginning of a conversation that ran well into an entire evening. It ran into the difficulties of the very large trucks, the danger of taxing heavy trucks off of the road, the misuse of trucks generally and finally an agreement of all concerned that the solution of congestion, heavy wheel load and numerous kindred problems lies in putting the heavy loads on more wheels, just as the railroads have solved the same problem.

This solution, of course, lies in the trailer or the semi-trailer. The latter was greatly favored by the persons engaged in this entirely informal conference.

Another thing agreed upon was this:

> **The greatest handicap the truck has today is the waste caused by the misfit sales. Owing to the fact that the truck does not fit the job it is intended for, it is not giving the efficient service that it should. Every truck that is not giving this efficient service, is blocking the sale of other trucks.**

These things were all discussed a few days before Alfred Smith, former governor of New York and later Chairman of the Board of the United States Trucking Corp., spoke before the National Automobile Chamber of Commerce. Smith was invited to tell to the men who make the trucks the troubles of his company. It was interesting to note that he said most of the things that entered into the conversation referred to, and then he said some more. Smith outlined for the truck manufacturers a good many things

that he thought they would have to do before the truck becomes a truly economic transportation medium in New York. He might have added, but he didn't, that the problems of the country are simply intensified in New York and when all of the New York wrinkles are ironed out, then the truck industry will be ready to go ahead with assurance.

A waste of truck time and ability is the great inefficiency Smith saw in trucks under present conditions in New York. He said that in most traffic in lower New York, the horse is more economical than the truck, because of the congestion. It is a lot less expensive for a horse and wagon than for a truck to wait for a shipment at a pier.

He said that it costs his company about $20 a day to operate a motor truck and that under ordinary conditions this truck loses three hours or more a day waiting, so that the charge necessary is not in keeping with the service rendered.

The remedy, as Smith sees it, is for all business to urge the adoption of the store door delivery plan. This plan, he said, would permit the efficient use of trucks. Trailers of the proper variety can be placed upon the piers and loaded at night, so that in the morning each motor can go to the pier, pick up a capacity load and depart on its errand without a loss of time. Under the present plan, he said, it is often the case that the piers are so jammed with trucks and horses, each outfit calling to obtain a small shipment, that each is in the way of some other vehicle and not 50 per cent of them leave the piers with a full load.

Why the Opposition

He said that the opposition to the store door delivery plan is now confined to mercantile establishments that maintain fleets of trucks bearing the name of the establishment for advertising purposes, and that for this reason the owners want these trucks to handle all of the work. Smith did not say, but he let it be inferred that he considers this advertising entirely too expensive and that the motor truck industry is bearing a good deal of the expense in the reflection that the truck is not efficient.

The former Governor said that he had been a good deal impressed by accounts of the freight handling job in Cincinnati, where, by use of interchangeable bodies, trucks are rendering a highly efficient service. Just what the reasonable radius of a truck haul is, he said, could not be measured until there is efficiency in handling the freight. No one would dispute the efficiency of the truck in the measure of covering ground as against the horse. Nor would any one argue the expense of maintaining idle equipment in dull times. He said that during the recent dull weeks his company had been maintaining between 400 and 500 idle horses. When he saw the feed bills, he earnestly wished that the entire equipment had been motorized, but when traffic demands are strong again, he would be thankful, because of the congestion in the streets, that he had horses.

After his talk Smith was asked what the reduction of traffic would be under the store door plan. The questioner said that he had been informed that store door delivery in Philadelphia would mean the elimination of half of the trucks engaged in this service. Smith answered that he believed that the store door plan would eliminate at least half of the traffic in the streets of lower New York.

The man who asked this question is one of the enthusiasts for store door delivery. He realizes that the greatest handicaps to the sale of his trucks to-day is the lack of efficiency of service due to conditions over which the purchaser of the truck has no control.

—

The points of view quoted in this article are those of men who have given thought to the future of the truck and are convinced that there is much more before the manufacturers as a group to prepare the way for proper selling of trucks.

—

Just at this point in the writing of this article there came to the desk a booklet entitled "Vocational Selling as Applied to the Motor Truck Industry," published by the Duplex Truck Company. In this book are many ideas that point to a new way of selling trucks. Indeed, the idea as a whole is newer than many will realize.

In the ten years of development of motor transportation a lot of men have been bribed by money and promises to enter the truck selling field because they had successfully sold something else. In the main these men have not been examined fully as to their fitness as truck salesmen. Some few companies—the Pierce-Arrow is an example—have made an earnest endeavor to educate their salesmen up to a standard. But even the promoters of these educational plans will admit freely that they have not reached their ideal.

Idea Not Always Working

Some companies have adopted the transportation and even the vocational idea in the selling of trucks. It is no criticism of this idea of selling trucks to state that a salesman for one of the companies that is pioneering in this idea has within the last few days lost a sale to a rival because he tried to sell the truck as a machine, while the salesman for a much less widely known truck put in his equipment on the transportation basis.

But to get back to this booklet on Vocational Selling. Some paragraphs can very well be quoted here:

"We have spent too much time telling about spark plugs, axles, transmissions, etc., instead of showing the buyer the real results to be obtained by the proper use of the motor truck."

Especially the PROPER part of it.

It is the improper use of motor trucks that has hurt. Too many men have not realized the heavy losses that would come to them as a result of congestion over which they have no control. Not being warned on this, they have attempted to make an entirely improper use of the motor truck; they have lost money and have become adherents of the horse-drawn vehicle—condemning the motor truck utterly.

Right here, let it be added that it is worse than foolish to sell a truck where it does not belong. In a recent conversation with a motor truck sales manager, the development of the TEC truck was referred to. This is a combination industrial and street truck. It is on the lines of the well known electric truck that is so much used in large plants and warehouses. The freight is loaded on a platform, the surface of which is only 27 in. from the ground. The truck backs under this platform and carries it and the freight to the destination and sets it down perhaps in the storage warehouse, without rehandling. There is nothing radically different about this truck from other industrial trucks except the size—5000 lb. freight capacity—and the wheels equipped for street use.

The sales manager referred to, markets road trucks. He hailed the new type as a much needed piece of equipment. He said that it would relieve his trucks of a great amount of unprofitable work. He cited this example. In New York there is a large amount of heavy traffic

for short distances. Aside from the combined warehouse and street problem, he pointed to the fact that in New York bricks are unloaded on the bank of the Hudson. Many of them are used within a mile or so of the dock. Road trucks have been used uneconomically for this haulage. There are several points involved: first, the loading of heavy material on a high truck platform; second, the necessity of the truck standing while it is loaded and unloaded; third, the congestion that delays the large equipment that would not so seriously check a smaller vehicle.

The important point is this: The truck salesman welcomed this innovation in truck transportation because it would relieve his trucks of business that is likely to create prejudice against them.

Again quoting from the booklet:

"You know that any method of selling must benefit both the seller and the buyer if it is to be a long-lived method."

That is very important but too obvious for discussion. It has not been the basis of many truck sales.

Frequently the booklet calls attention to the fact that transportation problems differ and the information that put one man right will not always serve for another. It tells salesmen that in the home office are many transportation analyses and that some of these will doubtless fit the case the salesman has in mind **IF HE WILL WRITE AN ACCURATE DESCRIPTION OF THE PROBLEM.**

Then follows a grouping of all known truck uses into their general classification, a valuable and interesting document. Forty-four body types for special uses are also named.

The solicitation, visitation and use of catalogues and other pertinent subjects are discussed. It is always kept in mind that it is not the chassis alone that is being sold.

—

Marketing Not Well Planned

To properly consider the details entering into this problem would require a book—a big one. Just a few general remarks in conclusion.

It is the history of industry that manufacturers frequently give much attention to the building they occupy, even greater attention to the design of the article they will make and that they will get the best advice on financing, and then they will pick a stranger to them and their product for the marketing job.

Frankly, between a good truck and an ordinary marketing department and an ordinary truck and an excellent marketing department, the writer would choose the latter combination. The best truck in the world is not much benefit to humanity or to business, if it is not properly sold.

Look over the truck list and draw conclusions as to why certain trucks and companies have succeeded.

Truck marketing—in the main—has been done very poorly. Truck advertising has been entirely uneconomical—perhaps crude.

In two recent monthly magazines there was an example of this:

One magazine, which has absolutely no interest in trucking and which is read largely by society folk, readers of good literature and admirers of well-printed pictures, carried four full-page advertisements of trucks at say $300 a page.

Another magazine, with a circulation that goes practically 100 per cent to truck users—some of them owners of large fleets—had only seven pages of advertisements for eight trucks at $60 a page. The subscribers of the latter paper average about 10 trucks each in actual ownership.

Think of the truck purchasing power of these two bodies of readers.

One of the most popular of truck advertising mediums asserts that its two largest classes of readers are lawyers and doctors!

Other Important Factors

From time to time there have been printed in AUTOMOTIVE INDUSTRIES articles prepared on the vocational basis, reflecting the inquiries of business papers among their subscribers. These would appear to have a very direct bearing on the proper marketing of trucks.

As to the life of the truck and service—these are important topics in themselves. Such studies as "The First Fifty" by the Pierce-Arrow Motor Car Co. and the "Roll Call" figures by The White Co. should have a great influence in the arguments made for worthy trucks. There are many other companies that can tell a similar story of their early vehicles.

Recently an engine builder in discussing service said that his company was forced to enter this field to protect their engines in "orphan trucks" and trucks that were not properly serviced.

Just the other day a notice was sent out that a factory service manager had been "promoted" to sales manager. It would seem that this was turning the thing around. Certainly a man with a sales experience should better realize the need of service than any one else around the factory, and certainly the man with the responsibility on his shoulders for all of the trucks the company had ever made should be more important to the organization than the man whose obligation rests with current production—as do the obligations of many sales managers.

Cam Design

CAMS are rotating or oscillating pieces of mechanism having specially formed surfaces against which a follower slides or rolls and thus receives a reciprocating or intermittent motion such as cannot be generally obtained by gear wheel or link motions. Cams are a familiar form of mechanism in the automobile industry, but there are probably few automotive engineers who realize the great variety of cams. Prof. Franklin De Ronde Furman in his Cams, Elementary and Advanced (John Wiley & Sons, Inc.) distinguishes between the following types: Radial or disk cams, side or cylindrical cams, conical cams, spherical cams, periphery cams, plate cams, heart cams, frog cams, mushroom cams, plate groove cams, wiper cams and rolling cams. The book referred to contains eight sections of which the first five were printed four years ago under the title Elementary Cams. Displacement, velocity and acceleration diagrams are given for a large variety of cams applicable to internal combustion engines, together with outlines of the cams giving these curves. Much of the material, however, applies to cams for other classes of work. The processes of design illustrated are mostly graphical and are readily followed by practical shopmen and draftsmen, as well as by technical students.

To Produce New Eight-Cylinder Engine for Use in Oldsmobile Chassis

Engine will be produced in quantity, using new tool equipment especially designed for the purpose. Cylinders will have rolled finish in place of ground surface. Blocks and heads to be interchangeable. Pressure lubrication and high speed, two- bearing crankshaft among features.

By J. Edward Schipper

FROM the engineering and production standpoints the new eight-cylinder Oldsmobile, known as Model 47, contains a number of interesting features. As this car is to be the quantity job of the Olds factory, and the engine is to be turned out in a plant specially tooled up for the purpose, it will undoubtedly be produced under conditions of unusual economy. More than $1,500,000 was spent on new tool equipment for the engine.

The chassis is practically identical with that of the four-cylinder model, but the new engine has features making for low labor cost. The price of the chassis equipped with touring body will be $1,695. Considering that the car is equipped with a four-passenger sport body with genuine leather upholstery, this price should certainly make a strong appeal to the buyer.

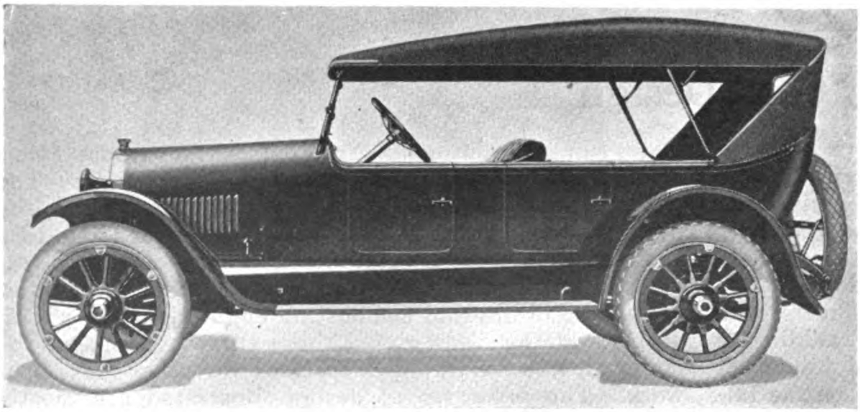
The engine is of conventional V type, the angle between the blocks being 90 deg. The cylinders are cast in groups of four, with removable cylinder heads, the major portion of the manifolds being integral. With cylinder dimensions of 2⅞ by 4½ in., the total displacement is 233.7 cu. in. The S. A. E. horsepower rating is 26.45, but the horsepower actually developed is 57 at 2600 r.p.m. The engine has three point suspension.

The valve passages are so arranged as to allow of a valve inclination of 6 deg. 17½ min. toward the cylinder axis, the object being to reduce the wall surface of the combustion chamber. Another noteworthy feature of the cylinder block is the integral intake manifold. Considerable study has been given to gas distribution, the intake being notable for the absence of abrupt bends. The diameter of the intake is 1 9/32 in. Exhaust passages are in line with the intake, sweeping around in an easy curve and allowing the exhaust to be carried away through a manifold bolted on top of the cylinder block.

The exhaust passages lie directly over and cross the intake passages, thus heating the intake. Cooling water circulates all around the cylinder bores and also around the intake and exhaust manifolds. Water from the pumps enters the jacket through tubes cast as part of the cylinder blocks. These tubes have five outlets, three being directly opposite the spaces between the cylinder barrels. Bosses are cast on the outside of the tube opposite the three center outlets, and holes are drilled through the bosses and the opposite wall of the tube, the holes through the bosses being afterward plugged. This is done to insure an even supply of water to all parts of the jacket. At each end of the cylinder block a wall is carried out, these two walls, with the inspection plate, entirely enclosing the valves.

Cylinder Bores Rolled to Size

Probably the most interesting feature of the cylinder block, however, is its manufacture. The cylinders are not finished by grinding in the usual manner, but are rolled to their finished diameter. By this method of rolling the bores, the metal inside the cylinder is slightly compressed, giving a hard, glassy surface. The rolls surround a central spindle, the assembly thus resembling a roller bearing; each single roller in the tool is carefully gaged so that the entire assembly generates an absolutely true cylinder. This is made to the true size of the cylinder bore. In a previous machining operation from 0.0005 to 0.001 in. metal is left on the diameter to be compressed by rolling. The roll, which works in oil against the cylinder surface, compresses the metal and the process is said to give greater smoothness of surface and greater resistance to wear than can be obtained otherwise.



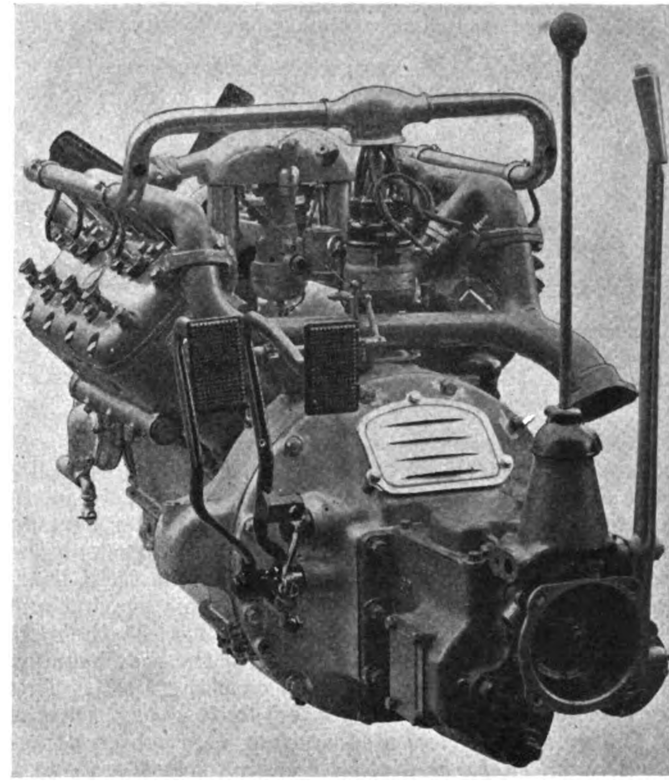
New Model 47 Oldsmobile

The two cylinder blocks are interchangeable, in spite of the fact that one block is set slightly ahead of the other. Semi-steel is employed for the cylinder head, which contains the combustion chambers. The heads for the four cylinders are a single casting, with combustion spaces of regular form. Bosses are cast on this head, to receive the compression cocks located in the cylinder axes, so that it is an easy matter to check the timing. The spark plugs are placed in the head directly over the intake valves, so that the inrushing gas will tend to keep the plugs clean and cool. The head is secured to the cylinder by fourteen 7/16-in.

cap screws, so located that all will be subjected to substantially equal strain by the explosion pressure. The right and the left cylinder heads are interchangeable.

The piston is a cast iron, three-ring type with a plain skirt, the third ring groove being beveled on the lower surface and holes drilled at 45 deg. to drain the oil back to the crankcase. The weight of this piston is 15 oz., and in assembling the pistons are selected so all eight in one engine vary but slightly from a fixed standard. The piston is fitted with a hollow piston pin of 21/32 in. diameter, locked in the boss by a tapered, pointed locking pin which is itself locked against looseness. The rings are 3/16 in. wide and are fitted closely in the grooves. The minimum clearance between the piston and cylinder bore is 0.002 in. and the maximum .0025 in. These pistons and the light rods used in connection with them are designed to make possible speeds as high as 3500 r.p.m., although the engine develops maximum power at 2600 r.p.m. A special fixture is used for line reaming the piston bosses square with the barrel of the piston, and both ends of the connecting rods are machined, so there is no possibility of misalignment.

I-beam section connecting rods are employed, the section being constant throughout the length, measuring 13/16 in. in depth, ⅝ in. in width and 3/32 in. in thickness. The upper end of the rod is bushed. The rods are of high carbon steel and are heat-treated to a Brinell reading of 180 to 215.



Three-quarter rear view of powerplant

Two-Bearing Crankshaft Used

The crankshaft is forged of 1045 S. A. E. steel and is of the two-bearing type. Owing to the small bore and the use of block cylinders the crankshaft is unusually compact, allowing a stiff shaft, although only two main bearings are employed. Tests indicate that the shaft is free from whip up to 3500 r.p.m. Counterbalances are welded solidly to the shaft and the finished shaft is put in both static and running balance. When the crankshaft is being balanced the oil holes of the shaft are filled with oil, and the oil pipes, which are curved on the cheeks of the crank, are in place. This means that the crankshaft is balanced under running conditions, and by this method it has been possible to eliminate perceptible periodic vibrations throughout the speed range of the engine. At the rear end of the crankshaft are three spiral grooves leading from the oil thrower, to turn back any oil which would otherwise tend to work out at this point.

Forward of the timing gear pinion is a helical gear which operates the two water pumps through a cross-shaft. To the forward end of the crankshaft is keyed a pulley which furnishes the drive for both the fan and the generator. The section of the crankshaft webs increases progressively from the pins to the axis of the shaft. The curved oil pipes secured to the webs carry the oil from No. 1 to No. 2 throw on one side of the shaft, and from No. 3 to No. 4 throw on the other side. This arrangement overcomes interference with oil flow due to centrifugal action and it also obviates the necessity for drilling the cheeks. The oil holes feeding the connecting rod bearings are drilled on the inside surfaces of the crankpins, so that the centrifugal force will cause the oil to pass over the entire surface of the bearing. It is claimed that when the oil hole is on the outside of the crankpin, the oil is whirled directly out of the bearing and into the cylinder bores, where it is picked up by the pistons and much of it needlessly burned or oxidized. This is said to be one of the factors tending toward oil economy in these engines.

The rear main bearing measures 2⅛ x 3 5/16 in., the front, 2⅛ x 2 27/32 in. The bearings are of the babbitt-lined, bronze back type, the specification for the lining metal being 90 to 92 per cent tin, 4 to 5 per cent antimony, 4 to 5 per cent copper, and 0.20 per cent maximum lead. The connecting rod bearings are 2⅛ in. in diameter by 2 11/32 in. in length.

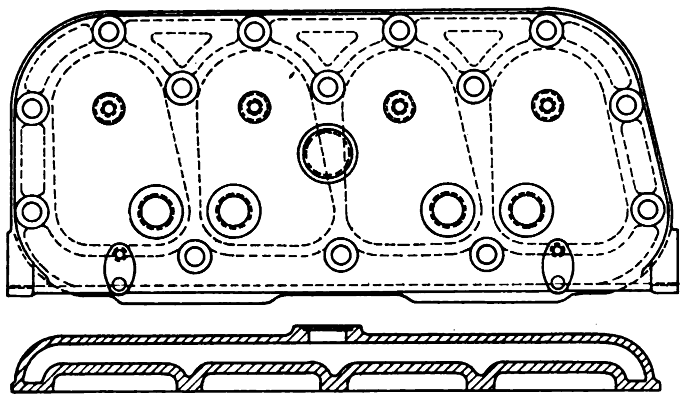
High tungsten steel is used for the exhaust valves and low tungsten for the inlet. These valves are tulip shaped, to reduce the resistance to gas flow. The valves have 1 7/16 in. diameter heads and 9/32 in. diameter stems. The clear diameter of opening is 1 9/32 in. Roller cam followers are fitted to the valve tappets. Each valve is operated by an independent cam, this being made possible by setting one block slightly forward of the other.

Valve Details

The valve springs have ten live coils and exert against the cams when the valve is closed a pressure of 66 lb., which is sufficient to cause the valves to follow the cam contour at maximum speed. The valve springs are 63/64 in. outside diameter and are tested by compressing from a free length of 3¼ in. to a closed length of 1¾ in. The spring must allow of this compression without taking a permanent set. The valve spring is held in place by a retainer which rests on a split collar fitted into a recess on the valve stem. This collar is hardened to 90 points scleroscope and forms an efficient locking device. The valve tappets are 9/16 in. in diameter by 2⅝ in. in length and work in a guide which forms a bearing from the center line of the roller right to the end of the tappet. Nickel steel is the material used for the tappet, and it is heat-treated to 50 to 55 scleroscope.

The valve adjusting screw is ⅜ in. in diameter and is heat-treated to glass hardness. The cam roller is ¾ in. in diameter by ¼ in. wide and is hardened to 75 to 85 scleroscope. The pin on which this roller runs is driven into the valve tappet and is also hardened.

The camshaft, with its sixteen integral cams, is a very interesting drop forging. The cams are of the constant acceleration and deceleration type and have a base line



Cylinder head

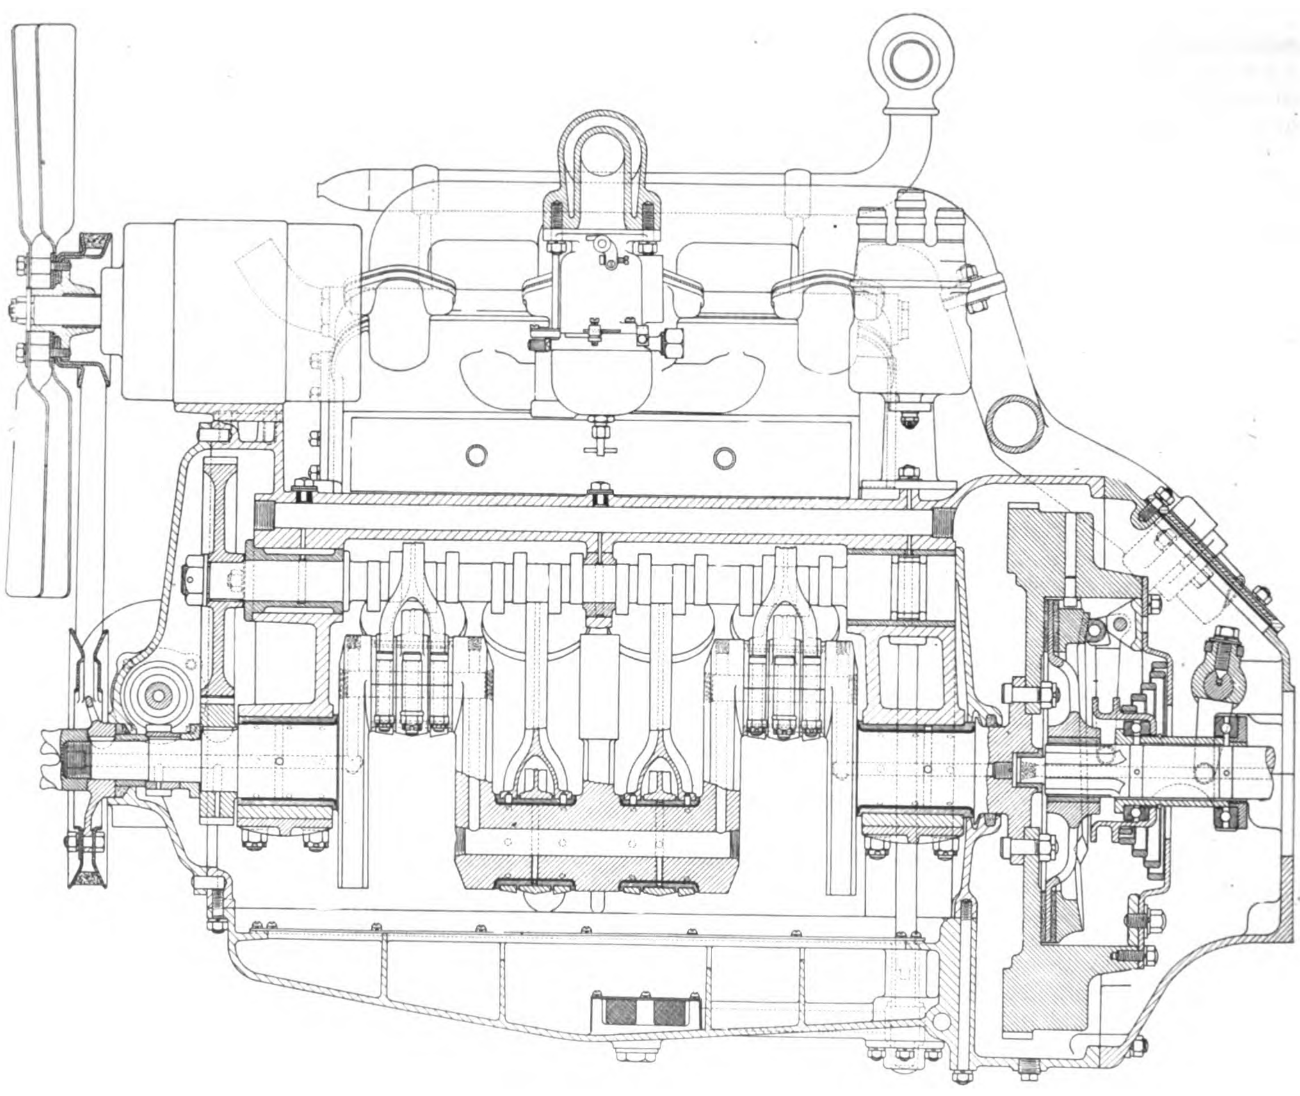
clearance of 0.006 in. on both exhaust and inlet. The lift of the cams is 0.2928 in. The camshaft is 1 1/16 in. in diameter and runs in three bearings, the center bearing being split to permit easy assembly. The thrust on the camshaft is taken up at opposite ends of the front bearing, a flange being on the inside end of this bearing and the timing gear hub on the opposite end. At the rear end of the camshaft, near the center of the rear bearing, a 15-tooth helical gear is pressed onto the shaft. This gear meshes with the distributor shaft gear. On the distributor shaft is mounted another gear which drives the oil pump shaft, also at half engine speed.

The timing of this engine is as follows: Inlet opens 4½ deg. after top dead center and closes 42 deg. after lower dead center; exhaust opens 45 deg. before lower and closes 3½ deg. after upper dead center.

The oil pump is located in the base of the oil pan and is of the conventional gear type. Both gears have eleven teeth, 10 pitch, and have a face 1 in. wide. These gears are straight spur type, whereas the driving gears are of the helical type and have fifteen teeth of 14 pitch with a 20 deg. angle. The timing gear on the crankshaft is of the helical type and has thirty-two teeth of 10 diam. pitch, with a 22 deg. 30 min. angle of helix. The timing gear, which is mounted on the camshaft, has sixty-four teeth.

The crankcase is made of aluminum, its sides extending down 4¼ in. below the center line of the crankshaft. These sides are ribbed and form a bridgework. The cylinder blocks are bolted to the crankcase by ten 7/16-in. studs each. The camshaft bearings are located directly above the crankshaft bearings. A cast oil passage ¾ in. in diameter extends the whole length of the crankcase, its function being that of an oil cooler. The main bearings are supported by box section ribs and the caps are bolted to the bearings by means of four 7/16-in. studs. The oil pan is also of aluminum.

The two water pumps are carried on the front gear cover and they are so located as to line up with the particular block which they supply. They are driven at crankshaft speed and their impellers are of the inclosed



Longitudinal section through engine and clutch

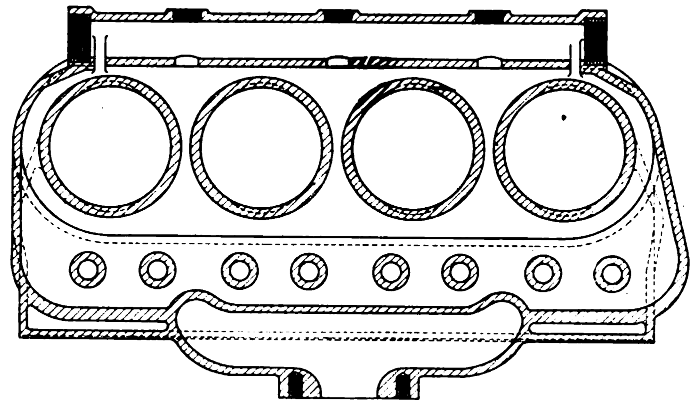
vane type which eliminate wall friction in the pumps.

Oiling is by pressure feed. The oil is first strained through a large, fine-mesh screen into the oil pan; from there it passes through the oil pump which is located in the base of the oil pan toward the rear, and is then delivered through a pipe in the bell housing to the top main oil-way cast in the crankcase. Here some of the oil branches off to the rear main bearing, while the main stream passes along the top of the crankcase and then down a drilled hole to the front main bearing. Here it enters the hollow crankshaft and flows along the center of the shaft and up through the web to No. 1 bearing. Thence it is carried through an arc-shaped pipe concentric with the crank axis to No. 2 bearing. At No. 2 bearing the smaller stream which comes in at the rear bearing is met. At the rear bearing there is a relief valve discharging to the crankcase. A small hole in the crankshaft supplies the front pump gears and timing gears with oil, and the rear camshaft bearing is similarly supplied from the top main oil channel.

The weight of the second unit power plant turned out in regular production is 714 lb. This includes the engine with generator, starter, carbureter, wires and header, fan, clutch, transmission, pedals, 5 qt. oil in motor and oil in transmission.

Motor minus clutch and transmission weighs..	606 lb.
Transmission filled with oil weighs...........	82 lb.
Borg & Beck clutch weighs..................	26 lb.
Motor alone without oil weighs..............	597½ lb.

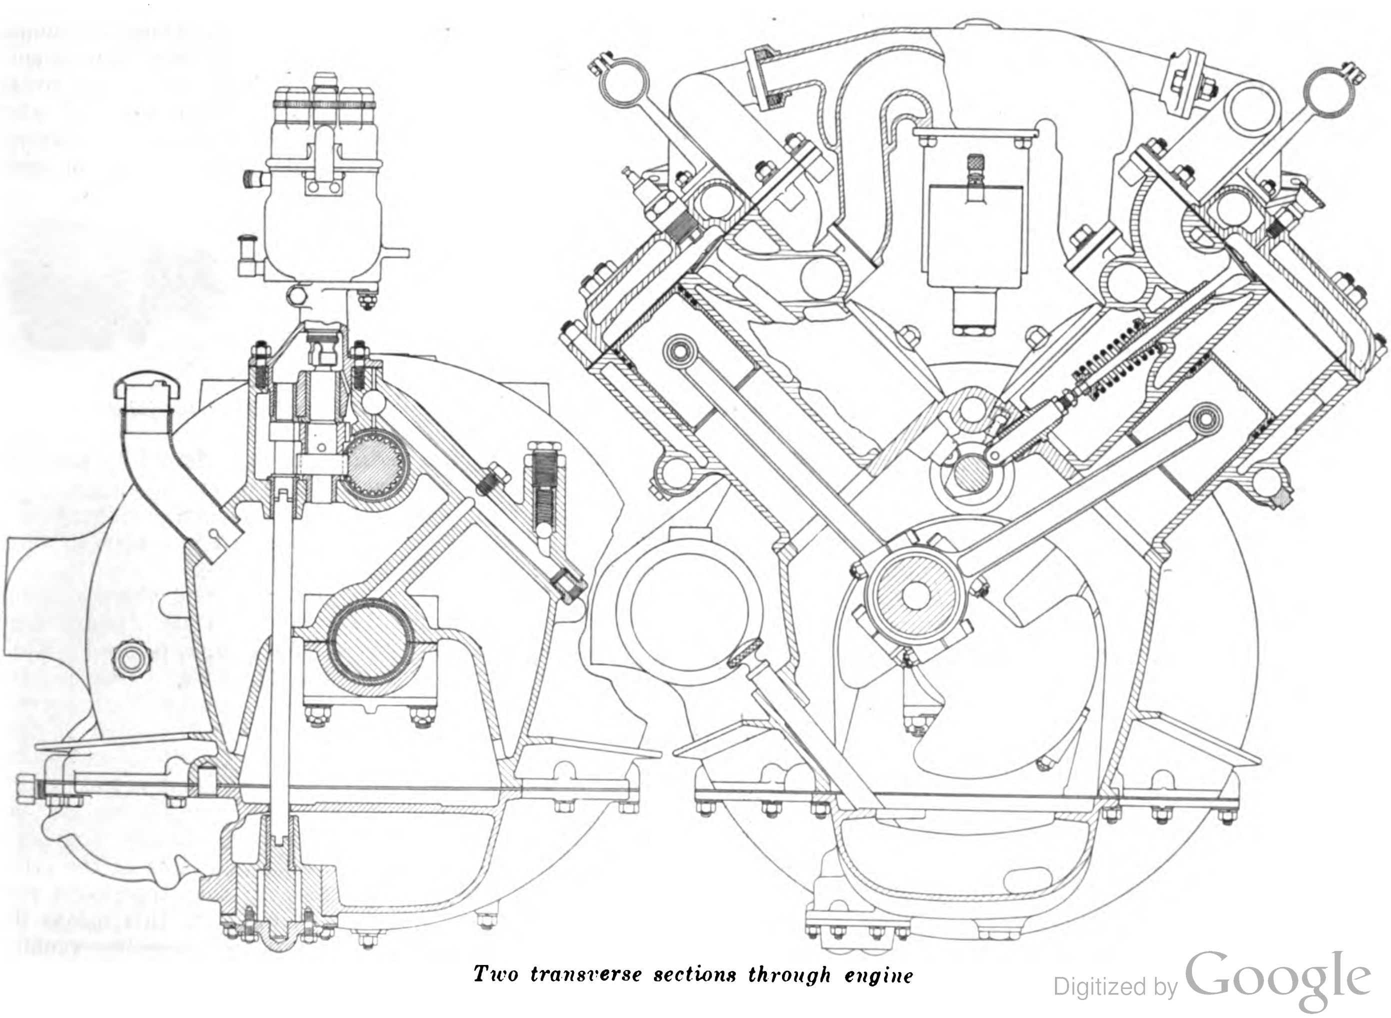
The clutch used is a Borg & Beck 10-in. The gearset is of the selective type and has three speeds forward and one reverse. The second speed ratio is 1.736 to 1; the first speed, 3.525 to 1, and the reverse, 3.966 to 1, with a 4 2/3 to 1 reduction on the rear axle. The gears are of 6-8 pitch. The drive from the transmission is taken through a Spicer universal joint encased in a ball housing connected to the end of the torque tube.



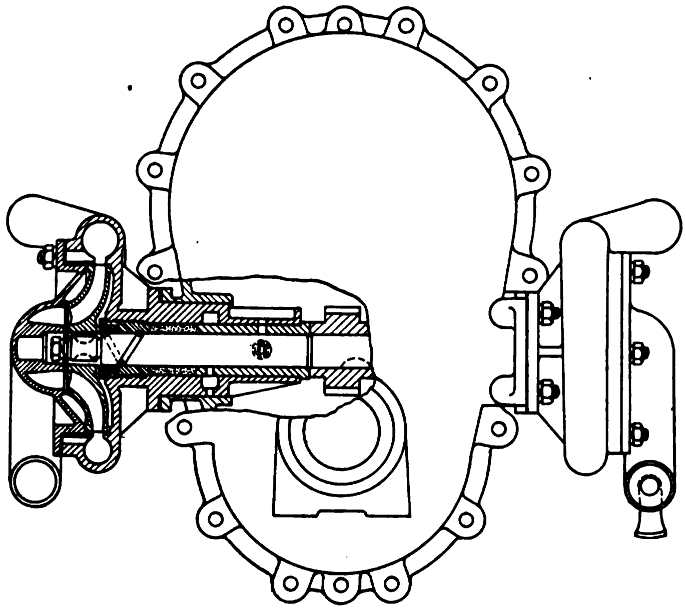
Horizontal section through cylinder block, showing water inlets and inlet manifold

The rear axle is of the three-quarter floating type and is of Oldsmobile design and manufacture. The axle pinion shaft is carried on ball bearings of liberal size. A Hyatt roller and a thrust bearing are fitted on both sides of the differential. The end bearings on this shaft are of the regular Hyatt type.

The front axle is of I section and the wheels are carried on radial ball bearings. The king-bolts are 1 in. diameter. There are oil cups on the king bolts and Alemite grease connections are fitted to the tie rod bolts. The front springs are 2 in. wide by 36 in. long and have 8 plates. The rear springs are semi-elliptic, underslung, 2¼ in. wide by 54 in. long and have 9 plates.



Two transverse sections through engine



Assembly, gear cover, water pump and shaft

Both front and rear springs are so designed as to be flat under the rated load of the car.

A split nut, semi-reversible type steering gear is fitted. The steering column, mounted on the left side, is nickel finished and rigidly braced to the instrument board. A corrugated walnut steering wheel is used, the diameter being 18 in.

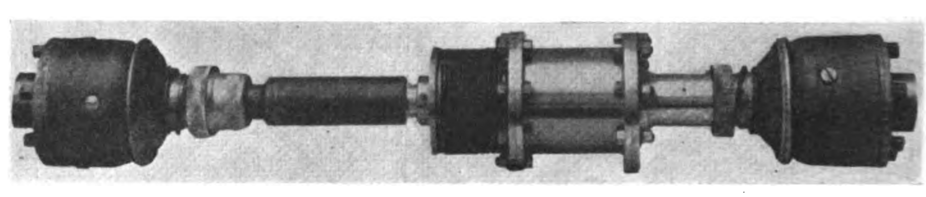
The seats on the "Pacemaker" four-passenger are amply wide. The dimensions of the front cushions are as follows: Depth, 18½ in.; width, 38 in.; thickness, 5½ in. rear and 6½ in. front. The rear cushion has a depth of 19½ in.; width, 40 in.; thickness, 8 in. front and 6 in. rear. These cushions have the conventional springs and are covered with fine grained, bright finish, black leather, French plaited. They are stuffed with a No. 1 4-oz. cotton batt. The upholstery on the rear seat back is about 9 in. deep, and on the front about 6 in. The cushions are kept in place by smoothly finished, black enameled, round edged retainers.

All open cars will be fitted with straight side 32 by 4-in. tires, the rear tires being nonskid, while on the closed cars 32 by 4-in. cord tires are used. The weights of the four-passenger car with 14 gal. of gasoline, 1½ gal. of oil, water and one spare cord tire is 2970 lb., of which 1360 lb. is at the front and 1605 at the rear.

A Shock Compensator for Shaft Drives

A SHOCK compensator designed by Richard T. Cooke, for insertion in the propeller shaft, to relieve the shocks coming on the mechanism of an automobile or motor truck when the clutch takes hold too rapidly, is to be manufactured by the Hartford Automotive Parts Co. The device consists of a cylinder filled with oil, in which there is a shaft having two paddles or vanes formed integral with it. There are also within the cylinder two partition walls dividing the cylindrical chamber into two compartments. There are two passages in each of these partitions, one a very restricted one through which the oil can flow in both directions, but only at a comparatively slow rate; the other controlled by a check valve, so that oil can flow through it only in one direction, but quite rapidly. The paddle shaft is the driving member and the housing the driven member.

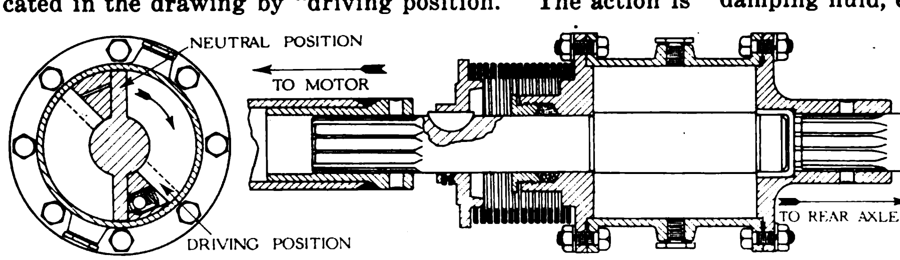
When the clutch is disengaged a coiled spring between the housing and the flange on the driving shaft keeps the paddle and the housing in the relative position indicated by "neutral position" in the cross sectional view, there being then no torque transmitted through the device. When power is applied by letting in the clutch, the torsional force of the spring will be overcome and the oil will be forced through the fine passage from one compartment of the housing to the other, thus causing the paddle shaft and housing to gradually assume the relative position indicated in the drawing by "driving position." The action is similar to that of a door check. Angular motion of about three-eighths of a turn in the propeller shaft, or from three-eighths to two turns of the engine, depending upon the gear reduction in the transmission, occurs before the drive is positive. During this period a marked cushioning effect is said to take place. A device of this kind should prove particularly valuable on heavy motor trucks, owing to the great inertia of the mass to be accelerated when changing to a higher speed. The device is said to prevent axle and other driving part breakage due to sudden application of power. It is claimed that the flexibility provided in the drive by the device makes gear changing, as in traffic, much less frequent and that, when desired, even a truck of medium weight can be started in second or third gear without undue clutch slippage.



Assembly of compensator, propeller shaft and universal joints

A fluid, the viscosity of which does not change to any great extent with ordinary changes in atmospheric temperature, can be used in the compensator if desired. While the fluid chamber is so packed as to prevent leakage of the damping fluid, even the loss of all the fluid will not prevent operation of the car, though in that case the cushioning effect, except for that due to return spring, will be lost.

It will be seen from the cut that the shaft is well supported in long bearings in the flanged ends of the cylindrical casing so that transverse play is inappreciable. By this means the possibility of the assembly running out of true is virtually eliminated.



Sectional views of shock compensator

British Light Car Becoming Increasingly Popular Because of Its Economy

The high grade four seater with an engine of about 100 cu. in. displacement selling at about $3,000 is now recognized as a permanent and practical type—one making a wider appeal to British buyers than any other type. First cost less important than economy. Owners soon learn to change gear frequently and almost unconsciously.

By M. W. Bourdon

SINCE the Olympia Show of 1919 the light car in Great Britain has developed very appreciably. It is no longer only a two-seated runabout with an engine of about 60-70 cu. in. displacement, but has become also a practical four-passenger vehicle with an engine of 90-100 cu. in. The two-seater is still very popular, but its limitations in certain directions have been eliminated and only in a few instances has it the cramped accommodation of a year ago.

As it is growing in chassis and engine dimensions so is the light car increasing in popularity and scope. It is generally admitted that the feature of the recent London Show was the light four-seated car, and it is safe to say that no British maker of this type having a standing in the industry is other than satisfied with prospects for 1921. There were approximately 50 firms exhibiting light cars of various sizes, but the type which is making the widest appeal is restricted to about half that number.

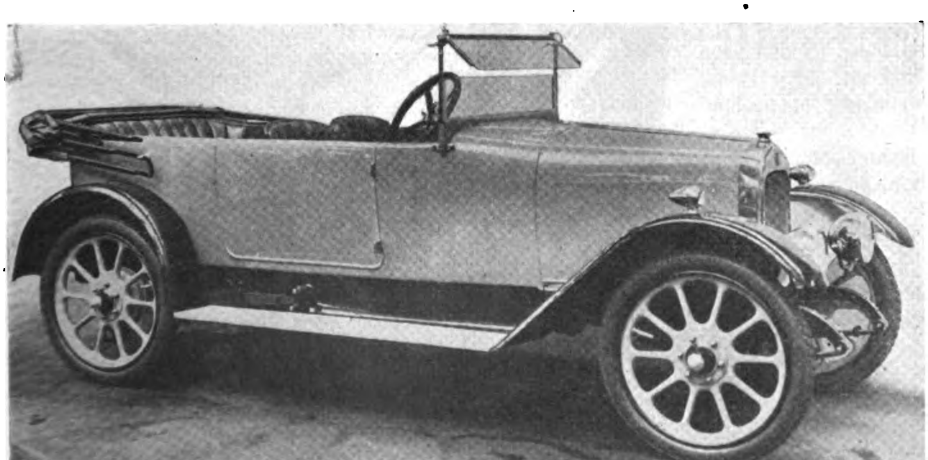
It is very difficult to generalize on the technical side of the light car, for the range of the type is so wide. That is to say, the term "light car" is very indefinite and is applied simultaneously to the four-seater weighing 1800 to 2200 lb. and to miniature two-seaters with motor cycle practice written all over them. The latter are cycle cars in all respects except name. Between these two extremes there are the two-cylinder horizontally opposed or Vee air-cooled two-seaters of about 8 hp. Of this section there probably is none so good or at all events so popular as the little Rover at anything like the price ($800); it was at one time turned out as fast as the makers could get bodies built, about 40 per week.

Next comes the section with four-cylinder water-cooled engines of 60-70 cu. in. capacity, the original of the general type. In this class are the 10-hp. Wolseley, Singer Calthorpe, A. C., and others which have or have not yet established their reputations. Finally, there is the section with which this article is primarily concerned. It is usually looked upon as a new type, but actually it was represented even in 1914 by the 10-hp. Humber with an engine capacity of approximately 100 cu. in.

It is in this last section where development is most observed. After being looked upon as an overgrown and overloaded miniature car, it is now recognized as a permanent and practical type and as one making a wider appeal to buyers than any other size of car.

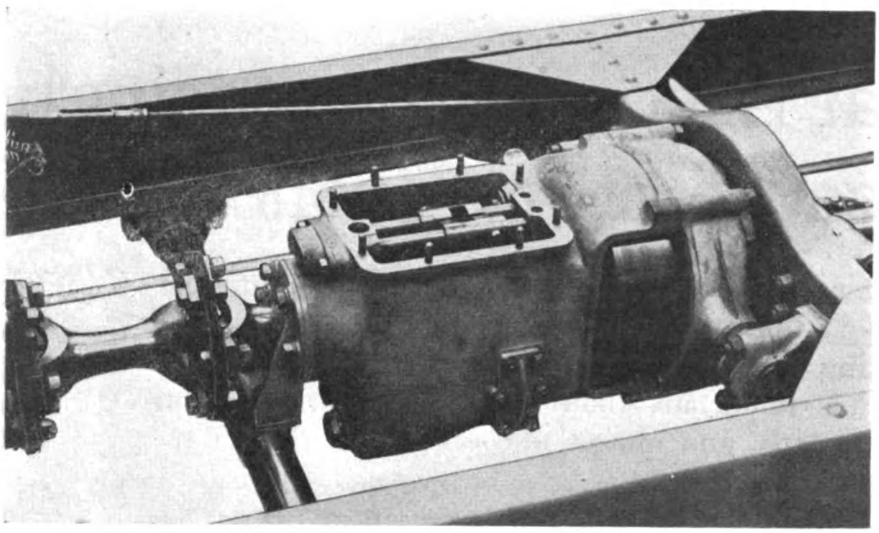
The light four-seater is a term which better describes it than "light car," for although the chassis is quite as often fitted with a "two-seated" body the latter generally has accommodation for two extra passengers in a more or less roomy folding rear seat. At all events, the chassis is designed to carry four passengers, which the original and still existing light car chassis was not.

A general idea of the type in question can be obtained from a knowledge of the engineering details of two of the best examples, wherein design varies widely without affecting the result in performance. These two are the new 12-hp. Standard and the small (so-called 10-hp.) Humber. There is little to choose between them.



Enfield Allday, a good example of the British light four-seater. The four-cylinder engine has 2½-in. bore and 4⅝-in. stroke. The transmission is a separate unit. One wide door on each side affords access to either front or rear seats, the former having folding backs and being hinged to tilt forward.

The 12-hp. Standard has a four-cylinder 68 x 110 mm. (2 11/16 x 4 5/16 in., 97.5 cu. in.) overhead valve engine with push rod operation; detachable head; block cast cylinders mounted on an aluminum crankcase; thermo-syphon water circulation; magneto ignition; hollow shaft lubrication carried up to the wrist pins and valve rocker shaft; dry single disc clutch; separate three-speed gear-set with right-handed control lever; open propeller shaft with fabric disc joints; overhead worm gear, 3.83 to 1 ratio; 32 x 3½ in. tires on all-metal hollow spoked wheels and brakes on transmission and wheel drums. The wheelbase is 108 in., track 48 in. and weight 2000 lb. Electric lighting and starter are fitted and with four-passenger body it sells at $3,200.



The Enfield Allday three-speed gearset has three-point suspension and is extended at the rear to enclose an expanding transmission brake. Two flexible disc couplings are used between clutch and gearbox

r.p.m., but speeds higher than that, in some cases 3000 r.p.m. and over, are reached and maintained — on the lower gears especially—for quite long periods at full throttle. They are unquestionably high-speed engines, and the power falls off rapidly below 1300-1400 r.p.m. As a result, the gear shift is frequently in use and this as much as anything accounts for their fuel efficiency without detracting seriously from the approval of users.

It must not be assumed that this type of car is appealing only to those buyers who are men, or women, of strictly limited means, though these were the class of people for whom it was originally designed. The light four-seater, with either a tonneau or a folding rear seat for two of the passengers, is being bought in increasing numbers by people of social and financial standing, who have been hard hit by the excessive income tax and cost of living generally. As they are reducing their domestic staffs, so they are turning to far smaller cars than those with which they at one time would have been satisfied. They are people who in 1914 would have derided any neighbor who rode in a car of less than 25 to 30 hp.; yet now they take pride in the running and appearance of their little 10 or 12-hp. four-seaters.

Even if this class of man does not buy a small car for constant or sole use, he probably very considerably restricts the mileage of his larger car (which quite possibly is a Rolls-Royce) and uses the small one for short journeys for economy's sake. His wife and daughter actually prefer the light car for driving themselves; they find it handier and easier to drive than a large one and quite large and presentable enough for shopping and social calls.

But the small car makes an even more forcible appeal to the man of no particular social standing and of somewhat limited means. He uses it quite successfully for touring and week-end runs. He can carry 3 friends with light luggage and cover 200-250 miles per day at an average speed of 20 to 22 m.p.h. exclusive of stops. The car will climb any hill on low gear; does not overheat; and with its well-upholstered and well-finished body is almost as comfortable as the 30-hp. six-cylinder car. The shorter

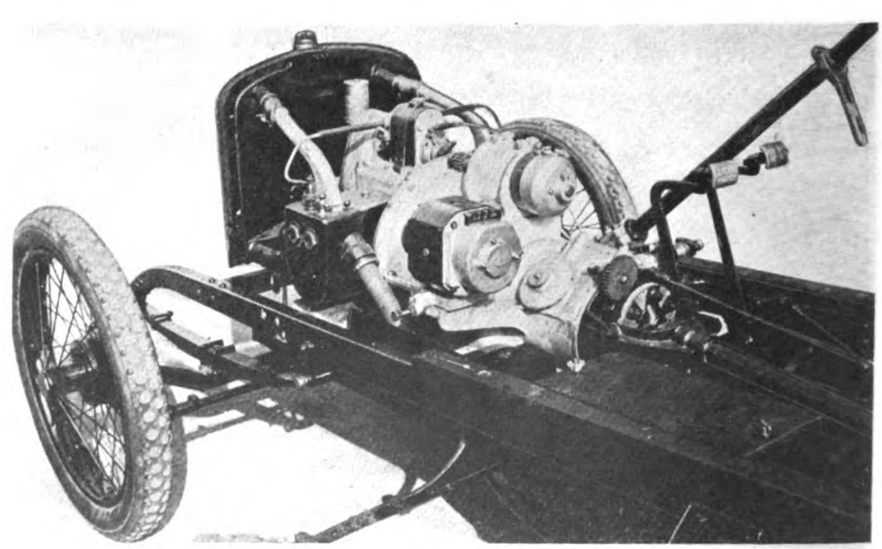
The Humber has a unit power plant with a four-cylinder block cast detachable L head engine, 65 x 120 mm. (2.56 x 4.73) or 97.2 cu. in. displacement. The cylinder block is cast as a unit with the top half of the crankcase. Trough and splash lubrication, magneto ignition and thermo-syphon water circulation are used. The inverted cone clutch is enclosed, leather-faced and has provision for running in oil. The gear-set has four speeds with the control lever on the right; open propeller shaft with disk and sliding block joints; straight bevel gear 4.33 to 1, 34 x 3½ in. tires on hollow spoke wheels; transmission and wheel brakes, a wheelbase of 106 in., a track of 55 in. and weighs 2200 lb. With full electric equipment and four-passenger body it sells at $3,400.

Another example is the 10-hp. Wolseley, but this is usually fitted with a two-seated body, though a standard model is a four-seater with a narrow (34-in.) rear seat, wide enough for two small-sized adults or two children; it hardly comes into the Standard and Humber class, having a smaller engine (2 9/16 x 3¾ in., approximately 76.8 cu. in.) and is very much overloaded with four full-sized passengers. Nevertheless, it makes a big appeal at $2,600 in the two-seater model, for with its overhead camshaft the engine efficiency is fairly high. The three-speed gear-set is on the back axle, which embodies worm drive with a ratio of 5.1 to 1. It is one of the best if not the best sprung of its class, having quarter elliptic springs fore and aft, as against the semi-elliptics all around on the Standard and Humber.

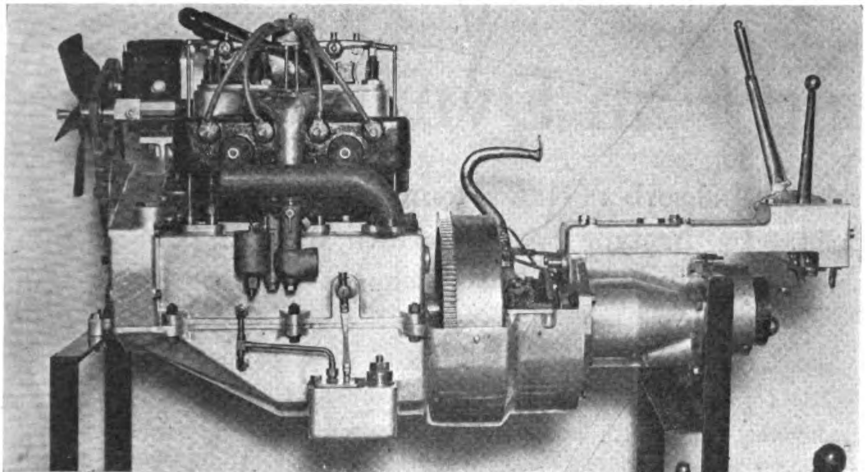
From the prices quoted it will be realized that these are not cheap cars as regards first cost. They are very well finished mechanically and otherwise.

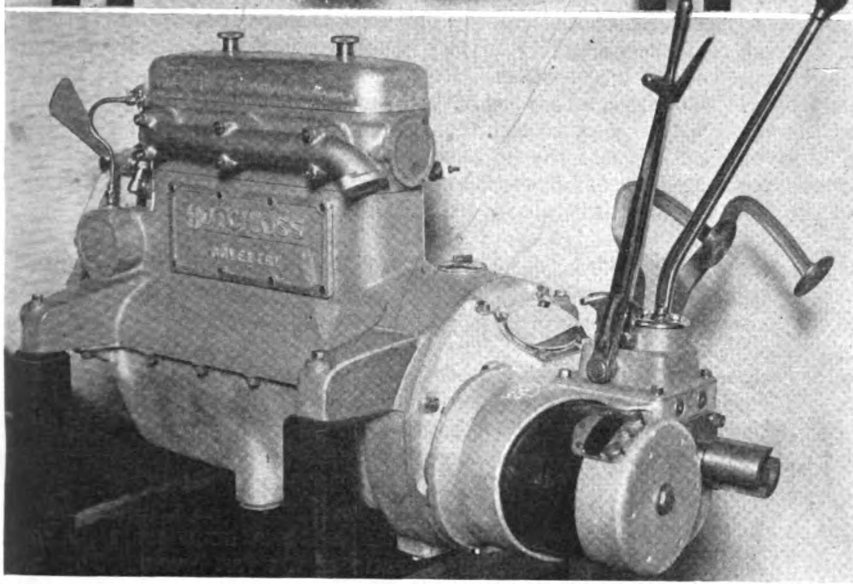
Where the light four-seater makes its appeal is in respect of economy in running, ease of maneuvre and "handiness." It runs on an average 29 to 33 miles to the gallon of fuel, when driven at moderate speeds. On high gear and level roads it has a maximum speed in the neighborhood of 50 m.p.h. Oil is 1500 to 2000 miles per gallon and the average life of a set of tires is 10,000 to 12,000 miles.

The engine efficiency is fairly high. The normal speed of rotation is 2000 to 2200



The unit powerplant of one of the lighter type cars built by the manufacturer of the Douglas motorcycle. The double opposed engine is only 3⅝ by 3⅝ in. but has electric starting and lighting generator and magneto ignition





Above—The Lagonda four-cylinder 2¾ by 3¾ in. engine is one of the few British engines with superimposed valves. Note construction of unit powerplant with open top casing for flywheel and clutch

Below—The English Hotchkiss powerplant, used by at least one British light car manufacturer. Note method of mounting the starting motor

wheelbase and the lighter weight do not enable the car to run as smoothly on rough roads as a bigger car *if the same average speeds are attempted.* If the road speed is reduced proportionately to the car size there is very little to choose between one and the other.

But the majority of buyers of the light four-seater want a well-finished car, and do not mind paying a comparatively high initial price so long as it runs economically, quietly and without pronounced engine vibration. They would prefer, no doubt, to run more on high, but they have no great objection to changing gear. They soon find that they are compelled to use the gear shift very frequently; they dislike it at first, but within a month they change gear almost as unconsciously as they operate the accelerator; and usually with similar quietude.

An original drawback to these little cars was their susceptibility to carbon deposit; they have quite a reasonable compression—from 70 to 80 lb. per square inch when new—and yet they were at one time prone to "pink" badly after quite a small mileage. But this fault has been overcome to a large extent by the experienced makers by the use of scraper rings and less haphazard lubrication, and these cars will now run 3000 to 4000 miles without decarbonizing. Local overheating was another cause of trouble. Running as they do for long periods at high rates of speed with full or nearly full throttle, the spark plug points are liable to become incandescent and cause pre-ignition and back-firing. The plug boss in the cylinder must therefore be in fairly intimate contact with the cooling water and care is essential to eliminate pockets in the water jackets where steam can generate. On the new Standard this pocketing has been overcome by a subsidiary water outlet (with an internal diameter of ½ in.), from the front end of the head to the radiator, the main outlet being at the side of the head. The detachable L-head design is quite satisfactory in these small sizes, and the spark plug difficulty has not occurred in this type. Where it has been most pronounced is in cyclinders in which the plug screws into a valve cap. Failing other remedies the plug adopted is made with external radiating fins and very heavy electrodes—what is sold as a "racing" plug.

Another original difficulty was due to rapid wear of crankshaft journals and big-ends. Hollow shaft lubrication has been adopted with some success in eliminating these troubles, and, although troughs for the big ends have frequently been retained, direct leads are now nearly always taken to the journals. Two-bearing crankshafts are normal, as are light cast iron pistons and H-section connecting rods. Obviously the balancing of reciprocating or rotating parts is an important consideration, though counter-weighted crankshafts are not used.

Generally speaking, the developed type is a high grade car in miniature, though, as may be expected, there are not a few examples of poor design, bad workmanship and unsuitable materials among the chassis and bodies turned out by small firms trying to make their own components—as the majority of them do.

It must be said that there are no dividing lines between the true light car (with 60-70 cu. in. engine), the light four seater (90-100 cu. in.) and the next size above. The latter comprises the Bean (110 cu. in.) and others of similar size; but they are accounted out of the light car class, although termed 12 hp. The four-cylinder Rover is also rated at 12 hp. with an engine capacity of 136 cu. in., but both it and the Bean are a heavier type of car, although in seating capacity there is little to choose between them and the 10 hp. Humber. Further, the Bean sells at $2,700 as against the Humber $3,400; but the better finish of the latter has enabled its makers to be fairly well assured of a market.

It is to be noted that British makers have by no means a monopoly in the type of chassis under discussion. Fiat, Citroen, Peugeot, and other Continental plants are turning out chassis for light four-seated bodies of similar size and selling them at approximately the same price in England as British cars, the import duty being counteracted by the rate of exchange between Italy or France and England. The Fiat model has an engine of 65 x 110 mm. (approximately 89 cu. in.). It need hardly be said that these also are high-grade cars in miniature; they have the same characteristics as to engine speed, weight, and gear ratios as the British productions, but at present the latter are not feeling this foreign competition.

There are indications that the development of the type is not yet complete, and one of the best known makers has

(*Continued on page* 651)

A Variable Speed Fan Dynamometer

The ordinary type of fan brake will absorb a given amount of power only when running at a fixed speed. In the type here described the fan is inclosed and load can be varied by changing area of discharge opening.

By Karl D. Wood*

FAN brakes are widely used as absorption dynamometers in testing internal-combustion engines because they are comparatively simple, inexpensive and flexible. They have, however, the disadvantage that a given fan will run at only one speed when the engine is delivering full power, that speed being determined by the size, proportions and environment of the fan and the density of the air. In order to be able to vary the speed at which a given power will be absorbed, English manufacturers have for some time been using a cylindrical housing around the fan with one or two variable openings in the periphery. They are not known, however, to have published any information showing the range of speed control available. Hence, these experiments were undertaken with a view to answering the following two questions:

(1) What range of speed control is obtainable with a fan brake?

(2) Given the rated horsepower and speed of an engine, what is the diameter of fan brake necessary in order to obtain complete tests of power vs. speed?

The general procedure of the experimental work was to mount a two-bladed paddle-wheel fan on a small electric dynamometer, build a cylindrical housing around it, the inlet and outlet of which were of controllable area, and measure simultaneous values of speed and horsepower with different sizes of inlet and outlet. This gave sufficient data to determine the speed and power ratios obtainable by opening and closing the outlet, and the size of inlet for maximum speed control.

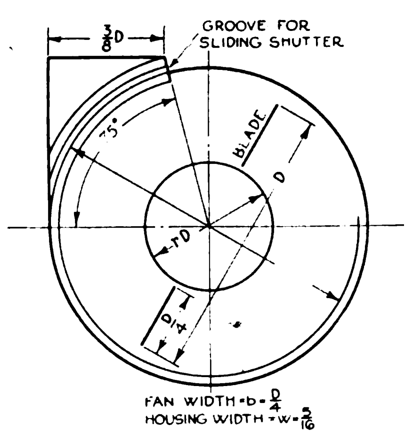


Fig. 1—Section through fan blades

The fan consisted of two square pieces of 1/8-in. sheet aluminum about 11 in. on each side, bolted to a steel arm 3/8 x 3 in. by means of steel angles. The diameter of the fan measured from tip to tip of the blades (the nominal diameter) was 44 in. The proportions of the fan brake are shown in Fig. 1, which is a section through the fan blades looking toward the inlet end of the brake. The two ends of the housing were sawed out of slabs of cleated tongue and groove pine and an 18-in. strip of galvanized iron nailed around the periphery of the ends completed the fan brake except for the sliding shutter. The estimated maximum cost of such a fan brake in January, 1920, labor included, is $25.00.

The fan brake was mounted on a 50-hp. Sprague electric dynamometer. Data for horsepower-speed curves were taken with inlet diameters of 26, 20 and 16 in. respectively and with inlet closed, the circumferential outlet opening being changed by steps of 2 in. up to 30 in. open for each setting of the inlet. The outlet uncovered about 75 deg. of the periphery of the housing when the circumferential opening was 30 in. Readings of static air pressure in the housing and air velocity through the outlet were also taken with a view to establishing a reasonable basis for the computation of the horsepower necessary to drive a fan brake of different proportions from the one tested, but no satisfactory formulas were obtained.

Fig. 2 shows the horsepower-speed curves for the fan brake tested, plotted on the same sheet with a horsepower-speed curve of the fan in free air and curves of three well-known engines. The observed points are shown in circles and dotted lines indicate extrapolation. The slope of the lines is 3.0; this differs from some other observers' results by as much as 0.1. The horizontal distance between curves *B* and *C*, measured with a logarithmic scale, is the speed ratio of the fan brake. For the brake tested the speed ratio was 1.7. The horizontal distance between curves *A* and *C* gives the maximum speed ratio that could be obtained by any improvements in the design of the fan brake. It will be noticed that *A* cuts the 1000 r.p.m. line about the same horsepower that *C* cuts the 2000 r.p.m. line, so the maximum speed ratio obtainable is 2 to 1. The vertical distance between the two lines gives the power ratio of the fan brake, and is naturally the cube of the speed ratio, or 5 to 1. Since the lines are parallel, the speed ratio is independent of the speed at which the fan is run. This means, of course, that the *speed* range is greater at higher speeds. At 300 hp. a speed range of 1600 r.p.m. is available, which is more than enough to take a complete full-throttle run on a 300-hp. Hispano-Suiza engine. At 18 hp. speed a range of only 650 r.p.m. is available, and this is not quite as great a speed range as is usually required in running tests on Ford engines. Curve *D* is a typical full-throttle Ford engine curve. While the characteristics of a fan brake give it greater speed range at high speed than at low, it must be very carefully built in order to be run with safety at speeds over 1500 r.p.m. Fig. 3 shows in full lines the curves of horsepower at 1000 r.p.m. against fan diameter for Sturtevant Steel Plate blowers plotted from data given in their catalog No. 234. These curves indicate that for fans of different diameter having other dimensions proportional to the diameters, the power absorbed by the fan varies about as the fifth power of the diameter, since the slopes of the curves are 5.3 and 5.1 respectively. The fact that the lines for Sturtevant blowers open and closed are parallel shows that the speed

*Technical note prepared under the supervision of the Automotive Power Plant Section of the Bureau of Standards, and submitted through the Subcommittee on Power Plants for Aircraft to the National Advisory Committee for Aeronautics for publication condensed.

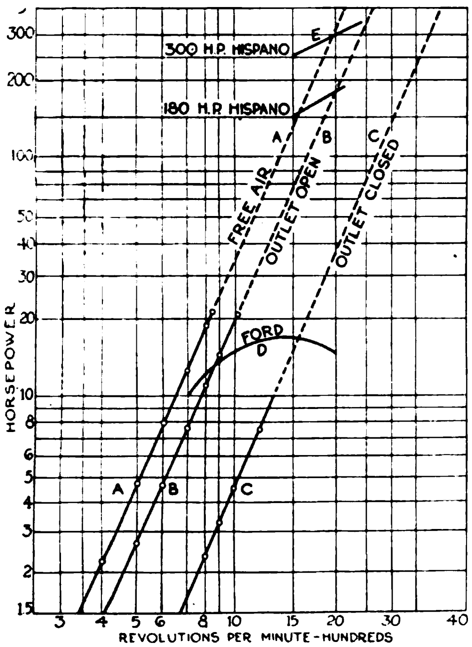

Fig. 2

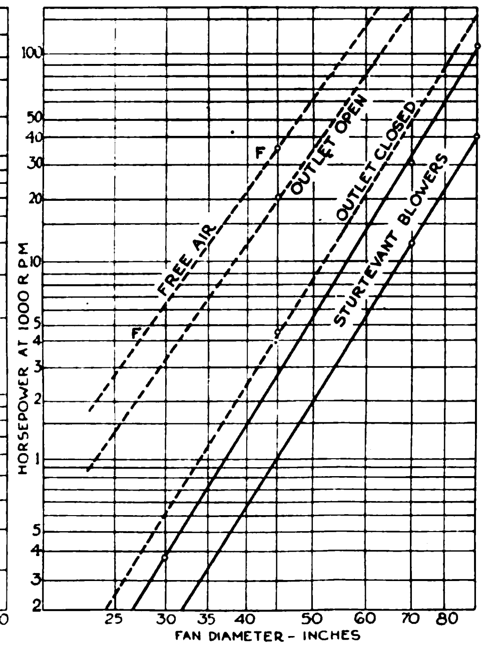

Fig. 3

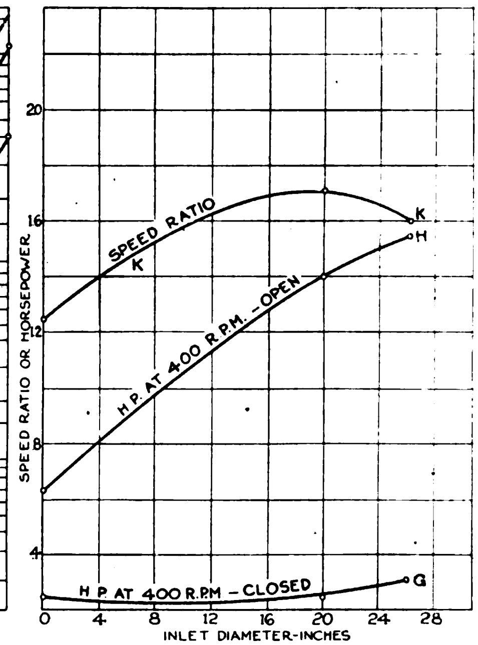

Fig. 4

and power ratios are independent of size of fan, and it is assumed for the purposes of this work that this is also true for fan brakes. The dotted lines are for the type of fan brake shown in Fig. 1. Each is drawn through one observed point with a slope of 5 to 1. They can be used to determine the size of fan required to run a test on a given engine provided an approximate horsepower-speed curve for the engine is known, but a fan built with the nominal diameter indicated on the curve may absorb as much as 10 per cent *more* or 10 per cent *less* power than indicated on the curve.

Fig. 4 shows how the diameter of the inlet affects the power absorbed by the fan and the speed ratio. Curve *H* shows that the power absorbed by the fan with outlet open varies almost directly as the inlet diameter, and curve *G* shows that the power absorbed with the outlet closed remains constant until the inlet diameter becomes greater than the inside diameter of the blades, when it increases. The ratio of any two ordinates on the curve gives the power ratio, which is the cube of the speed ratio, and the speed ratio is plotted as curve *K* to the same numerical scale as the horsepower curves. Curve *K* shows that if the diameter of inlet is *rD* (where *D* is fan diameter), the best value for *r* is about ½, which makes the inlet diameter just equal to the inside diameter of the fan blades. It might be possible to get a greater speed ratio if the blades were made oblong instead of square, with the axial length greater than the radial depth.

The conclusions of this investigation are, briefly:

(1) A fan brake can be made to give a power ratio of 5 to 1 or speed ratio of 1.7 to 1, by means of a variable shuttered housing.

(2) Performance of a fan brake of the same proportions as the one tested but of different diameter can be predetermined within about 20 per cent (i. e., ± 10 per cent from nominal) by means of the curves given. For accurate work a means of measuring torque must be used in conjunction with the fan brake.

British Light Car Movement Extending

(*Continued from page* 649)

confided to the writer his intention to add another 10 cubic inches or so to the capacity of his engine (now just under 100 cu. in.) without varying the chassis or price. This may reduce fuel economy, other things being equal, but it will improve high gear performance and make the chassis less overloaded when fitted with a sedan body—for which quite an appreciable number of buyers are asking, but, again, of high-grade.

Then, Morris, who has a good name and one of the biggest outputs of light cars in England, has put out a six-cylinder engine of the same bore and stroke as his four-cylinder model (2¾ x 4 in.) which, incidentally, has the unit power plant made by the English Hotchkiss Co. But this six-cylinder engine is only a "feeler" in an endeavor to sound the market to find out whether there is likely to be a sale for a super-grade light car.

The writer considers it is doubtful. His opinion is that buyers generally do not want anything bigger than 110 cu. in. for a larger capacity would diminish the economy feature and bring the car into another class altogether.

DURING the war the production of aluminum developed enormously, and many things which formerly were made of other metals are now made of aluminum. At the same time the processes of production have been materially improved. According to the German periodical *Prometheus*, 176,200 tons were produced in 1917, as compared with 84,800 tons in 1914. The United States led with 90,700 tons, followed by France (20,000 tons), Norway, Switzerland and Canada. Germany is compelled to import most of her aluminum or to produce it from foreign bauxites. During the war the German consumption rose from 10,000 to 40,000 tons, and in the near future it will probably reach 70,000 tons.

Refinements in Body Design to Be Seen on Many 1921 Models

Even the moderate priced closed cars use materials equal to those employed in the more expensive cars, this being necessary to insure durability. Still much to be desired in the matter of comfortable seating. Higher backs with better contour will add to comfort of users.

By George J. Mercer

CLOSED cars are quite uniform this year in the matter of interior design, appointments and material. Dealers who supply fabrics say that manufacturers of very moderate priced cars use materials for trimming that are the equal of those used in the more expensive cars. The reason for this is that a car must not only look well when new, but it must look well after service. Consequently the cheaper cotton velours that were used during the past year when materials were hard to obtain, have on account of their poor wearing quality been discarded. They have, however, temporarily hurt the sale of the mohairs, because while they look like them they do not wear the same, and besides there are more cars with a fine grade of wool fabric having a semi-smooth finish for trimming than usual.

It is a fact that real service and comfort have not in the past been such important elements in connection with body parts as they have become of late. Interior appointments such as lights, door and regulator handles and vanity cases must of course be uniform in design. The buyer may not have the requisite knowledge to understand cloth fabrics and painting, but if he is to remain sold, the cloth must not show a mark each time it is sat upon and the paint must not lose its luster in a short time.

There is still much to be desired in regard to comfort in seating and this will come in time. It can only be gained by having the cushion and back fit the human anatomy. The average cushion is generally most to blame in its relation to the height of the seat side. As a rule the springs are fairly good, but the backs are not comfortable on most open cars and the front seat back on closed cars is seldom right.

We have had a long era of the plain pleat. This type is readily adapted to quantity work and is easily kept clean, but too often the shape is a rounded contour from top to cushion, whereas a decided improvement would result if one row of buttons were placed at the height of the shoulders. This would draw the trimming in at that point and hold the bulge out below to fit the back below the shoulders. Providing there is sufficient slope to the back, the appearance made in this way appeals to the eye as being right. It is actually more comfortable in service. Sufficient height is also necessary in the case of the front seats of both open and closed bodies. This height is not sufficient for comfort in many cases, but it is not easy to gain more height as bodies are now designed. The rear seat can and should be 20 to 21 in. above the cushion, measured along a line parallel to the back from the cushion before it is depressed.

As will be seen from the accompanying photographs, mohair trimming is used for the Cadillac coupe, a conspicuous pattern being employed on the seats and plain material above. The LaFayette has a very inconspicuous pattern and plain material for sides and roof. The Cadillac coupe uses arm rails on the folding seat. The LaFayette limousine has an enclosure for the folding seats with locker space above.

In the Locomobile limousine the doors are paneled with carpet at the bottom. On all closed bodies the doors are without pockets. On this body arm holders are used. There are two dome lights and no corner light. The tendency to increase the power of the dome light and dispense with corner lights is growing.

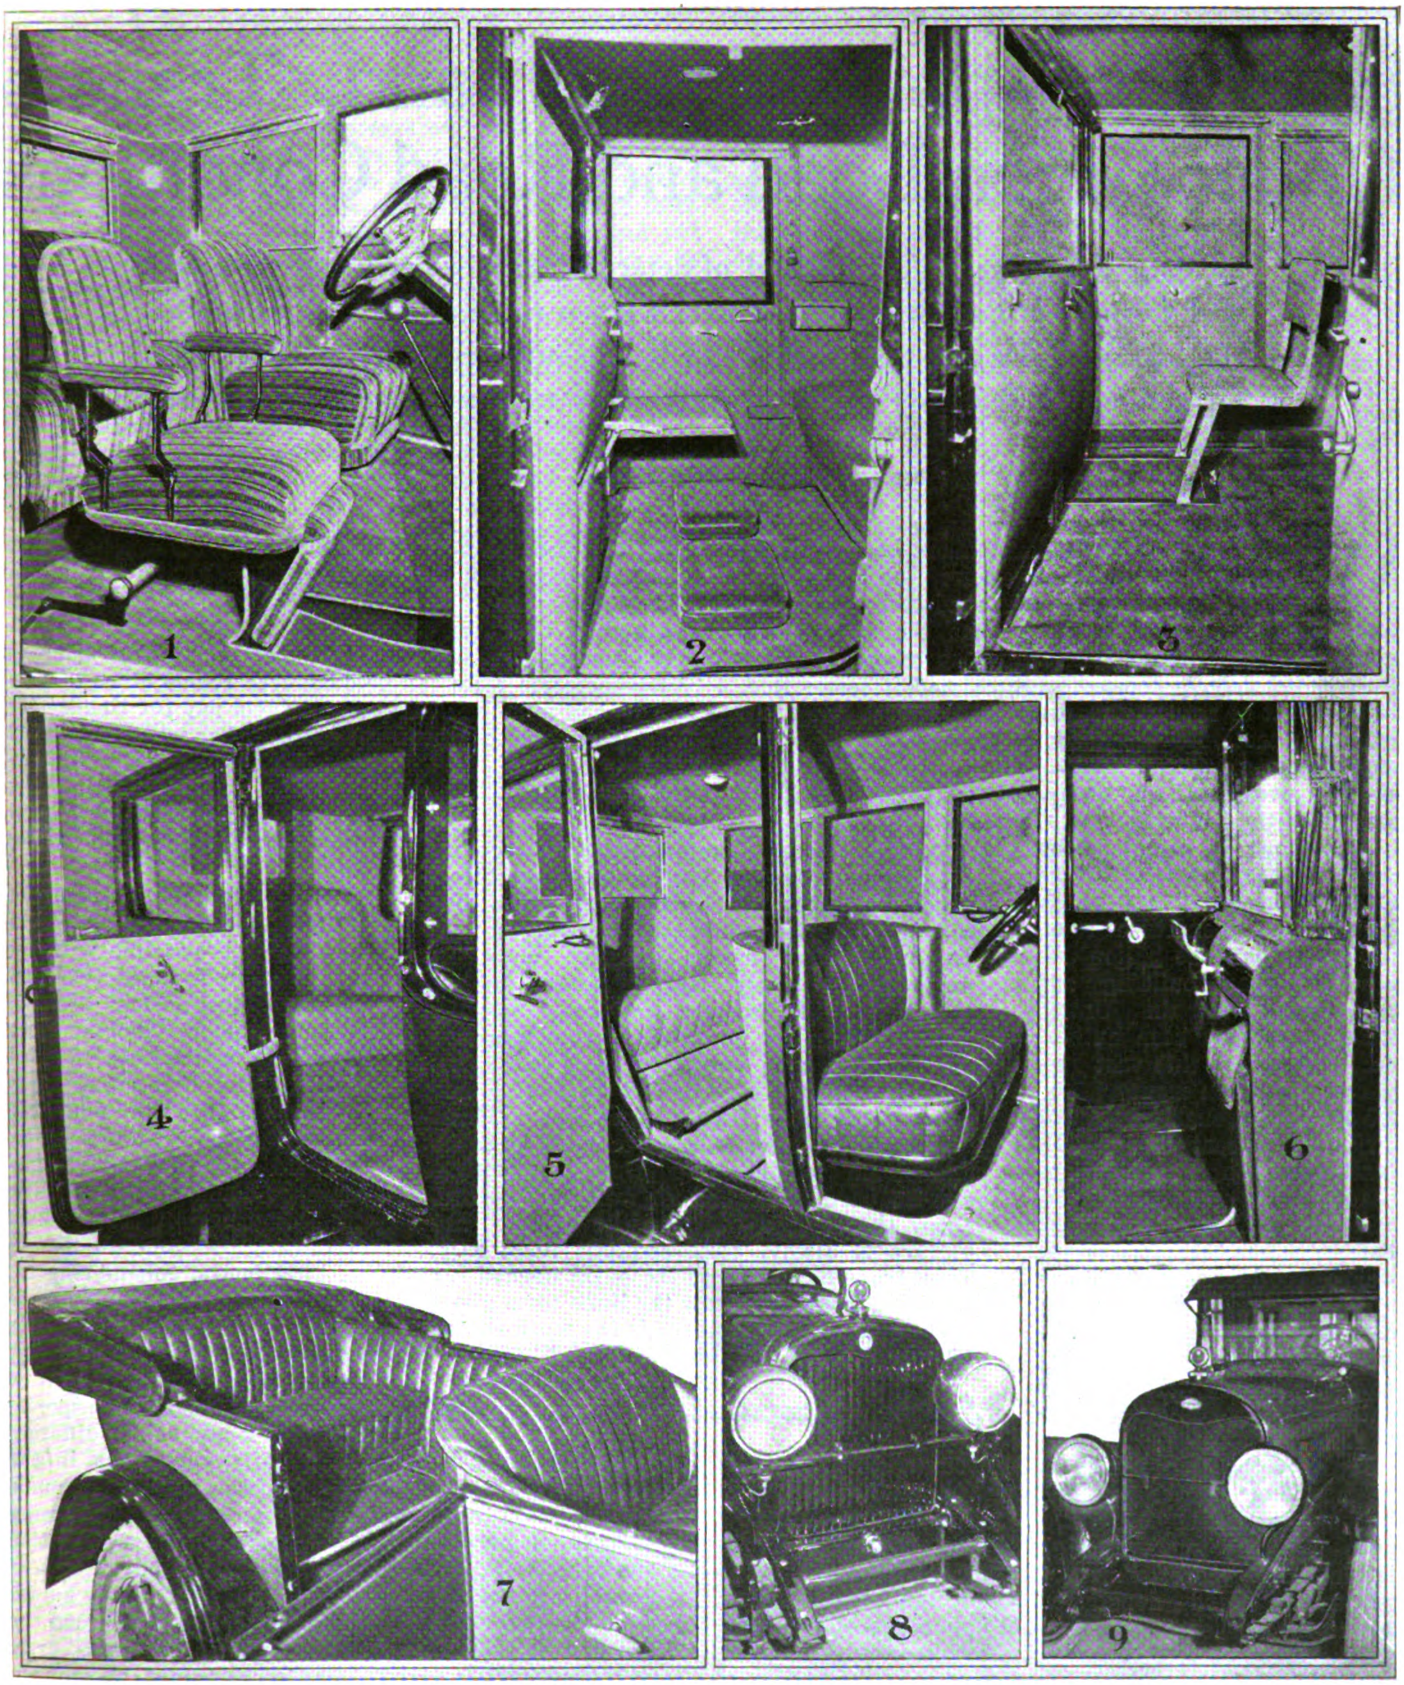
The Packard sedan is also a cloth trimmed body, but leather covering is used on the driver's seat. The back of this seat is higher than usual and more comfortable looking. The doors are plain and there is one dome light.

The Pierce cabriolet is a good example of a high class town car and is trimmed in broadcloth. In the Lincoln limousine cloth trimming is employed and the doors have carpet at the lower edge. The folding seats are of the flush floor type.

The Lincoln touring body is a good example of comfortable seating arrangement. The backs are high and well sloped and the cushions low and well proportioned.

The radiators of the LaFayette and the Lincoln are good examples of the tendency to abandon straight lines for the inner contour of the shell. Practically all the new radiators have departed from the old practice of using a straight line at the top, and now that the tendency also is to have rounded lines on the outer contour, the new inner lines are in keeping and a pleasing contrast to the style just passing out where the use of straight angular lines was somewhat overdone.

THE Midvale Steel Co. had an educational exhibit at the recent Columbus Tractor show intended to convince the tractor engineer that it pays to use rolled gear blanks in tractors in preference to cast iron blanks. A standard cast iron gear was shown on which a weight of 200 lb. had been dropped from a height of 6 ft., the gear being broken into four pieces by the first blow. A rolled steel gear subjected to the same test showed no serious effect after 20 blows. Gears were also shown out of which teeth had been broken in a testing machine and the force necessary to break the teeth measured. Two teeth in the cast iron gear had broken under pressures of 7515 and 5360 lb. respectively. With rolled steel gears without any special treatment it took 32,000 to 34,000 lb. to bend the teeth over. The teeth of the heat-treated gear required pressures of 40,000 to 42,000 lb. to break them.



(1) Interior of Cadillac coupe. Mohair trimmings are used, that on the seats having a pronounced stripe, while the other trimming is plain. The folding seat has folding arm rails. (2) Interior view of Pierce-Arrow cabriolet, trimmed in broadcloth. (3) The folding seats used in the Lincoln limousine are of the flush floor type. (4) On the Locomobile limousine a panel of carpet is fitted at the bottom of the door. (5) Packard sedan has leather covering on driver's seat, but other interior trim is cloth. (6) The Lafayette limousine is provided with lockers above the space into which the folding seats disappear. (7) The Lincoln touring body has high, well sloped seat backs which, together with low, well proportioned cushions, make for comfortable seating. (8 and 9) The Lincoln and Lafayette radiator shells are good examples of the practice now becoming popular of using curved inner as well as curved outer contour lines.

How to Apply Trucks and Trailers Under Given Load and Road Conditions

Explanation of graphical method of determining how much a given truck and trailer equipment can haul over a given route under various conditions as to grades and road surfaces to be encountered. Method can also be applied in selecting the best equipment to meet given conditions.

By Marius C. Krarup

WHILE trailers and semi-trailers are being employed in increasing measure, the large appropriations now made for road improvements in many States make it probable that the use of these auxiliaries in transportation will leap ahead at an unprecedented rate in the near future, and it seems that a development of this nature, provided it proves itself justified, may cast into the shadow, by its sheer economical importance, any other feature in the evolution of motive power for the highways.

According to recent statements by the Good Roads Board of the American Automobile Association, expenditures totalling more than one billion dollars for road building and maintenance in the United States have now been authorized, and out of this vast sum of real American money $550,000,000 will probably be spent during the current year of 1921. Practically the appropriations of four years are available for 1921 and 1922, as so far very little work has been done on the basis of bond issues of 1918 and 1919, owing to high prices for materials and labor as well as shortage in the flatcar rolling stock required for hauling road materials to their destinations by rail.

Figuring the cost as high as $10,000 per mile, which is the maximum allowed in California, for example, there is thus an immediate prospect of having 10,000 additional miles of highly improved highways in the United States within a few years. A vast amount of hauling is done over existing roads, done at whatever cost, because necessary in the ever expanding work of upbuilding and cementing the material elements of civilization in a resistlessly prospering country where all backward waves are of short duration. But this work is done in streaks. It is estimated in Illinois that in that State about 90 per cent of the hauling is done over 10 per cent of the improved roads, and those the roads so well improved and located that motor trucks and trailers can be operated over them with maximum profits without question. So great is the competitive economical pressure in the price of hauling that the march of enterprise and improvements naturally follows the lines of smallest transportation cost. The figures may be rough, but the reasoning is tried and sound, and the 10,000 miles of new and highly improved roads become an augury of a tremendous wave of new productive business activity. A most extraordinary amount of business transportation work can be done over 10,000 miles of good roads, and must be done to make them pay for themselves. Located where they are most needed, they will create work and business which would not be done without them. The transportation work will go to those who can afford the lowest bid.

EIGHT truck manufacturers recently wrote answers to the question "How Much Can a Truck Trail?" and, while they differed in viewpoints, all agreed on emphasizing that every instance must be analyzed separately. In the present article the author shows how any case may be analyzed in a few minutes. Anyone who can specify his roads somewhat as a small portion of a route is specified in Fig. 5 can answer his own trailer questions. Those who know their roads less well must be satisfied with a less definite answer. The method can be used backward as well as forward. Draw the desired work on the graph. The picture is always four straight lines only. Then trace backward to the outfit needed for realizing them. Or draw the lines for a given outfit on the graph and see if the work shown by the lines is suitable.

If all that is claimed for trailers and semi-trailers can be verified, it is possible with the aid of them to haul two tons almost at the normal price of hauling one by motor truck alone. It is possible in most cases to haul four cubic yards of merchandise in one trip where the motor truck alone, with its more limited volume-capacity, could transport little more than half of this bulk in practically the same number of working hours, considering especially that a working day is a unit which cannot always be lengthened or shortened to suit the work at hand. And it is possible to handle transportation over a number of different routes with close reference to daily variations in the requirements for each route. Railway trains are made long or short on the same principle, an ideal roadbed being at disposal to permit it. It is proved to the satisfaction of many that trailer service involves these advantages if the conditions are favorable, but it is not yet widely known just how favorable the conditions must be, how good the roads, how suitable the motive power and the gears, or to what extent trailer service may be extended to common roads without running up against uncertainties similar to those which hampered motor truck service in bygone days, and even during the recent war when extraordinary conditions were encountered.

These questions are almost identical with an inquiry about the utility of trailer service in conjunction with any ordinary installation of motor trucks operated with little reference to road conditions, taking them as they come,

but with a keen eye to a given set of business requirements, and the questions are therefore doubly interesting and timely. The answers as usually given involve terms and ideas with which the consumer is not quite familiar. Drawbar pull is figured by formula from engine specifications and "mean effective pressures." The application to any particular instance follows through a little series of arithmetical operations, simple enough for engineers who habitually reason in mathematical channels and have faith in the outcome, but forbidding to most laymen and not quick enough for executives. At the first technical knot in the thread of the demonstration they quit following. At the second they make up their minds that they will have to fight it all out with experience anyway, preferably with other people's experience. And so they decide to go slow, perhaps too slow. It is attempted in the following to sketch a method of investigation which is correct enough, can be easily amplified and which will remain alive and useful when passed on to the numerous actual and prospective consumers interested in deciding to what extent trailers and semi-trailers can be used advantageously under different conditions.

Table I shows the drawbar pulls obtainable at vehicle speeds from 1 to 20 miles per hour when certain net horsepowers are delivered at the rims of the driving wheels. Net horsepowers such as 15, 20 and 30, it is safe enough to figure, can be obtained from engines whose brake-horsepowers are rated 22½, 30 and 45, respectively, the efficiency of the transmission mechanism of the vehicle being taken as ⅔ or 67 per cent. This is a low rating for purely mechanical efficiency, but perhaps not too low for rough service when no other allowance is made for possible maladjustment of carburetors and cooling systems. At all events, the estimate can be suited to circumstances, the point at issue being the net horsepower delivered at the wheel rims. When the net horsepowers available for traction are taken as the starting point, questions of maximum engine speed and of cylinder dimensions are eliminated from the problem of ascertaining what can be done with trailers. It might be a comfort, however, if makers of trucks and tractors, who are in the best possible position for testing out the efficiency of their transmission gears, would generally adopt the practice of mentioning the maximum drawbar pull for each gear speed and a given diameter of driving wheels. And, if the engine is adapted for more than one fuel, the drawbar pulls for each of the fuels would make interesting reading for users.

The schedule of Table I can, of course, be expanded to include all net horsepowers of interest. The figures are obtained as follows: One horsepower overcomes a resistance of almost exactly 375 pounds at the rate of one mile per hour. From this figure all the drawbar pull figures are readily derived, being proportionate to power and inversely proportionate to speed. The column of speed figures in feet per second is given only to help in realizing what the different speeds mean in visible motion, as it is sensed by an onlooker. The table proves useful for the two main purposes, (1) to decide what can be done with trailers in conjunction with the trucks or tractors one has on hand, and (2) to decide what powers and gears would be preferable in trucks, tractors or tractor-trucks for the work one has on hand, the latter element including consideration of the local roads, maximum loads, and of the desired vehicle speeds. Drawbar pull in this connection is not, of course, understood to be the pull a motor vehicle can exert in addition to that required for moving itself, as sometimes applied in the case of traction by horses or traction engines, but includes the whole pull that can be developed by the motor unit. In all cases the drawbar pull has to overcome the whole traction resistance of the whole weight moved, and it is convenient to look upon this resistance as a percentage of the weight moved and as composed of two elements, one due to road grade, which is constant for a given route, and one due to road surface, which is nearly constant on the best roads, but highly variable, through the influence of weather and poor drainage, on poor roads.

A limitation to the increase of drawbar pull by gear reduction is imposed by the possibility of slip which occurs when the frictional resistance to spinning the driving wheels is smaller than the resistance to traction. The slip factor on hard and dry roads usually exceeds 60 per cent and permits a traction resistance not exceeding 60 per cent of that portion of the whole weight which rests over the driving wheels. On roads of looser structure the slip factor may drop below 40 per cent, and on roads made slippery by rain or snow to a much lower figure, which is, moreover, so variable from one spot to another that calculation is useless. The remedy is either to make the percentage of weight carried over the driving wheels high, as is done in motor trucks with large overhang and more radically in fourwheel-drive trucks, or to raise the slip factor by the well known means of traction rims on the wheels, traction chains or blocks, and to a certain degree by knobs on tires. The first method has the advantage of not raising the traction resistance but is not effective in extreme cases and not readily adapted to trailer service, in which it is the first principle to trail rather than to carry the load in order to secure large load space and other advantages. By the second method troublesome and incalculable slip is transformed into a not very objectionable increase of traction resistance accompanied by a dependable slip factor permitting the use of strong drawbar pulls.

When all the elements in truck and trailer operation here mentioned are made directly visible on a chart, it becomes possible to tell at a glance, almost, what may be done over a wide range of different circumstances. The matter of time consumed will be seen to depend largely on a favorable selection of gears.

Fig. 1 represents road conditions, including road grades up to 20 per cent and road surfaces causing traction resistances up to 20 per cent of the weight moved. The grades are scaled

Table I—Drawbar Pull Obtainable at Speeds From 1 to 20 Miles Per Hour From Net Horsepower Available at Rims of Driving Wheels

Miles per Hour	Feet per Second	Net Horsepower Available at Rims of Driving Wheels

Net horsepower available at rims of driving wheels may be taken as ⅔ of engine's brake horsepower.

vertically and the surface conditions horizontally. A small area at the lower left corner of the graph represents highly improved roads. The adjacent area in lighter shading represents inferior road conditions, including the steepest grades and poorest surfaces likely to form more than a negligible portion of the mileage in any territory where the commercial demand for haulage would justify regular motor truck or trailer service. All the rest of the area represents conditions which are met only sporadically and for very short distances, so that they do not appreciably affect the time consumed in covering a route, even if low gear must be employed in overcoming them.

The grade scale stands for the usual "per cent grades." Fig. 2 shows that this scale is not strictly proportionate to the drawbar pulls required for hauling loads. The line *AC* is the 20 per cent grade, but the line *BC* is the grade demanding a drawbar pull twenty times stronger (apart from the traction resistance of the surface in both cases) than that required for a 1 per cent grade. *AE* is the 10 per cent grade, and varies so slightly that the difference can scarcely be illustrated, from the grade over which the distance travelled is exactly ten times the rise of the road, making the needed pull just ten times smaller than the weight hauled. The discrepancy grows progressively as the grade gets steeper but is unimportant and not even sufficient to balance against another small discrepancy arising from the fact that the low gears required for the steeper grades nearly always are slightly less efficient than

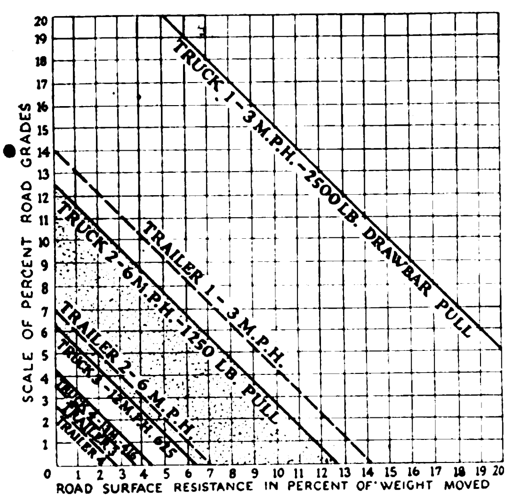

Fig. 1—Graph of resistances to vehicle movements due to grades and irregular or soft road surfaces Each square represents a total resistance determined by its vertical and horizontal distance from the zero point at the lower left corner. The light area at this corner therefore represents good roads having light grades and favorable surfaces. The adjoining area in shading represents common roads, and the rest of the squares difficult and unusual conditions increasing in severity toward the upper right corner. The oblique lines show the total resistance which can be overcome on each of the four gear speeds of a loaded truck and by the same truck when pulling a loaded trailer

the higher gears. These matters, while worth watching to avoid serious errors, sink into insignificance compared to the looseness in estimates of grades, surface resistances and distribution of weight and loads which can never be avoided in practice.

The scale of surface resistance in the graph, Fig. 1, is based, like that of grades, on an addition to the traction resistance equal to 1 per cent of the weight moved for each higher numerical unit on the scale. Only a small portion of it, up to about 5, represents normal surface resistances

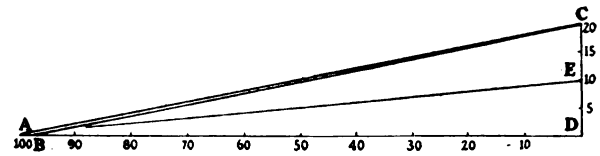

Fig. 2—Illustrates the small difference between a "20 per cent grade," AC, and the grade BC on which that portion of the resistance to traction which is due to grade alone, exactly equals 20 per cent of the weight moved. In the case of the "10 per cent grade," AE, the difference is too small to be shown, the two lines almost coinciding. The grade BC equals AD in length

of those roads on which something like 90 per cent of truck and trailer traffic is carried on at present. Paved and macadamized roads usually make less than 2 per cent of resistance on level stretches. Old brick, asphalt or wood blocks often raise the resistance to about 3 per cent before repairs are made. A macadam road considerably broken up easily reaches a resistance of 5. The average earth road, when dry and fairly hard, is rated at 2 to 6. Wet and rutty it may defy all estimate, being so variable, but this condition is rarely combined with steep grades, except in clay on mountainsides. It may be slippery, too, requiring an additional rating for the use of traction devices to avoid slip. Loose gravel is supposed to raise the resistance to as high as 15. Plowed land or sand may bring it to 20 or higher. There is nothing firm or final about the ratings, and the graph gives only the division on a percentage basis. All have to guess more or less as to what percentage of resistance a poor road surface offers. Only good roads are uniform.

There is shown on the graph the scope of road conditions that a loaded 2½-ton truck, weighing five tons, can cope with on each of its four gears, having an engine delivering 20 net horsepower at the wheel rims and carrying from two-thirds to seven-eighths of the total weight over the driving wheels. The gear speeds are taken to be 3, 6, 12 and 18 miles per hour. These are hurry gears for a truck of this size, but it is the object to pick an example rather unfavorable for trailer service, thereby bringing out more strongly what the effect of a great addition to the good-roads mileage is likely to be, such roads being shown to permit heavy trailer service at fair speeds even with unfavorable proportions of the gears of the motive power. Other power, gear and load combinations can be tried out in a few minutes by the reader with the aid of Table I and a sheet of paper ruled in squares.

For the truck selected, the oblique lines marked "Truck 1," "Truck 2," "Truck 3," "Truck 4," cut off to the left of them all the road conditions that can be negotiated in each case. As shown in Table I, the low gear gives a drawbar pull of 2500 lb., and this will admit of climbing a grade of 25 per cent, as 2500 lb. is 25 per cent of 10,000 lb., the total weight. But grades above 20 per cent need not be considered. So the line is drawn from the point in the graph denoting a 20 per cent grade combined with a 5 per cent surface resistance to the point representing a 5 per cent grade with a 20 per cent surface resistance. At all intermediate points along the line the sum of the grade resistance, shown on the ordinate (vertical), and the surface resistance, shown on the abscissa (horizontal), is 35. At all points to the left of the line the sum is smaller, denoting easier road conditions.

On the second speed, giving 6 miles per hour, the truck can negotiate grades up to 12½ on the best roads, or it can climb grades up to 2½ on roads giving the enormous surface resistance of 10 per cent, as the graph shows, the second line being laid down on the same principle as the line for the low gear.

The line for the third speed, or 12 miles per hour, takes in all roads that may be designated as good, having no grades above 4 per cent and no surface resistances above 3 per cent. And in addition it takes in well-surfaced roads up to 6 per cent grades and poorly surfaced roads with grades from 0 to 4.

The high speed, 18 miles per hour, will, of course, not ordinarily be employed with full load, but the graph shows that it can be employed on the majority of good roads. Usually the engine will be throttled to reduce the speed, with some loss in fuel efficiency.

Now let the trailer loaded with another 2½ tons of merchandise be hitched to the truck. Such a trailer may weigh about 1½ tons, making the addition to the weight hauled 4 tons and the total 9 tons, or 18,000 lb. The drawbar pull figures remain unchanged, and the load on the driving wheels is also the same as before. To get the lines showing what roads can be negotiated, it is only necessary to figure the new percentages of the total weight which the drawbar pulls now represent. If 2500 lb. is 25 per cent of 10,000 lb., what percentage is it of 18,000? Multiply by 10 and divide by 18. This gives a shade below 14. The line marked "Trailer 1" is drawn accordingly to show what truck and trailer with a combined load of 5 tons and a weight of 9 tons can do on low gear. Proceeding by the same method, one sees that the drawbar pull of 1250 lb. on second speed represents 7 per cent of the total weight, and the line drawn accordingly, from 7 grade to 7 surface resistance, takes in practically all good roads and a majority of common roads at 6 miles per hour. The third speed with trailer takes in the larger portion of good roads at 12 miles per hour. And in most cases much of the larger portion, perhaps usually as much as seven-eighths of the mileage of a route lies over roads of this character, so that little time is lost in comparison with the truck alone, which on the same roads often must be held down to about the same speed for reasons of prudence, maintenance cost and legal rules for heavy traffic. On high gear, at 18 miles per hour, the trailer outfit takes in grades or road resistances up to 2.3 per cent.

In all cases a slip factor (traction coefficient) of 40 per cent is sufficient to secure the hauling of the trailer, as the minimum load at the contacts of the driving wheels with the road is 6667 lb., and for trucks of the overhang type more than 8000 lb., while the maximum drawbar pull is 2500 lb.

Special resistances may arise. The use of traction devices to overcome temporary slipperiness may be considered as normal and included in the scope of the graph, justifying an increased rating of the surface resistance by 1 to 2 per cent, and allowance may likewise be made for the additional resistance encountered on curves and especially at sharp turns, due to misdirection of the drawbar pull. Starting with the wheels in a hole may cause difficulty which the driver cannot always avoid. At the top of a hill, with the trailer still on the slope, a similar increase in resistance occurs. The graph shows that the low gear will take care of these factors, even all combined, unless the otherwise existing road condition calls for low gear and nearly exhausts its capacity. If a route contemplated for trailer service presents possibilities like those mentioned, provision should, of course, preferably be made for them in laying down the low gear line and selecting motive power, gears and loads in such manner that the required low gear line can be realized.

There is need of a good scale of surface resistances. Some experienced road specialists may have the data, but there is a difficulty in designating the different materials and qualities by such terms that anybody can identify them with the actual condition of an actual road which he has in mind from personal observation or which has been carefully described to him. Some data on the effect of wheel diameters also remain to be collected, as large semi-trailer wheels, for example, meet smaller surface resistance than ordinary truck and trailer wheels, yet not always in inverse proportion to diameters. Hauling is not meticulous laboratory work, however. With a few fixed surface data, distributed along the scale from 0 to 15 per cent and well authenticated, one who estimates a given route should have no trouble in assigning the proper per cent value to intermediate road qualities not specified on the scale. Experience in distinguishing sharply between grade and surface resistances is perhaps the main personal requirement. At worst the low gear will take care of many errors, so far as muddling through is concerned. A determined call for the best surface resistance scale, well phrased and possibly illustrated, might elicit something of great interest in this connection, as well as in other directions.

The method which has now been outlined permits a good deal of experimenting and demonstrating to be done handily on paper, and it may be turned to account for good salesmanship and for securing the best utilization of any fleet of motor trucks and trailers operated over a number of routes. At one point of some importance Fig. 1 is lacking, however. It fails to visualize or suggest the time factor, because a square representing a bad road condition, of which there may be a fraction of a mile, is just as large and prominent on the graph as another square representing a road condition of which there may be twenty miles. Trailer time often comes near equalling

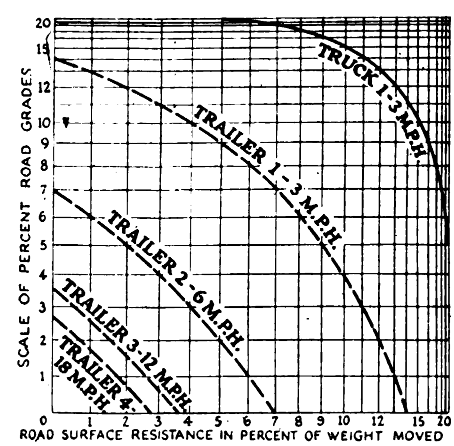

Fig 3—Graph picturing road conditions somewhat in proportion to their prevalence, each square or rectangle representing a certain total resistance to traction by its location, and the probable frequency or mileage by its area. The curves represent the same truck and trailer as the oblique lines on Fig. 1, the whole area to the left of them denoting roughly the share of all road conditions which can be negotiated in each case

truck time, because those bad or steep stretches are very short, which call for a lower gear with the trailer than with the truck alone. As no two routes are quite alike, the running time can be figured closely only by means of specifications or charts for each route, but a general idea of distances, difficulties and time consumption can be conveyed by means of a graph like Fig. 3 and the tell-tale gear lines laid down in such a graph. It may be used in the same manner as Fig. 1, and the lines shown in this case are the low gear line for the same truck as in Fig. 1 and all the lines for the trailer outfit from Fig. 1. These lines here become curves. This graph is shown here not because it is believed to be thoroughly practical with reference to trailers. It sacrifices simplicity too much for this

purpose and is not specific enough. It illustrates a situation but does not give figured values for distances and time. But it is presented because it may be found particularly useful for choosing, examining and demonstrating the capacities of trucks and tractors whose relations to their work are judged on a plan of generous allowances in matters of power and weight for the overcoming of exceptional difficulties when the need arises.

Each of the small squares or rectangles in Fig. 3 pictures by its comparative area the probable frequency or mileage of the road condition, or working condition, which is designated by its location in the graph. So far as roads are concerned, as all roads are intended for removing difficulties in transportation, it is a fair assumption that frequency or mileage of a given road feature is in inverse proportion, on any given route, to the difficulty or road resistance it presents. The nature of the graph is based on this assumption, which may be extended to tractor work with some modifications, and should be useful for estimating the required types and specifications of vehicles, with the time factor easily if not accurately included in the considerations. But this interest is largely professional.

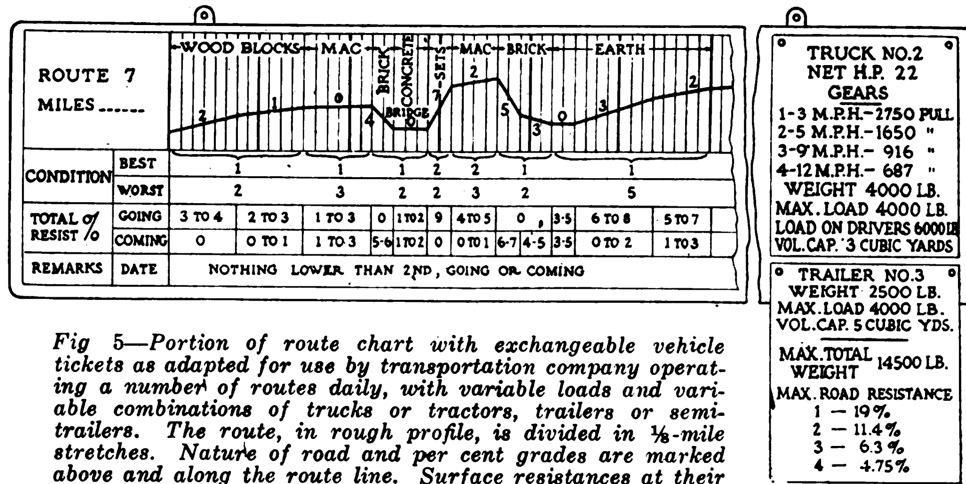

Fig 5—Portion of route chart with exchangeable vehicle tickets as adapted for use by transportation company operating a number of routes daily, with variable loads and variable combinations of trucks or tractors, trailers or semi-trailers. The route, in rough profile, is divided in 1/8-mile stretches. Nature of road and per cent grades are marked above and along the route line. Surface resistances at their best and worst are marked below. Total road resistances are footed up, subject to whatever changes may occur in the road condition from day to day. In practice, only the doubtful stretches should be considered, and these mainly when unusual loads require an unusual combination of the vehicles

With closer reference to trailer work and the timing for routes whose peculiarities are known and may be charted, one reverts to the simpler type of graph. Fig. 4 shows one way in which the normal resistances of a route may be marked with their corresponding mileage upon those squares in the graph which represent the various resistances concerned. Gear speed lines for available transportation units and desired loads may be laid down, and it may then be observed to what extent the marked squares come inside or outside (left or right) of the respective speed lines. Time can then readily be figured, and the method is not laborious when Table I and graph blanks are at hand.

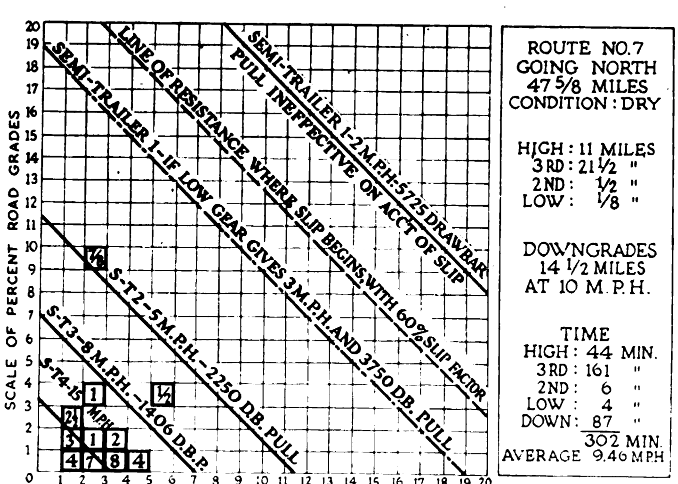

Fig. 4—Graph on the same plan as Fig. 1 and showing the work and working limitations of a semi-trailer outfit. Without connection herewith, there is indicated on the graph, by marked squares and figures in the same representing mileage, a system for viewing the road conditions of any given route in relation to the hauling capacity of a transportation outfit, including timing of work over the route

Fig. 4 shows the lines for a tractor-truck with semi-trailer in addition to the markings for a supposed route. The following data are assumed for the semi-trailer outfit: Horsepower 30 at the driving wheels, gears 2, 5, 8 and 15, weight of tractor-truck 2½ tons, weight of semi-trailer 1½ ton, payload 6 tons, weight on drivers 3¾ tons, weight on trailer wheels 4¾ tons, total weight 10 tons. It will be noticed on the graph that in this case the low gear cannot be made useful up to the power limit without the use of special traction devices for raising the slip factor.

Traction resistance on downgrades need rarely be considered, and the timing for downgrades may be estimated somewhat according to the degree of caution desired of the driver. If heavy surface resistance occurs on a light downgrade the net resistance can, if necessary for completeness, be marked under the base line of the graph. To illustrate the possibilities, the writer remembers one serpentine downgrade six miles long and averaging 13.2 per cent on which the pull of the grade was not everywhere sufficient for overcoming the drag of the sandy roadbed. And a great deal of trailing had been done over it, not by motor truck, but by 20-mule teams.

Fig. 5 shows a plan for a separate route chart that may be pieced up in sections—since routes, too, may vary from day to day—and pictures the road data for both directions of travel. It can probably be much improved in the hands of skilled fleet operators, as by eliminating all detail of features which present no difficulties.

While the method described in the foregoing for tracing the requirements in horsepowers and gears are applicable to ordinary motor truck work as well as to trailers, something of this order is no doubt more widely needed in connection with trailer equipments, as these are very low powered transportation units for their loads and cannot possibly be as independent of road conditions as trucks must be in order to be saleable, while, on the other hand, they exhibit ample justification over a wide range of conditions and circumstances, partly by moving loads too heavy for trucks of general utility and perhaps even more by large volume capacity and great flexibility in their adaptation to varying demands. In this article the only aim has been to indicate an easy way to estimate with some degree of accuracy the ton-load and ton-mile capacities that are compatible with any set of road conditions, in which estimate the X may be on either side of the equation.

A Commercial Monoplane Designed to Carry Pilot and Six Passengers

Clean design with minimum parasite resistance and efficient wing curve said to result in excellent performance. Wings externally braced. Both passengers and crew have clear vision downward.

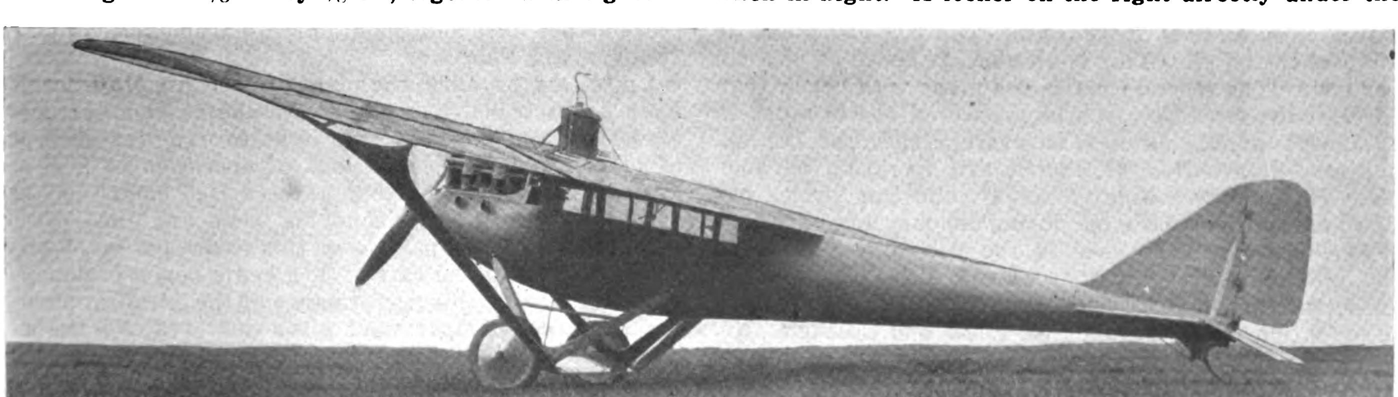
THE monoplane shown in the accompanying photographs was built expressly for passenger carrying purposes and with the object in view of providing a strictly commercial ship embodying efficiency and comfort.

An externally braced monoplane is used to make possible a thin wing section with consequent high efficiency at high speeds. The wings taper in plan from the fuselage to the tips and are constructed of wood and fabric. The webs and beams used are said to be of more liberal design than those used in standard biplane wings of equal dimensions. There are, besides the usual two beams, twelve auxiliary strips linking the webs together and adding greatly to the strength of the wings. The wings are braced by Y-shaped struts which pass from a tie rod just back of the landing wheels to a point about two-thirds out on the wing, the strut dividing and fastening directly onto each beam. The planes themselves have a small dihedral. Large ailerons are cut into the trailing edge of the wings and are actuated by a strong and positive system of tubes and cranks which connect them with the dual stick control.

The landing gear has its two wheels spaced with a 7-ft. tread, which makes it easy to avoid tipping when landing. The wheels are of the wire-spoke extra strong type and carry 750 x 125 mm. tires. They are mounted upon a 2-in. tubular axle. Streamlining between this axle and the tie-rod holding the wing struts is in the form of an airfoil, the axle being the leading edge and the rod the trailing edge. Landing shocks are absorbed by rubber cords, which allow the axle to rise against stops 6 in., the leading edge of the small airfoil rising with it and the rest of the airfoil remaining in place.

The design embodies unusually clean lines. The fuselage merges directly into the center section, the roof of the passenger compartment being ply-wood and conforming to the wing curve. The fuselage is made up of six main longerons 1⅝ in. by ⅞ in., together with eighteen longitudinal ribs ⅞ in. by ⅜ in., all of which are supported by fourteen ply-wood bulkheads and inclosed in a laminated covering ¼ in. thick, thus forming a rigid structure. The fuselage terminates at its rear in an aluminum casting in which the rudder and elevators turn. The passengers are accommodated in three seats arranged in tandem. The first seat accommodates two people, either of whom may pilot the plane or, with one stick removed, one may pilot and the other be a passenger. The second seat holds three people and the rear one two. Entrance is through a door on the left side and at the front of the compartment, a portion of the first and second seats hinging to enable easy access to the rear seat. The windows which reach the entire length of the passenger compartment, are placed in a portion of the fuselage which slopes inward at the bottom, thus an excellent view downward is obtained. There is a dome light in the roof of the cabin. The fuselage looks small for its capacity. Head-room is provided by utilizing what would ordinarily be the interior of the center section of the wing.

The rudder is controlled by two sets of pedals, all of which are interlocked and work in unison, being connected to the rudder by cables entirely within the fuselage. The pilots have good forward vision through windshields provided with large openings at the side, making it easy to remove any moisture which accumulates on the glass. Side vision is obtained through the windows already mentioned. There is a mahogany instrument board mounting an air-speed indicator, altimeter, motometer, revolution counter, ignition switch and oil pressure gage. The spark and throttle are controlled by levers centrally located within easy reach of either front seat. There are fuel shut-off cocks within easy reach of the pilot with which he can cut out either or both of the fuel tanks. Small levers within convenient reach of the operator give the radiator shutter any desired setting when in flight. A locker on the right directly under the



The Jacuzzi commercial monoplane, carrying seven persons

instrument board contains the storage battery while a similar locker on the left is available for tools, etc.

The engine used is a Hall-Scott L-6 capable of developing over 200 hp. but in this airplane it is said to require an average output of about 100 hp. at the average flying speed of 100 m.p.h., thus providing ample reserve power, which when all used is said to increase the speed to over 125 m.p.h. Delco ignition and two Stromberg carbureters are used. The engine is mounted in the forward end of the fuselage and turns a propeller 8 ft. 2 in. in diameter.

Precaution is taken against fire by allowing practically no chance for an accumulation of gas or oil vapors in the fuselage. Overflow from the carbureters is led away through pipes. The carbureters receive their air through scoops cut through the side of the fuselage, thus eliminating practically all back-fire hazard. The fuel is carried in two gravity tanks made of copper and mounted in the wings at either side of the fuselage. Fan-driven pumps deliver all fuel in these tanks to their highest point, thus maintaining a constant gravity head at all fuel levels. The portion of the fuselage immediately under the engine is provided with a large number of ventilation holes.

Cooling is by a radiator mounted in unobstructed position and provided with a heavy canvas shutter which when entirely open is rolled up at one side of the radiator. As previously stated, this shutter can be given any desired setting while in flight. The venturi tube of the air-speed indicator is mounted high above the radiator out of the propeller slip-stream and all air disturbances set up by the plane.

The following specifications and performance data are furnished by the manufacturer, Jacuzzi Bros., Inc.:

Length over all	29 ft.
Span	52 ft.
Height (top of radiator)	10 ft. 6 in.
Wing area (with center section)	400 sq. ft.
Weight empty	1,800 lbs.
Weight fully loaded	3,400 lbs.
Fuel capacity	80 gal.
Oil capacity (outside engine)	4 gal.
Fuel consumption per hour	8 to 9 gal.
Radius of action	900 to 1,000 mi.
Speed, half throttle	100 mi. per hr.
Speed, three-quarter throttle	125 mi. per hr.
Minimum landing speed, full load	45 mi. per hr.
Minimum landing speed, half load	38 mi. per hr.
Approximate ceiling	22,000 ft.

According to the builders, the plane handles exceptionally well, the rudder being markedly effective in taxying. The wings are notably rigid in flight due no doubt largely to their great depth near the fuselage and the special interior construction. A landing sufficiently bad to collapse one wheel and bend the axle is said to have failed to indicate weakness in the design or construction of the rest of the landing gear. The performance of this plane is attributed to the unusually clean design in which parasite resistance has been reduced as much as possible, while at the same time a wing section of high efficiency is employed.

One and a Half Million Miles Flown by Air Mail Planes

MORE than one and a half million miles flown by the planes in the Air Mail Service shows that 21 of these planes have traveled more than the distance around the earth at the Equator. The prize plane of these veterans of the air was D. H. Plane No. 76, which flew 38,348 miles in 407 hours and 8 minutes before it went out of service on Oct. 16, 1920. The average speed of this plane was 94.4 mi. per hr. The plane with the next greatest record was D. H. Plane No. 74, which flew 38,381 miles in 420 hours and 15 minutes, and is still going strong across the Sierra Nevada Mountains from Reno to San Francisco. It is one of the planes that the Air Mail mechanics expect to see make a record of 50,000 miles or better. Its average speed has been 89.1 mi. per hr. through the entire period of its activities. This plane added 3443 miles to its record during the months of January and February. Four other De Haviland planes have each exceeded 30,000 miles of operation.

Next to these top-notchers in the mail service stand the two Curtiss R-4 planes. Of these, No. 31 had a record at the close in 1920 of 33,644 miles in 378 hours and 49 minutes in the air. This is an average speed of 88.8 mi. per hour. The second Curtiss R-4 plane with better than 30,000 miles was No. 35, which covered 30,948 miles in 397 hours and 25 minutes, an average speed of 77.9 mi. per hr. Planes Nos. 31 and 35 are operating between New York and Washington to-day, and the former has flown an additional 6885 mi. during January and February.

The first airplanes used in the Air Mail Service on the date of its inauguration, May 15, 1918, were Curtiss JN-4 training planes, Nos. 11 and 12. Both of these are in operation to-day between St. Louis and Chicago. No. 11 has flown 31,208 mi. and No. 12 30,090 mi.

The first planes purchased by the Post Office Department were 8 machines manufactured by the Standard Aircraft Corporation of Elizabeth, N. J., which was in business only during the war. Seven of these eight planes are still in existence, two of them flying daily between Chicago and St. Louis. Their record is 15,781 mi. and 10,256 mi. respectively.

Two of the Glenn L. Martin twin motor mail planes put into service in the winter of 1919 have exceeded 25,000 miles of service. Plane No. 201 of this type has flown 27,757 mi. at an average speed of 75.3 mi. per hr. Plane No. 202 has seen 25,593 mi. of service at an average speed of 89.2 mi. per hr. Both of these two planes are being repaired and overhauled and give promise of getting into the 40,000 to 50,000 miles class.

The Junker all-metal monoplanes are the latest planes put into the Air Mail Service. They have not had the mileage that should have been obtained from them, owing to the fact that they had serious engineering defects in their fuel system and engine installation. One of these planes covered 7677 miles between August and Dec. 31, at an average speed of 81.1 mi. per hr. A second of the all-metal monoplanes has flown 6159 miles. Both of these planes have additional mileage accumulated during January and February.

Up to Dec. 31, 1920, the planes in the Air Mail Service have flown 18,806 hours and 37 minutes and have covered 1,572,450½ miles. This is an average for all types of planes under all conditions of operation of 83.6 mi. per hr. In that period they have carried more than 49,000,000 letters. The mechanics' time and the cost of airplane and repair parts over this entire period of service have been at the rate of 30.5 cents per mile flown.

In announcing this performance of the Air Mail planes, the Post Office Department gives due credit to the mechanics who are keeping them in condition for the daily flights, and the pilots who have handled them with daring and judgment under most trying and adverse conditions of weather.

A Labor Dispute Which Was Settled by Frankness

The following article describes how an Eastern manufacturer succeeded in coming out of labor trouble with more good will from his employees than when he went in. The accomplishment was due to the simple expedient of laying all the cards face up on the table.

IT is possible for an employer to come out of a labor difficulty with more good will from his workmen than when he went it. One executive recently "got together" with his workmen and solved mutual difficulties merely by laying all the facts on the table, even when the difficulties had gone so far as to result in a strike affecting an important "keystone" department. The details of the settlement are of interest to the many other manufacturers who are, unfortunately, meeting similar situations with only too great regularity.

About 1500 men are employed in this plant, which is located in a town of about 15,000 inhabitants. Ever since the establishment of the concern in 1898, it has been the custom of the management to adjust all differences with workers through a committee elected by the employees to represent them. An open shop has been maintained.

Union agents have attempted to organize the plant, but had met with little success over a period of years. Finally, however, they did manage to organize the foundry. Shortly after, a strike was threatened, the demands being for a reduction of the working day from ten to nine hours, maintenance of the present wage scale, and recognition of the union. The management refused to deal with the union agents, but was willing to discuss the wages and hours demand through the usual representative channels.

This status continued for a day or so, when the foundrymen finally did walk out. The next day the management urged the rest of the workers to remain loyal and to choose their representatives for conference so that the actual facts surrounding the demands and the possibility of granting them might be threshed out. One or two men in a certain department were known to be among the ultra-radical group. The management urged that they be elected in the committee representing the workers. One of these men in particular had been putting forth many heated and radical arguments. He was chosen as a member of the shop committee.

When the committee met in conference with the general manager, the latter put the following facts before them:

1. He showed the committee actual charts prepared from production records which proved that since 1914 the production of the plant per man per hour had decreased about 33 1/3 per cent.
2. He showed them similar charts from the foundry production record for the last two years which showed on the graph a very sharp and steady decrease since 1916. the percentage being much greater than for the rest of the plant.
3. He told the committee that he knew the men were loafing; that it was proved by these records. He said that he knew they could produce as much in nine hours as they were now in ten—if they would; they could do it even in seven hours, if they tried.
4. He told them he had known of this condition for a long time, but had said nothing in the belief that after the war things would settle down and conditions would return to normal; but that present conditions could not continue if the plant was to go on operating successfully.
5. He explained to them that local conditions had much to do with the number of working hours. In this town no workman lives more than a mile from the plant, most of them within five minutes' walk. Thus they have as much time at home as the man in New York City who actually works only eight hours.

When these facts had been presented, a lively discussion followed in which nearly every member of the committee took part. Objections were brought up and were answered by the general manager. One of the outgrowths of the discussion being that the radical member of the committee was unable to successfully defend in open forum and in the face of true facts laid on the table the views he had been disseminating. This very man, in fact, got up and finally said:

"We *have* been loafing on the job. I know it and you know it. We have the facts here, and the thing for us to do is to go out there and really begin to produce something."

The management then proposed to try a nine-and-one-half hour day temporarily with the same rate of pay as for ten hours, with a promise of readjustment later if it seemed justified. This proposal was agreed to.

In the meantime, of course, the foundrymen were on strike. The committee members after this meeting went out and talked with the striking men, told them they could come back—if they came at once without recognition of the union—and that they would be better off to do so. The next morning all the strikers were on deck.

The immediate trouble was thus settled—a desirable but by no means an ultimate end. Frequently employers have been able to break a strike in one way or another and get the men back to work, but too often the resulting ill-feeling that has been aroused reflects very definitely in even more greatly decreased production and discontent. In this case, however, the strike was taken as an opportunity to give the workmen true facts in regard to the entire situation. By laying all the cards on the table, and then frankly inviting discussion, this management came out of a strike with a greater feeling of good will and co-operation on the part of its workers than at the start. That is the unusual feature of this experience.

Proof of this is shown in production records since that time. Production in every department of the plant has risen, especially that in the foundry.

This settlement illustrates strikingly the possibilities presented to the management which, with a really honest purpose, is willing to put the facts before their employees. The name of the concern is withheld merely because the story is a rather intimate one, while the facts are applicable in one place as well as another.

Where Is the Motorcycle Going?

The general status of the industry, together with the relation between foreign and domestic business, was discussed last week. This article takes up the more detailed problems of overcoming prejudice, over-emphasis of racing, the size of the future motorcycle, and the field for future development. Vital necessity for cooperative effort by manufacturers is indicated.

By Norman G. Shidle

IT may be admitted that so far as the opinion of the general public is concerned, the motorcycle has a distinct prejudice to overcome. The automobile once had the same difficulty, but the automobile succeeded in overcoming it; the motorcycle has not yet done so.

In seeking the best means by which this prejudice may be overcome, the necessity for co-operative effort among the manufacturers becomes apparent. In an industry composed of so few units, it should not be difficult to get together to boost the industry in general for the good of each individual. This is necessary if any real progress is to be made. The chief necessity for the motorcycle in the domestic field is the widening of the potential sales market. No real progress will be made while the manufacturers content themselves with fighting over the business available in the present market, which seems to have grown smaller—certainly not larger—during recent years.

Why Not Study England?

The situation in England presents a field for study in this connection. The motorcycle is undoubtedly popular there and American manufacturers might gain by attempting to analyze thoroughly the reasons for this fact with the idea of adapting them to American merchandising conditions. Some interesting material was recently presented by M. Olley, chief engineer of the Rolls Royce Co. of America in this connection. He said in part:

"The motorcycle is becoming an institution in England and is used by old and young, and by both sexes almost equally.

"On English roads and in English weather, it is the perfection of motoring as distinct from mere luxurious riding. The machine amounts to nothing in itself, weighs only 150 lb., is no bigger than an ordinary bicycle, travels 100 miles on a gallon of gas, yet transports you anywhere at 30 miles an hour average and 60 miles an hour maximum speed.

"It can never lose its place in the affection of the British motorists, probably 80 per cent of whom have served their apprenticeship on motorcycles. It is a fine training for driving a car.

"Design in England is affected greatly by the essential democracy of its inhabitants or perhaps by the fact that there the car is not the standard of the man.

"Here a man will buy a car of cost proportioned accurately to his income or his pretensions.

"There a cabinet minister or railroad president will own a Ford sedan, or will take pride in the possession of a miniature vehicle peculiar to the country, called a 'light car' or voiturette, and resembling a traveling bathtub. His social status is not governed by the car he drives, or by his income, but rather by the particular accent with which he speaks the English language."

It is obvious that as general prejudice to the motorcycle is lessened the sales field will widen. One way in which co-operative effort may be effective is in a definite attempt to break down this barrier of prejudice. A co-operative publicity campaign, conducted along broad and intelligent lines, in a conservative and dignified manner, would go far toward accomplishing this end.

No single manufacturer, naturally, wishes to undertake such an effort alone, since the benefits would be shared by the others without cost. But the general benefit to the industry from such a campaign will be great. It is, in fact, the understanding of the writer that such a movement is practically under way. It will be to the lasting benefit of the industry.

This is merely a single instance, however, of the way in which active co-operation is needed among the manufacturers. The industry as a whole cannot grow unless all of its units are willing to bury their small grievances against one another and fight shoulder to shoulder for a common end.

Outsiders cannot be expected to have much respect for the various manufacturers if they have but little for each other. In every possible manner co-operative effort for the boosting of the motorcycle in general should be fostered by the motorcycle manufacturers. Along this line lie some of the best possibilities for the future progress of the motorcycle.

The motorcycle has been merchandised chiefly as a sporting proposition. It has appealed almost entirely to the young man with a love of speed and hard riding; the young man who likes a thrill, and who gets real joy from dashing over open stretches of roads as fast as his machine will carry him.

To this group the motorcycle still appeals and will always appeal. The sales in this field are so great as to constitute an overwhelming percentage of the entire motorcycle sales in the United States. Since this is the backbone of the motorcycle trade, it is obviously necessary that every effort should be made to sell to this field and to develop it to its fullest. The manufacturers are accomplishing this with a large degree of success.

But this field is obviously limited in scope, and if the motorcycle confines itself within these limits, the end of its development is not far distant. Other fields must be opened up if progress is to be made. And the overemphasis of this sporting phase in both publicity and interest among dealers and manufacturers is likely to hinder that further development.

Racing, for instance, is an extremely expensive form of advertising. The cost of financing riders and equipment, of manufacturing and developing special engines for racing work, etc., constitute an enormous expense. One factory advertising manager recently said something like this in regard to racing:

"It's great, we all admit; but, lands sakes, how it costs! If you have your doubts about the cost, just ask some of the dealers who footed the racing bills last season. It puts some nick in our advertising budget and the annual cost runs into six figures. . . . For the factory to attempt to support a third or one-half of all the races would load an excessive and unfair cost on the retail price of stock machines and side-cars."

Racing as an aid to sales is scarcely of value in proportion to the financial burden which it imposes. It has a favorable influence only with a limited class of prospects, and its influence on the more intelligent of this class of speed and sport lovers is probably not as great as is generally imagined. Any sensible motorcycle purchaser knows that the machine he buys is nothing like the machine of the same name which has won the various races and that fundamentally the two have little in common except that they were made by the same manufacturer.

Certain types of racing, moreover, have a definitely bad influence on outside persons, who might otherwise be favorably inclined toward the motorcycle and thus become prospective purchasers. The establishment of road records, for example, has caused a great deal of unfavorable criticism for the motorcycle. So strong was this criticism, in fact, that the chief manufacturers have practically discontinued this form of racing altogether. This was a definite step in the right direction.

Probably no single factor ever brought the motorcycle into disrepute so strongly as the motordromes which were established in various parts of the country several years ago. The numerous injuries and deaths gained wide publicity, while the excessive noise created in the vicinity of the motordrome caused hundreds of people to gain a permanent and constant grudge against the vehicle. These were discontinued after a short time.

But all of these things have had their part in building up prejudice and consequently sales resistance for the motorcycle outside of its narrow sporting field. This resistance, however, must be broken down if the industry is to permanently progress.

Racing is a strong tradition with the motorcycle industry, and like many other traditions has survived in full vigor long after its former usefulness has passed. One reason for this may be found, perhaps, in the fact that more than one manufacturing executive has been very close to the thrills and joys of racing himself, and his memories of the exciting times of his old racing days are so pleasant and strong as to somewhat warp his perspective when attempting to view the industry from a purely business and merchandising point of view.

This is not an argument for the elimination of motorcycle racing. Motorcycle racing has and always will have a definite place. But it is getting far more than its fair share of attention and is the cause of more expense than its merchandising value warrants.

All of the factors thus far presented are recognized more or less by nearly everyone connected with the industry. Some of those who have thought most along these lines have some definite suggestions to offer. One point that is pertinent to any such discussion is that of the mechanical phases of the American motorcycle.

Let it be granted in the first place that the American motorcycle of to-day is a carefully built, quality machine, very powerful and rugged, capable of very high speed and of taking hills of nearly any variety, that there is a definite place for such a machine in this country where many roads are bad and where the rugged qualities are necessary. The very fact that there are 234,000 motorcycles in the United States shows that there is a definite market for machines of the powerful type, but the fact that the number is not increasing would indicate that the demand has been met.

The big manufacturers appear to have some similar thought, as is indicated by the introduction of middleweight machines by both Hendee and Harley-Davidson, while both of these makers now have on the market a single cylinder, though not a light weight machine, adapted to commercial use.

Only a limited number of persons in any country need or desire a machine capable of going seventy miles an hour, and the opportunity for the utilization of the power of these big machines is also extremely limited.

If the field of the motorcycle is to be extended, it must be through the development of a machine more suited to the use of a greater number of persons. The heavy 15 to 19 hp. machines can not be operated with comfort by anyone except an athlete, while their initial cost and operating cost is comparatively large if they are to be used merely as a sporting proposition.

If a man desires a vehicle chiefly to take him from one place to another, he has no use for the high power and speed of the big machine and is not likely to pay the high price charged for it.

One of the chief executives of one of the principal concerns said recently, "Frankly, this big machine is too hard to handle. I can't ride it myself any more."

In the mind of at least one concern is the idea that the future development of the motorcycle lies along the increasing use of the so-called middleweight machine. One of the executives of this concern stated that he believed the sale of this type of machine could be increased very greatly, especially among persons hitherto shy of the big machine. He thinks that the sale can be increased so greatly as to render real quantity production possible, with a consequent decrease in price, thus widening the market still further.

This view looks more nearly toward the direction in which the future development of the motorcycle is likely to be.

But even the so-called middleweight machines are good-sized motorcycles and sell at a price only slightly lower than the big machines. Thus the price is still high enough to make the motorcycle compete to some extent with the smaller automobiles. It is not a machine that is within the means of the man unable to buy a small car, who still desires a rapid means of individual transportation for himself.

There are three fields for development of the motorcycle outside of the sporting field:

1. Police and municipal work of various kinds.
2. Utility work, such as delivery for stores, etc.
3. Personal utility work: a vehicle for taking a man to and from work; to the store and back; and for short pleasure rides.

The first field is being cultivated intelligently and intensively by the manufacturers. Several large sales in this field were announced recently by one of the big companies and more will probably follow.

Some effort by individual dealers has been made in the second direction, but this field will bear more attention

than it has been given in the past. For certain reasons, however, it has definite limitations.

The third field is almost entirely undeveloped, although it probably constitutes the one great outlet for the progress of the American motorcycle industry. The potential field which it presents cannot be definitely calculated, but it is large.

For the first two limited purposes, as well as for sport, the present type of big and middle-sized machine is suitable. But for this last and very wide field, it is not suitable both because of its size and its cost.

Manufacturers are wont to object that the light motorcycle is not feasible in this country because of the bad roads and because of the demand among our riders for speed and power. An analysis of the situation does not seem to validate this criticism.

There is a demand among present riders for speed and power. But the whole point of this discussion tends to show that the very trouble with the motorcycle industry is its failure to develop and recognize the potential demands of a different class of possible riders. It must go forward into the development of this group or stagnate as a power and speed sporting proposition.

And the riders in this third class are largely those who could get great efficiency and usefulness from their machine, scarcely ever leaving a paved street or an improved road. It includes thousands of potential municipal buyers and of small town buyers who care a great deal for steady, constant individual transportation and not a tinker's darn for high speed and excessive power.

Some very definite opinions were expressed recently by a man who has been closely connected with the motorcycle industry since 1902, who is still connected with it and who has some rather frank statements to make in regard to its present and future status. While the writer does not specially wish to endorse these opinions, they undoubtedly contain much real food for thought and present an angle worthy of serious consideration and analysis by manufacturing executives coming as they do from one thoroughly familiar with conditions past and present. A part of what this man says is as follows:

". . . The fact is, the motorcycle business is very sick. A few million folks want a motorcycle, but not the kind factories insist on building. Those, and a few thousands more, who would take one of the present types, won't pay the price the factories demand.

"There will be nothing doing in a cut. The factories are going to stand pat and force the dealers to put it over at to-day's market. The dealers won't and can't.

"I've been in the game since 1902, and believe that I know some of the things that are wrong with it. I have gotten factory men to admit them, but they won't see the light and break away from customs.

"The crying need of the motorcycle industry is and always has been distribution. . . . this limited and fluctuating distribution is due to two things:

1. Refusal of manufacturers to produce a popular type of machine in volume.
2. The slow progress made, either in educating the low grade type dealer who predominates in the retail field or in replacing him with a better type of merchant.

"The motorcycle business needs a Ford or a Dodge; someone who appreciates the one model, volume and low price. They don't know the meaning of the word volume when they are content with 25,000 machines a year as a maximum; nor of the term 'popular price,' when they are charging $490 and $650. They don't know the meaning of the word 'standardization' when the big fellows are trying to build models to please everybody and get the other fellow's share as well as their own.

"The first necessity is a radical change in manufacturing policies, but I am convinced that this will not come from within the industry. It will have to be an outsider who comes in with an open mind, disregards the past and starts production on the type of machine the public wants, at a price which will appeal."

This from a man who has been in contact with the industry for 19 years as a department head in a large factory, as a member of a dealer organization, and as a constant motorcycle rider. It contains much that is worth thinking about.

The man who made these statements is wrong in implying that the present manufacturers do not have an open mind. There is probably no group of men who are striving more diligently toward the goal of achievement than the executives of the various motorcycle companies. It is with the idea of presenting some frank criticism to this open-minded group that this article has been written. To a group of any other kind, such criticism would be useless.

An analysis of the entire situation, however, would lead to the belief that there is a call in the United States for a lighter, cheaper motorcycle, merchandised in a progressive and intelligent manner, the bad traditions of the industry being ruthlessly thrown away and the good traditions carried forward with renewed vigor. A summary brings out several important needs for the immediate future developments of the motorcycle industry:

1. A careful, open-minded analysis of the broader possibilities for permanent progress.
2. Active co-operative effort on the part of all manufacturers together for the betterment and promotion of the industry as a whole.
3. Definite and immediate action in regard to raising dealer personnel, radical if necessary.
4. Intensive effort in the development of new sales fields, and care not to allow the traditional sporting and racing features of the industry to overshadow possibilities for future development in a manner out of proportion to their true importance.
5. A serious consideration of sales possibilities of a light-weight machine for general personal transportation purposes; and the production of a machine at a cost low enough to appeal to the man desiring such transportation but not financially able to pay for either a Ford or the present heavy or middleweight motorcycle.
6. The encouragement by manufacturers of frank constructive criticism by the motorcycle trade press; thus allowing the various companies to gain the benefit of candid suggestions from those in a position to view the industry as a whole.

This article has consciously refrained from discussing in detail the many good features of the motorcycle industry and the numerous constructive efforts which are being made within the industry for its betterment. These things are present in abundance. The article has assumed this and constitutes merely a friendly attempt to examine from an outside, though related, viewpoint the interested onlooker's analysis of the present status of the motorcycle industry. The purpose has been to criticize in a helpful way, but not to disparage in any sense the many constructive agencies now at work within the industry.

ONE of the speakers on tractor subjects at the recent Columbus show said that a life of 7½ years of 45 working days can be conservatively figured on in connection with farm tractors, making the total active life of the tractor 337 days. The annual depreciation charge, therefore, is about 14 per cent of the cost price. In addition 4 per cent should be allowed for repairs.

The FORUM

Kinship of Aircraft and Automotive Industries

Editor AUTOMOTIVE INDUSTRIES:

I think all of us who attend meetings of the S. A. E. are always vividly impressed while attending them with the close inter-relationship between all branches of the automotive industry. I also fear that as the memory of these gatherings becomes more dim that very important impression does likewise. Therefore, I think that a good technical publication like AUTOMOTIVE INDUSTRIES is doing a real favor to all of us when it comes around with a reminder that we all belong in the internal combustion family.

At last winter's session there were a few of these impressions that I determined not to forget. One was that I am interested in fuel, that I wanted to attend the fuel session, that I could not attend it because of simultaneous meetings on other subjects, and that I must read the proceedings of the fuel session. I also was equally impressed with the fact that fuel men should attend the aeronautical session and if simultaneous meetings made it impracticable they should read what we did. To further illustrate this inter-relationship, let me recall the statement of a well known automobile engineer who sat next to me during the general meeting. "Of course I am interested in aeronautics, especially in the engines," he said. "The designers of aviation engines are doing things all the time that I ought to know about, and I am equally sure that a lot of the research work going on in the other branches of the industry would be of real value to the designers of aircraft engines. The same is true of airplane engineers and chassis and body builders—not that a body builder can work directly from a plane design, but there is a lot of detail research work which should be of real use to him." Another engineer, who was listening to the above conversation, remarked that he was attending the aeronautic session because some day he might be building aviation engines himself, and it is a fact that it is the belief of some of the best engineering minds in the world that co-operative thought will lead to the best development and that there is every reason to think that the automobile industry itself may be very directly affected to its advantage by the development of aircraft, especially along commercial lines.

Later on, outside, we discussed this same question and the consensus seemed to be that many members of the S.A.E. hardly realize the really intimate relation between flying and the automobile. Aircraft will never take the place of the automobile, but there will grow to be a more and more intimate relation as time goes on and it is certainly to be hoped that the automobile engineers as they go back to their own work will not forget all about the youngest member of the family, because some day they may have to go into partnership with him. Builders of automotive apparatus are very short-sighted if they do not realize that the time will come, and that sooner than many of them think, when there will be a great passenger and fast express service by lighter or heavier than aircraft. As an analogy, one famous builder of carriage bodies has said that as early as 1898 he began to work on designs for automobile bodies and he certainly profited by his farsightedness. In the same way we all know how some of the great bicycle manufacturers were interested in the automobile game and one at least of these men devoted a great deal of his time and energy to good roads campaigns, not only on account of his bicycle business, but also because of his farsightedness in looking ahead to the time when the automobile's popularity would depend on good roads. Many men at that time, and some of them even own up to it now, thought that these manufacturers were almost insane when they began to play with what was thought to be at that time a toy—"the horseless carriage." Yet to-day the proportion of carriage bodies built is very small indeed compared with the automobile bodies turned out. Those who remember far enough back can trace the development of some of the great automobile concerns of to-day from the experiments of those early pioneers in the bicycle business.

A great number of automobile concerns became interested in aeronautics during the war, but almost all of these have at the present time apparently dropped all thought of aeronautics, and, while no one can believe that aviation is the panacea for all transportation evils, still the automobile engineer whose thoughts trend along aeronautic lines and who keeps in touch with the game as it is to-day, and who goes further than that and does a certain amount of research and perhaps experimentation is laying the foundation for the future which will well repay his foresight.

The great basic difficulty now is the lack of any Federal control of construction and of flying in the United States. There are no great number of real landing fields, but given the proper legislation to prevent freaks from injuring the development of the industry and unsound fliers from injuring themselves and others, landing fields will come and the aeronautical industry will develop like a plant in good soil which is properly cared for. The automotive industry at large can be of the utmost assistance to aeronautics by lending its powerful influence to the solving of the basic problem of legislation, and to quite as great an extent by giving its thought toward the solution of the many technical problems which confront the art to-day. Many of these technical problems could have real light thrown on them by their being attacked from the entirely outside and fresh viewpoint of men who have not been so close to the industry that they have difficulty in viewing the matter as a whole. Experimental work may be considered too great an expense. If so, an automotive concern might do two things: (1) conduct the experimental work on paper, or (2) induce the Government to bear the expense. In several instances (all too few as a matter of fact), the Government has let contracts to the automotive industry to build experimental jobs, though most work of this type is conducted at McCook Field in Dayton. With the entire industry interested in aeronautics more of this work undoubtedly would be placed with the industry. The automotive industry had, before this country got into the war, a few men who were farsighted enough to see the tremendous benefit this industry could be to aircraft as a whole should the emergency arise and when

this country did get into the war it had to call on the whole industry. If it had not been for the automotive industry this country would have been in a particularly helpless condition, so far as aircraft went, and although it is to be definitely hoped that should we have to go to war again the aeronautical industry will be sufficiently on its feet to give a good account of itself, undoubtedly more or less help would have to be obtained from the great automobile and body building plants.

Therefore it behooves the industry at large to keep an eye on aeronautics and to keep itself in a position where, if the emergency arose, there could be an instant response which would give this country a strength potentially and actually which it could not otherwise have.

This whole thought goes back fundamentally to the basic idea of the industry—the whole automotive industry is one family—the internal combustion group, and, while it is impossible to tell at the present time where the family is going to, it is certainly on its way.

JOHN R. CAUTLEY.

Passenger Car Displacement Per Ton-Foot Basis

Editor AUTOMOTIVE INDUSTRIES:

Your article in the March 3rd issue of the AUTOMOTIVE INDUSTRIES is the best exposition of the subject that has ever been presented and, covering as it does practically all passenger cars, is of very great importance and enables a fair comparison to be made of the ability and merits of all the cars.

In the classification that appeared in your Statistical Number, and which also was very complete as regards the details generally, there was lacking the total weight and the pay load or live load that are necessary for making a comparison of the merits of the various cars, and you have now worked these out on a basis fair to all the makers and in a form that can be seen at a glance.

Might I suggest that a similar procedure be followed with reference to the classification of gasoline trucks that also appear in your Statistical Number, so that similar knowledge can be gained with regard to the motor trucks? There are so many of these (over 500), I appreciate this may be quite a task, but this condition might be met in part by taking say, 100 to 200 of the leading makes and comparing these, as they would probably represent the entire number, most of which are in small production.

In this connection, also, the live load or **rated pay load** should be given for each truck, and the displacement per ton-foot should also be given on the basis of **pay load** as this is what is wanted in the final analysis. There is no other means of knowing whether the pay load is 20 or 50 per cent of the total weight. This pay load varies greatly in the various trucks, and in a tabulation comprising 219 trucks, which was recently shown me, the pay load ran from 18 to 50 per cent and therefore the user had no means of knowing whether he was carrying around 5 pounds of dead load to one pound of pay load or 2 pounds of dead load to 1 pound of pay load (which greatly affects the efficiency of the trucks).

Reverting now to the table on page 495, the final analysis should be on the pay load or live load and based on the 150 lbs. per passenger that you have assumed. The first car given in your list carries only 4 passengers or 600 lbs. pay load for 4670 lbs. total weight or, say, 12.9 per cent pay load; therefore, the cubic inch displacement per ton-foot pay load becomes 192; further, for the last car in your table, Piedmont 4-30, carrying 34 per cent pay load, it becomes 138, and, similarly, for the Ford, carrying 31.8 per cent pay load, it becomes 110. Of course, I recognize that it is not quite fair to compare the lightest and the heaviest cars, and in order to make a fair comparison these cars, which are generally spoken of as light, medium or heavy, should be compared in their various classes and as a basis of comparison it is suggested that these might be classified on their loaded weights as follows:

Light	Medium	Heavy
Under 3000 lbs.	3001-4400 lbs.	4401-8800 lbs.

On this basis we get the following results:

LIGHT WEIGHT CARS

*Correction: In figuring the original table from which this tabulation is made the displacement of the Brewster engine was given as 376.5 instead of 276.5 cu. in. the correct figure, due to a typographical error. This makes the displacement per ton-ft. 29.2 cu. in. instead of 39.4 the figure originally given.—Editor.

By taking the highest efficiency in each class as unity (1.00) the relative efficiencies can at once be compared and the importance of the percentage of live load becomes apparent and generally the higher this pay load percentage the more economical the car, but it does not always work out that the lightest car is the most economical.

As regards the cubic in displacement per ton foot, no account is taken of the relative economies of the different engines, and this result may be attained very much more economically in one car than in the other, so that the real economy in gasoline per mile may be very much different than that indicated in your table. Take the Franklin car, for instance, which is at the very top of your table; it is claimed, and presumably admitted, that this car gives a very high mileage per gallon of gasoline and in the above table giving the relative economies it does not work out very well and shows 179 per foot-ton of pay load although its weight is quite low.

With reference to your comparison with the small Fiat car, is it exactly fair to compare this with the average American car? This car is lighter than the Ford and really belongs in the light car class, but as regards cubic inch displacement per ton-foot it does not show up as well as the first two at the head of your list. You do not state the number of passengers carried but I understand this car is designed for four passengers or 600 lbs. and on this assumption the pay load is 28 per cent, giving an efficiency of 98 as compared with 110 for the Ford.

In making all the comparisons it must be borne in mind that in all the larger and refined cars weight per se is not the consideration but riding and other qualities.

Medium Weight Cars: The weight given for the Buick car is wrong and should be 3750 lbs. and not 2700 lbs. The weight of the Oldsmobile car is 3450 lbs. and not 3900 lbs.

Heavy Weight Cars: The weight of the Brewster car is 4450 lbs. and not 4850 lbs. as given in your table.

W. J. P. MOORE.

In determining the cu. in. piston displacement per ton-ft. for the different makes of passenger cars we did not intend it as a figure of merit or of efficiency, because as applied to automobiles these terms have a very vague meaning. The index figures given in Mr. Moore's table are not correctly termed relative efficiency. They are the ratios obtained by dividing the displacement per ton-ft. pay load of each car by the lowest displacement per ton-ft. pay load of any car in the same weight class.

Our object in preparing the original table was to show what is being done by engineers in powering their cars or in making a compromise between the requirement of fuel economy on the one hand and high acceleration on the other.

While the ratio of pay load to total load has a great influence on the economy of a car on the passenger-mile cost basis, combining this figure with the cu. in. per ton-ft. confounds two quite different things. Of course, the economy of the car as a transportation unit should bear a close relation to the index figure calculated by Mr. Moore.

We doubt whether there would be much value in a table showing the cu. in. displacement per pay ton-ft. of different trucks, for the reason that the rated load capacity of a truck is an arbitrary figure. To illustrate what we mean, let us say that a certain truck has been sold for a number of years as a 2-ton. Now competition becomes exceedingly keen and the manufacturer believes he can "get away with" a 2½ ton rating, so he announces the truck as a 2½ ton model. This would greatly increase Mr. Moore's efficiency figure for the truck but it would not add one iota to its real merit.

In making the comparison with the Fiat small car it was not our idea to show that this car was superior to American cars generally. We reasoned that inasmuch as gasoline is exceedingly expensive in Italy and this is a very small car and therefore undoubtedly designed for economical operation, the powering (that is, the cu. in. per ton-ft.) is probably as low as considered possible in a practical machine by the designers, and that the figure arrived at for this car therefore constitutes apparently the limit beyond which it is impractical to go in seeking for economy.

The weight figures were those given us by the manufacturers with the passenger weight added by us. We requested the manufacturers to give us the weight of the car in running condition with tanks full. As long as the displacement figure is reduced to 4, the unit of total weight of car and load, it makes very little difference whether the passenger weight is assumed to be 150 or 200 lbs.—Editor.

IN a review of the recently issued volume, "How to Keep Invention Records," in AUTOMOTIVE INDUSTRIES for Jan. 27, the name of the author was inadvertently omitted. The book was written by Harry A. Toulmin, Jr., J.D., Litt.D., a patent attorney. The introduction is by James T. Newton, former U. S. Commissioner of Patents. The volume is published by D. Appleton & Co.

IN a recent paper read before the graduates section of the Institution of Automobile Engineers the statement was made that it was quite useless to drill the oil scoops at the bottom of the connecting rods, as the centrifugal force was so much greater than the inertia force that no oil could possibly be thrown up on to the pin from the scoop. The scoop was to create an oil mist.

Exported Cars Are Making Market for Parts and Equipment

Increased trade, due to pioneer sales, is making itself apparent in the monthly reports of sales to the various countries of the world. The January figures illustrate this point by totals that run well over previous figures. Increased business in both pneumatic and solid tires. British hope to regain New Zealand motor trade.

THE thousands of automotive vehicles—cars, trucks and tractors—exported from the United States in 1920, as well as those of previous years, are making excellent markets for equipment and accessories in all countries of the world. That is nowhere more strikingly shown than by the export figures from this country for the month of January, the last for which official totals are obtainable. These show that the foreign shipments for that month were 136 per cent of the monthly averages for 1920 and 208 per cent of the business that was done in the same lines in January, 1920. The respective figures are:

Parts and equipment exports in January, 1921	$9,679,295
Parts and equipment exports in January, 1920	4,649,192
Parts and equipment exports monthly average twelve months of 1920	7,113,507

The significance of this to the manufacturer and exporter is that the cars and trucks sold last year are needing equipment. These cars, as in the United States, were put to work when they were sold in Asia, Africa, Latin-America, Australia, Europe and elsewhere. When the business depression came, they were not scrapped, regardless of what may have happened to the saie of new vehicles. They were kept running and to-day they are in need of spark plugs, windshields, magnetos, covers, pistons, piston rings, horns, lamps, batteries and all that class of automotive parts which must be replaced from time to time.

Tires make up another item which should be included in this list. They are not, however, shown in the tabulation just given. But exporters and tire manufacturers report increased business on both pneumatics and solids. This is natural, when it is remembered that more than 142,500 passenger cars and 29,000 motor trucks (as well as 24,000 motor cycles) were shipped from the United States to various foreign countries last year and that, in addition, thousands of other cars and trucks were built during the year in the branches maintained by Henry Ford in Canada, Argentina, Brazil, England, Spain, France and Denmark which do not show in the export statistics but which require American equipment.

A tabulation of the leading countries in the January parts exports, not including tires and engines, shows the following to have been the leading countries:

England	$2,617,307	Australia	$194,819
Argentina	1,610,061	Brazil	170,069
Denmark	844,353	New Zealand	130,031
France	758,624	Philippines	109,550
Canada	729,706	British South Africa	87,588
Spain	370,393	Chile	62,677
Mexico	243,597	Uruguay	61,396
Dutch East Indies	239,372	Peru	53,751
Cuba	222,546		

New Zealand Problems

THE Wellington, New Zealand, correspondent of the London *Times*, in a lengthy survey of the local motor trade, discusses factors that are handicapping the development of the trade. Summarized these factors are:

Reduced price for wool, uncertainty in trade generally, unfavorable attitude of the banks toward the motor trade in particular—apparently the bankers regard the trade as almost wholly a pleasure giving, joy riding business—and the unfavorable rate of exchange. He thinks that the British and the European car makers are likely to recover the market, but points out that manufacturers who wish to increase their standing in this market will need to be familiar with the character and varying conditions of New Zealand roads, and that gasoline is not only dear but at times scarce. In effect these two conditions emphasize the need for gasoline economy, a light tare and big tires.

Another point noted by the New Zealand writer is that the trend is toward heavier and larger capacity motor trucks, which are found to stand up better under the road and local usage conditions.

Suggestions As To India

THE British Trade Commissioner in India, T. M. Ainscough, recently offered the following suggestions to the British motor trade for working the Indian market. He advised that branches be opened in Calcutta, Bombay, Madras and Lahore, each furnished with a stock of chassis and spare parts and a well equipped garage and workshop for the execution of all repairs and body-building. Each depot should be staffed by an experienced sales manager, three or four European mechanics, trained in the home factory, and two good touring salesmen. In addition agents should be appointed in Cawnpore, Allahabad, Rawalpindi, Peshawar, Delhi, Bangalore, Nagpur and Rangoon.

An alternative method recommended is the nomination of one of the well-known motor importers as representative in India, or the appointment of a good house in each center. The maker should also send out a few salesmen and half a dozen mechanics.

With regard to the types of vehicle for which there is likely to be an increasing sale, trucks merit first attention. Light trucks for merchandise service in and around cities are in demand, and would sell in greater numbers if transport companies were organized. Their use for mail collection is likely to grow.

Of heavy trucks, the prospects for sales are considered excellent. Their use in transport between the plains and the hill stations is growing, and municipalities are large

buyers. On the cotton plantations trucks are replacing the bullock cart. It is thought that they will be brought into extended use as feeders for the railways and may supersede the light line.

Notes On Swedish Trade

IN an article contributed to a recent number of the *Swedish-American Trade Journal*, S. A. G. Swenson contributes some very interesting facts concerning the trade in Scandinavia. Swenson, according to an identification note, has been active in establishing dealer outlets for American cars in Northern Europe.

He reviews briefly the boom in the automotive trade following the armistice and says that the orderly progress of this trade was somewhat interfered with because the Germans offered some cars and trucks there at low prices. Then he says:

"Several companies in Scandinavia are now under 're-construction.' However, the old established real dealers and a few new ones who knew the business and stuck to it have not been much affected by the present readjustment; they are well established, have good lines to sell, and know how to market them. Some dealers, though, have heavy stocks being carried over the winter and naturally do not want to contract for this year.

"Sweden imported 9061 automobiles, valued at 54,200,000 kronor, from all countries during January-November, 1920. In the corresponding period of 1919 the number was 2440, valued at 12,500,000 krona. The United States exported during the eleven months of 1920 5294 cars to Sweden, valued at $6,643,617, while Norway and Denmark took 3182 and 1074 respectively."

Swenson then lists 51 American passenger cars that he knows were being sold in Sweden with 24 European cars. As to Swedish made vehicles he says:

"The Scania-Vabis, made by the Scania-Vabis Co., is a Swedish product. This company, however, specializes more in high-grade motor trucks. Another Swedish car, the T. V., in the light class, is manufactured by the Thulin Works, with a present output of one car per day. This company also planned to produce the T. V. motorcycle."

In discussing trade methods, Swenson says:

"With regard to export houses, it is true that a manufacturer can have advantage of operating through such a distributor, as he should thus be assured of immediate payment and relieved of a great deal of responsibility in connection with service, and furthermore, one can expect that the export house should be better posted on foreign conditions by having representatives stationed abroad, but unless the export house has a financial interest in the foreign firm the method is impractical, and it is evident that dealers on the other side have become skeptical of export middlemen and prefer direct factory connections.

"The Swedish territory is in some cases handled from Copenhagen or Christiania. With due respect to the Danish and Norwegian merchant it must be said that it is not wise to place an agency for Sweden with a dealer domiciled in either city. Scandinavia is a name for three separate states and Sweden is, by the way, the largest and uses the most motor cars.

"As an example we may mention that the Norwegian, Swedish and Finnish agency for a well-known French car was given to a firm in Christiania. The reverse procedure is not entirely satisfactory either. For example, a light American car is handled for the whole of Scandinavia by a dealer in a provincial town in Northern Sweden. Most of the large dealers have as much as they can handle, and it is good business ethics to help the small dealers, but it would be better for the manufacturers to have such agents act as dealers for their respective countries. Arrangements of this kind have sometimes been made because the manufacturer did not find better connections, but in the majority of cases he was ignorant of the market, or did not care because his ability to deliver cars was limited.

"The Norwegian market is smaller than that of Sweden, but it is a fact that Norway is more aggressive than Sweden in the matter of good American products. The cars one sees in Christiania are practically all American. It is interesting to compare the automobile lines introduced in Sweden with those in Norway and Denmark. There are approximately 50 American and 25 European lines in Sweden, of which about 26 American and 3 European are also represented in Norway, and 33 and 10 respectively in Denmark. On the other hand, Norway and Denmark have certain lines that are not handled by Swedish dealers, namely Norway 15 American and 7 European, and Denmark 10 American and as many as 35 European."

Spark Plugs In Argentine

AN estimate is made by Vice Consul Harold C. Waters, of Buenos Aires, that 600,000 spark plugs are sold annually in the Argentine Republic, and he believes that at least 75 per cent of them are of American manufacture. This coincides with an estimate of 75 per cent, by Consul Ezra M. Lawton, of Sao Paulo, Brazil, as being the percentage of American made plugs sold in Brazil.

The Argentine market, however, is being entered by an increasingly large number of European manufacturers, who have recently brought in the following brands: German, Bosch; English, Lodge and Hobson; French, Oleo-Magneto, Pognon, Apollo, and Hauquaire. The foreign brands are made only in metric dimensions, whereas many American makers sell both the standard American and the metric sizes. Both Consul Waters and Consul Lawton agree that the more satisfactory manner of packing is to have each plug in a separate cardboard box.

Foreign Trade Financing Fund

WITH regard to the effort being made to finance The Foreign Trade Financing Corp., automotive manufacturers should always keep in mind that it is the intention of the heads of this corporation to assign this money to use according to the source. Thus, if the automotive industry is a large subscriber to the stock of the corporation it will have a large share of the available funds placed at its disposal. The sale of stock is said to be progressing at a satisfactory rate.

Red Sea District

THE possibilities of automobile sales in the Red Sea commercial district, of which Aden, Arabia, is the center, is discussed by Addison E. Southard, American consul at Aden, in the Feb. 21 report of the Bureau of Foreign and Domestic Commerce. "The Aden Red Sea district may be considered as having immediate possibilities as a limited market for motor vehicles," the Consul declares.

Tractor Future In Australia

AN Australian correspondent in an article emphasizing the need for suitable settlers in Australia chiefly as a measure of protecting the British Empire, states that of 200,000,000 acres of arable land, only 12,500,000 are being cultivated. The fact suggests an immense scope for tractors and power farming plant, which Great Britain cannot possibly meet under present conditions of tractor enterprise; the Austin and Fordson outputs being the only ones of any numerical value.

The Trend Toward Decentralization in Organization

The trend toward decentralization may become as much of a fetish as did centralization some years ago. The minimum amount of system necessary to prevent confusion is probably the ideal. Upon the intelligence of the individual depends largely the amount of system necessary.

By Harry Tipper

SOME of the industrial engineers who have been engaged upon meeting the problems arising out of production in a good many different lines of industry are beginning to talk of the necessity of decentralizing in the large industrial organizations, in order to secure the progress in effective work which must be secured in the future. They contend that we have established so many special departments for the general standardization of system within the plant, and so much overhead organization has been created through this development, that too much responsibility has been taken away from the foreman and the sub-foreman. We have attempted to reduce the necessity for the individual judgment of the foreman in order to provide a system which would facilitate mass operation without confusion.

In doing this some of the engineers contend that we have gone too far in that direction, and that we should give the foreman a larger opportunity to control his own department. By these means they expect to render the system more flexible, to improve the executive capacity of the foreman and to reduce the overhead by simplifying the special departmental requirements.

The value of this contention cannot be practically determined at the present time, because experiments in decentralizing have not been carried sufficiently far to make any conclusions permissible. It is quite possible, however, to centralize so much in the hands of special departments that the efficiency is not increased by the increase in specialization. There may be a drop in efficiency due to the tendency for all such departments to enlarge their own technique and their own technical detail, without any thorough understanding of the value of that technique to the general establishment.

We are wise enough to know that the possibility of human error requires a tolerance allowance in the actual production work, but we do not always follow the same precedent in dealing with system and methods of operation.

Not long ago I was consulted about a proposed change in the system of operating one of the special departments of a fair-sized plant. It seemed that some errors were discovered in the operation of the system and the changes were intended to remove those errors. A little examination showed that the total number of errors discovered represented less than one per cent in proportion to the total operations of the department. The changes in the system meant an addition of five people to the personnel of the department.

Five more people meant an additional possibility of the human error, because every new motion necessary in the conduct of the system added a new possibility of error in each motion to be made. Unless the new checks and balances would remove a large proportion of the original errors established, the addition of more system could be expected to lessen the efficiency, because it increased the number of places where error could creep in and the number of motions where a mistake could be made.

Under the circumstances, my judgment was that the changes in the system were unwarranted by the conditions; that they would bring no observable improvement in accuracy; and that they would probably lead to a decrease in accuracy due to the larger possibility of human failure.

In an establishment with which I was well acquainted some years ago, the manager of one of the special departments became so interested in securing accuracy of records and conditions, that his department was enlarged with great rapidity in order to analyze the items, check the conditions and balance the results. After a number of years, a change was made in the management of that department. The new manager operated with 50 per cent of the personnel and the observable errors were not increased by this reduction of the system.

The first manager had become so interested in securing accuracy for the sake of securing it, he had forgotten that an unusual degree of analysis in his department could not have any bearing upon the total result because the extra accuracy secured in that department was lost in the relative approximation required in the work of other branches of the operation.

We are constantly referring to the red tape which surrounds the governmental departments, which makes it so difficult to do business with any satisfaction. These governmental departments are limited by the laws, precedents and rules which have been established from time to time for the protection of the public, for the definition of responsibility or for the extension of the system. While it is not visible to the same degree, there is a tendency for the system in its detailed technique to evolve a lot of unnecessary motions in many of the special departments in the large industrial establishments in this country. This leads to a bureaucratic condition, within the departments themselves, and the elevation of a rule to a principle so that it cannot be disturbed and must travel its accustomed way, whether that method answers the purpose most effectively or not.

Some of these things had been observed by intelligent engineers in their study of plans under different conditions and with different operations, and they have led to the talk about decentralization which threatens to become as much of a fetish as centralization did some years ago.

The minimum amount of system necessary to prevent confusion is probably the ideal amount of system. The practical amount of system is dependent upon the measure of intelligent understanding possessed by all supervisors. If we are willing to spend the necessary time and effort to educate supervisors, instead of obliging them to educate themselves in the inefficient and fragmentary way in which this education must be secured, we will be able to give all supervisors a larger measure of responsibility, simplify the work of the special departments without losing any of the required standardization.

The present tendency to inflexible routine in the special departments would be eliminated or reduced, because it would be checked constantly by the practical understanding of the supervisor who was permitted to exercise his responsibility in connection with it. Mostly, the human errors are due to lack of interest and misunderstanding, and no system based upon these deficiencies will eliminate the errors. Systems, which run wild in their accumulation of technical detail for the purpose of eliminating error, are quite likely to enlarge it and to add to the cost burden under which the establishment labors.

For a considerable time we have paid some attention to training the skilled worker in his job, and a lot of time and thought has been given to the education of the salesman and the office force. It will pay us to spend some time on the education of the men responsible for production, and we should be able to eliminate a lot of cumbersome special systems when we have been at that work for a reasonable period.

The development of theoretical education along with practical education for the foreman, which has been taking place in the last year or two, is an excellent sign. No development is more greatly needed in the improvement of production efficiency. It will be accelerated if we study the systems we at present employ, find out from the foreman and the other supervisors the difficulties and troubles which arise out of these systems and take into serious consideration the question of simplifying them by permitting the supervisors a larger degree of responsibility in connection with them.

Instincts and Incentives

THERE are various instincts which make men work. There is often a more or less direct relation between the instinct which motivates the worker and the quality and quantity of work produced. This fact should be more generally recognized, since its importance increases directly in proportion to the length of time over which it operates.

In other words, fear of losing his job may drive a man to extended effort for a short period of time, but if no other incentive to work is ever provided, other instincts, such as hate and distrustfulness, come into play and are almost sure to overcome the fear of losing his job. The growth of these other instincts among many individuals combine to produce industrial inefficiency and in the long run industrial chaos.

What little data is available as the result of experiments tends to show that men urged by the better instincts of pride in workmanship, ambition and desire for service, as well as by desire for money and fear of unemployment, will produce work of greater quality and quantity over any considerable period of time.

All these factors should be considered when discussing the matter of better workmanship and the providing of incentives. A recent pamphlet published by the Cleveland Chamber of Commerce entitled "Employees' Incentive Plans in Cleveland Industries" divides the plans discussed into four classifications: profit sharing plans, limited profit sharing plans, bonus plans and stock sales plans.

Examination of this classification brings out the fact that every one of these incentives appeals to a single instinct, the instinct for monetary gain. It is undoubtedly true that an appeal to this instinct is likely to play an important part in many successful incentive plans. But it is significant that all the plans noted appeal almost entirely to this instinct. The term "incentive plan" must be supposed to have a very narrow definition if it is to refer only to money incentives.

A broader interpretation of the term is necessary and a wider group of instincts need to be considered if permanent progress is to be made along these lines. And it is very desirable that the study necessary to such progress be pushed forward as rapidly as conditions permit.

Commercial Vehicles of Great Britain

A COPY of the second edition of a book of specifications of British commercial motor vehicles, published by the B. F. Goodrich Co., Ltd., of London, under date of 1920, has just come to hand. Specifications of forty-four different makes of vehicles are given, including trucks, tractors and sight-seeing buses as well as vehicles of all three motive powers. There are articles on A Standard System for Recording the Operating Costs of Commercial Vehicles, Lengthening the Life of a Motor Vehicle and Relation of Tire Equipment to Cost of Maintenance of Commercial Motor Vehicles. Besides the book contains useful information on British tire standards, British commercial vehicle associations, etc.

Government and Business

THE announced theme of the Ninth Annual Meeting of the Chamber of Commerce of the United States indicates that the meeting will be an interesting and profitable one. The theme is:

"In the public interest; more business methods in business, less government management of business."

The advance notice of this meeting states that all questions to be brought before the meeting will be approached as they relate to the general theme. If this program is carefully and intelligently followed, the gathering of business men at Atlantic City April 27 to 29 should do much to solve many of the minor, but perplexing troubles of business. There is and must be such an intimate connection between government and business, especially while heavy taxes are necessary to clear up the war expenses, that almost any new undertaking is considered from this point of view.

Many business men are hopeful that the present administration will take long steps toward injecting the business idea into government. This hope has been increased by the news that Secretary of Commerce Hoover is consulting frequently and frankly with business men. He is hearing the views of men who are successful in private business and is letting them pass on his ideas. It goes without saying that these men will reach a common idea in these meetings, for both sides are approaching the questions with a view of being mutually helpful. The annual meeting of the Chamber of Commerce should do much to promote the work that Secretary Hoover is endeavoring to carry out.

Then, too, if the business men and the government departments can agree on a few fundamentals, and each is led to see the troubles of the other, there will be less antagonism over details.

Annual Working Days of Farm Tractors

MANY of the farmers who purchase tractors do not at once dispose of the number of horses that the tractor should be able to displace. The tractor is something new to them, largely of the nature of an experiment, and they decide that they will feel their way slowly and not take any unnecessary risks. The loss of any considerable part of his crop is a serious matter to the average farmer, and as he is not quite sure of his tractor and of himself as a tractor operator he holds onto most of his horses for the first year at least. The result is that the tractor does not prove as economical as it otherwise would.

For some classes of work the tractor is so obviously superior to the horse that most or all of it is done with it right away. This applies particularly to plowing. After a farmer has once plowed at the rate of 8 acres or more a day, the old rate of 2 to 2½ acres seems exceedingly slow. But for other lines of work the tractor is not visibly better than the horse, and as long as horses are kept on the farm in any numbers they will be used for this work. To judge from a report recently issued by the U. S. Department of Agriculture, this applies particularly to haying, for whereas 85 per cent of all the plowing on the farms covered by the report was done by the tractors, only 15 per cent of the hay loading and hauling was so done. The low efficiency the tractor showed in hauling hay on wagons is readily understood, because in drawing a load of hay the tractor is giving only a small fraction of its maximum useful output. But in order to make the tractor an economical investment, all of the work for which horses are usually required should be done by motor power so that horses can be dispensed with.

It is rather remarkable that the investigation, which covered 286 farms in Ohio, Indiana and Illinois with an average area of 258 acres, showed an average annual use of only 30.8 full days per tractor. Some years ago it was figured that the average number of days use per year was close to 50, while at the Columbus tractor show one of the speakers mentioned 45 days. It would seem that on the farms in-

vestigated there was altogether too much equipment for the work to be done, which cut down the amount of work for the tractor, and hence its economy.

In making this statement we are not finding fault with the report, the natural object of which was to present conditions as they actually existed. The trouble is that, for one reason or another, the farmers found it impossible to dispense with a considerable number of horses and that owing to the existence of both the horse and the power equipment the annual working time of both was undoubtedly very low.

It is rather remarkable that only 2.7 full days of belt work was done annually by each tractor. It ought to be an easy matter to find much more belt work than this. The solution of the power farming problem lies in rendering the equipment adaptable for the multitudinous classes of work that require to be done on the farm, thus eliminating the cost of horse maintenance and reducing the periods of idleness of the expensive power equipment.

Better Springs for Light Loads

ONE factor frequently commented upon in connection with passenger-carrying vehicles relates to the fact that they are almost universally hard riding under light loads. It is necessary, of course, to fit to any such vehicle springs having sufficient capacity to carry a full complement of passengers, even under adverse road conditions, with the result that when the same vehicle is only partly loaded the riding qualities are much less satisfactory. This is espepecially noticeable in the case of a bus when such vehicle carries only a few of the total number of passengers for which seats are provided, particularly when, as is usually the case, rather poor cushion springs are provided.

During the past few years many unconventional types of springs have been suggested which are designed to overcome this fault, but so far as we recall none of these have proved sufficiently satisfactory from every standpoint to see any extensive commercial application. So the problem is still with us.

Spring suspension is one feature of chassis design which has perhaps received more study than any other one item outside the engine and its accessories, yet there is still room for great improvement. The theory of spring action is well developed, but it still remains to design springs which are entirely satisfactory under all conditions of service. The problem is not an easy one, but the reward for its solution should be great enough to encourage those who are sufficiently persistent in work to this end.

Highway Transportation

UNTIL the many industries that use the highways, either in the transportation over them of their raw material, partly manufactured or finished products, realize the relationship of their industry to the highway problem it is not to be expected that transportation development will go ahead as it should.

The highway problem to-day is more than one of road construction and maintenance, it is one of the proper use of the highway and streets of our cities; it involves not only the highway but our railway and waterway termini in relation to these highways and the most efficient methods of handling commodities over these highways.

Our highway problem is one that must be looked squarely in the face not only by motor car and motor truck manufacturers, but by railway executives, city governments, suburban trolley interests, waterway executives and every other executive with whom transportation is a problem. It is only by the broad consideration of it by all of these parties concerned that economic results will follow. The movement cannot be pushed by any one industry to the detriment of others. The broad policy of rendering to the railroads that which economically belongs to the railroads and to the highways that which economically belongs to highways, must be applied throughout to waterways, trolleys and, in time, to airways.

In the bringing together of these several interests, the Federal Highway Council has accomplished commendatory service. For the first time in the history of highway transportation large railway executives, large express company executives and large trolley and waterway executives have met with highway executives and traffic executives to work together in untangling the highway problem. Some disinterested organization of this character is the only kind in which all interests will agree to come together. It is to be hoped that the work already accomplished by these varying interests, meeting under the guidance of the Federal Highway Council, in connection with store door delivery will continue and that, when this needed movement is accomplished, the problem of the short haul will be as fearlessly considered by all parties concerned as has the store door delivery. No other organization, without strings tying it to some particular industry, is so well qualified to handle this work. There is every year a growing need for such a citizen organization. It is free from government domination. It is not obliged to answer any particular industry. It works with but one end in view, namely, the economics of highway transportation, construction and maintenance.

Floatless Carbureters

SOME engineers are of the opinion that the next step in carbureter development will be the elimination of the float mechanism. Several carbureters of this type are being marketed in Europe, and a few are offered by American manufacturers. Some of these have means for vacuum feed and thus make it unnecessary to use a separate vacuum tank or pressure fuel feeding system. There is thus eliminated in some cases two float mechanisms, which, though they are the cause of relatively little trouble in themselves, add extra parts which advocates of the floatless vacuum feed type maintain are superfluous, and therefore involve a needless expense. A device of some kind must, of course, be substituted for the float, and whether this will involve moving parts that are less reliable and less expensive than the float mechanism remains to be seen.

Unit Parts Makers in Service Plan

Stations Proposed to Cover Country

Complete Stocks for Assembled Cars to be Carried Within Easy Reach

DETROIT, March 22—Rapid progress has been made in the past few days by some of the leading unit parts manufacturers for the establishment of a nation-wide distribution system for parts for assembled cars and trucks. The plan is said to have the approval of some of the leading vehicle assemblers. Plans are rapidly being brought into workable form and a definite announcement is expected in the near future.

The entire subject was considered at a conference in New York last Friday, but many details remain to be worked out. Thirty major stations where standard unit parts can be obtained by distributers and dealers are in operation, but the plan calls for twice this number of major stations and as many sub-stations as may be needed to cover the country in such a way that no service shop will be more than six hours distant from the nearest parts depot.

The idea took nebular form in the minds of various parts and car manufacturers at about the same time, and was in recognition of the need for better servicing of automotive vehicles. There were differences of opinion as to how it should be worked out, and it was necessary to reconcile these opinions. This resulted in many informal meetings and in much missionary work. One of the leading engine manufacturers was the prime mover, and he now has associated with him some of the most prominent unit parts makers.

Consideration was given to the subject at a recent meeting in Chicago of the Motor Truck Manufacturers Association and there will be a conference here next week between committees representing the parts makers and the Motor Truck Sales Managers Association.

Will Carry $5,000,000 Stock

The depots will carry ultimately stocks of parts of eight unit manufacturers. It is estimated $5,000,000 will be invested when the system is in complete operation.

A nation-wide advertising campaign announcing the sale of genuine parts at prices which will eliminate the pirate is planned to stimulate demand for genuine parts and to acquaint the owner with the fact that they can be obtained at the same price or less from the depot maintained under the new system. The genuine replacement parts will bear the trade mark of the unit manufacturer.

There is a wide divergence of opinion among passenger car and truck manufacturers in regard to the merits of such a system. Some of them are in hearty accord with the movement and others are bitterly opposed to it.

Promotors of the venture contend that under this system it would be much less expensive to carry an adequate stock of parts and that it would give a tremendous stimulus to the sale of assembled vehicles. There is no idea of preventing manufacturers, distributers and dealers from carrying a stock of parts if they so desire.

Would Avoid Duplication

In behalf of the plan it is pointed out that under the present system many duplicate stocks are carried in each city, but in the case of smaller car and truck stations these stocks are often inadequate. Then, too, the lack of uniformity in profit percentages and charges, and varying distances between assembling factories and service stocks, results in wide divergence in prices on the same part in the same city. The aggregate stock carried in some of the cities is so large, yet so spread out, that it does not meet the real needs of many of the stations, and had proved so expensive that the overhead more than absorbs the profit, even when this profit seems to be unduly high.

The result is that pirate parts manufacturers and dealers can quite easily sell these parts for a mere fraction of the price asked by the dealer with the contract. Under the new plan, distribution would be unified so that a complete stock would be carried in one central

SOVIET GOVERNMENT BUYS SLOUGH TRUCKS

LONDON, March 21 (*Special Correspondence*) — The Russian Soviet Government is understood to have contracted with the Slough Trading Co. for the purchase of a large number of reconditioned trucks now stored at Slough. A very large proportion of these trucks are of American make and were sold by the War Department at the close of the war. It is reported that the Russian Government wants to buy several hundred, and since the trade agreement between Russia and Great Britain has been signed it is not expected any obstacles will be placed in the way of the transaction. The sale will help trade renewal and will stabilize the market value of several classes of motor trucks.

Importers Organize in Mexican Capital

Will Seek to Improve Methods of Car Importation, Distribution and Sale

NEW ORLEANS, March 21—Spanish newspapers of the city of Mexico received here to-day tell of the organization in the capital of the southern republic of the Mexican Association of Automobile Importers, embracing as active members all the firms engaged in this line in Mexico City, and as associate members about 78 per cent of the firms similarly engaged outside the capital. There are about a score of these firms in Mexico City, but the number in the other large cities of the country are not mentioned.

In its statement to the press, the "Associacion Mexicana de Importadores de Automoviles," to be known briefly as the "A. M. I. A.," gives the purposes of its organization as "to procure unity, harmony and better relations, both business and social, among the automobile importers of Mexico; to represent its members in all necessary action to obtain commercial advantages and legal protection; to improve methods of importation, distribution and sale of automobiles throughout Mexico, and to assist in the establishment of good roads in all parts of the republic."

Apparently the native newspapers of Mexico City are largely responsible for the organization of the association, as the first meeting was held in the offices of one of the papers, and was attended not only by all the automobile importers, but by the publishers of all the newspapers in Mexico City, and in several surrounding cities as well. Entrance fees of $250 (gold) for active members,

SEES CHEAP AIRPLANES SOON

BOSTON, March 18—Airplanes as cheap as automobiles were predicted by M. Luckiesh, director of applied science at the Nela Research Laboratory in Cleveland, who spoke at the Engineers' Club under the auspices of the American Institute of Electrical Engineers. He said this ought to come in five years.

PREPARE TO BUILD FORD DAM

TROY, N. Y., March 21—Engineers having in charge preliminary arrangements for the erection of Henry Ford's great tractor plant at the United States dam across the Hudson River here have arrived in this city and will begin active work excavating for the power plant as soon as the high water recedes.

Business Continues Upward Trend

General Conditions Show Improvement

National Response to Better Business Extends—Spring Weather Brings Cheer

NEW YORK, March 21—Reports from various sections of the country indicate a slow but gradual improvement in trade and industrial conditions in general. Excellent spring weather has broadened sales demand, both at wholesale and retail. The early spring has had much to do with the upward trend in automobile sales and it is partly seasonal.

Good weather has brought increased activity in farm work and plowing and planting are moving rapidly northward. This should improve the spirits of the farmers and make them a little more willing to buy. It probably is responsible for reports of better trade prospects in Kentucky, Minnesota, Missouri, Iowa and Texas. There are few districts, in fact, which report wholesale or retail trade as dull. In most sections it is classed as "fair."

It must be conceded, however, that while conditions are steadily improving, especially in the automotive trade, industry as a whole is lagging and that while unemployment is less widely diffused there are millions of workers who are idle. In this connection it is encouraging to note that unemployment is decreasing in the South and that several thousand men have gone back to work in Chattanooga, Louisville, New Orleans, Memphis, St. Louis and Atlanta.

It has been said that when the break in sales resistance came in the Northwest the worst would be over. The indications are that this condition soon is coming if it has not already arrived. Any sign of improvement in the South is significant for it has been felt it would take this section longest to go through the readjustment process. Although conditions there are getting better, it is too early to look for heavy sales. In this connection the Atlanta correspondent of AUTOMOTIVE INDUSTRIES says:

All Lines Found Improved

"Business is gradually getting back to normal in all lines but it has not yet recovered from the long period of depression. An intensive merchandising and sales campaign at this time doubtless would produce some results but postponement of that effort until conditions are more favorable, probably would be advisable. The condition of the cotton market always has much to do with the financial situation in the South. The present price still hovers around 10 cents a pound and with thousands of farmers holding last year's crop for higher prices they haven't the money with which to buy anything. Caution is advisable until it is known just how much the cotton acreage will be reduced this year. If there is a material cut it probably would be safe to make a hard drive for sales as higher priced cotton will be the inevitable result."

The central west seems to offer good sales opportunities at this time. The Milwaukee correspondent of AUTOMOTIVE INDUSTRIES wires:

Central West Reviving

"Knitting mills are running full time. Other factors in the clothing and dry goods business show rapid improvement. Further slight revival is noted in the steel industries. Merchants find money easier to get and a marked improvement is expected at once, with the income tax paying period past. Hotels report a revival of business, the first since December, and used car advertising brings a much improved response. Altogether the outlook is distinctly encouraging."

Taken as a whole there has been something of a general industrial revival in Ohio and Indiana and there has been a considerable increase in the sale of cars.

The outlook in New England is not so encouraging as it was a few weeks ago when renewal of operations by textile mills and boot and shoes factories was general. It was found that the orders which resulted in the opening of plants were largely to complete depleted stocks.

R. A. Stranahan Predicts Car Shortage in June

ATLANTA, March 18—R. A. Stranahan, president of the Champion Spark Plug Co., and of the National Automotive Equipment Jobbers' Association, predicted that there would exist a shortage of motor cars in the United States by May and June of this year, in an address before the Southern Automotive Equipment Jobbers' Association, which held its annual convention in Atlanta, March 11 and 12.

Stranahan declared that Champion business during January and February of this year compared very favorably with the same months in 1920, while advance specifications from dealers and jobbers were better for March of this year than the same month in 1920, and for April of the present year were more than 100 per cent greater than April, 1920. Orders, however, he stated, were still low, not more than one-third or one-half as great as during the same period in 1920. In the sale of manufacturers' equipment, he declared that 1921 would fall considerably below the record of 1920, but expressed the belief that the accessory and equipment business as a whole for 1921 would surpass 1920.

Kansas City Finds Sales Volume Rising

City Buying in Good Volume—Farmers Returning to Market Slowly

KANSAS CITY, March 21—Steady increase in retail trade is reported in Kansas City and the larger cities of the territory. Established dealers with a good car of reputation, with service departments actually helping to keep cars running—this class of dealers is getting really first class volume. Cars not so well known and cars handled by dealers who for one reason or another have not maintained service, are not selling so well at retail; the shortage in movement reduces the average of passenger car sales to about 80 per cent of normal in the city.

After two weeks of brisk movement of carloads from Kansas City distributors to country dealers, this phase of the business has settled down to a steady outgo of single cars, usually driven out by or for the country dealer. The dealer in the small town is having difficulty financing his stock purchases; the farmer, his chief source of volume business, is not buying yet, and the small-town business men do not offer a wide market. Dealers are taking from distributors, therefore, only as they sell. But this volume is increasing steadily, as farmers become reconciled to new conditions.

The chief factor now operating to increase sales is the restoration of confidence in the minds of the salaried man. Until this month men on salary were hanging onto their money fearful of possible financial catastrophe (either personal or national). They now see that the world is moving calmly along; that business is being transacted in most lines on a level about 75 per cent of normal (in some lines 100 per cent) and that they are going to keep on earning and getting salaries.

Used car sales are said to be increasing faster than new car sales. Several dealers report that while they were getting fair results even in fall and winter and better this spring on new cars, they had not moved any used cars until the past few weeks.

HANSON REDUCES PRICES

ATLANTA, March 18—Prices on Hanson open models will be reduced at once. The 5-passenger and roadster models will be sold for $2,185, and the 4-passenger model at $2,285. The former prices were $2,365 and $2,465 respectively. The price on the sedan will continue at $3,165.

Pence Company Buys Trainload of Buicks

Half-Million Order Indicates Sales Resumption in Northwest—Ford Branch Starts

MINNEAPOLIS, March 18 — While generally speaking there is only a slight lifting of the sales cloud situation, one optimistic note is struck in the receipt by the Pence Automobile Co., which buys Buicks for a large territory and distributes on its own account, of a trainload of cars, the first time this train has moved its wheels for four months.

The Pence company owns two trains and this one was composed of 76 cars, four automobiles to a car, which cost the firm just $411,139.20. Upon arrival of the train the company had just thirty cars left in the house. It is the opinion of this firm that the savings banks' increased deposits show that the people have the money to buy automobiles. This firm's retail sales have looked up. However, generally speaking, the country situation does not seem much improved from a financial viewpoint, as to motor car purchases.

In the Twin Cities retail sales have improved some with the mild weather, but a large percentage of these are from car owners and involving trades. The new business does not seem to be appreciable. In trucks there promises to be a better business. In fact inquiry is good, but the basis of the hope for better business is the quantity of trucks that will be required by contractors who get their bids accepted for road construction under the Babcock law, adopted by popular vote at the general election in Minnesota.

Another note of interest is the resumption of operation by the Minneapolis assembling plant of the Ford Co. The rate of assembly reached this week is 250 cars per day. The branch reports 3500 orders of cars for March delivery in Minnesota, northern Wisconsin and eastern South Dakota. For April this is 6000 cars. These are larger than a year ago. Dealers' stocks are said to be about cleaned up.

Buick and Dort Plants Increase Operations

DETROIT, March 18—Further improvement in the industry is shown in the step-up in production within the last three weeks in factories throughout Michigan. Practically every manufacturer outlined increased schedules for March production, but in many cases the brisk demand noticeable since the first of the month had resulted in revision of those schedules upward. This is true particularly in Flint, which was hard hit by the depression.

The Buick plant now is turning out around 250 cars daily, the output for the last ten days ranging from 240 to 260. The Buick plant capacity in finished cars is 600 daily. During last year's peak Buick was employing 22,000 men. There are approximately 12,000 employed now working about 60 per cent normal time. Sales demand, Buick officials say, is better than was expected, necessitating the sharp upward trend in production. The plant built approximately 200 cars a day in February.

Dort Motor Car Co., which produced about 700 cars in February, now is turning out an average of 60 each day with 500 of the normal force of 1500 men working full time. The new Dort model, officials say, rapidly is winning its way with automobile lovers, and actual sales and prospects they say will necessitate another step-up in production by the end of March.

Dodge Resumes Work with 4000 Employees

DETROIT, March 21—About 4000 of the normal force of 22,000 employed at Dodge Brothers resumed work to-day on a schedule conforming with sales requirements which is expected to be steadily increased.

Arthur T. Waterfall, general manager, said that the company would make no statement regarding the actual number of men to be employed at the start nor the probable production. The report that the company would put on a night shift was denied by officials, who declared they were just feeling their way and that future activities would depend entirely on demand.

Canaday Forms Company to Handle Willys Ads

TOLEDO, March 21—The formation of the United States Advertising Corp. by Ward M. Canaday, formerly advertising manager of the Willys-Overland Co., was announced this week. The move indicated a further trend toward economy in the Overland administration.

Practically the entire management of the Willys advertising staff goes over into the new company, which will handle the Overland contract and the Mather Spring Co. advertising. Canaday is president of the company. He has been with the Willys-Overland company for five years. The company is capitalized at $50,000. It will have charge of Overland service publications as well as all advertising. The Overland contract was held for many years by the Martin V. Kelley Co.

DECLINE NINE HOUR WORK DAY

YOUNGSTOWN, OHIO, March 19—Operations at the Salem plant of the Mullins Body Corp. have been suspended following the refusal of employees to work nine hours a day at the same pay they received for eight hours. The men asked for a reduction of 10 per cent and that the eight hour schedule be continued. The 10 per cent reduction has been made in the wages of executives, office workers, foremen, engineers, watchmen and other employees as well as piece and premium workers.

Overland Factories Extending Schedules

Plan Centralization of Production Control and Development of Quality Standards

TOLEDO, March 21—With the return of Overland officials from the Boston automobile show yesterday, indications appeared to point to gradual increase in production at the Toledo plant of the Willys-Overland Co. Vice-President Charles B. Wilson and Sales Manager A. C. Barber attended the show at Boston and met with the Willys New England dealers while there.

It was the first opportunity the dealers have had to get acquainted with the new factory heads and also put the factory men in touch with the Eastern markets. The officials expressed themselves as pleased with the results of the show.

On Thursday the first issue of the Willys News, the factory employees' paper, since the change in management and since the "closed for inventory" period last November, was put out.

Employees are being added to the payroll and the production of Willys-Knight cars is increasing. The plant schedule is now running between 25 and 40 cars daily. The output varies with the demands from dealers.

Much of the work at the plant for several weeks has been directed toward increasing the quality of Overland products. All parts on hand have been rigidly inspected and the officials have ordered more attention to all details in the production end.

A new production system is being installed at the plant under the supervision of Wilson. The general plan has the goal of centralization of production control and development of quality in the product. J. A. Sheldon, production manager, will have direct factory supervision of the production plan, and Ernest Smith, will have direction of the executive work.

A central planning office is being organized and co-ordinated with it will be production booths in each department of the factory. The amount of work to be done daily will be laid out at the central office and the part each department will do will be indicated at its own production booth. Each booth manager will know the amount of work to be done in his section and the time of its arrival and departure.

To Decide Changes in Models

An important part of the general program being lined up is the naming of a committee to pass on proposed changes and improvements in the Overland models. There are eleven men on the committee, including some of the oldest employees of the company.

"These men will be expected to keep our cars in the vanguard," said Vice-President Wilson. "Any suggestion that any man in the factory makes will be considered by this committee."

Chevrolet Refund Offered to Buyers

Will Return $70 to $100 a Car if Sales Aggregate 50,000 Vehicles by July 31

NEW YORK, March 21—As a special inducement to prospective buyers to come into the market at once, the Chevrolet Motor Co. has announced a refund of from $70 to $100 on its several models, providing sales between Jan. 1 and July 31 equal the 50,000 production schedule which the company has outlined for this period.

List prices of models and the amount of reduction under the proposed plan are:

Roadster and touring, $795, refund $70; light delivery wagon, $820, refund $70; chassis, $770, refund $70; coupe, $1325, refund $100; sedan, $1375, refund $100.

According to the announcement the refund represents savings in material prices under present readjusted conditions, which savings can be made provided Chevrolet factories continue to operate on the estimated average quantity production basis. It is in keeping with the Chevrolet policy, it declares, to make the price of its product as low as quality manufacture on a large scale will permit.

Fifty thousand cars is the minimum, the company says, which its engineers estimate will secure substantial savings in cost in manufacture. Purchasers under the plan will receive a certificate from dealers which will be redeemed as indicated on its face. Production results will be announced by August 10.

Goodyear Coordinates Sales Departments

AKRON, March 21—With the appointment of R. S. Wilson, truck tire manager, as manager of the Western division of the Goodyear Tire & Rubber Co., with headquarters in Chicago, several changes in personnel have been announced coincidentally with a readjustment of the Goodyear sales service, so as to improve the company's method of stimulating sales service throughout the entire country.

Wilson, as Western division manager, will supervise a territory embracing twelve States. He succeeds H. P. Ziegler. G. E. Brunner, manager of the service department, has been announced as successor to Wilson as truck tire manager at Akron.

Brunner's promotion leads to a change in the functioning of the service and of the sales promotion departments, under which C. W. Santee, who has been manager of the sales promotion department, becomes manager of sales service.

Responsible to Santee will be R. W. Clark, manager of sales promotion; W. H. Sorn, manager of the service department; P. R. Baugh, manager of the dealer development division; H. H. Tolman, manager of the government sales division; C. A. Reed, manager of the stock clearance division, and A. R. Kroh, farm lecturer and field worker.

The new arrangement which closely co-ordinates the work of various departments directly related to sales, is expected to increase the scope of Goodyear sales service. Santee, now director of the plant has been with Goodyear since 1919. He was first attached to the office of sales manager L. C. Rockhill, later becoming manager of the sales promotion department in charge of the work of centralizing promotional work on all products.

Brunner, the new manager of the truck tire department, has been with Goodyear since 1914. He is a former faculty member of Mercersburg Academy. He became manager of the service department in 1917.

Goodyear Meeting Adjourned

AKRON, March 21—The special meeting of the stockholders of the Goodyear Tire & Rubber Co., set for to-morrow, to act upon the reorganization program, has been adjourned to March 29. This is the second postponement, but President Seiberling declares satisfactory progress is being made by the committees negotiating with merchandise creditors, although a little more time will be needed to adjust the situation satisfactorily.

Ford Plant Increases Production of Benzol

DETROIT, March 18—The first of a number of benzol stations to be operated by the Ford Motor Co. has been started here. Heretofore the sale of benzol has been confined to three Ford stations near the Rouge and Dearborn plants, outside of Detroit. With production increasing at the blast furnaces, the company plans to maintain stations throughout Detroit.

The fuel is a by-product extracted from the gas produced when coal is decomposed into coke at the Rouge ovens. The 5000 gal. produced daily is mixed with an equal amount of gasoline to make impossible the thickening of the by-product in cold weather, and a 12 per cent mileage increase is guaranteed. The fact that the benzol is sold cheaper than gasoline naturally is an inducement to drivers.

KENWORTHY REORGANIZED

SOUTH BEND, IND., March 21—The Kenworthy Motors Co has been reorganized and the majority of the board of directors now consists of officers of the Dodge Mfg. Co. The new directors are F. T. Howlett, general purchasing agent; Walter E. Rowe, chief engineer; Frederick S. Willett, comptroller, and Temple Williams, assistant to M. W. Mix, president of the Dodge company. The Kenworthy plant is being operated under the direction of Rowe. The books are being brought up to date as rapidly as possible and an investigation is being made to determine the possibility of continuing operations.

C. C. Hanch Joins Advertising Firm

Former Maxwell-Chalmers Executive Will Be Counsel to McKee Company

INDIANAPOLIS, March 21—Charles C. Hanch, vice-president of the National Automobile Chamber of Commerce, widely known in the administrative activities of the automobile industry, has become associated with the Homer McKee Advertising Co., Inc., of Indianapolis. Hanch has long been associated with the automobile industry,—nineteen years as treasurer of Nordyke & Marmon Co. of Indianapolis, four years as treasurer of the Studebaker Corp. and later as general manager of the Maxwell-Chalmers interests.

In entering the advertising and merchandising business with the McKee organization Hanch will be able to continue his close contact with the automotive industry, through his work as general business counsel of the McKee company. Hanch believes conditions have brought about a new alignment in American business in which scientific distribution of goods based upon sound engineering, production and finance is the crying need in the transformation through which the automobile industry is passing. He points out that manufacturers have reached the peak on production economies and now must concentrate upon distribution economies which heretofore have been permitted to run wild.

Hanch is chairman of the Taxation and Patents committees of the National Automobile Chamber of Commerce and was one of the prime movers in the organization of the national body of automobile manufacturers. He had been in Washington lately in conference with the government's taxation experts relative to tax revision in impending legislation. During the war he was Chief of the Automotive Products Section of the War Industries Board at Washington and following the armistice he was sent abroad by the Bureau of Foreign and Domestic Commerce of the U. S. Department of Commerce to study and report commercial and industrial conditions in England, Belgium, France and Italy.

One of Hanch's accomplishments in the automobile industry was the initiating of the movement and serving as chairman of the committee that effected the cross-licensing patent agreement among American automobile manufacturers.

PERFECTION PAYS CREDITORS

MILWAUKEE, March 21—Creditors of the Perfection Engine Co. have accepted the offer of a 50 per cent composition of all claims, which are being liquidated by special loans made by two principal stockholders in the corporation. It probably will continue operations. Upon involuntary bankruptcy proceedings, schedules were filed admitting liabilities of $16,306.76 and claiming assets of $27,273.56.

Continental Nears 70 Per Cent Basis

Will Reach New Production Mark by April 1—Truck Demand Remains Slow

DETROIT, March 21—Steady improvement in the passenger car end of the automotive industry is demonstrated in the constantly increasing production at the Detroit plant of the Continental Motors Corp. Officials said to-day the plant would be on a 70 per cent production basis April 1.

While there has been no marked increase in production of truck engines at the Muskegon plant, that end, they say, is showing signs of improvement. With the start of roadway repair and construction, and building operations throughout the country during the next few weeks, the demand for trucks is expected to take a spurt. Continental officials, however, do not look for greatly increased production in the truck end for 60 days.

Renewed activity in the passenger car division is not confined to any car or group of cars, but reflects conditions throughout the industry, officials say. It is significant that with the increased production Continental at present is employing only about 45 per cent of the normal force. The normal mark, insofar as production is concerned, officials say, will be maintained with less than 75 per cent of the usual force.

Toledo Commutator on Full Production

TOLEDO, March 21—The Toledo Standard Commutator Co. has gone on a full time production basis this week. The company has several contracts with automobile factories and has begun receiving orders for the production drive getting under way.

At the annual meeting of stockholders this week the officers were re-elected. Charles A. VanDeusen is president; Eugene Rheinfrank, vice-president; E. B. Moon, secretary-treasurer. D. O. Kershaw, for many years with the Electric Auto-Lite Corp., has associated himself with the company as vice-president and general manager.

W. S. HUDSON TO BUILD TRUCKS

PHILADELPHIA, March 21—William S. Hudson, president of the Hudson Motor Specialties Co. and inventor of the Hudford truck attachment, is forming a company to build a 3-ton truck which will embody in its construction many of Hudson's patented features. The vehicle will be named the Hudson truck and it will be produced by the Hudson Motor Specialties Co. The control will be in the hands of Hudson who is said to have evolved entirely new methods of distribution. J. H. Malone, who was advertising director of the Chilton publications, will be vice-president.

SOUTHEAST EXPRESS MOTORIZES DELIVERY

ATLANTA, March 21—The Southeastern Express Co., organized some weeks ago to take over the business of the Southern Railway lines, has standardized on White trucks and placed a large order for equipment. When delivery is completed the fleet operating for the Southeastern Express Co. will be one of the largest truck fleets in the South. The order was placed through the White Atlanta branch by J. R. Hockaday, president of the new express company.

Baxter New President of Holt Manufacturing

STOCKTON, CAL., March 19—Thomas F. Baxter has been elected president of the Holt Mfg. Co. to succeed the late Benjamin Holt. Baxter has served as general manager since 1914. Alfred B. Holt, elder son of the founder of the company, has been elected a vice-president, and C. Parker Holt is treasurer. William E. Shepherd has been made manager of the Western end of the business, and J. A. Hymer, sales manager of the Western territory, succeeding Thomas H. Luke who becomes director of sales. R. S. Springer remains as vice-president and factory manager, and M. M. Baker as vice-president and manager of the Peoria plant.

The company reports that there is a satisfactory sale West of the Rocky Mountains of the 5-ton model of the caterpillar tractor, which was offered in that territory for the first time only a few months ago. This model, which was used by the American army during the war, is offered in standard type for general farm and road work, and a special low seat design has been made for orchard work.

Velie Speeds Output to Thirty Cars Daily

MOLINE, ILL., March 21—Production of the Velie Motors Corp. has jumped to 30 cars a day and next week is expected to go to 35 daily. The plant has gone on a 9-hour shift to meet the production schedule and this working hours increase, officers say, has been effected without decrease of wages.

Lee Hazard, production manager, says Velie orders within the last few weeks required the increased production and he does not foresee any early let up.

HAYNES PASSES 60 PER CENT

KOKOMO, IND., March 21—The Haynes Automobile Co. is gradually returning to normal production schedules. With the addition of a considerable number of employees the factory is now turning out cars at more than 60 per cent of its capacity. It is expected this figure will be raised to 75 per cent in April.

Winton Production Normal by May 1

Changes in Executives Witness Return of Alexander Winton to Active Role

CLEVELAND, March 21—An increase in sales of cars that set in on Jan. 1 and has continued to the present, led to the statement to-day at the plant of the Winton company that the factory probably would be operated on maximum production capacity by the first of May. The capacity is ten cars a day.

At the same time, the announcement was made that C. W. Churchill, who for a number of years had been general manager of the corporation, has resigned. Churchill retains a monetary interest in the corporation. Several years ago he came to the local plant from the New York branch of the corporation to act as sales manager. Later he was made general manager.

The position vacated by Churchill has not been filled and for the present his duties will be discharged by executive officers of the corporation. In the last few weeks, Alexander Winton, whose business capacity and knowledge of the automobile industry were responsible largely for the upbuilding of the corporation, has been taking a more and more active part in directing affairs.

Another change of executives was made in the sales department where J. C. Miller was made manager of sales, succeeding O. F. Baughman, who had occupied the position for a number of years. Miller left the New York branch to take up his new position.

Charles Mears, advertising manager, resigned, effective April 1, to engage in the advertising business in this city. He will handle the account of the Winton company in connection with his business.

INDUSTRY'S PAY-ROLLS GROW

WASHINGTON, March 18—Study of employment in selected industries during February as conducted by the Bureau of Labor Statistics of the Department of Labor shows the per capita earnings in the automobile trade were 16.2 per cent greater than in January. This increase is found despite cuts of 15 per cent in one establishment and five per cent in another. There was an increase of 1.3 per cent in the number on the payrolls of 40 reporting automobile plants. and an increase of 17.8 per cent in the amount of the payroll.

GRAND PRIX DATE, JULY 25

PARIS, March 1—(*Special Correspondence*)—Monday, July 25, has been definitely fixed as the date of the French Grand Prix 3-liter race at Le Mans. The Motorcycle Grand Prix will be held on the previous day over the same course. This change has been made in order to attract the popular crowd, which only has Sundays free, to the race for two-wheel machines.

Amarillo Becomes Big Tractor Center

Farm Machinery Sales in 1920 Total $20,000,000—Transform Former Cattle Ranches

AMARILLO, TEX., March 21—Amarillo bids fair to be the chief distributing point for tractors, power farm machinery and road building machinery of the entire Southwest in the next few years. This is indicated by the number of big distributing concerns located here now and the amount of business done during the past year. The motorized farm machinery business grew from an insignificant figure in 1915 to $20,000,000 in 1920.

This is considered phenomenal by the machinery houses of Texas and the big cities of the North and East when it is taken into consideration that the farm implement business in the Panhandle of Texas and New Mexico is really in its infancy. It is considered more remarkable because Amarillo is the only city of 16,000 in the United States which did that amount of farm machinery business during the last year.

Machinery men believe Amarillo will become the greatest distributing point in the country because the vast stretches of rolling prairies, once great cattle ranches, are rapidly being made into grain farms of vast acreages. The tractor and the other motor implements of the farm are being installed on every ranch which is subdivided into farms. A ranch which formerly contained 50,000 acres—and there are hundreds of them—means from 50 to 100 tractors, a score of binders and a bunch of threshers.

In a few years the vast plains of west Texas will be waving fields of grain and other crops, and as this is developed the sales of motor farm machinery will be increased, the machinery men say. In addition to the hundreds of thousands of acres of land being converted into farms in the Panhandle of Texas, like numbers of acres are turning to growing crops in New Mexico and parts of Oklahoma which are supplied by the implement houses in this city.

Nine Houses Now Open

At present there are nine big implement houses located here. They employ several hundred persons and have an annual payroll of several hundred thousand dollars. These nine houses did $20,000,000 worth of business in implements last year, and they report that despite the fact that money appears more stringent, the business for 1921 will increase from $5,000,000 to $10,000,000.

The big concerns located in Amarillo now are: Case with C. E. Kiser as manager, Avery with H. M. Hunter as manager, the Emerson-Brantingham with G. W. Davidson as manager, Dempster with R. T. Emmett as manager, Harvester with W. A. Frisk as manager, Roberts-Troxell with George Roberts as manager, Twin City with R. B. George as manager (Mr. George also handles the Oliver lines), Advance-Rumely with J. G. Wells as manager, Allis-Chalmers with J. D. Ingram as manager, and Kibbe Tractor & Implement with P. F. Kibbe as manager. The Minneapolis Threshing Machine Co. also has a branch here with G. C. Small as manager.

In many cases district managers of the really big concerns are handling lines of farm implements not carried by their own concerns. In that way anything from a plow point to one of the biggest tractors or most modern binders or threshing machines can be had in Amarillo without waiting for orders from the main houses. Every branch house here carries a stock of from $50,000 to $100,000 worth of machinery and implements all the year around. Some of them handle auto trucks, and the farmers are buying them rapidly.

Higher Taxes Hamper Car Sales in Japan

SEATTLE, WASH., March 21—Imposition of increased taxes is hampering the development of Japan as an automobile market, according to representatives of the American automotive industry returning from the Orient. Illustrative of the manner in which burdens are being heaped on motorists in the Nipponese Empire is a recent decision of the Yokohama Municipal Office to raise the schedule of motor car taxes about 30 per cent over the taxes formerly in effect.

Cars operated privately will be taxed from 85 yen (yen 50 cents United States money) a year upward, depending upon the seating capacity. The minimum of 85 yen a year is for cars with a capacity of three persons or less. For four passenger cars the tax will be 105 yen and 20 yen is added for each additional seat. A seven-passenger car, for example, will be taxed 165 yen a year.

Passenger motor cars in public service will be taxed at the rate of 65 yen for three-passenger capacity; 75 yen for four-passenger capacity, and 90 yen for five-passenger capacity, and 15 yen for each additional seat above five. Trucks of one, one and one-half and two tons are provided for, the taxes respectively being 50 yen, 55 yen and 65 yen.

MILES ON EUROPEAN TRIP

NEW YORK, March 23—S. A. Miles, manager of the New York and Chicago Shows for the National Automobile Chamber of Commerce, sailed for Europe on the Aquitania, Tuesday. While abroad Miles will investigate the European automobile situation for the Export Department of the N. A. C. C. He will be abroad about two months. Besides Mrs. Miles, the veteran show manager will be accompanied by William G. Stirm and Charles E. Ellias. They have been associated with him for years in arranging shows and will be his guests on the trip.

Banker Finds Cars Safer Than Stocks

President of Gotham Bank Finds Losses Rare—Declares Stock Most Liquid

NEW YORK, March 18—Henry Bizallion, president of the Gotham National Bank, told Reo dealers of the New York territory in convention here to-day, that they could use two arguments to convince their bankers that their businesses were entitled to loans:

1—There is no other class of merchants whose stock is so liquid.

2—Cases of loss by bankers who have financed dealers in stocking cars are so rare as to attract wide attention.

The banker said that his wide experience in handling automobile paper had shown that the average dealer's loan on any particular car was usually liquidated in two months in this territory. He said a bank could more safely loan on cars as security up to 90 per cent of their value than on stocks.

Bizallion said that his bank advanced money to dealers on mortgages or bills of sale covering cars at the legal rate of 6 per cent plus a charge for drawing up the necessary documents, which never exceeded $2.

The banker said that in the long experience of his institution with automobile financing it had never lost a dollar except in one case of fraud, which he said might happen in any business.

A. M. Welch, assistant manager of the Reo Motor Car Co. of New York, presided at the convention luncheon. R. C. Rueschaw, general sales manager of the Reo company, talked along sales lines and congratulated the dealers on their part of the work, which he said had enabled the factory to operate at full tilt without warehousing cars or trucks.

ARMY FIXES SALES DATES

WASHINGTON, March 19—Sales of surplus army automotive material will be held at Camp Jessup, Atlanta, the week beginning April 4; at Camp Normoylen, San Antonio, Texas, April 11; at El Paso, Texas, April 18; at Jeffersonville, Ind., April 25, and at Schenectady, N. Y., May 1. These dates are tentative and subject to revision.

The sales will be similar to the one held at Camp Holabird, Baltimore, at which a large number of unserviceable vehicles, as well as parts were sold.

TO SELL OBERBERGER STOCK

MILWAUKEE, March 19—Foreclosure sale of 1260 shares of the capital stock of the John Obenberger Forge Co. owned by President John Obenberger and held by the First Wisconsin National Bank as collateral security for loans, will be held March 21 at the courthouse in Milwaukee at the instance of the bank. The financial affairs of the Obenberger company for some time have been in the hands of a committee of creditors.

South Africa Finds Business Improved

Tractor Representatives Make Bid for Market—Passenger Cars Find Buyers

JOHANNESBURG, SOUTH AFRICA, Feb. 4—(Special Correspondence)—The trade position in January has been quite satisfactory taking into consideration the general tendency to slackness in trade generally. The firms interested in the motor trade are reporting a general improvement; although this is only slight, it shows that the industry in South Africa is on a solid footing.

Tractors are being pushed out here and the Holt people recently held a demonstration near Johannesburg. The Titan agents have also been in the field in this direction. General Motors Export Co. are out to place the Samson tractor on the market and an expert is due to leave the States this month. He will be attached to the Johannesburg office, from which all distribution is made. Karrier and Guy Motors South Africa, Limited, have commenced operations in Johannesburg.

These English trucks have come to stay and it is noticeable that more trucks are being placed in commission in the commercial centers of the Union every month. Steam trucks are finding favor, but the internal combustion engine continues to do very well. Commercial houses are finding that the truck speeds up work and in consequence are buying them. There are now several firms in Johannesburg who have fleets of trucks for work of all descriptions and it is a matter of some difficulty to get fixed up in a hurry by them.

Consignments of Briscoe cars that were received a few weeks ago are reported to be all sold and other makes give similar results. The English Belsize has arrived. The four gear system is installed and because of this hill climbing is not as easy without changing, as is the case with most American cars.

Light Cars Meet Favor

Among the light cars that are new arrivals are the Spacke and the Morris Oxford. The former needs no comment, as it is manufactured in the United States. This little car has been at Cape Town for some time, but the first model to come to Johannesburg only arrived a few weeks ago. The Morris Oxford is a light English proposition and is a car in every sense of the word. It is well finished and fitted with all the modern conveniences that are expected in a modern automobile. It is one of the few English cars that have come out here that is fitted with the three gear system. The latest model is very fine and has caused much comment all round. The Arrol-Johnston model (1921) has arrived and is fitted with disk wheels as standard equipment.

There has been no shortage of fuel during the past month and there is every indication at present that the supply will be maintained. South Africa is in a peculiar position. It is an important and fast developing country and requires all the assistance possible from the products of modern manufacture. The supply of petrol is a vital factor in a young country, as will be seen from the following. The railroad system of this country is very comprehensive, but it has to serve large tracts of fruitful land. At present there are no adequate feeders to the railroad system and in time regular truck services will be organized to feed the railways.

Plenty of Work for Trucks

This is a recognized fact and the internal combustion engined truck is going to come in for a great deal of the work of developing the country. The fuel supply will, therefore, have to be clearly adequate before any such schemes can possibly be undertaken. At the present there is no guarantee that supplies will be adequate to fill the demand that will be made as the country develops. Special efforts are being made by both American and English manufacturers to place large quantities of trucks and tractors on the market in addition to passenger cars, and for this to be successfully accomplished there are two factors to be reckoned with. Fuel and service are essential in a country where long distances have to be covered and when these two problems are solved there is no reason why a large market should not be opened up.

Tires have seldom got a square deal in South Africa, owing to both lack of knowledge and bad roads, but the tire companies have opened campaigns bringing to the notice of the user the necessity of looking after their tires. Cords are becoming more popular, especially among motorists who do a good deal of country traveling.

SOUTH AFRICA BUYS TOOLS

WASHINGTON, March 18—Trade in garage tools and equipment is growing rapidly in South Africa. Johannesburg alone now has over 150 motor-repairing and overhauling establishments, the whole of South Africa has over 1000, all of which, besides carrying stocks of spares and accessories, are constant purchasers of the tools peculiar to their business, according to a report received by the Bureau of Foreign and Domestic Commerce. Especially is there a demand for tire-levers, wrenches, bearing scrapers, sheet rubber, spanners, ordinary and snub-nosed pliers and similar appliances.

INDIA INCREASES DUTIES

WASHINGTON, March 21—Duties on automobiles imported into India were increased from 7½ per cent ad valorem to 20 per cent as of March 1, according to a cablegram received by the Bureau of Foreign and Domestic Commerce from Consul General A. W. Weddell of Calcutta.

High Fuel Prices Hurt French Trade

Industry Threatened by Continued High Costs — Seek Abolition of Taxes

(By Cable to AUTOMOTIVE INDUSTRIES)

PARIS, March 21—Vigorous efforts to bring down the cost of gasoline will be made in France because of the realization that the life of the automotive industries is threatened by the present high price. Gasoline now is selling in France at 2 francs 45 centimes per litre compared with 92 centimes per litre in America at the present exchange rate. A syndicate of French manufacturers and representatives of various societies made up of persons using gasoline have united for concerted action. An attempt will be made to bring about abolition of Government taxes on gasoline and close study is being given to a proposal for the purchase by automobile manufacturers of large quantities of gasoline in Galicia to be thrown on the French market.

French dealers are preparing a petition to be presented to the Government for the abolition of the 10 per cent retail sales tax on all cars of not more than 15 horsepower. It is asserted that this tax is highly detrimental.

There was an increase of 854 per cent in French automobile exports for the year 1920 as compared with 1919. The value of the export business was 1,188,000,000 francs. Imports decreased 45 per cent.

Jules Goux has entered a Peugeot in the Indianapolis sweepstakes, nominating Howard Wilcox as the driver. Jean Chassagne is expected to enter a second Peugeot.

Germany announces that its first post-war automobile show will be in the fall.

Because of French competition, all the British aviation companies operating lines between London and Paris suspended their service but have resumed upon the promise of the British government to increase subsidies. The rates charged by the French companies for passenger service between Paris and London are practically the same as railroad rates.

The Belgian Minister of Finance has introduced a bill calling for a 20 per cent ad valorem import duty on cars.

SPAIN TO REDUCE TARIFFS

WASHINGTON, March 21—The import duties on automobiles and possibly tires into Spain probably will be lowered by Royal Decree on March 20 or shortly thereafter. This information was contained in a cablegram from Commercial Attache Cunningham at Madrid to the Bureau of Foreign and Domestic Commerce. Cunningham advises that shipments for delivery after that date should be made subject to the new duty which is expected to be higher on such items as steel products, hardware supplies, textiles and others but lower on automobiles.

British Sales Show 1921 Light Car Year

Buying Tendency Ascribed to Excessive Large Car Costs—Factories Hard Hit

LONDON, March 10—(*Special Correspondence*)—Early indications that 1921 would be pre-eminently a light car year are being strengthened by developments. Application of the term is being widened and it seems to include everything up to 15 horsepower rating. Ultimately, however, the deciding factor in determining what is a light car will be either weight alone or weight and power rating up to some limit suggesting a correct ratio of power and weight.

Elastic use of the term "light car" is not without its dangers. One of them is that recently makers of genuine light cars have been fitting four seater bodies on short chassis, thereby reducing comfort and piling on weight. In one or two instances this has upset the balance of the car.

The main reason for this trend toward light cars is the present excessive price of the larger vehicles. The British light car now is priced at from $2,500 to $3,000 (normal exchange) which was the cost before the war of a medium grade full size British car. It should not be forgotten, however, that the buyers of $3,000 cars cannot afford it as well now as they could a larger car at the same figure before the war.

The big problem, therefore, is in determining how far it will be possible to cut the cost of a medium grade car and thereby eliminate the light car which is almost as expensive to build. This situation is working in favor of the "full bodied" American car.

As a means of reducing prices, there is a possibility of starters being eliminated from the standard light car equipment and of the magneto being superseded by a dynamo combined with an igniter.

Leyland Business Shaken

The Leyland company, the largest British motor truck builder, proposes to bring out a light car in the near future to take the place of the straight line "luxury 8" shown at Olympia. This announcement indicates that the company senses the trend of demand. The balance sheet of the Leyland company shows a sharp falling off in business. This reduction makes it impossible to pay a dividend on the ordinary stock although the dividends will be continued on the preference shares.

Crossley Report Disappoints

The report of Crossley Motors, Ltd., following close on the comparatively good showing of the first year's Willys-Overland-Crossley business, is disappointing as the figures include the substantial sum paid the Crossley stockholders by the Willys-Overland British interests for the Crossley aircraft factory at Heaton Chapel, Manchester.

Unless the company has a large inventory on hand it is difficult to see how it can hope to meet the expected revival in trade as it has a surplus of only $50,345. Apparently importing and assembling Overland cars, in spite of the 33 per cent tariff and the adverse exchange situation, is more profitable than the manufacture of expensive cars of the Crossley type. There recently have been reports that the Crossley company intended to bring out a "40" for the Indian and Colonial markets.

To Wind Up Sanderson

The Joseph Sankey Co., manufacturers of metal wheels used on the Angus Sanderson cars, has taken judgment against Angus Sanderson & Co. for $75,000 and has obtained an order in the high court for the compulsory winding up of the company. This follows a recent decision of the bank creditors to continue operations. The financial difficulties of the company are considered unfortunate because the car is good value and has passed successfully through the development stages. The design is good and with certain modifications should lend itself to mass production, which was the original intention of the promoters.

Trading Company in Difficulty

Following financial difficulties in the affairs of the makers of Bean cars, similar trouble is being experienced by the British Motor Trading Corp., the selling organization for these cars and for Glasgow agricultural tractors. The corporation has also very widely handled Crossley cars and Vulcan trucks. As a first result of these troubles, it is stated that the makers of the Glasgow tractors have taken over the selling organization.

Sizaire Berwick Hit by Strike

The business of the Sizaire Berwick Co. now is being carried on by an administrator appointed by the creditors but it is understood the prospects are favorable and that the present output of 6 cars a week may be increased soon to 18 a week. The company suffered a long delay in getting into production because of the molders' strike which lasted 15 weeks. The present price of the chassis is $7,500.

Price Guarantees in Effect

There is a widespread movement among British manufacturers to fall in with the arrangement first planned a short while ago by a few small makers to guarantee to refund to purchasers of their cars any payment made in excess of the lowest current price between now and a specified date in the future. This date is usually about July 1 next, though in one or two cases it is extended to August or until the end of the year. The following are among the prominent makers who have adopted this principle publicly: Albert, June 30; Crossley, July 1; Cubitt, July 1; Riley, July 31; Rover, June 30; Ruston Hornsby, June 30; Singer, June 1; Star, July 31; Sunbeam, June 30; Swift, June 1; Vauxhall, August 1. In addition a similar guarantee is issued by the British agents for certain American cars.

Tractor Subsidies Proposed by French

Army Experts Suggest Way to Advance Agriculture and Protect Military Needs

PARIS March 11—(*Special correspondence*)—French agriculture can be put into a flourishing condition, and the military interests of France can be safeguarded, if the agricultural tractor is made suitable for military operations as well as for work on land, declares General Castelnau. Before the war France had 16,000,000 acres of land under wheat cultivation, compared with 9,800,000 at the present time. To get the best results out of the land, French farmers ought to put 2500 tractors in service each year until a total of 25,000 is reached.

General Castelnau believes that the best way to accomplish this is by giving subsidies to farmers who own tractors which can be used, if necessary, for military purposes, and which the army could call up for service in case of war. The arrangement proposed is similar to that existing for trucks before the war, when France had an approved type of commercial truck suitable for military service. The army requisitioned 5000 of these trucks in 1914, and by the end of the war had increased the number of military trucks to between 80,000 and 100,000.

It is suggested that the same arrangement should be made for tractors, farmers being encouraged to purchase these semi-military types, which would be examined at intervals, in order to see that they were maintained in good mechanical condition and for which the Government would pay an annual subsidy.

TO OPERATE TRUCK LINES

WASHINGTON, March 22—A concession has been granted to an Argentine company for the operation of three lines of motor trucks for passengers and cargo, the lines to run from Paraguari to Ita via intervening points, according to the Bureau of Foreign and Domestic Commerce. Considerable interest is aroused among agriculturists and Government officials in this proposed line.

DENLINGER PARTS RESTRAINED

MERIDEN, CONN., March 21—The Connecticut Telephone & Electric Co. has been granted a permanent injunction restraining the Denlinger Lamp & Ignition Co. of Rochester from the sale of ignition parts alleged to have been made in imitation of the Connecticut patents.

OLD TIMER DIRECTORS CALLED

DETROIT, March 21—Albert Champion, president of the Old Timers Club, has issued a call to the directors of the organization who were elected at the meeting in Chicago during the automobile show, to meet at the Hotel Durant, Flint, Michigan, April 2 and 3.

Chamber Proposes Changes in Overhead

Would Eliminate Rigidity of Present Systems and Allow for Better Distribution

WASHINGTON, March 21—Manufacturers throughout the country have been advised by the Chamber of Commerce of the United States that to adjust overhead charges on the basis of the normal year is to take a forward step to better times. Inquiry shows the plan to be feasible in practice, though there are many business men who regard it as novel and daring, an idea which must be demonstrated more fully. Many cost accountants insist that our cost systems are far too rigid because overhead expenses are spread too thin in times of forced production and massed too heavily in period of slight demand and production.

The fabricated production department of the National Chamber contends that cost systems should recognize the continuity of time wherein any single year or month may or may not typify and represent normal production and demand. It is pointed out that certain expenses accrue regardless of operation of plants and often bear no relation to output. Cost systems should provide that these expenses, known as overhead, should be absorbed and pro-rated on the basis of a normal year.

This practice would allow absorption of overhead in costs, and create a surplus of overhead cost to take care of those years when output is reduced below normal and overhead charges are not fully taken up in the costs of the year. The chamber tells us that this method would assure the business man a reward for his efforts in speeding-up; eliminate the needless throttling of business by the practical attempt to load semi-normal production with greater charges than can be borne or should be borne.

What Is the Normal Year?

The question naturally arises, "What is the normal year?" The standard year is indeed difficult to determine. The Chamber of Commerce believes that "the normal year does not remain on a dead level, but should probably curve upward gradually and conservatively with the growth of population and markets. To do otherwise would indicate industrial stagnation." In the establishment of normal unit overhead charges, the normal overhead expenses for the various departments of the business and normal production must be considered and divided to obtain the normal unit overhead charge. Accidental expenses of the previous years should be wiped out and an effort made to anticipate and allow for trend of expense for the coming year.

According to the chamber, "there is nothing conclusive, final or binding about this estimate of normal expenses. Each month your cost system gives the estimated overhead expenses and the actual expenses. If there is an increase of the actual over the estimated, and upon analysis that increase is found to be a real increase, due to unanticipated increase of salaries or insurance rates, etc., and not inflation arising from reduced production, an adjustment upward can immediately be made in the unit overhead charges. Each concern will establish for itself a safety zone, below or above which decreases or increases in real costs will be reflected and taken up in the selling price." Warning is sounded against placing the normal production at high figures reached only in exceptional years.

National Underwriters to Approve Bumpers

NEW YORK, March 22—The National Automobile Underwriters Conference has authorized a reduction of 5 per cent in collision insurance rate on commercial cars and trucks equipped with either a radiator guard or a bumper, or both, provided such device or devices have been listed as standard by Underwriters Laboratories. This is contingent on there being at least two truck bumpers and two radiator guards listed prior to July 1, the ruling to take effect on that date.

This announcement is accompanied by the statement that manufacturers of guards, or truck companies which make their own guards, may desire to place their product before the Laboratories for examination in advance of July. On receipt of request from any manufacturer the procedure will be outlined.

Passenger cars now get an allowance for approved front bumper of 10 per cent, rear bumper 2½ per cent, and both front and rear 12½ per cent. This percentage is higher for passenger cars because the damage or loss is greater than in truck collision.

TO LOWER COLLISION RATES

MILWAUKEE, March 18—Lower collision insurance premium rates for new drivers with new cars, and also for experienced drivers with new cars, in comparison with older passenger cars, is the novel plan to be followed by a mutual insurance company just organized in Milwaukee. Incorporation was granted on March 21 to this company, as the Federal Mutual of Milwaukee. J. J. Helby, president of a casualty company, and who will be elected president of the automobile insurance company, is the author of the new plan in making rates. He says that careful investigation shows that new drivers, and older drivers with new cars, are much more careful.

SAMSON PRICE REDUCED

JANESVILLE, WIS., March 19—J. A. Craig, president of the Samson Tractor Co., a subsidiary of the General Motors Corp., has announced a 20 per cent reduction in the price of tractors and a 10 per cent cut in the price of power harrows and plows.

Unit Parts Makers Have Service Plan

Abolition of Private Parts Maker Important—Credit Demands to Be Higher

(*Continued from page* 674)

station in every important city. Dealers could carry small stocks of parts in the greatest demand and could rely on the parts establishment for less frequently called for articles. The capital tied up in parts would thereby be reduced.

One of the chief advantages would be elimination of the pirate. The parts manufacturers assert the public does not realize the great quantity and variety of inferior parts on the market, and that the average buyer does not comprehend the risk he takes in purchasing parts of this type.

All branches of the automotive industry are in agreement in the belief that the problem of service is one of major importance and that the company which provides the best service will corral the largest number of sales. Sponsors of the nation-wide parts station plan contend that it will give the maker of an assembled vehicle the advantage over manufacturers who build the greater part of their product. Better results are promised with a smaller investment of capital. It also is asserted that with the problem of a parts stock solved for them, dealers in assembled vehicles could devote all their time and capital to original car sales.

Another proposal for stabilization of the industry by the parts makers is denial of credit to the promotor of a vehicle factory who cannot demonstrate he has the capital to reasonably insure success. This would hit the wild-catter who is in to-day and out to-morrow, leaving owners of his vehicles with orphans on their hands and at the mercy of parts pirates.

The advantages of the parts station venture are summarized in this way by one of its enthusiastic sponsors:

It would eliminate investment in parts by the manufacturers, his distributers and dealers, enabling them to use the money which would otherwise be tied up in parts in the development of sales.

It would familiarize the public with the actual value offered in the assembler's products.

Would Make Prices Reasonable

It would enable manufacturers, distributers and dealers to obtain genuine parts at reasonable prices upon short notice in any part of the United States and in foreign countries.

It would eliminate the use of inferior parts furnished by pirate manufacturers.

It would benefit manufacturers by assuring them of adequate service.

It would not interfere with the operations of repair shops, garages or service stations, but would permit them to do business with a smaller investment.

Hawkins Goes with General Motors

Serves as Advisor on Sales Service

Former Ford Sales Manager Makes New Connection—Widely Known Figure

DETROIT, March 23—Norval A. Hawkins, formerly general sales manager for the Ford Motor Co., will join the General Motors Corp. on April 1 and will be a member of the advisory staff, located at Detroit, handling subjects pertaining to sales, advertising and service.

Hawkins is one of the most widely known sales executives in the industry and the success of the Ford Co. in its early days is regarded as due in large measure to his efforts. Since leaving the Ford Co. he has devoted his time to several enterprises and now is head of Hawkins, Gies & Co., accountants, with offices here. Rumors about Hawkins' future activities have been numerous in the last few months. They have connected him with General Motors, the new W. C. Durant enterprise and the new venture of F. L. Klingensmith.

Since the retirement of Hawkins from the Ford organization there has been much speculation as to his future connections because it was assumed he would remain in the automotive industry. He opened a set of books for Ford in 1903 and for three years served as auditor. He then became sales manager and continued in that capacity for 12 years until January 1919. Besides being president of Hawkins, Gies & Co., he is president of the Sturgis Steel Gocart Co. of Sturgis, Mich., and a director in several other concerns.

Acceptance Corporation Reorganizes Personnel

NEW YORK, March 24—Curtis C. Cooper was elected president of the General Motors Acceptance Corp. at a meeting this afternoon. He was named after a meeting of the stockholders at which these directors were elected: C. C. Cooper, Rlbert L. Deane, Irenee duPont, Lamot du Pont, Pierre S. du Pont, Paul Fitzpatrick, J. Armory Haskell, John J. Raskob, John J. Schumann, r., and Alfred H. Swayne.

Besides making Cooper president, and Swayne chairman of the board, the directors elected the following officers' Vice-presidents, Deane, Schumann, Donald M. Staidal and James H. McMahon; treasurer, Reune Martin; secretary, George H. Bartholomew; auditor, F. Stanley Parson; counsel, Livingston L. Short.

Haskell remains as a director but retired as president because of his other duties as vice-president of the General Motors Corp. in charge of operations. Fitzpatrick also remains on the board but retires as vice-president because of his recent election as vice-president of the General Motors Export Corp. McMahon, who was made one of the vice-presidents of the Acceptance Corporation, was promoted in recognition of his constructive work in credit department.

FORD COMPANY SELLS LAST OF SURPLUS CARS

DETROIT, March 21—The Ford Motor Co. started operations this week on a six-day basis for the first time since Christmas. The company is now producing almost 3000 cars a day and according to officials orders are catching up rapidly with production. All the surplus cars on hand when the plant closed Dec. 24 have been sold.

Service Stations Send Call for Mechanics

NEW YORK, March 22—Service stations in this city have in the last week been getting more work than they have in the past three months. Some of the shops have lately been so slack that forces of mechanics have been cut down to the very limit, one shop ordinarily employing eighteen men being reduced to the service manager and one mechanic. The sudden rush of service work has found most of these shops unprepared to take care of orders with the reduced forces and the calls for mechanics are many. Among the shops reporting greatly increased business are Overland, Marmon, Master Truck, Automotive Service Corp., and Chevrolet.

GRAY EXTENDS ENGINE WORKS

DETROIT, March 19—Announcement is made that under the reorganization of the Gray Motor Co. which will produce a $1500 motor car in the early fall, separate plant units will be organized for its marine and other motor business but they will remain under the same management. The Gray Motor Co. is one of the oldest motor manufacturers in the United States and has nearly 60,000 Gray motors in operation in all parts of the world. It is announced that a new 40 h.p. 4 cylinder overhead valve unit plant will be ready for production and delivery July 1. Marine and other motors will be distributed from the assembling plants which will be established in all parts of the world to handle the new motor car.

Assert Present Fees Ample in New York

Organizations Declare Funds for Maintenance Now Realized—Oppose Construction Uses

ALBANY, N. Y., March 23—The Lowman bill was passed in the Senate to-day after a sharp attack by Senator Lusk upon automobile clubs, which, he declared, were banded together to keep the State from raising through motor vehicle fees the money necessary for the maintenance of its good roads system.

Increases in passenger car registration fees range from $2.50 on low powered cars to $6 on high powered cars of more costly make. On motor trucks the increases range from 35 per cent on the lighter models to 50 per cent on those above 5-ton capacity, and as high as 100 per cent on trucks of 10-ton capacity or over.

ALBANY, N. Y., March 21—Insisting that existing license fees were ample to meet State needs for maintenance and repair of main highways, representatives of forty New York State automobile organizations at a conference here drew up a declaration of opposition to the proposed increased fees and submitted this to the legislative committee in charge. Pending formal action by the legislature, the organizations will get in personal touch with legislators and request support of their position.

Represented at the hearing were the National Automobile Chamber of Commerce, Motor Truck Association of America, Automobile Dealers Association of New York, New York State Automobile Association, New York State Motor Federation, Central New York Warehousemen's Club, New York Furniture & Warehousemen's Association, Van Owners Association of Greater New York, and many individual clubs of car and truck owners.

The principle that registration fees should be devoted to repair and maintenance of highways only, and that motor vehicle owners should not be burdened with costs of construction or reconstruction, was set forth in plain terms. That returns now from vehicle registration were ample for this purpose was shown.

UNITED BODY MOVES OFFICES

CLEVELAND, March 21—What is regarded as an important development in automobile circles is seen in the announcement that executive offices of the United Automotive Body Co. have been removed from Springboro, Pa., to this city.

Congress Outlines Definite Program

Emergency Tariff, Anti-Dumping Tariff and Internal Revenues, Order of Business

WASHINGTON, March 23—With five sub-committees of the House Ways and Means Committee actually engaged in drafting a permanent tariff schedule, there is evidence of a real effort on the part of Congress to settle the chaotic condition of business and industry through a definite legislative program. Analysis of this program indicates quite strongly that it will be mid-summer before the automotive industry will know what it must contribute to the national exchequer through taxation. The Senate Finance Committee will, however, begin hearings on the internal revenue measures on or before the convening of the extraordinary session April 11.

According to the program outlined by Senator Penrose, chairman of Senate Finance committee, and Chairman Fordney of the House Committee on Ways and Means, the emergency tariff confined to agricultural products, will have the right of way on the calendar. It has been a political boomerang for several months, and Congressional leaders have agreed to pass the original bill without amendment in order to clear the track for other important legislative measures.

President Harding and well-informed leaders favored an emergency tariff confined to high staples but on inquiry found it would never pass with a few items on the list. In order to obtain sufficient Democratic votes for cloture rule, it was found necessary to consent to sectional demands and include 26 agricultural products. The ten months period written in the original bill will be reduced to six months because leaders feel that this period will be adequate. They expect to have the permanent tariff enacted before the expiration of this period.

To Write Automobile Schedules

Chairman Fordney announced to-day that Congressmen Tilson of Connecticut, Luther Mott of New York and Timberlake of Colorado, would write the schedule for metals and manufactures thereof. The tariff item includes automobiles and automotive products. The sub-committees to handle the free list have not been organized. These sub-committees are expected to report their schedules to the full committee early in the session as the tariff will precede the internal revenue legislation in the House.

That the Senate Finance committee will not call witnesses for tax hearings until next month is indicated in the announcement that Chairman Penrose will be away for several days. It is apparent that these hearings will be brief and representatives of the automotive industry must present clear and concise arguments in the few minutes allotted. If the industry is to oppose the proposed tax levies, it will be necessary to convince the committee of the inequities of the Treasury and other plans, for it must be remembered that this committee will be swamped with suggestions as to sources of revenue and will have little time for study.

Copies of the arguments presented at the hearings will be turned over to the House Ways and Means committee for its guidance in framing tax bills. With an estimate of the yield from the new permanent tariff at hand, the House committee must design internal revenue measures to bring the balance required into the Treasury. The Senate will use the measures originating in the House as a guide for re-drafting or amendments.

It has been tentatively agreed to consider the emergency tariff first, followed by the anti-dumping measure, passage of a bill or amendment providing for assessment of import duties upon the basis of American and not foreign valuation, the permanent tariff and finally the internal revenue bill. Senator Penrose hopes to clean the slate by Aug. 1, although this prediction may be regarded as unduly optimistic in view of the tremendous amount of work at hand.

Contingency Reserves Reduce Case Surplus

CHICAGO, March 21—Net income of the J. I. Case Threshing Machine Co. in the year ended Dec. 31, 1920, amounted to $2,936,962, as compared with $4,305,211 in 1919. From this was deducted $1,000,000 as contingent reserve, increased dividends on the common and preferred stocks, which left a surplus for the year of only $156,962, compared with $2,843,961 the preceding year.

The income account for the last year compares as follows:

	1920	1919
Gr. sales	$34,547,321	$32,342,653
Net earns	4,791,942	6,021,607
Bal. aft. int., dpr., Fd. txs.	2,936,963	4,305,211
Contg. res	1,000,000	......
Bd. prm., etc	......	143,761
Extra chgs	......	*1,261,968
Net profit	1,936 693	2,909,482
Bal. aft. pfd. divs	1,026,963	2,029,232
Sur. aft. com. divs	156.963	1,448.232
†Earn. per com. share	$7.90	$15.61

*European assets written off.

†Based on $13,000.000 common stock outstanding Dec. 31, 1920. A stock dividend of 39,000 shares was paid Dec. 15, 1920.

S. A. E. NOMINATES OFFICERS

NEW YORK, March 22—The nominating committee of the Metropolitan Section of the Society of Automotive Engineers, consisting of H. G. McComb, chairman, Norman Bell and C. F. Scott has named the following ticket for officers of the Section for the year 1921-22: For chairman, H. W. Slauson; for treasurer, Ethelbert Favery; for secretary, F. E. McKone; for members of governing board, P. M. Heldt, C. T. Myers and W. E. Kemp. A. M. Wolf, the retiring chairman, becomes vice-chairman, in accordance with the by-laws of the Section.

New York Engineers Study Brake Action

Metropolitan Section S. A. E. Hears Interesting Discussions at March Meeting

NEW YORK, March 18—The regular monthly meeting of the Society of Automotive Engineers' Metropolitan Section, held here this evening, was devoted to discussion of brakes and clutches. The principal paper was read by H. G. Farwell, chief engineer of the Raybestos Co., who recently returned from Europe, where he has been making a study of practice in reference to brakes and clutches used on British and continental cars.

He said that most of these brakes are of the expanding type, and that more attention is given to their design and construction than is as a rule given to brakes on American cars. Many metal linings are used in spite of the fact that their coefficient of friction is only about half that of good asbestos linings. Cone clutches are still the predominant type, both leather and fabric being employed for facing, but many plate and multiple disk types are also employed. Four-wheel brakes are seeing wider application and are favorably regarded.

A second paper, presented by W. D. Reese of the Fifth Avenue Coach Co., described the brakes used on the 'buses operated by this company. Since these vehicles are continually used in traffic where frequent and very certain stops are necessary, the brakes must be extremely rugged and very certain in action. Carefully made tests have shown that the buses in question are capable of a deceleration rate of about 3.75 m.p.h. per sec. on dry smooth asphalt paving. It is estimated that the aggregate number of stops per year made by the buses of this company is 36,000,000. Some 10,000 ft. of brake lining materials per year is required.

R. W. Hastings, chief engineer of the Parker Axle & Products Corp., described the multiple disk type of brake used in axles produced by his company. These brakes closely resemble in design the multiple disk type of clutch, but are applied by toggle linkage.

Hydraulic Brake Described

A representative of the Four Wheel Hydraulic Brake Co. described the four wheel braking system put out by this company, while A. A. Rost, a dealer in Delage cars, recited experiences with the four wheel braking system used on cars of this make.

In the discussion which followed the paper Clarence Carson, consulting engineer of the H. W. Johns-Manville Co., described the efforts being made by one division of the Standards Committee, in cooperation with the Motor Transport Division of the Quartermaster Corps and the Bureau of Standards, to standardize a method of testing brake linings for durability.

INDUSTRIAL NOTES

North Star Mfg. Co., Chicago, has taken over the business of the S. & M. Mfg. Co., maker of the North Star glare shield.

Ekern-Turk Mfg. Co., Pipestone, Minn., upon expiration of its contract with H. G. Paro Co., Chicago, will handle all its products through jobbers direct.

Perfection Heater & Mfg. Co. has closed a contract with Sheridan Motors Co. whereby Perfection heaters will be standard equipment on all Sheridan closed cars.

R. C. Smith Tool & Mfg. Co., Newark, N. J., has moved into a larger factory in that city, where it will extend the variety of its machine-tool line and its production capacity.

Motor Car Supply Co. has been organized in Charleston, W. Va., to do an exclusive jobbing business. The company will have a capital of $150,000. Officers are H. F. Shepherd, president; W. D. Harold, vice-president, and George D. Cochrane, secretary and treasurer.

Precision Stud & Bolt Co., a new Milwaukee corporation, organized with $20,000 capital, has taken over a factory building and after making alterations will install equipment and tools for manufacturing studs, bolts, screws, nuts and other similar mechanical specialties and supplies.

Robeson Preservo Co. of Port Huron, Mich., which for 20 years has been manufacturing canvas waterproofing for other lines, has entered the automotive field. The company, according to Carl F. Adams, president, will make a special waterproofing for automobile tops and truck covers.

Schoeffler-Graham Mfg. Co., Milwaukee, recently incorporated with $50,000 capital to take over the machine shop business of Schoeffler & Graham, will hereafter concentrate on a patented horizontal hoist for dump body motor trucks. It has leased considerable floor space to increase the capacity about 100 per cent.

Utility Hoist & Mfg. Co., Milwaukee, has accepted the offer of the business men's club at Prairie du Sac, Wis., to relocate the plant and offices in that city. Prairie du Sac is a rapidly growing industrial community, due largely to the abundance of cheap current from mammoth hydroelectric generating plants on the Wisconsin River at this point.

FILE RED DIAMOND PETITION

ATLANTA, March 21—An involuntary petition in bankruptcy has been filed in the United States District Court here against the Red Diamond Motors Co., Inc., of Athens, Ga., a company incorporated some months ago with $5,000,000 capital to establish a plant at Athens for the manufacture of a newly invented engine. Stockholders of the corporation are scattered throughout this country and Mexico. No statement of liabilities and assets has yet been filed.

FEDERAL SHOWS NEW MODELS

DETROIT, March 21—Federal Motor Truck Co. is showing a new 5-ton model at the automobile show, priced at $5,350. The new truck is equipped with a specially designed Continental 4-cylinder engine, 4¾ by 6, and is geared to permit extra high speed adding materially to the efficiency of the truck.

Federal also is showing a new dump body mounted on a 2-ton truck. The truck is so equipped that the front end can be elevated for dumping into manholes or cellars, or the entire body can be elevated to a height six feet above the truck and the front end then raised slightly to permit of dumping across a sidewalk or into window or doorway above the walk. This equipment also makes possible the use of two or three smaller trucks for loading, the body hoisting attachment permitting the dumping into the bed of the heavy truck.

Bearings Service Pays Bonus to Employees

DETROIT, March 21—The Bearings Service Co., which acts as service department for the Timken Roller Bearing Co., the Hyatt Roller Bearing Co., and the New Departure Mfg. Co., will divide approximately 2 per cent of the net sales for the year 1920 as a bonus fund. All employees who served continuously six months or more participate. The bonus plan provides for a trust fund which pays the participant interest at the rate of 6 per cent a year. The participant is privileged to draw 20 per cent of his bonus each year or he may elect to receive payment in full at the end of five years together with a proportionate share of all forfeitures and excess earnings. Participants are divided into four groups according to length of service and personal efficiency rating. The plan applies to all employees, both in the general office here and in the company's 33 branches.

Romer Forms Company to Make Passenger Car

BOSTON, March 21—The Romer Motors Corp. has been organized by Albert J. Romer, designer of the Northway passenger car and formerly chief engineer of the Murray Motor Car Co. in association with Frank C. Gilbert, formerly of the Northway Motor Sales Corp. Offices have been opened at 43-57 Cornhill Street in this city, and a factory site of 16 acres has been purchased at Danvers, Mass.

Plans for a factory building are being prepared. The first unit will be a one-story structure 100 x 500 ft. Designs have been completed for passenger car bodies and chassis, and it is expected the first cars will be on the road by June 1.

TO FORM AVIATION COMPANY

CINCINNATI, March 22—Definite steps to co-operate with the Cincinnati Aero Club in forming a co-operative aviation company to be known as the Commercial Aviation Co. have been taken by the Aviation Committee of the Cincinnati Chamber of Commerce. The aero club is to erect a hangar on Reading Road, this city, and to construct a flying field and furnish instruction in operating machines as well as for commercial purposes. It will be capitalized at $100,000.

METAL MARKETS

CAUTION on the part of automotive purchasing agents continues to be the outstanding feature of the iron, steel and non-ferrous metal markets. The tonnage involved in inquiries is much greater than that actually ordered. No better proof that the market is still a buyers' affair is needed than that it is possible to sound producers on 500 tons and meet with no objection on their part when a contract for 100 or 200 tons is offered on the basis of the 500-ton quotation. On the whole, however, new steel orders from automotive concerns are still light, the bulk of shipments from mills consisting of previously suspended orders that have recently been reinstated. In those commodities for which there is a relatively light but, for all that, steadily growing demand, such as pig iron and sheets, values continue flexible, and to that extent the market may be characterized as still unsettled. Each transaction is a law unto itself, price depending upon the individual buyer's skill as a negotiator and the desirability of his business. Influences from outside of the automotive industries make for considerably quickened eagerness on the part of pig iron interests for orders from automotive foundries. In spite of the curtailment of pig iron production to what is very close to the irreducible minimum, much difficulty is encountered in finding consuming outlets for this output, due to the continued idleness of the building industry and lack of railroad demand. As a result of this condition, automotive consumption is receiving far more attention than it formerly did, and every pig iron market letter stresses the resumption of automotive buying as a market prop. The truth of the matter is that, with structural steel operations on a basis of 14 per cent of capacity, railroads and shipbuilders out of the market, and miscellaneous demand very light, the automotive industries are not only the largest but almost the only representative buyers in the market, and this in spite of the fact that automotive production has not yet attained anything like its normal stride. That automotive purchasing agents, in full consciousness of their orders furnishing the stop-gap in this period of transition for the iron and steel industry, proceed with prudent regard for this condition is only natural.

Pig Iron.—Middle West automotive foundries, because of improved labor conditions, are ordering somewhat more iron forward. The Ford Motor Co. is offering pig from its River Rouge furnace to those who hold contracts for Ford castings. About the best way to describe the market for No. 2 foundry is to say that bids of $25, valley, are being listened to.

Steel.—Somewhat more activity in automobile sheets is noted. Four cents as the basis for No. 28 black is chiefly used as a level from which to make reductions in order to compete for what business offers. Shipments of cold-finished steel bars and cold-rolled strip steel consist largely of reinstated orders. No representative new business has been placed so far.

Aluminum.—Buyers appear still to be holding off.

Copper.—Producers contemplate further reduction in output.

Tin.—Speculation in London and, to some extent, in New York makes up the sole activity.

Lead.—The "outside" market is now fully ¼c. higher than the chief interests' New York quotation.

Zinc.—Continuingly dull.

Bank Credits

Written exclusively for AUTOMOTIVE INDUSTRIES *by the Guaranty Trust Co., second largest bank in America.*

NEW YORK, March 24—There was scarcely any trace of last week's shifting of funds incident to the income and excess profits tax payments in the week-end bank statements, nor was there any outstanding feature in the money market which could be ascribed to the operations on March 15. On the other hand, there was an easier tone in the money market, especially after the first two days of the week. Call money ranged from 6 per cent to 7 per cent with 7 per cent as the renewal rate all week, but with the bulk of the business in the latter part of the week done at 6 per cent. On Monday of this week the renewal rate dropped to 6½ per cent, the lowest renewal rate since the latter part of January. While there was a relaxation in time money rates the supply was not plentiful. Rates dropped to 6½ per cent to 7 per cent for all maturities up to 5 months, and 6½ per cent to 6¾ per cent for 6 months' paper. The shorter maturities were in greatest demand. The return of funds to the banks following the tax payments is said to have been partially responsible for the easing of rates.

The improvement made in the reserve ratio of the Federal Reserve Banks as a whole is greater than the figures show in view of the new method used in calculating the deposits. The ratio of total reserves to net deposits and Federal Reserve note liabilities combined increased from 50.9 per cent to 51 per cent (on the old basis of figuring this 51 per cent would be about 52½ per cent). The ratio of gold reserves to Federal Reserve notes in circulation, after setting aside 35 per cent against net deposits, increased from 59.9 per cent to 60.6 per cent. These increases were caused largely by a decline in net deposits of $180,905,000 and a decline in Federal Reserve note circulation of $42,960,000, and by increases in gold reserves of $18,133,000 and cash reserves of $17,365,000. Federal Reserve notes in circulation, at $2,962,880,000, are at the lowest figure since Feb. 13, 1920, and are $442,000,000 below the amount shown in the Christmas-week statement. The decline in rediscounts is an additional sign of increasing strength. Rediscounts decreased $143,500,000 and are down $506,000,000 from the December high. Total earning assets declined $138,097,000.

Reports from the steel industry continue to show decreasing output. The U. S. Steel Corp. is working at about 45 per cent of capacity as against 60 per cent the week before, and the independents are said to be working at from 15 per cent to 25 per cent of capacity. The whole industry is working at a rate to produce about 16,000,000 tons of steel ingots per year, far below the rate for recent years but 17 per cent more than during the lean year of 1908. On the other hand there is said to be a perceptible increase in the demand in the trade.

Wholesale prices are still tending downward. Dun's reports show that for the forty-fifth consecutive week wholesale prices of commodities have a downward trend. Last week there were 77 reductions out of 101 revisions of wholesale prices; the week before there had been 59 out of 81. This is in line with the reports of slow recovery in the West, where the buying power of agriculturalists is still at a low ebb in view of low prices received for farm products. The Western mail-order houses reflect this in their reports for the first two months of the year. One of the largest mail-order houses in the country reports February sales of 50.35 per cent less than for February, 1920, and 10 per cent less than for January this year. The two months sales are reported to be 48.69 per cent less than for the corresponding period of a year ago.

Revised figures for the cotton production of 1920 as given by the Census Bureau may explain, together with the trade reaction and the decreased consumption at home and abroad, the present stagnation in the cotton industry.

Republic Truck Shows Deficit of $344,564

NEW YORK, March 22—The annual report of the Republic Motor Truck Co. for the year ended Dec. 31, 1920, shows after expenses, interest charges and adjustment of inventory values, etc., a deficit of $344,564.

The consolidated income account of Republic Motor Truck Co., Inc., and Republic Truck Sales Corp. for the year 1920 is as follows:

	1920
Sales*	$15,675,221
Manufacturing costs	12,793,001
Balance	$2,882,220
Other income	269,406
Total income	$3,151,626
Expenses, interest, charges, etc.	2,592,444
Net profit	$559,182
Prov. for bos. stock and in. adj.	903,746
Deficit	$344,564
Preferred dividends	60,634
Total deficit	$405,198
Profit and loss surplus	$1,508,806

BARLEY MOTORS LOSES SUIT

KALAMAZOO, MICH., March 18—A. C. Barley, president of the Barley Motor Car Co., has been denied a motion for a new trial in the suit brought against him by the American National Bank, of Nashville, Tenn. Judge George V. Weimer, of the Kalamazoo County Circuit Court, filed the opinion. The plaintiff brought suit to recover the contract price on certain automobile frames sold the Barley Motor Car Co. and won the case.

CORRECTION

A typographical error in AUTOMOTIVE INDUSTRIES last week was responsible for the statement that W. A. Ryan is general manager of the Ford plant. Ryan is general sales manager, which position he has held several years.

FINANCIAL NOTES

Dunlop Tire & Rubber Corp. of America has placed a $6,000,000 mortgage on its Buffalo plant with the Fidelity Trust Co. The plant is about 90 per cent completed and will have a capacity of about 12,500 tires daily.

Times Square Auto Supply Co., Inc., shows net profits for 1920 as $10,831 after preferred dividends and depreciation. Inventory is placed at $4,178,605 after writing off a depreciation of $919,000.

Kelsey Wheel Co. reports gross sales of $25,200,913 for 1920 and net operating profits of $3,325,804. Net profits for the year after depreciation, Federal taxes and fixed charges were $1,916,008. President Kelsey said the net profits were the largest the company has ever shown.

International Body Corp. of Newark, N. J., has been placed in receivership on application of two former officers of the company, who say that the company never began to function in the making of automobile bodies. The company was organized with a capital of $1,000,000. The bill of complaint fixes its assets at $38,000 and its unsecured liabilities at half that amount.

American La France Fire Engine Co. declared the regular quarterly dividends of 2½ per cent on the common and 1¾ per cent on the preferred stock. The common is payable May 16 and the preferred April 1. The company's balance sheet shows total assets of $8,574,594, with a surplus of $1,405,010.

Parish & Bingham Corp. reports net sales for 1920 as $9,128,443; cost of sales, depreciation, etc., $9,089,814; manufacturing profit, $38,629; selling, general and administrative expense, $203,492; deficit, $164,863; other charges, $192,726; deficit, $357,589; dividends, $450,000; deficit, $807,589; previous surplus, $3,139,952; total surplus, $2,332,363. The balance sheet shows total assets and liabilities of $5,686,770.

Jordan Motor Car Co. has declared a regular quarterly dividend payable March 31 to stockholders of record March 18.

COURT STOPS REYNOLDS SALE

MT. CLEMONS, MICH., March 23—The Circuit Court of Macomb county has declined to confirm the sale of the assets of the Reynolds Motor Truck Co. by Charles J. Reimold, the receiver, to Charles M. Kennan, for $26,250. Kennan operates a garage in this city. The report filed with the court stated that the bid of Kennan was the only one received but it was held by the judge to be inadequate and it is understood that since that time Reimold has been able to get offers from two other persons who would be willing to buy the property.

WASHINGTON OFFICERS CHANGE

SPOKANE, WASH., March 21—John B. White, president of the Washington Tire & Rubber Co. has resigned and J. L. Bowling, who was vice-president, has been selected to succeed him. Roy Hayes, a Waverly farmer, has been elected a trustee to fill the vacancy caused by White's retirement. The company has not been in operation for several months

Men of the Industry

Harvey J. Woodard has resigned as vice-president in charge of sales of the Republic Rubber Corp. of Youngstown, Ohio, and as president of the Canton-Blackstone Co. of Canton, Ohio, its affiliated subsidiary. Woodward went to Youngstown in 1917 to take charge of sales of the Republic Rubber Corp. Previous to joining the Republic corporation, Woodard was with the Knight Tire Co. of Canton, Ohio, as sales manager and, prior to that time, twelve years with the Diamond Rubber Co., serving from 1903 to 1912 as their district sales manager in New York.

Paul Fitzpatrick, who has been a vice-president of the General Motors Acceptance Corp., has resigned to become vice president of the General Motors Export Corp. Fitzpatrick left the Continental Guaranty Co. to go with General Motors and played a prominent part in the organization of the Acceptance Corporation. He is regarded as an expert on financing of automobile time sales. He recently returned from a tour of inspection of the Acceptance Corporation's offices in Europe. It is understood that several changes among the officers of the Acceptance Corporation will be announced after a meeting this week.

Henry W. Uhl has severed his connection with the Eisemann Magneto Corp., Brooklyn, effective April 1. Uhl's activities were centered chiefly upon the Eisemann magneto generator for 4-cylinder engines, also the new automatic advance type magneto. He has been connected with the engineering staff of the corporation since October, 1916. Uhl has not made any statement in regard to his future plans.

Walter F. Graham has resigned as metallurgist with the Spicer Mfg. Co., Plainfield, N. J., and is now associated with the Henry Souther Engineering Co., consulting, metallurgical and inspecting engineers, Hartford, Conn. Graham was formerly associated with the late Henry Souther as metallurgist for the Standard Roller Bearing Co. and subsequently with the Ferro Foundry & Machine Co. and the Ingersoll-Rand Co.

Herbert W. Bonnell, general manager of the Kissel Kar Co. of Milwaukee, distributor of the Kissel in Wisconsin, has resigned to accept the position of vice-president and general manager of the William F. Sims Motor Car Co., Milwaukee, State distributor of the Lincoln. Bonnell was for five years manager of the Mitchell Automobile Co. of Milwaukee, going to the Kissel Kar Co. about three and a half years ago.

Arthur E. Swanson, organization and efficiency expert of the Firestone Tire & Rubber Co., has resigned and will establish offices as a consulting efficiency expert in Akron. Swanson formerly was dean of the School of Commerce of Northwestern University. During the war he served as special expert for the United States Shipping Board and was also bureau director for the Federal War Trade Board.

William C. Jenkins of New York has joined the Bull Dog Tractor Co. of F du Lac, Wis., in the capacity of fiscal and advertising director. He was for twelve years on the editorial staff of the "National Magazine," Boston, and previously spent many years in newspaper work in Wisconsin.

W. R. Melcher, formerly Eastern representative of the Gemco Mfg. Co., has returned to his first love, C. A. Shaler Co., Waupun, Wis., with whom he was associated during 1918-19. Melcher will act in the capacity of special jobbers' service representative on Shaler vulcanizers and the Shaler road-lighter.

Alfred Reeves, general manager of the National Automobile Chamber of Commerce, will address the Pittsburgh Automotive Association on March 31 and the Philadelphia Automobile Dealers Association on April 1. The subject in both cities will be "1921 Prospects for the Automotive Industry."

L. G. Meldram, who has had wide experience in the motor truck, passenger car and export fields, has been appointed general manager of the Trailer Maufacturers Association, to succeed H. W. Perry, who resigned. Perry has not announced his plans for the future.

E. J. Thomas has been named private secretary to Vice-President and Factory Manager P. W. Litchfield of the Goodyear Tire & Rubber Co. of Akron. He succeeds George Miley, who is assigned as registrar at the Goodyear Industrial University for employees.

Edward J. Waltzer has been elected president of the Wisconsin Tool & Supply Co., Milwaukee, following his acquirement of the major interest in the business, in which he has been a stockholder since early last fall. William H. Lawton continues as vice-president and chief engineer.

C. S. Heimbauch has been appointed manager of the Des Moines branch of the J. I. Case Plow Works Co. He has been identified with the implement business since 1897, in recent years being sales manager of a Kansas City business in which he had a part interest.

H. C. Walker, managing director of Hooper & Co., Ltd., of London, returned to England Tuesday after a short stay in this country, during which he investigated the prospect for the sale of English-built automobile bodies here.

James W. Brooks has resigned as educational director of the Federal Highway Council and will make motion pictures visualizing educational problems and industrial progress. Associated with him will be John W. Wierk, formerly of Brooklyn.

R. G. Hendricks, who was connected with the King Motor Car Co. under the old régime as factory manager and who was retained by Charles Finnegan when he purchased the King assets, has resigned. Hendricks has not annbunced future plans.

James J. Harrington of Cincinnati has been appointed supervisor of all foreign branches of the Ford Motor Co., with headquarters in London, England, succeeding W. C. Anderson, who resigned recently.

Ward H. Marsh has been appointed sales and advertising manager of the Lincoln Motor Car Co., Detroit, resigning as advertising manager of the Burroughs Adding Machine Co. to take the position.

W. E. Finnigan has resigned as general sales-manager of the Gray-Dort Motors, Ltd., Chatham, Ont., and is now general director of sales with the Ruggles Motor Truck Co., Ltd., London, Ont.

Carl W. Bettcher has been appointed sales manager of the Eastern Machine Screw Corp., New Haven, Conn. He will give his special attention to the H. & G. die-head business of the company.

Fred McCarthy has resigned as sales engineer with the Jennings Corporation to join the C. C. Merz Sales Co., Pittsburgh distributors of H. C. S. cars.

Fred W. Cederleaf has resigned as chief engineer of the Sparks-Withington Co. to join the Ziegler Mfg. Co., Alexandria, Ind., as works manager.

Harry E. Marshall has been appointed Pacific Coast representative of the Mueller Electric Co. of Cleveland and will maintain offices in San Francisco.

H. M. Carroll has been appointed advertising and sales promotion chief of the Remy Electric Co. He was formerly connected with the Hyatt Roller Bearing Co.

A. H. Heller, metallurgical engineer, has become a partner in the Day Company of Washington and San Francisco.

Stewart Manufacturing Shows Slight Decrease

CHICAGO, March 18—Profits of the Stewart Mfg. Co., of which 95 per cent of the stock is owned by the Stewart-Warner Speedometer Co., showed a decrease during the year ended Dec. 31, 1920. In the previous year operating profits totaled $349,736 and in the past year, $272,897. Dividends were smaller, however, during the year just ended and there was a material reduction in the provision for Federal taxes, this resulting in a surplus for the year of only $2.000 less than for the year previous.

The income account with comparisons is as follows:

	1920	1919
Operating profits	$272,897	$349,736
Provided for Federal taxes	36,810	83,811
Preferred dividend	20,974	33,810
Common dividend	180,000	195,000
Surplus for year	35,113	37,115

Withdraw Junker Planes from Air Mail Service

WASHINGTON, March 22, 1921—All Junker planes owned by the Post Office Department have been withdrawn from service and under the recommendations of a special committee investigating numerous accidents to these machines while in flight, will be thoroughly tested at the McCook Aviation Field, Ohio. The committee which conducted an inquiry into the recent fatality at La Crosse, Wis., consisted of Major McCord, in charge of the Army Air Service offices at Chicago, John A. Jordon, superintendent of construction, Air Mail Service of the Post Office Department, and Randolph G. Page, chief pilot.

EDWARD LISLE, SR., DROWNED

Edward Lisle, Sr., founder of the Star and Briton motor companies at Wolverhampton and a pioneer British automobile builder, was drowned recently. He was 69 years old. He is said to have suffered from insomnia as a result of business worries. Lisle was a practical mechanic and introduced a British copy of the Benz 3½ hp. belt driven small car about 1899. Lisle, who was one of the old type of Englishmen, was much respected.

Calendar

SHOWS

April 3-9—Denver, Annual Automobile Show, Auditorium.

April 4-9—Seattle, Annual Automobile Show, Seattle Motor Car Dealers' Ass'n, Arena Hippodrome.

FOREIGN SHOWS

April, 1921—Sofia, Bulgaria, Tractor Trials, under the Bulgarian Ministry of Agriculture.

Apr. 20 - May 5 — Mexico City, Mexican Automobile Show, National Theatre Bldg.

May 28, 1921 — Czecho-Slovak International Automobile Exposition of Cars, Trucks, Tractors, Motorcycles and Equipment. Prague.

May 28-June 8—International Automobile Exhibition, Basle, Switzerland.

June, 1921—Reykjavik, Iceland, Agricultural Exhibition—Agricultural Machinery—Icelander Agricultural Society, Reykjavik, Iceland.

Oct. 5-16—Paris, France, Paris Motor Show, Grand Palais, Administration de l'Exposition Internationale de l'Automobile, 51, Rue Pergolèse, Paris.

Nov. 4-12 — London, British Motor Show, Society Motor Mfrs. and Traders.

CONVENTIONS

May 4-7 — Cleveland, National Foreign Trade Council.

May 17-19—Buffalo, Convention of Factory Service Managers, Auspices of Service Committee, N. A. C. C.

May 24-28 — West Baden, Ind., Summer Meeting Society of Automotive Engineers, West Baden Springs Hotel.

Oct. 12-14. 1921—Chicago Twenty-eighth Annual Convention National Implement & Vehicle Ass'n.

RACES

June 18—Uniontown, Pa., Speedway Events.

July 25—Grand Prix, Le Mans.

Labor Day—Uniontown, Pa., Autumn Classic.

S. A. E. MEETINGS

Buffalo section—April 19—Paper on "Carbureter Performance," by F. C. Mock.

Dayton section—May 3.

Metropolitan section—April 14—Paper on "Low Grade Fuel Carburetion," by A. H. Beach.

Minneapolis section — April 6 — Discussion of repair equipment.

Washington section—April 1—Aeronautical Engineering Session.

Importers Organize in Mexican Capital

(*Continued from page 674*)

and of $100 for associate members, were fixed, with $50 monthly dues for the active and $25 for the associate. The association is controlled by a board of directors elected for two years, with a general manager named each month to carry out the plans and instructions.

An annual automobile show, automobile tours of the republic, and truck and tractor demonstrations in the agricultural sections of the republic are among the plans. The new association is a member, by virtue of the American firms on its rolls, of the American Chamber of Commerce in Mexico, and of the Association of Chambers of Commerce of Mexico. The president of the association, Carlos Wille, at the first meeting named committees on associate memberships, on a monthly publication, on good roads, tours and shows, and on legislation and statistics.

Mexico City firms—the active members of the association—are listed as follows:

National Auto Importing Co., Moore & Cummings, R. Lozano & Co., Lamborn & Co., Siemens-Schuckert Werke, Mohler & DeGress, Mexico Motors Co., International Commerce Co., Pena Motor Sales Co., J. M. Marquez, Plana & Mirabent, B. Estades & Co., American Motor Co., Compania Automotriz Mexicana, Compania Unida de Ventas, Azcarraga & Copeland, Mayfield Auto Co., F. J. Meckel and R. G. Canton, Inc.

Because of the extensive road-building program which has been inaugurated by the new government of Mexico, the Department of Communications and Public Works, and the Department of Development, are interested in the new association, and have applied for membership, at the same time offering all facilities of the government for the aid of the association in its program of automobile shows, truck and tractor demonstrations and road building. The balance of power in the association is in the hands of foreigners, mainly Americans and Germans, but all the newspapers express the hope that more Mexican business men will come into the association by taking up agencies.

WILLYS' COAST HOME BOUGHT BY CHRYSLER

DETROIT, March 18—Announcement has been made in Toledo that John N. Willys has sold his home site at Pasadena, Cal., to Walter P. Chrysler for a sum approximating $200,000. Chrysler is executive vice-president of the Willys Corporation.

British Exports Gain as Imports Decline

LONDON, March 10 (*Special Correspondence*)—British automobile imports for January numbered 513 cars and 364 car chassis, and 1095 trucks and truck chassis. These were valued at approximately $686,390, $624,410, and $900,000 respectively. Parts imports were valued at $2,782,340. Tractor imports valued at $742,145 compared with imports of $566,285 for January, 1920. Tire imports were valued at $1,545,610, a decrease from $1,757,990 in January, 1920. In every case but tractors imports showed a marked falling off.

Automobile exports for January increased in value from $459,445 in January, 1920, to $1,588,805 for January, 1921. Car chassis exports increased from $405,000 to $910,965. Truck exports also showed large increases over January, 1920. Parts exports showed a gain from $1,697,420 in 1920, to $3,539,275 in 1921. Tractor exports totalled $725,115 as compared with $106,805 in 1920. Tire exports fell off from $2,379,730 in 1920, to $1,758,360 in the current year.

$6,000,000 FOR LOUISIANA ROADS

NEW ORLEANS, March 21—Approximately $6,000,000 of Federal, State and local funds are available for highway and bridge construction in Louisiana this year, according to the apportionment of the bureau of public roads of the Department of Agriculture, on a basis of information compiled from reports.

Nineteen Cars to Race for Grand Prix Trophy

PARIS, March 19—Entries for the French Grand Prix 321-mile race have now definitely closed with a total of 19 cars representing France, England, Italy and America. The competitors, together with the names of the drivers so far as they are known, are as follows:

1	Ballot	Jean Chassagne
2	Ballot	Ralph de Palma
3	Ballot	
4	Ballot	
5	Fiat	Louis Wagner
6	Fiat	Pietro Bordino
7	Fiat	Ferdinando Minoia
8	Sunbeam	Rene Thomas
9	Sunbeam	Andre Boillot
10	Talbot	Dario Resta
11	Talbot	K. Lee Guinness
12	Talbot-Darracq	Zobrowski
13	Talbot-Darracq	Seagreave
14	Talbot-Darracq	H. J. Cooper
15	Mathis	
16	Duesenberg	Albert Guyot
17	Duesenberg	Inghibert
18	Duesenberg	Tom Milton
19	Duesenberg	Eddie Hearne

All cars in the race are limited to a piston displacement of 183 cu. in., with a maximum weight empty of 1763 lb. Eight in line engines will predominate, having been adopted by Ballot, Sunbeam, Talbot, Talbot-Darracq and Duesenberg. The Italian Fiats have four-cylinder engines, but experiments are being carried out with eights in line.

The number of starters is lower than was expected, this being due in a large measure to the high entry fees fixed by the Automobile Club of France. The fee for a single car is 15,000 francs, while the Duesenbergs which came in after January 1 had to pay double fees, or 86,000 francs for a team of four cars.

TO HOLD OLYMPIA TRUCK SHOW

LONDON, March 1—(*Special Correspondence*)— The date of the 1921 passenger car show at Olympia has been fixed for Nov. 4 to 12. Thus it will not clash with the Paris salon in October, nor the Brussels show in December.

AUTOMOTIVE INDUSTRIES
The AUTOMOBILE

VOL. XLIV NEW YORK—THURSDAY, MARCH 31, 1921 NO. 13

Why the French Automobile Production Program Failed

Two years ago France was talking of producing 200,000 motor cars annually. Now the industry is in a state of near-collapse. Here is a review of the events of the period between the talk of large production and the survival of the fittest.

By W. F. Bradley

NO French automobile factory has lived up to the production program mapped out at the end of the war, while prices fixed at that period have not even approximately been adhered to. In looking back over the period of 28 months, it is amazing that so many errors should have been made in the time required to get into production, in the cost price of cars, in the possibility of the home and foreign markets, and in the general conditions that would prevail and influence the automobile industry.

It was estimated that the production capacity of the French automobile factories, as enlarged under the war program, was 200,000 cars per annum. This estimate was never explained in detailed reports of factories, but it is known that many war equipment factories planned automotive production that have never really entered the business.

At least three firms, Citroen, Renault and Berliet, had production possibilities of 100 cars per day, or each of them the ability to meet the requirements of the whole of France on the pre-war standard.

Six others, Panhard, Darracq, De Dion Bouton, Clement Bayard, Lorraine-Dietrich and Peugeot, had production facilities for at least 10 cars per day, thus making a total for nine firms of 108,000 cars per annum. There are numerous factories not referred to here which announced indefinite programs based upon war equipment factories. Also there are other automobile factories in France which did not announce definitely the production plans.

Never have the sales of automobiles in France exceeded 35,000 a year, and, granting that the sales would be doubled after the armistice, this left a large number of cars to be exported, if sold. French exports never reached a figure apparently anticipated in the disposal of this production.

These figures never have been reached by the industry as a whole, or by any single firm in the trade. Citroen united his workers a few days after the armistice and informed them that they must expect short time for a few months, but by the following March he guaranteed that they would be working on the same basis as during the busiest days of the war. Instead of this, Citroen was not in production until a year later, and, although he has been more successful in carrying out his plans than any others, he has never touched the 100-car-a-day figure, and is not likely to attain it in the immediate future. Probably the highest figure attained has been 75 cars per day, which constitutes a record for France; depression setting in, this had to be cut within a few weeks.

At the present time, despite the enlarged manufac-

turing facilities, the output of automobiles is not as high as immediately before the war. This means that the factories are all working well within 50 per cent of their possibilities; in certain cases the production is not more than 15 per cent of the capacity. The weeding out process proceeds slowly and is causing a minimum of disturbance in the industry, for the French factories, not being so highly specialized as those of America, it is an easier matter to get into other classes of production where the depression is less severely felt.

Renault is a pretty good example of this, for the automobile, truck and tractor business being insufficient to keep the works in full operation, he is now producing small tools, chains, jacks, hoists, change speed mechanisms, factory transmissions and stationary motors. Berliet is another big factory having had to convert to other lines of production, among these being railroad rolling stock. The French automobile factories not being big, as judged by American standards, and the fact that they had connections with other branches of engineering, or were able to convert with a fair amount of facility to other lines, has helped to attenuate the crisis in a considerable measure.

At the present time numbers of firms are merely living on the edge of the automobile business, and holding on to the industry in a precarious manner, although it undoubtedly would be to the benefit of all if these firms would drop out altogether. The French courts have shown a wonderful leniency, firms being allowed to remain in business by arrangements with the creditors, whereas in other countries they would have been forced into liquidation.

The Price Movement

France set out, after the armistice, with the idea that the era of economical motoring was about to break. Citroen's program was a four-passenger automobile with all modern improvements at 7,950 francs; Renault announced a slightly larger car, also with electric lighting and starting, spare wheels and five-passenger body, for 8,800 francs; Berliet promised a 15-h.p. complete car at 9,500 francs; Peugeot had a four-passenger model in preparation at less than 8,000 francs; Clement-Bayard intended to come into the same class, and Lorraine-Dietrich laid plans for a high-class six, on big production lines, which, it was expected, could be sold for about 12,000 francs.

Not a single program has been realized. Citroen climbed from 7,950 francs to 15,900, and has since dropped down to 14.310 francs; Berliet went from his original price of 9,500 francs to 23,500 francs; Peugeot got up to 21,000 for a model which it had been hoped to sell at one-third this price; the popular Renault jumped from 8,800 to 22,500 francs. These are but a few typical examples, but the same thing applied throughout the industry, although certain manufacturers displayed a spirit of reserve in fixing their car prices.

When the first post-war automobile show was held in 1919, a motor famine prevailed in France. Although a year had elapsed since the armistice, not a single factory had got into regular production, and the majority had nothing more than sample models to show, with very faint hopes of being able to deliver in less than another year. Clients were clamoring for cars, and orders flowed in, the show closing with practically all manufacturers booked up for two or three years ahead. Makers knew that there was no possibility of making deliveries within the time limits they had agreed to, yet, with very few exceptions, they continued to take orders. A few of the more conservative makers only accepted such orders as they knew they could execute, and declined the others.

During this apparently prosperous period makers failed to realize that they were being fooled by dealers and the public. Convinced that promises would not be kept, the dealer who had prospects for five cars placed his order with four different firms, intending later to cancel with those makers who did not live up to delivery dates. Had there been co-operation among manufacturers this danger could have been averted, but, although the French trade is grouped into two powerful trade associations, it was never thought to get together and verify the validity of the orders.

Duplicated Orders

It was not long before manufacturers realized they had made gross errors in calculating the cost of production, and in consequence prices began to soar until the peak was reached in the spring of 1920. The reasons given for the rises were the increased cost of coal and raw material, the 8-hour day and the consequent reduced efficiency of labor. There is no doubt that these had their influence on the production costs, but it is equally certain that, after the armistice, French makers established their selling prices light-heartedly and without any real knowledge of what it would cost them to produce.

On the whole, the public stood for the first rises without much complaint, but when deliveries were not forthcoming at even the higher prices, and in several cases it was announced that the cheap model had been withdrawn and replaced by a better and more costly type, the storm burst. Legal action was taken to compel manufacturers to deliver at the original price, and in some cases compensation was claimed for late delivery. The courts were divided, for while some decided that there had been increases in the cost of raw material over which manufacturers had no control, others concluded that manufacturers ought to have been able to foresee these increases and, in any case, it was they who ought to bear the consequences and not the clients. In certain cases the line of argument of the judge was that if there had been a decrease in the cost of raw material, manufacturers would not have voluntarily dropped the price to the client and, consequently, they were not justified in increasing it when conditions went against them. Adequate publicity was given to the cases decided in favor of the manufacturer, but not much was allowed to appear in print regarding the lawsuits decided against them.

The Orders Disappear

By the spring and summer of 1920 the public, as a whole, was convinced that it was being exploited by French automobile manufacturers, and, while some persons commenced legal proceedings, others simply cancelled their orders on the ground of late delivery. Naturally those dealers who had contracted for considerably more cars than they had ever hoped to get were very ready to take advantage of the cancellation clause, the final result being that manufacturers who had thought they were booked up for two or three years suddenly found themselves, in June and July of last year, with no genuine orders on their books.

Much as manufacturers have been criticized by dealers and the public for their actions during this period, it must be recorded that the faults were not all on their side. While the demand remained good, dealers refused to be tied down by price limits, and after getting cars on the understanding that they would be sold at the prevailing catalog price, they disposed of them to the highest bidder. The client imagined that the maker was responsible for this, and the reputation of the entire industry was damaged.

Although purchasers protested against the actions of

makers, they were not above taking advantage of the situation. One man of considerable local influence threatened legal action if he was not given delivery of a car at the original price. To avoid a legal action, the factory decided to stand the loss on the car by supplying at the initial price. Within 24 hours of getting delivery the client sold the car at a 25 per cent increase. In this case the dealer lodged a complaint with the public prosecutor for illegal speculation.

Move for Standardization

It always has been difficult to get French makers to pull together on matters of general policy, but even the hopes of united action which sprang up during the war have been doomed to disappointment. If tire and rim sizes are excluded, no standardization work has been done. Magneto bases have been made uniform, but this was a war measure.

Eight important manufacturers got together in 1919 to make purchases in common and to standardize the automobile industry, or at any rate their particular portion of it. The program was promising, and even went so far as a cheap car, the various parts of which would be built in the different factories and assembled and marketed for the benefit of the entire group. Offices were opened in the Champs Elysées and engineers set to work to adopt standards, without, however, paying any attention to the work which had already been done in this direction. Some of the engineers in this group admitted that they had never heard of the American standards promoted by the Society of Automotive Engineers. This organization had entirely disappeared within one year, owing to the inability of the manufacturers to work together. While the joint car was unnecessary, there was nothing in the rest of the program that was not perfectly feasible and likely to be beneficial to the industry.

Fluctuations in Automobile Prices on the French Market

	Armistice	Jan., 1920	July, 1920	Jan., 1921	March, 1921
	fr.	fr.	fr.	fr.	fr.
Citroen, 10 hp. 4-pass.	7,950	15,000	15,900	15,700	14,310
Berliet, 15 hp. 4-pass.	9,500	9,500	18,000	23,500	22,000
Delage, 6 cyl. chassis	45,000	55,000	70,000	63,000	48,000
Renault, 10 hp. 4-pass.	8,800	12,800	22,500	22,500	16,500
Ford, 4-pass.	10,500	18,000	20,070	15,000	13,900

The causes of the present depression in the French industry are multiple. It is doubtful if the increased cost of production is mainly responsible for the refusal of the public to buy, for there has been a small but gradual decrease in price during the past three months without any corresponding increase in purchasing. Gradually the public has been educated to higher car prices, but it cannot be made to accept the high operating costs now prevailing.

The Government 10 per cent luxury tax is not only unpopular but a real handicap to the whole of the industry, for it is impossible to convince the Frenchman that a Ford, a Citroen or a small Renault must be classed as an article of luxury. In order to overcome the effects of this tax Citroen instituted, and other makers adopted, the plan of paying the tax themselves, and presenting this as a reduction on the price of the car. In this way the pill is sugar-coated, but the purchaser does not entirely overlook the fact that it is still a pill. Frequent protests have been made by the industry against the luxury tax, and its repeal on at least small cars is constantly being urged, but without any result.

Taxation a Handicap

Another barrier to the progress of the industry is the high rate of taxation on automobiles. Even the smallest car pays 500 francs a year in direct taxation, while a medium four-passenger car of the European type has to contribute 800 francs per annum to the state. In certain districts the annual tax on a Ford is almost 1,000 francs a year, or $200 at nominal exchange. The Government plea is that funds are required and the automobile owner must pay, but there is no doubt that the total amount going into the treasury funds would be increased if the individual taxes were lowered.

The French automobile industry is being bled by the gasoline ring. When the Frenchman is called upon to pay 12 frs. 25c. for a 5-litre can of gasoline (67 cents per American gallon at present exchange) he is informed that American financiers who will do nothing to help bring down the rate of exchange are the profiteers. Gasoline is sold retail in New York at the present time at 30 cents a gallon, which at the prevailing rate of exchange (14 frs. to the dollar) would make the cost on the French market 4 frs. 52c. per 5-litre can, instead of 12 frs. 25c. The difference, 7 frs. 63c., represents shipping costs and the profit of the select ring which controls gasoline in France. In this sum is included a Governmen tax of 1 fr. per can.

A leader of the American oil industry has declared that if the present monopoly were removed gasoline could be sold retail in France at 5 frs. per can.

This would only be possible, however, by taking the business out of the hands of the present "refiners," whose refining operation consists in putting American gasoline into French cans and sticking labels on the cans. This group has no interest in the adoption of bulk storage and curb sales from gasoline tanks, with the consequence that the old-fashioned method of selling in cans, many of which will not contain the quantity they are supposed to hold, and all of which entail some loss through evaporation, filling and leakage, remains in force. Gasoline economy by the use of small high-efficiency engines, by scientific carbureters and the best carbureter adjustments has been pushed to the limit. The great problem which now confronts the French automobile industry is cheap fuel. The industry is being strangled by high gasoline costs, and unless these costs are lowered or unless other and cheaper fuel is found, it is certain that the industry will be permanently crippled.

Pleas Are Unheeded

High taxes, high gasoline and oil costs and the accompanying increased charges for garage and repair work are the leading obstacles to the recovery of the French automobile industry. On several occasions the restrictive influence of these taxes has been brought to the attention of the Government, but even the leaders of the industry appear to be more concerned in getting further protection against outside competition, or in maintaining the present protection, than in removing the national restrictions. At present there is a desire to obtain the introduction of another prohibition period, despite the fact that the rate of exchange has completely killed American and English competition. Only Italy and Germany have an advantage under the exchange rates.

By the sale in France of the whole of the American and French army automobile stocks, the truck market has been saturated, and at the present moment the sale

(Continued on page 698)

An Electric Truck for Industrial and Street Use

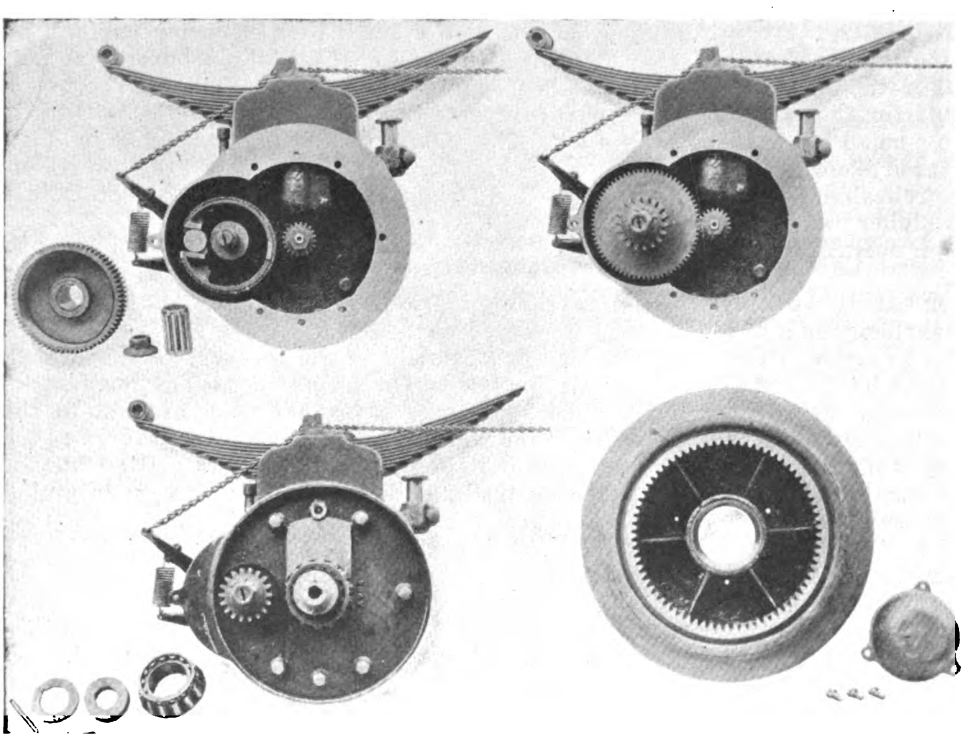
Combines in one vehicle features which adapt it for use between warehouse and dock when paving is good. Has short turning radius and elevating platform which enables quick handling and economy in time for loading and unloading, often without rehandling at destination.

By P. M. Heldt

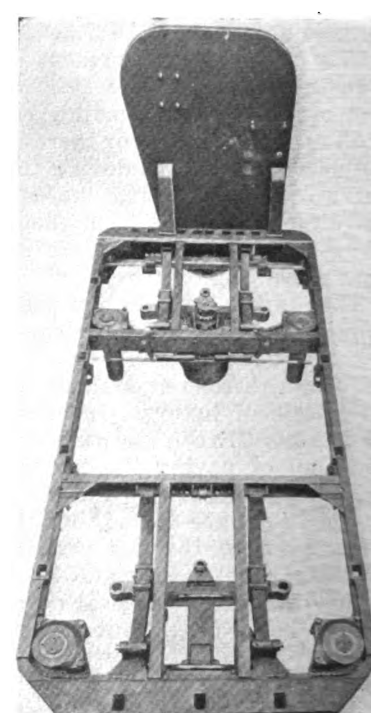
WHAT may be termed a cross between the regular industrial truck designed for use only on railroad platforms, steamship piers and factory floors, and the commercial truck for road service has recently been developed. It is based on the idea that there is a great deal of transportation between freight terminals and warehouses, for instance, which are only a short distance apart, say not more than a mile, and are connected by paved streets. If the freight is first handled at the dock or freight station on an industrial truck, then transferred to a commercial vehicle to be hauled to the warehouse and there again handled indoors on an industrial truck, a great deal of effort is wasted in loading and unloading. The Tec truck is designed to take the freight as it is unloaded from the steamer or freight car and carry it directly to its ultimate destination, even if this be on the top floor of a warehouse, provided the distance is not too great and the route is over hard surfaced roads.

In the design of this truck two points in particular were aimed at, namely, to secure unusual maneuverability, so as to be able to make short turns in factory and warehouse aisles; and to select such wheel and tire equipment as to make it possible to run at considerable speed over ordinary paved streets rather than over floors only. The truck, moreover, is of the lifting type and is used in connection with a set of loading platforms on which the load is piled and from which it is removed while the truck is engaged elsewhere.

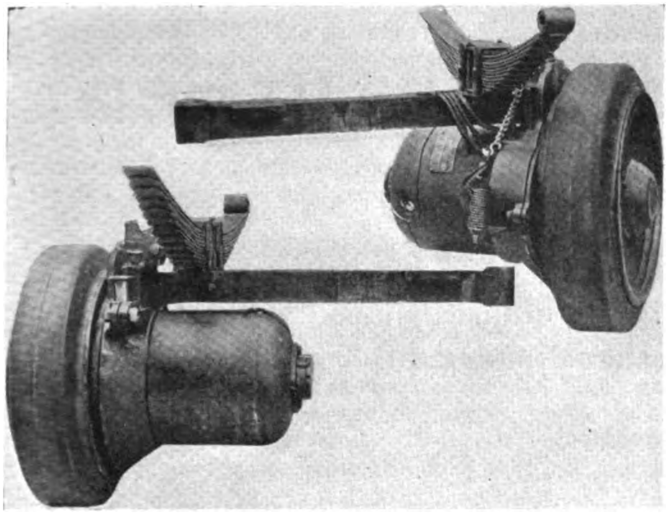
In order to secure maximum maneuverability the truck was made of the four-wheel drive, four-wheel steer type. In this way the turning radius is reduced to one-half what it would be with two-wheel steer and the same wheelbase and maximum steering wheel deflection. There is an electric motor on each wheel, so that the usual difficulties of transmitting power to a swiveled drive wheel are here eliminated, the motor turning with the knuckle in steering. The truck has a capacity of 5000 lb. and weighs complete 4700 to 4900 lb. There are five motors in all on each truck, four for the drive and the fifth, which is of the same size as the others, for operating the lifting jacks. All are G. E. motors, with the rating of 17 amperes at 60 volts. The manufacturers, the Terminal Engineering Company, Inc., make their own controllers, which give three forward and three reverse speeds, and also permit of the use of the



Details of driving gear and brake



Frame of Tec truck



Axle with wheel and motor unit

motors for braking purposes. The wheel drive gearing is built under the patents of the Commercial Truck Co. of Philadelphia. The drive from the armature shaft to the road wheel is by double reduction through a one-piece spur gear and pinion, the first reduction being from the spur pinion on the motor shaft to the intermediate spur gear, and the second from the pinion (integral with the intermediate gear) to the internal gear on the periphery of the road wheel. The mechanism, which is completely enclosed, is grease packed, and operates therefore under favorable lubricating conditions. There is an expanding brake on the intermediate gear of the drive to each wheel, and braking effort can be exerted on all four wheels.

The wheels are 20 in. in diameter and are fitted with 5-in. solid rubber tires. These tires are 3 in. deep, thus providing the same depth of rubber cushion as the solid tires on large-wheel street trucks, rather than the lesser cushion which is standard for indoor floor purposes.

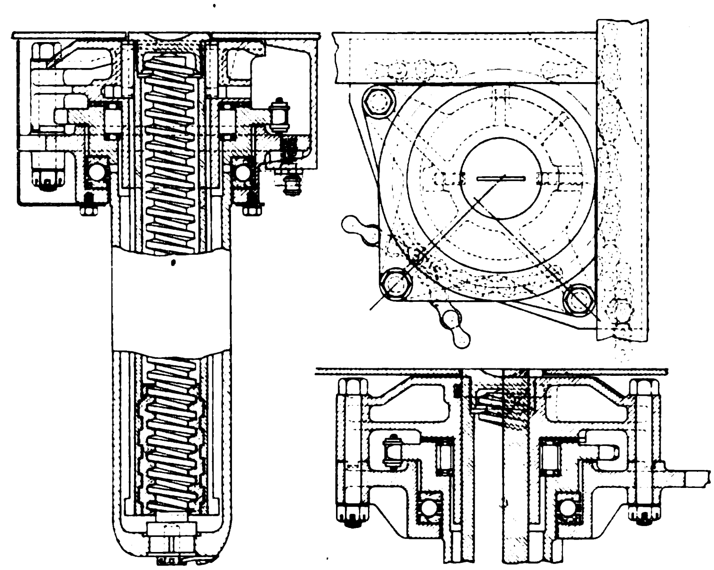
The frame is built up of 4-in. reinforced channel steel, hot riveted. It is supported on the axle by four half elliptic springs 26 in. long by 2 in. wide. The wheel units and jack units are packed with grease, so that the lubrication of the transmission gearing is effected automatically. Other bearing points are lubricated from oil reservoirs.

Tec truck carrying loaded platform

The elevating mechanism consists of four screw jacks driven by a roller chain. There is a spur gear reduction between the motor and the sprocket which operates the chain. This sprocket has a mechanical friction slip so there can be no danger of over-driving the elevating mechanism. One of the reasons for using the chain is that weaving of the truck frame does not cause binding in drive. The travel of the jacks is controlled from the dash. The maximum travel is 9½ in.

Either an Exide or an Edison battery can be used on the truck, the Exide being either the 34 cell M. V. 9 or the 35 cell M. V. 11 type and the Edison the 59 cell A-4 or G-6. There is a hinged cover in the truck deck, which permits of quickly changing the battery if it is desired to use the truck continuously. Another advantage of the hinged cover is that it permits of easy inspection of the battery. A charging receptacle of the Anderson type is provided, and there is an extra charging receptacle at the driver's platform for convenient use when charging the battery on the truck.

The controller is of the drum type and is mounted on the dash. Owing to the fact that a higher voltage is used



Detail of lifting jacks and their chain-operating mechanism

than the conventional industrial truck voltage, the operating current is comparatively low, and this, together with wide controller fingers, reduces the wear of these fingers. As a safety feature arrangements are made so that it is impossible to move the controller handle unless the operator is in the driving position. The speed range, light is ½ to 10 m.p.h. and with full load ½ to 7 m.p.h. Resistance is used in the main circuit only on the low speed, and on the high and intermediate speeds there is therefore no loss of current by resistance.

The frame is provided with stake pockets which are of steel, hot riveted to the inside of the frame, giving flush frame sides. Stakes can be conveniently carried in the rear of the dash when not in use. An automatic coupler is furnished with the truck. This has 2 x 8 in. double acting helical springs to prevent shocks when towing trailers, shifting loaded freight cars or when engaged in other heavy duty. The coupler can be released from the dash. The equipment furnished includes red and white running lights with Conophor lens, both front and rear. These lights are set in the frame so that they are protected against injury. Other items of equipment are an electric horn, license plate brackets, Veeder Odometer and a combination latch lock on the controller which securely locks

(Continued on page 711)

New Four-Cylinder Engine to Be a Stock Product

Conventional construction employed for most parts, but cast iron cylinders and pistons are of harder metal than is ordinarily used. Pressure-splash lubrication employed, with no external piping.

By J. Edward Schipper

A NEW overhead valve, 3½ by 5 in., four-cylinder engine for the general trade is now being prepared for production. The engine is a block-cast unit with the cylinders integral with the upper half of the crankcase. It has a detachable cylinder head and an overhead valve arrangement operated through rocker arms from the camshaft located in the crankcase.

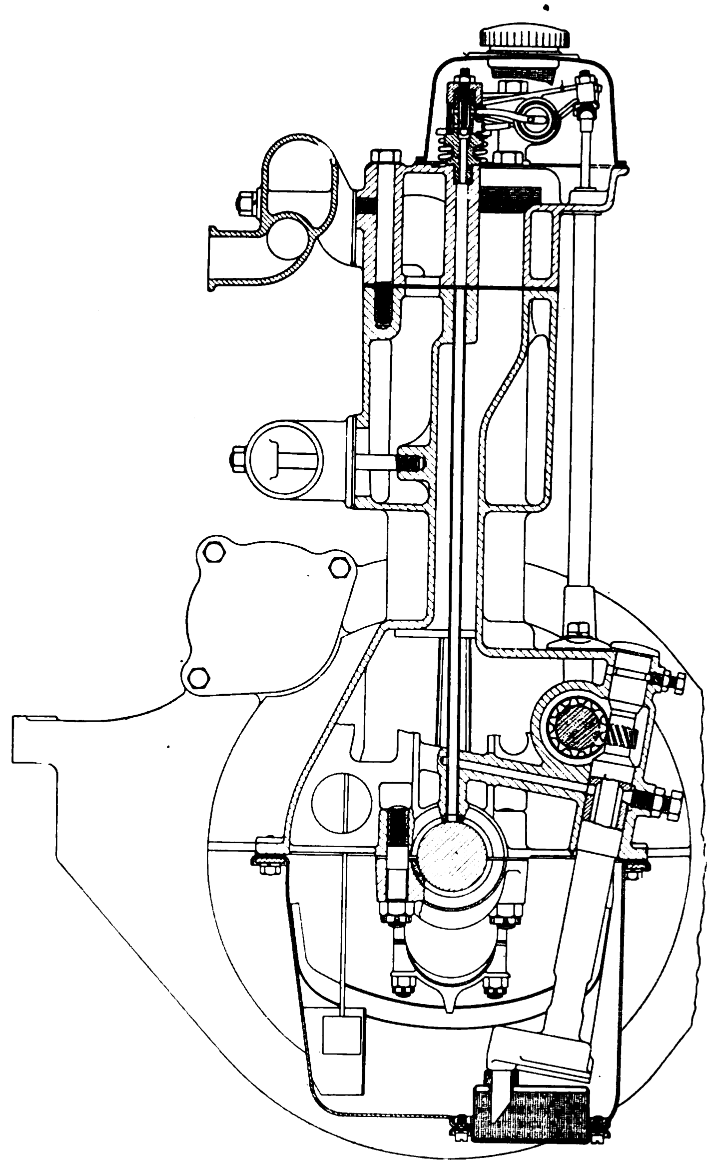
The combustion chamber surfaces are completely machined, so they will be alike in dimensions and finish. The cylinders are tested with the scleroscope and must show 38 points of hardness after annealing. This is rather hard for cylinder metal from the machining standpoint but gives extra endurance in service. The cylinder head is fastened to the block by thirteen heat-treated cap screws.

The pistons are also of hard, grey iron, ground to size and heat treated to eliminate internal stresses. They are held within narrow weight limits and are fitted with three piston rings 3/16 in. wide, all three being located above the piston pins. These latter are of case hardened steel, ground to size, and are full floating. In production they are inspected with Johansson snap gages and are held to tolerances of 0.0005 in. The scleroscope reading on these pins must be at least 80.

The connecting rods are drop-forgings of I-beam section, heat treated to a tensile strength of more than 100,000 lb. per sq. in. The center-to-center length is 11 in., or 2.2 times the stroke. The connecting rod bearings are 2 in. in diameter by 1⅞ in. in length. They are of die-cast babbitt in bronze shells. The bearing caps are held by nickel steel bolts and castellated nuts. Laminated shims are used as spacers between the bearings and caps for adjustment. In manufacture, the connecting rods are balanced against each other, not only as regards their total weights, but also as regards the weight at each end.

Medium carbon steel is utilized in the three-bearing crankshaft. The shaft diameter varies from front to rear, the three bearings being of 2 in., 2 1/6 in. and 2⅛ in. diameter respectively. The center bearing is as long as the front bearing; that is, 2½ in., while the rear bearing is 3⅜ in. in length. A large oil throw off ring is fitted at the rear, in connection with a special bearing cap construction, to eliminate oil leaks at the rear end. The shaft is put in both rotative and static balance before assembly. One of the features of the shaft is the lightness secured by drilling a 1½-in. hole through the crankpins.

The camshaft is also a three-bearing unit with integral cams ground to size. The cam has a spiral angle contour which is said to insure quiet operation in spite of considerable variation in tappet adjustment. The camshaft runs in cast iron bearings which vary from 1 13/16 in. diameter at the front to 1 11/16 in. at the rear. The center bearing of the camshaft is in two sections, between which is a helical gear for driving an oil pump. This gear is cut in the shaft and runs in a pocket of oil. End play of the shaft is taken up by spring pressure acting on a hardened button in the end of the shaft.



Transverse sectional assembly of new Gray-Beall 3½ by 5 in. overhead valve engine

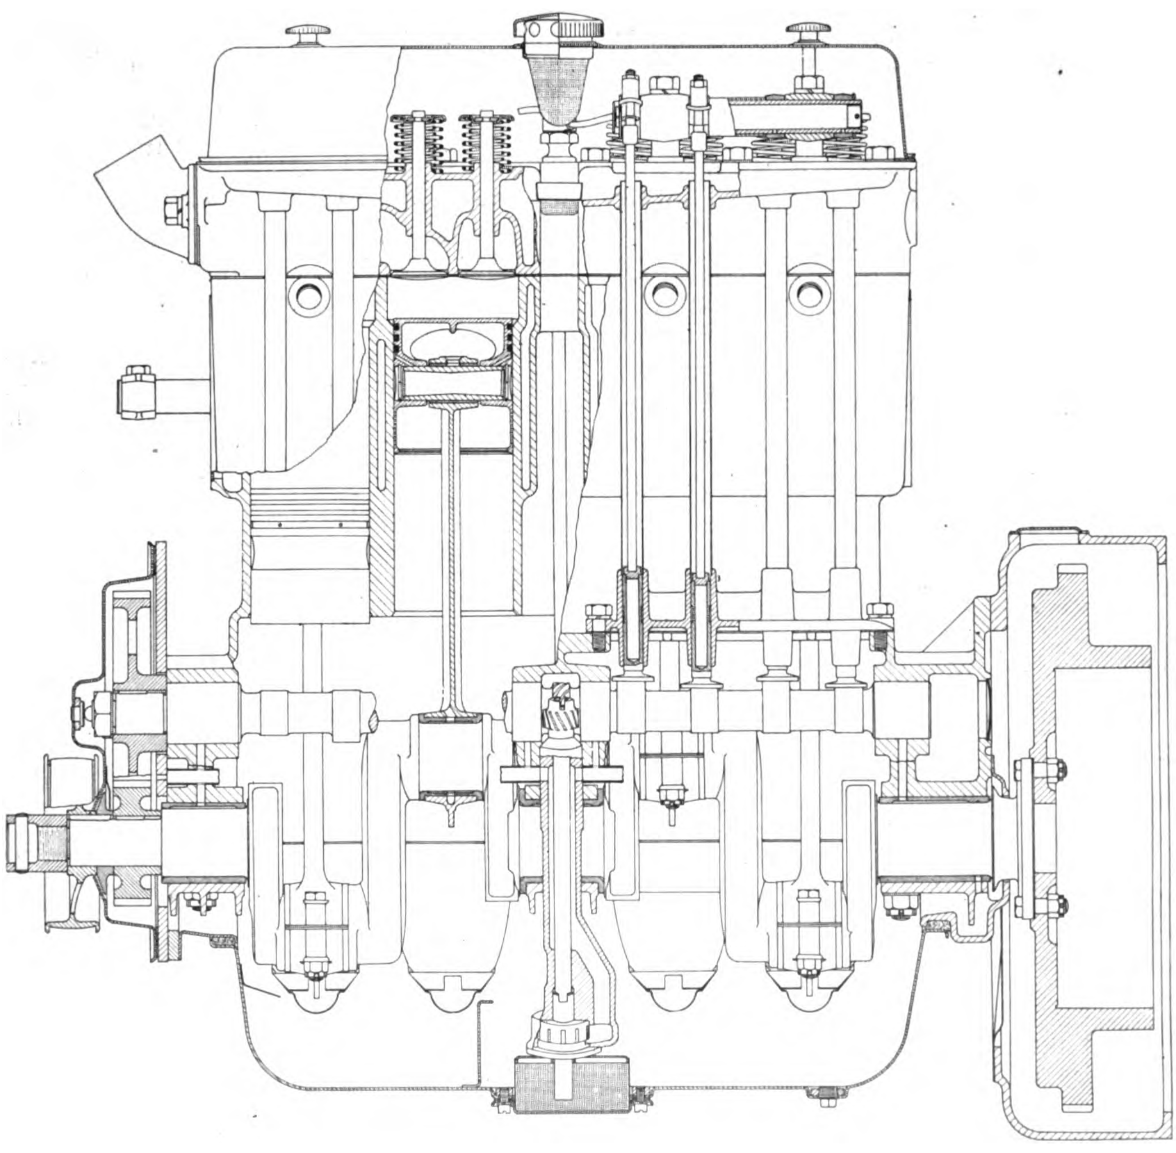
Each push rod is enclosed in a steel tube connecting the tappet guide with the cylinder head and cap inclosure, thus providing a dust-proof valve mechanism. The valves are operated by rocker arms on a 1-in. hollow rocker shaft mounted overhead. The rocker arms are of forged steel, pack hardened, and the holes in them are ground out. The fit of the rocker arms on the shaft, which is also hardened and ground, is held within 0.0005 in.

Lubrication is by pressure feed. The oil pump is located in the pan and is supported from the crankcase above by a removable shaft and housing. After passing through the screen and pump, the oil is forced up through the pump shaft housing and is conducted to the crankshaft and camshaft bearings through drilled holes and cast-in steel pipes. There are no copper pipes, or oil connections used at any point. It is not necessary to unfasten or remove any connections to take out the oil pump.

The oil is also forced to the three helical timing gears and to each of the connecting rod troughs in the splash pan. These are of special design, so arranged as to prevent the oil from splashing out laterally and also to keep the trough from emptying itself when the motor is severely jolted while passing over a bump, or running on an incline. The oil level in these remains constant when the engine is inclined, so that it is possible to install the engine for a straight line drive without interfering with the lubricating system.

In working out the design of the engine with a view to facilitating its use on different chassis, the timing gear cover was so arranged that it may be removed without disturbing the front engine supports. The bell housing is an S. A. E. No. 3. The oil pan can be removed quickly and easily without disturbing the front end supports, and either thermo-syphon or pump water circulation may be had. Ordinarily, thermo-syphon is provided, but provision has been made for the installation of a centrifugal water pump. The oil pump shaft has been extended and a mounting provided in such a way that a governor or distributor can be fitted on the side of the cylinder block without interfering with other accessories.

This engine, known as the Gray-Beall, is named from the combination of the Gray Motor interests with F. S. Beall, formerly vice-president of production at the Packard company. It is this engine which will be incorporated in the car to be produced by this same concern, with which F. L. Klingensmith, formerly vice-president of the Ford Motor Co., has associated himself.



Longitudinal section of new Gray-Beall 3½ by 5 in. overhead valve, rocker arm engine

French Propaganda Against the Straight Side Tire

Evidently the American tires left in Europe by our army are gaining popularity to an extent that has alarmed the French tire makers, who prefer the clincher type. Here is the protest of the French maker and an answer based upon experience with American tires.

SEVERAL of our French contemporaries, including Omnia and La Vie Automobile, have recently printed articles in which they attempt to convince their readers that the straight side pneumatic tire as manufactured in large numbers in this country, is far inferior to the clincher type of tire, the European standard, and has practically no merits at all. The straight side tire is used in the United States exclusively for all sizes above 30 x 3½ (31 x 4) in.

During the war large numbers of American cars with straight side tires were exported to France, and the replacement of these tires alone creates a considerable demand for the straight side type. It seems, moreover, that French users, having become acquainted with the advantages of this tire, are demanding it as regular equipment on new cars. This move is being fought by the French tire industry. As it is well for our tire makers (who believe in the straight side tire) to know what arguments are being put forth against it abroad, we reproduce below the article of La Vie Automobile in translation. The original article was appended to one describing the Michelin cable tire, thus revealing the evident source of inspiration.

By Charles Faroux

ALL of the pneumatic tires employed in France for a long time have been of the soft bead or clincher type. As every one knows, they are mounted on a rim having on each side a sort of internal clincher in which the round portion of the bead engages. Placing a clincher tire on a rim is made a very easy matter by the use of suitable levers.

In America use is made chiefly of so-called straight side tires, or hoop tires. The covers have no projecting beads. Near the edge of the covers a metallic core is embedded in the bead, thus preventing the diameter of the cover on the bead side from varying one way or the other. The rims which go with these tires comprise two flanges which may be made independent of the rim.

Mounting of the tire on the rim is possible only if the rim is detachable. In the systems in most common use one of the flanges may be detached from the rim; the flange which was removed is then replaced and is secured in position by means of a locking system.

This American system was almost unknown to us before the war, but the throwing onto the market of a larger number of American vehicles made it known in our country. At the present time a large number of vehicles in service in France are fitted with straight side tires.

Thus the pneumatic tire situation has been complicated, for to the single system formerly in use there has been added an entirely different system, which compels dealers to carry a double stock in order to be able to meet all demands.

Is this complication justified by any superiority of the American system? Not at all—quite the contrary. The two kinds of tires do not differ one from the other except by their methods of fastening; outside of the beads they are exactly alike in construction, and provided workmanship and material are the same, the American and European tire are equivalent. There remains the question of the fastening means.

The European method is simplicity itself, as already pointed out; with it there is no need for a complicated equipment for putting on the tire. Besides, the single piece rim is inexpensive and substantial.

On the contrary, the American tire absolutely requires either a detachable rim or else a rim which contracts temporarily while the tire is passed over its flange.

Disadvantages of the Straight-Side Tire

Straight-side tires entail the use of a relatively complicated rim, which necessarily increases the weight of the wheel at the rim and, consequently, its moment of inertia.

The farther away from the axis the weight of the wheel is located the longer will be the lever arm which moves the weight in its rotation, and the greater the effort required to get it up to speed. Inversely, the greater the amount of energy stored up in the wheel once it has been brought up to speed, the more violent must be the braking action, and the disadvantages of a road wheel acting as a flywheel are well known; it is these disadvantages which have led to the almost complete abandonment of the numerous designs of demountable rim, which apparently are more attractive than the demountable wheel.

It is easy to measure the power required to start a wheel when fitted with a clincher and straight side tire respectively. Experiments made by Michelin were conducted with two wheels identical up to the tires, in which the difference in weight at the circumference amounted to 23.43 lb.

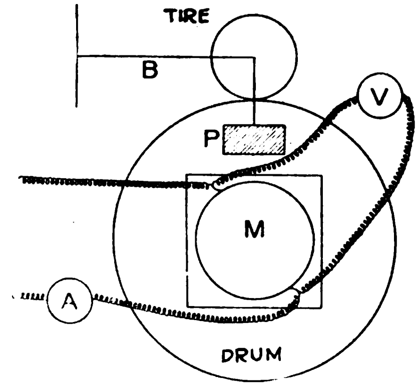


Fig. 1—Machine for testing tires as regards rolling resistance

Account of Test

The tire loaded with a weight P of 1100 lb. is carried at the end of a lever arm B. It

rests on the surface of a drum which turns at a peripheral speed of 30 m.p.h. The drum is driven by an electric motor M. It is possible to measure the power absorbed by the motor by means of a voltmeter V and an ammeter A. The tire is first raised in such a manner that it does not touch the drum on which it bears. On the voltmeter and ammeter are read off the power consumptions corresponding to starting and normal running. Chronometer readings are taken of the time elapsing before the starting point and the normal speed are attained.

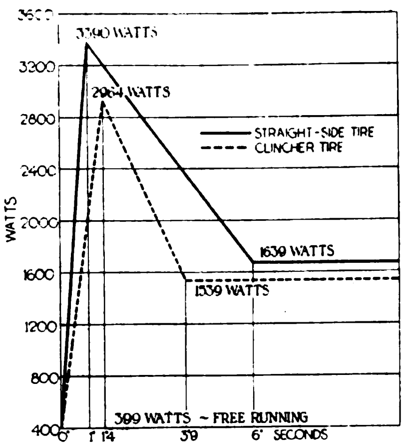

Fig. 2—Rolling resistance as measured by the machine shown in Fig. 1

The results of the experiment are plotted graphically in Fig. 2.

1—On starting the straight side wheel takes 426 watts more than the clincher wheel. This is more than ½ hp. and is enormous (1 hp. = 746 watts).

2—The normal speed is attained by the clincher tire at the end of 3 m. 9 s., and by the straight side tire at the end of 6 m.

3—At normal speed the straight side tire takes 100 watts (1/7 hp.) more than the clincher.

The phenomena observed at the moment of starting are reproduced, in an inverse sense, when the brakes are applied. The figures cited above refer to one wheel; the car has four of them; therefore, these figures must be multiplied by four in order to get an idea of what is going on on a vehicle. The phenomena above described take place not only on starting and braking but at every acceleration and deceleration, with reduced force.

Mechanism in the Mud

Aside from the disadvantage due to the greater inertia of the straight sided tire, there are disadvantages of a practical nature in connection with the mechanism. The rim of a wheel is extremely close to the ground, and, consequently, whatever you do, this rim is constantly covered with mud. The result is that all parts not protected by paint are quickly rusted. Now, the mechanical parts which hold the removable flange of the American rim in place—studs, nuts, lugs—are necessarily rusted, as it would be impossible to cover the threads of the nuts, for instance, with paint. As a new tire fitted to a wheel may remain in place for months, the difficulties encountered in trying to operate this rusty hardware, after having been in use for three months during the winter, in the mud of the suburbs, may readily be imagined. Every thing is locked and frozen by rust, and it is necessary to develop superhuman efforts to separate the parts from each other.

The tire dismounted, we are not at the end of our trouble, as it is necessary to fit a new cover to a rim completely covered with rust; if it should happen that the removable flange of the rim be slightly distorted, which is almost certain to be the case if it had to be removed with hammer blows, we can readily imagine all the fun which we will have in performing this operation.

Americans having the reputation of being practical people—a reputation sometimes ill deserved (see the kind of order that obtains in the heaps of merchandise in the American camps)—how is it that this extremely practical people continue to make use of such an unhandy tire?

Simply for the reason that automobiles are not used in the same way in America as in Europe. An American who has had a break-down never occupies himself, so to speak, with his car. If it balks he leaves it where it is, at the side of the road, and telephones to the nearest garage. The repairman arrives, takes the disabled car in tow, if necessary, hauls it to his shop and makes the repair.

This is the mode of procedure which is applied as well in the case of a tire blow-out as in that of a broken rear axle. The shops, consequently, are well equipped to do any kind of repairs. It is readily conceived that with an elaborate equipment the replacement of a tire, however defective its method of mounting may be, does not require much time. In any case, the owner of the car never soils his hands, and, consequently, he does not suffer from the disadvantages which the system presents.

On the other hand, it must not be believed that all Americans ride on straight side tires. In the cities, it is true, these tires are being used, but in the country, where the farmers use their Ford or similar vehicle in their daily work, these vehicles have wheels fitted with good old clincher tires; exactly the same as European tires.

Let us, therefore, not complicate the task of our manufacturers, to our own great detriment, by compelling them to carry two complete series of tire models. In the final analysis it is your own pocketbook which carries the burden of this complication.

The European tire has proven itself clearly superior to the American tire; let us stick to it and if the hazards of the liquidation of stocks have brought us into possession of a vehicle with straight side tires, let us not hesitate on the first occasion to have the special rims—however complicated and ingenious they may be—replaced by good old clincher rims, which will enable us to find tire replacements at the store of the nearest dealer.

Advantages and Safety of the Straight Side Tire

By P. M. Heldt

WE must first inform our confrère that he is very much mistaken as to the conditions under which cars are used in the United States. That they were used mainly in the cities may have been true twenty years ago, but we have moved ahead somewhat since the beginning of the century, in road construction as well as in automobile manufacture. There are now close to nine million automobiles in service in this country and we do not believe that our manufacturers would ever have succeeded in finding purchasers for so many if the owners did not have sufficient confidence in their cars and in themselves to drive more than a few miles away from a garage. That it is the common practice of American motorists, when suffering from a flat tire, to call up a garage is absurd.

Of course, we prefer to do our tire mending at home or in the garage to doing it on the road, and for that reason we carry demountable rims, but we fully believe that French motorists also prefer to do their tinkering at home at their leisure. That Americans are poor mechanics, as stated by Omnia, is untrue. It does not require any high degree of mechanical skill to operate an ordinary detachable rim, and the average American

is fully capable of removing either a straight side tire or a clincher tire. The American farmer, particularly, is probably more self-reliant and capable in mechanical matters than any class of European motorists except those with machine shop training.

The difficulty of applying and removing straight side tires is greatly exaggerated. Sometimes, if a tire has been in place on the rim continuously for a year or more, it may be rusted on and, therefore, hard to dislodge, but this is so whether the tire is a straight side or clincher type. This is naturally a rare occurrence. Ordinarily, after the straight side tire has been on the wheel for some time, it slides right off the wheel and on again and it is incomparably easier to handle than the clincher tire.

There are a number of positive advantages in the straight side tire, without which it would never have been made the standard of the American tire industry. First comes the factor of safety. It is obvious that in case of a sudden deflation a tire with a non-extensible bead (straight side) cannot be wrenched from the rim so easily as a flexible bead tire (clincher). The danger resultant upon shedding a tire when going at high speed is well known.

Another important advantage of the straight side tire is its greater immunity from damage when run under-inflated. The edges of the rim of a clincher tire have a tendency to gouge into the tire when the pressure of inflation is suddenly released. In the straight side tire, where the edges of the rim flanges flare outwardly, there is no such tendency, and rim cutting is, therefore, practically eliminated. Under-inflation is the abuse which is responsible for many cases of unsatisfactory tire service, and it is far less injurious to the straight side than to the clincher tire.

Observations of tires of otherwise substantially equal construction but with straight sides and clincher beads, respectively, have shown the former to be substantially longer lived. S. P. Thacher, technical assistant to the president of the United States Rubber Company, says on this point:

"In studying the reasons for this difference, we have come to the conclusion that they lie in the better structural arrangement of the plies of fabric or cord at and above the bead proper and in the larger volume of air carried by the straight-side type. These are the basic reasons, and they explain the margin in favor of the straight-side when tires of both types go through a road test without injury. The margin becomes still greater if the tires are run flat even the minimum distance required to stop the car after a puncture or cut has occurred. Under these conditions the deflated straight-side tire lies naturally over the out-turned flanges of the rim without injury, while the inturned flanges of the clincher rim cut and chafe many miles out of the clincher tire."

The superiority of the straight-side over the clincher type of construction is emphasized by its use in the giant truck tires. It is the firm conviction of our tire makers that tires of 8 in. and greater width would be impossible with clincher beads, as the tire would not have the required support on the rim, causing a certain lateral instability of the vehicle.

The reference to "rusted hardware" is hardly calculated to strengthen the argument of our French contemporaries. A clincher rim is no less "hardware" than the detachable rim and just as likely to rust. Such catch phrases prove nothing. We remember M. Michelin using the same mode of attack against rubber non-skid treads which he referred to as "sculptured tires," but this did not prevent the success of these treads.

The best answer to the French allegation that the straight-side tire is a makeshift which can be changed conveniently only at a garage furnished with elaborate equipment, is that there are hundreds of thousands of motorists in this country successfully using straight-side tires who never think of going to a garage or tire station to replace their tires. American tire manufacturers are not ignorant of the features of the clincher tire, as they have produced many times more such tires than European tire makers. The straight-side tire is based on the old Dunlop bicycle tire which had steel cables in its retaining edges to make them inextensible. American manufacturers supplied the detachable rim and combined it with the inextensible edged tire. This combination has become the standard of this country for all except the smallest size of automobile tire. According to late information, it has been placed in production by at least one British and one French firm, and we feel quite sure that if we ever come down to a single universal standard for pneumatic tires for automobiles it will be the straight-side tire.

Why the French Automobile Production Program Failed

(*Continued from page* 691)

of new trucks is even more difficult than the sale of passenger cars. French manufacturers feel that they have been made to suffer unnecessary hardships by these Government sales, and there is no doubt that there is a large element of truth in their contention. The sale of these army stocks has been woefully mismanaged, but this, of course, is not any consolation to the manufacturers who find themselves obliged to cut their production 75 per cent.

Dealers who have attempted to get on the French market with American cars and automobiles have not had a happy experience. For a long time imports were prohibited; then a 70 per cent duty; then, to make matters worse, exchange rates rose from 8 francs to the dollar to 17 to the dollar, to fall to the present comparatively high rate of 14 to the dollar. As a consequence, the sale of American passenger cars on the French market is now at a standstill, and the numerous dealers who got into this line at the armistice, as the result of the experience they had had during the war with American cars, have either been forced out or, if they possess the means, are waiting for an improvement in the future.

Ford has a rather special position and has remained on the market, for, although the price increased from 10,500 francs at the armistice to more than 20,000 francs, falling to the present price of 13,900, this car has continued to undersell French makes. Last year Ford suffered as much from the general depression as any others, the volume of business in 1920 being lowest on record.

For a time the tire field looked very promising, but even here immense sums have been lost. Up to the middle of last year the tire factories were unable to meet demand and American makes were sold readily. Firestone, U. S., Oldfield, Ajax, Fisk, Braender were some of the makes unknown here before the war which got on the market, either directly or through dealers. When the slump came many of the individual dealers found themselves with large stocks and had to sell out at very heavy losses. These deals have temporarily demoralized the French tire market.

New High-Grade British Chassis Is Designed for Production

Is equipped with four cylinder 3⅜ x 5-5/16 in. engine developing 40 h.p. at 2000 r.p.m. Overhead valves and detachable head are employed. Aluminum cone clutch without facing runs in oil. Clutch and gearset are easily dismantled for repair. Cantilever springs are mounted inside frame. American and British practice combined in design.

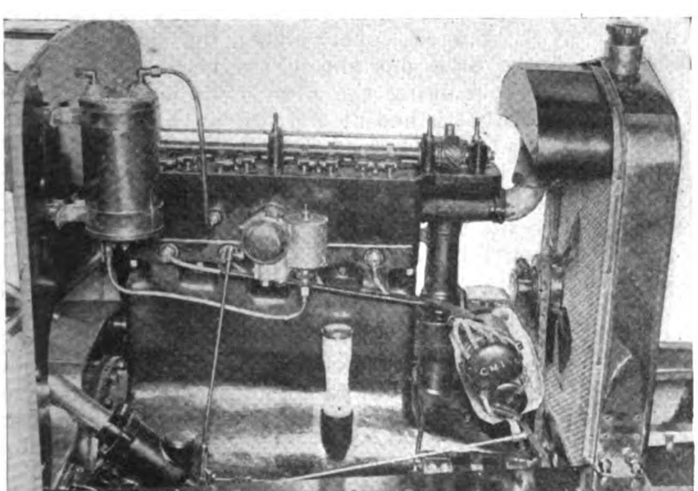
By M. W. Bourdon

THE criticism leveled, generally with good reason, against British chassis designs of all sizes and prices, i.e., that production costs are given insufficient consideration, cannot be applied to the new 18 hp. Phoenix. True, there are points where further economy is possible, as might be expected in a first attempt to design a chassis which shall be economical to produce and at the same time comply to the full with British standards in respect to efficiency, smoothness of running and ease of upkeep. This new model is not put forward as a cheap car, but as one of high-grade designed to make and sell at a reasonable figure; it is attracting the keen attention of a number of British manufacturers, who are only now coming to realize that economical production is absolutely essential to future success and that it can be attained without sacrificing ideals in other directions.

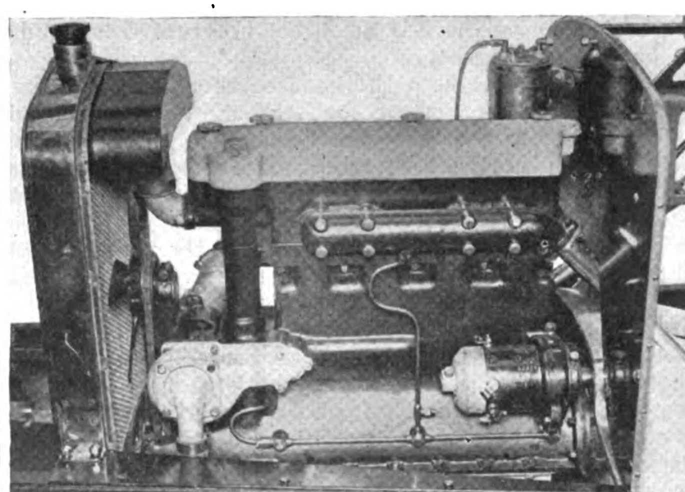
It is a subject for remark that Phoenix should be the first British manufacturer to make radical departures in order to reduce manufacturing costs while increasing engine efficiency, and that, too, in a chassis of medium power, for this maker has not in the past been renowned for up-to-dateness in design—even on British standards. The plant is modern, but Phoenix design has hitherto been more in accord with the length of time the firm has been in the industry—nearly twenty years. Further, the largest car yet made has been a 12 hp. with three seats abreast.

The new model, which sells at $3,200 with five-passenger body, has a four-cylinder block cast engine with overhead camshaft, valves in line and a detachable head. Bore and stroke are 85 x 135 mm. (3⅜ x 5 5/16 in.) and a power output of 22 hp. at 1,000 r.p.m. is claimed, and 40 b.hp. at 2,000 r.p.m. The camshaft is carried by four plain bearings, one at the rear, one central and two at the front—one of the latter at each side of the helical driving gear, which has a ball thrust. Camshaft bearings are lubricated by pressure through an exterior pipe leading direct from the pump to a union on the side of the cylinder head and thence by an internal duct to the central bearing; a small bore pipe runs from the latter to the end bearings with spray jets on to the cams and rockers.

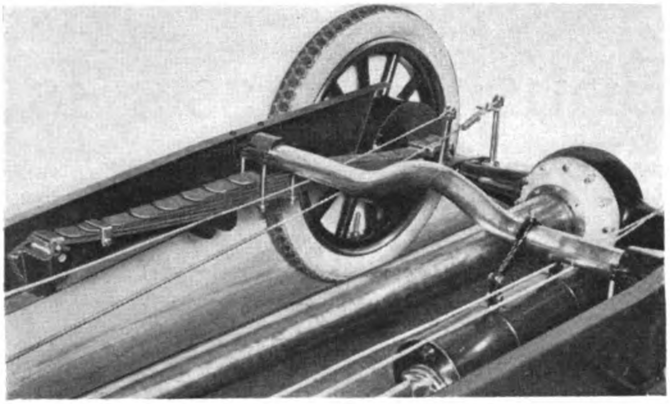
A feature is the design of the rockers, each of which may roughly be likened to a long link from a roller chain, with one end roller internal to form a bush and a third roller to which the cams apply offset between the two end ones. At present the rocker is built up of steel side plates, hardened steel pins and two hardened steel rollers, a bronze bush forming the pivot bearing; and here is an opening for economy in production which could probably be made use of by getting a detail on



Right side of new 18-hp. Phoenix engine. Overhead camshaft has four bearings and is driven by helical gears. Magneto ignition is used. Note recesses for nuts on inverted holding-down studs



Left side of Phoenix engine, showing water pump bolted to facing on block casting of crankcase and cylinders. Cored passages make hose connections between engine and pump unnecessary



Cantilever springs on new Phoenix chassis are located inside the frame. Trunnion bearing at center has oil-less bushing bearing upon the tubular cross member of the frame. Ends of springs have sliding contact on axle and frame bracket. Side member of frame is cut off short to give clearance to brake drum on wheel

the same principle made by a roller chain maker. The rockers are mounted in pairs and pivot at the ends opposite to the valves on short shafts in separate brackets attached to the top of the head. Thus low cams are used with the lift increased in the actual valve opening.

Valve clearance is adjusted by a cap screwing on to the threaded valve stem and locked by coned contact between it and the spring plate, the latter having a dowel which fits into a groove in the valve stem to prevent it from turning during the process of adjustment. There is scope for economy here also since it appears that but for the advantage of roller contact between rocker and valve—which is certainly worth considering—no benefit arises from this arrangement.

The cylinder head is held to the block by inverted studs ½ in. diameter and nuts; 5 on each side pass through the top of the block, the latter having exterior recesses for the nuts. The elimination of central studs is an innovation—in England at all events—and has two advantages (1) increased area gasket contact faces around the cylinder bores and (2) shorter studs of larger diameter. It is an arrangement which also simplifies the appearance if not the machining of the head in overhead camshaft designs. But obviously special precautions are needed to prevent distortion allowing leakage of water or compression at or about the longitudinal center line of the block, where there is no direct pressure from studs as usual.

Formed integral with the head casting is a trunk inclosing the upper end of the vertical drive-shaft and carrying two of the drive-shaft bearings, the other two being in a corresponding trunk extending up from the distribution casing and integral with the latter and the cylinder and crankcase block.

To enable the head to be removed and the valves taken out without disturbing the camshaft drive, the vertical shaft has a sleeve coupling secured to the lower half. Tongues on the shaft ends engage with slots in the sleeve and are offset from the shaft center line so that in reassembling the head it is impossible to upset the timing by coupling up the shaft half a révolution out. This is claimed to be a simple machining job without allowing backlash to occúr, but in the writer's opinion there is scope here for a small economy in the manner in which an undoubtedly excellent idea is carried out.

Magneto ignition is fitted, although the original intention was to use a dynamo battery system. The magneto has displaced the dynamo and the latter is therefore belt drawn, but by a separate belt from that driving the fan.

The top half of the crankcase is integral with the cylinder block and the housing of the cross-shaft for water pump and magneto drives. Three journal bearings support the crankshaft in the upper half of the crankcase, and these are fitted with die-cast liners of the same size as and interchangeable with those of the connecting rod big-ends.

Cast-iron pistons with three compression rings are used. The piston body is peculiar in that it is recessed and lightened by coring between the lower ring and the skirt. Hollow wrist pins float in the piston bosses, but are fixed in the small ends of the H-section connecting rods by a draw bolt engaging a shallow groove at the center of the pin. Three oil holes run from the bottom edge of the lower ring groove at each side to the interior of the unbushed piston bosses.

Pump water circulation is used. The pump casing has a self-adjusting gland and is bolted to the cylinder block with a cored passage to the water jackets, thus avoiding the need for separate pipes or connections between the two. Special precautions are taken to prevent water leaking into the crankcase, there being a drain hole in the pump shaft casing and a reverse groove in the cross-shaft bushing. The honeycomb radiator, in this model normally located, instead of being at the front of the dashboard as in the older models, has its shell and core separate, the latter being supported inside the steel shell at three points on rubber cushions.

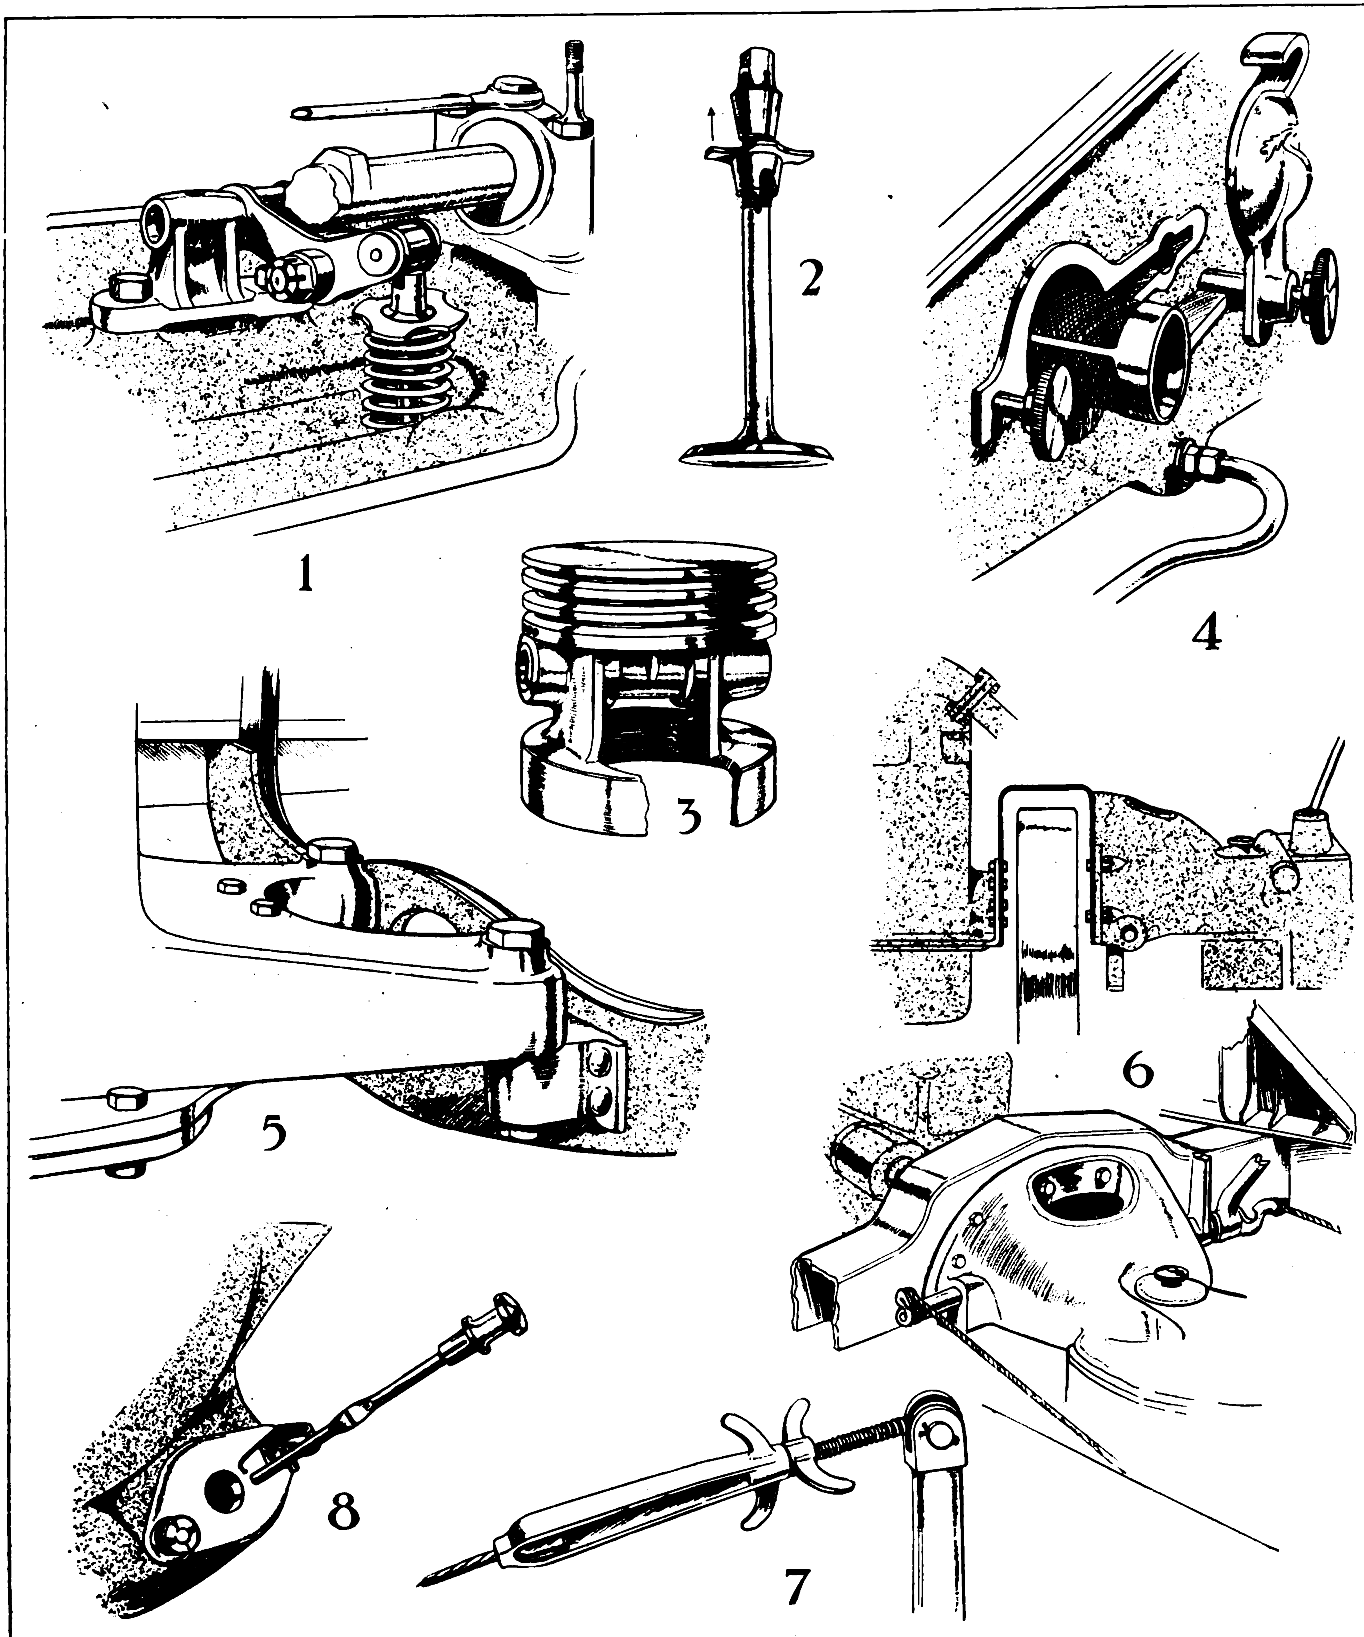
Engine lubrication is maintained by a modified trough system, for although troughs are used under the big ends, the oil is carried by direct exterior leads to the main journal bearings and to the overhead camshaft. The excess of oil fed to the camshaft lubricates the vertical and cross-shaft bearings and gears in returning to the crankcase. The oil pump is driven by a lower extension of the vertical driveshaft for the overhead valve gear.

Another special feature lies in the mounting of the oil filter, located at the bottom of the sump. It is a cylinder of gauze with its inner end closed and its open outer end making contact with the inner wall of the sump opposite a hole from the outside of which the oil suction pipe leads to the pump. Although the filter is submerged, it can be withdrawn in five seconds for cleaning without draining the oil. An inch or so above the high level of the oil is a round hole in the sump wall with a slot extending from one side, the opening being normally enclosed by a flanged cover plate; by slackening two knurled finger nuts, one end of the plate can be swung upward, thus bringing the filter cylinder opposite the hole. An arm, attached at one end to the bolt which is fixed in the pivoted end of the cover plate, carries the filter attached at the other end, as will be seen from the cut. When the filter arrives at this point, its arm or bracket and the cover plate can be withdrawn as a unit, the slot from the side of the hole allowing the arm to pass through.

While this filter arrangement is more costly than a cylinder of gauze with a flanged outer end bolted over the outlet hole to the suction pipe, it overcomes, without great expense, and with the advantage of still being on the suction side of the pump, the great objection of users to submerged filters which cannot readily be cleaned or inspected.

Engine and gearset are not truly a unit, for they are separately bolted to the front and back, respectively, of an inverted channel section crossmember of the frame. This is a deep bridge-like pressing, which half encircles the flywheel located within the channel. The arrange-

Details of Parts of New Phoenix Chassis



(1) *Overhead camshaft and valve gear.* (2) *Combined spring anchorage and clearance adjustment on threaded valve stem.* (3) *Lantern type cast iron piston. Note oil holes for lubricating piston pin.* (4) *Oil filter partly removed. It is easily taken out for cleaning without draining oil from sump.* (5) *Front engine brackets bolted to cross member of frame.* (6) *Two views showing method of mounting engine and gearset. They are both attached to the channel section pressed steel cross member, thus forming what is in effect a unit powerplant.* (7) *Brake cable adjustment and locking device.* (8) *Oil filler and level gage on rear axle*

ment allows either the engine or the gearset to be detached independently of the other, and yet has most of the advantages of unit construction. The clutch pit is inverted, being open below and enclosed above, though a hole in the top (which is integral with the upper half of the gearset casing) allows the clutch coupling and striking fork to be reached or seen from above.

The clutch is of the cone type, the driven member being of aluminum without fabric or other facing; it is enclosed and runs in oil within the flywheel, with a ball-bearing pilot. The aluminum-to-iron cone clutch has been a successful feature of Phoenix cars for many years past. Between clutchshaft and gearset is a single fabric disk coupling and this, together with the open-bottomed pit, allows the clutch as a unit to be dismantled and lowered clear in five minutes without disturbing any other detail. Similarly, the lower half of the gear-casing, being held up to the top by six bolts and nuts, can be lowered independently, bringing the layshaft with it and also bottom half of spherical housing of torque tube.

Three speeds are provided with central control lever, the six-spline shafts and the pilot end being carried on ball-bearings. The gear-casing is divided horizontally on the mainshaft bearing center line; the bottom half forms the housings for the layshaft and reverse shaft bearings and also half the housings for main shaft and torque ball at the end of the propeller shaft casing. The gearset overhangs from the crossmember, to which it is bolted, more than seems advisable, and this shortcoming is not mitigated by the fact that it takes torque and thrust from the propeller shaft casing.

The universal joint is of the plain bushed star type, directly lubricated from the gear-casing. Final drive is by spiral bevel, with the pinion formed solid with its shaft, the latter having a sliding coupling connecting it to the propeller shaft.

Two steel pressings welded together form the tapered torque tube, which is bolted to the aluminum front cover of the axle center. Steel pressings welded together on the vertical center line also form the casing of the full floating axle, with the differential, crown bevel and pinion mounted on a front cover of aluminum. At rear of the center is the usual oil-filling elbow on a detachable aluminum cover, the elbow cap embodying a bayonet gauge for oil level indication. The axle shafts are splined at each end and convey the drive through dog clutches to the pressed steel hubs which are mounted on Timken bearings. The front hubs are also steel pressings and run on Timken bearings.

All steering joints, spring shackles, clutch and brake-shaft bearings have oil-less bushings. The steering gear is of the worm and full worm wheel type with axial adjustment for the worm shaft, the housing being bolted to the front face of the crossmember between engine and gearset.

Both sets of brake shoes apply within the rear wheel drums, and are actuated by steel cable connections with adjustment at the rear ends. Full cantilever springs, 49 ins. long, are located inside the frame, are used at the rear, and semi-elliptics, 36 ins. in length, at the front. The cantilevers are pivoted with oil-less bushes on a tubular crossmember. Their front ends slide within pivoted brackets and rear ends slide within a fixed bracket on the rear axle, the sliding surface being lubricated from an oil well. The wheels are of the detachable pressed steel and hollow spoked pattern, with 815 x 105 m.m. tires (32 x 4 ins.).

Fuel is fed by vacuum from a 15-gal. tank arranged longitudinally inside the frame. A large filling spout, containing a combined filter and gauge, projects through the right-hand step-board.

The standard body is a five-passenger open type, upholstered in leather. This has the usual one-man top and divided windscreen with swinging upper panel. Beside the usual equipment, which includes a speedometer, spare wheel and tire, luggage-carrier and electric horn, a folding tonneau screen is provided, an item which is for the first time included in the standard price of a British car—and, so far as the writer is aware, in that of any car, irrespective of country or origin. But it is an item which many people maintain is as essential for completeness of equipment as is a front screen for the driver and his companion.

One of the designers of this new chassis is a man at one time with a British automobile firm whose cars are world-famed. He has lived temporarily in the United States, studying American production methods, which fact justifies the opinion of observers that American and British brains have collaborated in evolving the new Phoenix.

Effect of Varying the Number of Plies in Plywood

In making up plywood for a particular use the question frequently arises, Should three plies or more than three be used to obtain the required thickness? Some data from tests by the U. S. Forest Products Laboratory may be of assistance in answering this question.

An increase in the number of plies results in a decrease in the tensile and bending strength parallel to the grain of the faces and an increase in the corresponding strength at right angles to the grain of the faces.

If the same bending or tensile strength is desired in two directions, parallel and perpendicular to the grain of the faces, the greater the number of plies the more nearly the desired result is obtained. It must be borne in mind, however, that plywood with a large number of plies, while stronger at right angles to the grain of the faces, cannot be so strong parallel to the grain of the faces as three-ply wood, and hence a three-ply panel is preferable where greater strength is desired in one direction than in the other.

Where great resistance to splitting is necessary, as in plywood that is fastened along the edges with screws and bolts and is subjected to forces through the fastenings, a large number of plies affords a better fastening.

It is common experience that a glued joint is more likely to fail when thick laminations are glued with the grain crossed than when thin laminations are glued. The same weakness exists in plywood when thick plies are glued together. When plywood is subject to moisture changes, stresses in the glued joint due to shrinkage are greater for the thick plies than for the thin plies. Hence in plywood constructed with many thin plies the glued joints will not be so likely to fail as in plywood constructed with a smaller number of thick plies.

It is reported from Christiania that the North Electro-Kemisk Aktieselskab, the works of which are at Tysse, has been experimenting with a special ferro-chrome alloy, produced electrically, which will not rust and which is not affected by most acids. The process of production is said to be so cheap that the new steel will not cost more than other kinds. The company, it is said, contemplates the establishment of works for the production of this steel.

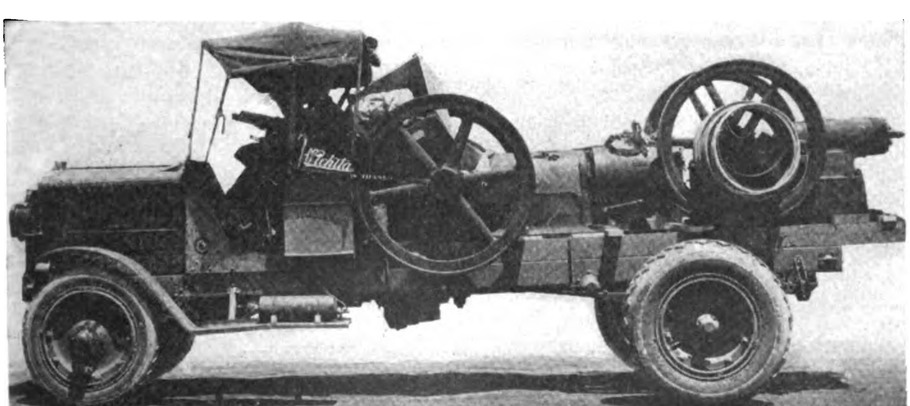
A Flexible Frame Truck Designed for Use on Poor Roads

Two and one-half ton job intended primarily for use in oil fields. Individual units protected against damage by frame distortion. Ample reserve power, unusual road clearance, and giant pneumatic tires featured.

ONE of the severest classes of service to which motor trucks are put is that in the oil fields. All of the material necessary for putting down a well, from the lumber for the derrick to the fuel required for the boiler, must be transported from the nearest railroad to the well location. This material varies in size and bulk from light hand tools to a boiler weighing more than 10 tons, the latter being used for generating steam to drive the drilling machinery.

When a well is once started, all of the material required must be delivered in an uninterrupted stream, for a delay may mean great loss. Where there are a number of wells going down in a field, the first well brought in has the biggest flow; each additional well put down weakens the flow of the others tapping the same pool. Therefore, if a well is brought in 10 days before its neighbors, and develops a flow of 2000 barrels, it will have a total flow of 20,000 barrels more than any of the others in the same field. At $3.00 per barrel, this represents a clear gain of $60,000. For this reason a well when once started is rushed through to completion as quickly as possible. Work is carried on night and day, no delay of any sort being tolerated. It is not unusual to pay as much as $200 for transporting a much needed load of oil well material over 10 miles of a particularly bad road during the rainy season.

Trucks designed for use mainly in the cities have been found unsuited for this work, owing to insufficient reserve power, insufficient frame strength and flexibility, and insufficient road clearance. Practically all oil field transportation is done with 2½-ton and 3½-ton trucks with 3-ton two-wheel trailers, the majority of the material hauled, such as lumber, boilers, drill tools, and casing, being too long and heavy to be carried on the long wheelbase truck. For operation over soft roads, both truck and trailer are equipped with giant pneumatics, as they give better traction and do not cut in as deep as solids.



Wichita Oil Field Special with typical load

A special study of the transportation requirements of oil well operators has been made by the Wichita Motors Co., whose plant is located in the center of the oil field district. They began by making changes and alterations on their standard 2½-ton model and after thorough tests under working conditions, built some other trucks in which the weaknesses of those previously tried were eliminated. The final result was a specially designed 2½-ton truck, known as the RX Oil Field Special. The particular features of this truck are giant pneumatic tires, ample road clearance, a form of construction whereby the individual units are protected against damage from twisting and distortion of the frame, heavy sectional flexible frame and ample reserve power.

The greatest problem was to obtain the proper balance between motor size, transmission and rear axle reductions, and rear wheel diameter in order to obtain an ability that would not put too much of an overload on the worm axle and transmission, and still give sufficient tractive effort and road clearance to pull through bad places with a heavy load on truck and trailer. Frame breakage was another problem. Some of the frames on the first experimental models were fractured at three different points at once after only four weeks of service, in spite of the fact that they were reinforced with a ¾-in. truss rod. These fractures always occurred at a point in the channel where a rigid cross member or bracket was attached. It was not due to overloading, but to the constant twisting and distortion, due to the numerous chuck holes in the road, and as the cross members and brackets localized all these twists and distortions on the side channel, it was only a matter of time before fracture occurred, regardless of the section of the channel.

The frame now used is of the flexible type of pressed steel having channels 7 in. deep of 5/16 in. alloy steel stock. It is free to deflect and distort for practically its full length, there being only two rigid cross members, one at the rear ends of the rear springs, and the other close to the flywheel, the latter being used for supporting the pedals and control levers.

Bad effects due to extreme distortion are eliminated by making the radiator, hood, floor board and dash, and seat box, each a separate unit, having no connection to its adjacent units. This permits the whole front end to weave without straining or loosening any of these units. Three point suspension is used for the power-plant, which is a four-cylinder, 4¼ x 6 in. valve-in-head, detachable head type.

In order to insure perfect vaporization of the fuel used the entire intake

manifold is surrounded by hot exhaust gases so that the entering charge is certain to get sufficient heat to properly vaporize low-grade fuels. Connecting rod bearings can be inspected and adjusted through hand holes in the side of the crankcase. Ignition is by means of a single high tension magneto. Frictionless, elastic fabric universal joints are used throughout, as they require no attention or lubrication, and are impervious to oil and water. The engine is governed by a Duplex governor; the clutch is a cone type, leather lined, 15¾ in. in diameter, and is preferred because of its simplicity and ease of adjustment. The transmission, located amidships, is a four-speed direct on fourth, with pump aperture for attaching an air pump for pneumatic tires, and is suspended in the frame at three points. Hotchkiss drive is used. The rear axle is worm driven. Both brakes are internals, 2¼ x 18 in. in dimensions, and located at the rear wheels. The wheels are of steel, spoke type for solid tires, and disk type for pneumatics. The tire dimensions in the case of solids are 36 x 4 front, 36 x 8 rear; in the case of pneumatics, 36 x 6 front, 42 x 9 rear. The wheelbase is 160 in., but can also be made 135 in. The total weight of the chassis is 5900 pounds. A power or hand winch can be supplied as extra equipment, to be used for loading or pulling the truck out of a mudhole.

Besides the work for which it was specially built, the RX model has been found to be well adapted also for high altitude work around mines and in South American countries, such as Peru, Chile, and Bolivia, where in many instances trucks are required to start with a full load at a seaport and climb to some inland town at an altitude of 10,000 to 15,000 ft. The usual procedure for high altitude operation is to increase the compression. This is quite satisfactory if the truck is to remain at high altitudes, but if its duties require it to descend, the engine knocks, and generally performs badly. The Wichita RX Oil Field Special is said to have a sufficient reserve of power to take care of the loss due to altitude. There are now twenty-seven of these Oil Field Specials in operation in South America, and all are working at altitudes over 10,000 feet. Other lines of industry in which the transportation requirements are similar to those in the oil fields are the lumber industry and sugar beet farming and the Model RX truck has also found application in these fields.

An Automobile for Operating Over Snow

A HIGHLY successful automobile for operating over snow and ice was revealed at the French competition for motor sleighs. The machine is the invention of the French engineer Kegresse. The Kegresse invention is of the self-track laying type, but instead of an all-metal track use is made of a molded rubber band with a canvas base.

On the Citroens entered in the French trials, Kegresse used an endless rubber band having a width of 9½ in. and a length of 63 in. in contact with the ground. This band is carried on pulleys of 18 in. diameter, the rear pulleys, mounted on the ordinary axle shaft being the drivers, and the forward ones carried in a fork with radius rods for maintaining tension, being the idlers. The belt has a minimum thickness of half an inch, but is fitted with stiffening bands along each edge and with ribs to secure greater adherence, which give an increased maximum thickness.

The method of holding the band on the pulleys, and at the same time of preventing slip without unnecessary tension on the belt, is interesting. Teeth of rubber and canvas, with a certain mixture of cork, are formed on the inner face of the band. The pressed steel pulleys have rounded edges and are in pairs. The face width is 4¼ in. Two are mounted on the same shaft leaving a space between them of 1 in., and the teeth on the inner face of the endless band run in this space. The inner pulley of each pair is fixed, and the outer one has a tendency to move inward on the shaft as the drive is taken up. The tendency to slip is thus minimized.

Between the driving and the driven pulleys there are four pairs of rollers of 7 in. diameter and 4 in. face. Practically all the load is carried on these, for the idler pulleys, being mounted in a pivoted fork, are kept on the ground only by their own weight. A couple of broad straps encircling the axle and a cross frame member keep these pulleys in a slightly raised position.

The weight of the machine is such as to give a pressure on the ground of about 1 lb. per sq. in.

The ordinary steering gear is maintained, each front wheel being fitted with a very flexible laminated wood skid with laminated springs, the dimensions being roughly 11 in. in width by 4 ft. in length. Each skid is cut away in the center so as to allow the wheel to pass through to a depth of about 1½ in., so that on a hard surface the weight is taken on the pneumatic tires, and the skids only come into play when the tire has bedded in the snow to this extent. The skids are carried in brackets from the steering pivot and are free to swing to a certain extent, so if an obstacle is struck the skid swings up before it, and its flexible construction enables it to absorb the shock. The front springs of the car are maintained.

Two of the Citroens equipped with the Kegresse appliance had the normal gear ratio of 4½ to 1. The third machine had an additional reduction gear fitted, giving a total reduction of 9 to 1. All three machines operated over the snow, but the low gear reduction one was more suitable for work on the mountain side. The machines were brought down 63 per cent gradients and climbed 22 per cent gradients.

Influence of Nickel on Cast Iron

Best results obtained with alloy containing 1 per cent nickel, the increase in compressive and transverse strength amounting to 30 per cent, while tensile strength increases 25 per cent and the hardness 18 per cent. Effect of cobalt reverse of that with nickel, except in respect to hardness.

THE use of alloy steels has assumed great importance during recent years, and their properties have been the subject of numerous researches. The same does not apply to the alloys which may be obtained with cast iron. About all that can be found on this subject in the literature of the industries is a few general studies on the influence of titanium and vanadium on the properties of cast iron. The influence of nickel it appears has never been investigated, notwithstanding the fact that this metal has long been used in the manufacture of steel. Messrs. Buner and Piwowarski have endeavored to supply information on this subject and have reported the results of their experiments in *Stahl und Eisen*.

The metal used in the experiments of the authors was Swedish charcoal iron with a total carbon content of 3.90 per cent, of which 2.80 per cent was graphitic carbon, 0.048 per cent of phosphorus, 0.18 per cent of manganese and 0.69 per cent of silicon.

Fusion tests on masses of 100 grams, to which had been added 1.2 to 3 grams of nickel, showed that this metal readily forms an alloy at a temperature only 50 deg. C. higher than the melting temperature of cast iron. Operations were then continued on larger masses. In a graphite crucible 8 in. high and 4 in. in diameter at the top, 2250 grams of cast iron (about 5 lb.) were molten. The temperature was then raised exactly 100 deg. C. above the melting point, and the nickel then added in small fragments. The bath was agitated with a ring of carbon and the alloy was then poured into molds in such a way as to obtain test pieces of 20 mm. diameter and 650 mm. length.

Several batches were thus made in succession, with increasing proportions of nickel, not exceeding 2 to 3 per cent of nickel, however, as in that case the product becomes too expensive.

The test pieces were subjected to tension tests on a length of 600 mm. until fracture. After the fracture, chips were removed from one of the parts by means of a milling cutter for the chemical analysis, and a piece 15 mm. in length was sawed off for photo-micrographic purposes. From the remainder there were made two test pieces for shock tests and two cubes for compression tests. The shock tests were made with a Charpy 10 kgm. shock test machine and the compression tests with a Martens 50-ton machine. The pieces remaining after the shock tests, which measured 10 x 10 x 15 mm., served to determine the solubility in acids. They were subjected for a period of 24 hours to the action of a 1 per cent sulphuric acid solution and the loss in weight determined, as noted below.

From the other portion of the original test piece there were made smaller test pieces for flexure tests. After photomicrographic records had been taken of polished surfaces, hardness tests were made with the Brinell ball hardness testing instrument. The hardness was calculated by the following formula:

$$\text{H (hardness)} = \frac{P}{\text{surface}} = \frac{2P}{\pi D\,(D - \sqrt{D^2 - d^2})}$$

in which P is the pressure exerted (1500 kg.); D, the diameter of the ball (10 mm.) and d the diameter of the impression. The results of these experiments are summarized in the accompanying table.

The best results are obtained with an alloy of 1 per cent nickel. The transverse strength is increased 30 per cent; the compressive strength, 30 per cent.; the tensile strength, 25 per cent, while the hardness is increased only 18 per cent. An addition of nickel of 1½ per cent gave no advantage whatever, the influence of the nickel on the separation of graphite more than compensating for the favorable effect on the ferrite.

Metallographic studies showed that the metal presented the aspect of a good gray iron, with needles of graphite regularly distributed in a mass of ferrite and nice laminations of pearlite.

For the manufacture of high tensile cast iron for machine parts, gear blanks, etc., a cast iron containing 1.2 per cent of nickel may be recommended. That the melting point is raised 5 deg. is of no particular consequence in practice.

It was considered interesting to find out whether cobalt, which is used more and more in alloy steels and whose physical and chemical properties are very close to those of nickel, had effects similar to those of nickel when alloyed with cast iron.

The methods followed in the experiments were exactly the same as those in the experiments with nickel. Table I gives the results obtained. They are diametrically opposed to those obtained with nickel. The resistance to bending diminished rapidly, the tensile and compression strengths decreased somewhat, while the hardness is slightly increased. These results are in accordance with those of the chemical analysis. Cobalt retards the separation of the graphite and favors the formation of carbides. Therefore the use of cobalt for improving cast iron is out of the question.

Table I—Results of Tests on Cast Iron with Nickel and Cobalt Additions

No. of Test	Ni., Per Cent	Co., Per Cent	Total Carbon, Per Cent	Ratio to Graphitic to Total Carbon, Per Cent	Graphitic Carbon, Per Cent	Transverse Strength, Lbs. Per Sq. In.	Flexure, In. Opinions of British Leaders on the Future of Aircraft

Included in this article are some opinions expressed at the Air Conference which were not reported with full significance in the bulletins issued for the press at that time, but which are valuable to commercial world.

THE Proceedings of the British Air Conference, 1920, have been published as a White Paper. The conference, which was the first of its kind, took place at the Guildhall, London.

The range of subjects was so extensive that the proceedings are valuable both to the student of aeronautics and to the commercial world generally.

The proceedings were largely reported in the press at the time of the conference, but there is much interesting new matter, in the form of replies by the readers of papers to points raised in the course of discussion, which is now published for the first time:

Sir Frederick Sykes's Views

Major-General Sir Frederick Sykes, Controller-General of Civil Aviation, who read a paper on "Civil Aviation and Air Services" points out, in the course of his reply, that civil and service aviation are closely allied and that the nation which is the strongest in commercial air traffic will be the strongest also in the aerial warfare of the future. He thinks that the war has proved that military power, whether on land, on sea, or in the air, evolving naturally from the exigencies of imperial responsibility and world trade is healthier than a military system artificially imposed upon the State. The extent to which civil air traffic will be carried on in the event of a future war will depend, he believes, on the measure of importance air transport organization has attained. On the other hand, he states that there must always be a division between civil and service aviation and that the more useful aircraft become for commerce, the greater will be the tendency for civil and service types of machines to diverge. "You cannot economically in peace use service machines for air traffic," he says, "any more than you could use a warship as a passenger or freight steamer." For that reason some of the proposals which had been made that the Government should build airplanes capable of being used in war and lend them to companies to operate, and that the Air Ministry should make an allowance toward every machine and the salary of every pilot employed in commercial transport, on the understanding that the whole of the machinery should be taken over by the Government in emergency, are hardly practicable. Such schemes, if carried out, would possess, he believes, the double disadvantage of militating against the development of commercial types and of impeding private enterprise by a system of bureaucratic control.

Gen. Sykes expresses himself as being fully in accord with the proposal that *all* mails should be "surrendered" to aircraft operating on continental air routes, and while he thinks that this would be a great and essential step forward, he doubts whether the Post Office can organize this support quickly enough and on a sufficient scale to meet the difficulties of the next two or three years. In the interval he considers it necessary that direct subsidies should be granted, a proposal which has been authorized since the Conference took place.

Suggestions for Helping British Aviation

The paper on "The Operation of Civil Aircraft in Relation to the Constructor" was by H. White Smith, C.B.E., chairman of the Society of British Aircraft Constructors, who deals with many points raised by subsequent speakers.

He thinks that much has still to be done to improve the present standard of comfort on aeroplanes and he believes that if air services are to become popular the ordinary traveling public has yet to be convinced that the air fare is worth the difference over that charged for rail and steamer journeys.

While development of new types of civil aircraft is proceeding, he does not think that we can claim to have reached yet the point of commercial success and he considers that subsidies are highly necessary in order to carry on until such time as aircraft become developed. He points out further that although the running costs of the latest types of aircraft are most helpful, yet there are so few actually in service that little benefit is derived from improved economies, and that the transport companies will need to spend a large amount of capital in order to purchase latest types and to bring their fleets up to date. He suggests that possibly some help towards the provision of these latest types could be given in order to allow old war types to be scrapped.

Lines of Technical Development

Air Vice Marshall Sir E. L. Ellington, Director-General of Supply and Research, spoke on "The Present Position of Aircraft Research and Contemplated Development." In his reply he outlines the development which is taking place in the design of suitable aerial cameras, and in other experimental photographic work. Included among these are a shock-absorbing camera mounting, an automobile film camera, embodying all the necessary instruments for survey purposes, instruments for recording angle of tilt at the moment of exposure and the development of night photography.

Although the Air Marshall's advocacy of the possible usefulness of the steam engine for aircraft work was strongly questioned, he now states that "taking it all round I still strongly consider that the steam engine is sufficiently attractive for aircraft to justify some preliminary experiments on the matter."

Capt. F. S. Barnwell, who dealt with the question of "The Technical Aspects of Civil and Service Aviation," urges the continuance of research as to the efficiency of the thick tapered cantilever wing, suggests that all future aeroplanes (at least all civil ones) must be stable and states that there is no serious difficulty in attaining

stability without any appreciable loss of performance. In this connection he mentions that instability is not by any means the greatest source of danger; engine failure he places first with low power and poor range of vision as being nearly as serious in practice.

Co-operation With Navy and Army

Air Marshall Sir H. M. Trenchard, Chief of the Air Staff, who spoke on "Aspects of Service Aviation," deals mainly with the question raised regarding the seconding of naval and military officers for service in the air force. He thinks that the views expressed by representatives of the Admiralty and the War Office that "there might be danger of officers seconded to the Air Force losing touch with the parent services and in consequence becoming ultimately less valuable in their capacity as officers of that service," are too narrow.

There is some truth, he believes, in the suggestion that there is a danger of this sort in all specialization, but it is on the whole readily surmountable in practice and he voices the opinion that it is desirable for the two older services to obtain a knowledge of air warfare which can only be obtained by allowing some of their officers to be trained by, and serve for a time in the Royal Air Force. In so doing he is convinced that they will gain themselves and that the Air Force, too, will unquestionably gain seems clear to him that if the national forces are regarded (as they should be) as serving one common national purpose, that purpose must be advanced by maintaining a steady flow of officers of the sea and land forces to and from the air force. The air, which is over the sea and land, presents new problems to the fighters on each which must be studied in conjunction and not in isolation. The air is one, and the Air Force has been created to embrace all who fight in it.

Possibilities of Commercial Airships

Sir Trevor Dawson, R.N., who spoke on "The Commercial Airship—Its Operation and Construction."

Sir Trevor considers that one of the largest airship bases of the future will be somewhere in the Iberian Peninsula and will form the terminal station for airship services to North and South America and also to South Africa; the great advantage of a terminal station in Spain being that routes from there across the Atlantic entirely avoid the bad weather frequently prevailing in the higher latitudes. From this terminal station it would be practicable to use, for distributive services in Europe, smaller airships and aeroplanes of much greater speed, which would be little affected by bad weather.

He emphasizes also the need for extensive experiments being carried out in connection with the mooring of airships to mooring towers and also mooring over the water, and he hopes that the Air Ministry will be able to do some practical work in those directions, as well as in investigating the question of using hydrogen fuel, particularly for commercial purposes.

He believes that naval officers are now convinced of the great value of airships for long endurance patrol work over sea and that as the commercial airship will be readily convertible into a naval cruiser with very little alteration indeed, the ships could take up active service within a matter of days after receiving orders for mobilization. The development in design produced by commercial experience will be equally applicable to the design of service airships which, in his opinion, is a strong argument in favor of State assistance being given for the establishment of commercial airship services and for the construction of large types of airships which could be operated on a successful commercial basis.

Aircraft Cooling System Data

THE branch of the German army administration which, during the war, was entrusted with the procurement of aircraft and accessories was known as the Flugzeugmeisterei. In addition to purchasing this material for the army, it was the duty of the Flugzeugmeisterei to carry on the research work necessary to advance the design of aircraft as rapidly as possible. The result was that in the course of time there were organized departments of a technical character for every branch of aircraft engineering. A valuable working basis was found in the aircraft experimental laboratory at Adlershof, organized two years before the war, which placed all of its equipment and its whole personnel at the service of the aerial arm. Additional research men of established reputation were secured for investigating unsolved problems of design. The results obtained were circulated immediately among interested parties through technical reports, and at the conclusion of the state of war these reports were made available also to the general public.

The problem then arose of making available to aircraft specialists the results which had not been published in the reports up to the fall of 1918 and at the same time to give the greatest possible publicity to the general results of the experimental work of the Flugzeugmeisterei, which constituted a valuable basis for further development in this field. This led to the idea of issuing a large work, somewhat in the nature of a scientific legacy of the Flugzeugmeisterei (which latter was dissolved in accordance with the treaty of Versailles) for the promotion of scientific design and as a stimulant to the urgently needed research work in this field. Written in strictly scientific and impartial style, this Handbook of Aircraft Engineering was intended to place at the disposal of designers and testers of planes for the coming commercial aviation in compact form the exceedingly valuable data concerning experiences of the period 1914-1918.

This Handbook of Aircraft Engineering, written in German, is issued in a number of volumes, each dealing with a specific subject. Vol. VI, Part II, entitled Cooling and Coolers for Aircraft Engines, by Dr. Ing Pülz, with a supplement on the Elements of the Cooling Process by Prof. Dr. Trefftz and Dr. Pohlhausen, has been sent us for review, the publishers being Richard Carl Schmidt & Co. of Berlin. This book contains a great deal of experimental data on aircraft radiators, systematically arranged, and is well illustrated. A list of the chapter headings will give an idea of the contents and the manner of treatment. This list is as follows: Absorption of Heat by the Cooling Water; Circulation of the Water in the Cooling Circuit; Dispersal of Heat in the Radiator; Weight of Radiators; Air Resistance of Radiators; Internal Construction of Radiators; Development of Radiator Constructions; The Radiator in the Airplane; Radiator Accessories; The Cooling Medium and Treatment of the Radiator in Winter; Elements of the Cooling Process.

Malleable Castings Production as Related to the Automotive Industry

The history of an industry has a more definite bearing upon the quality of its product than is generally recognized. This article traces the technical and commercial development of malleable castings production. Similar articles will follow concerning other industries. The facts are worth consideration in analyzing materials for car and truck construction.

THE materials which go into automotive vehicles are being studied with renewed care. The time has passed when manufacturers were tempted to compete for material of doubtful quality at almost any price. Castings are now being more carefully inspected; performance is being more accurately followed and checked, with the realization that keen competition in the selling market is demanding more perfection of detail and more uniform standards of performance.

Among the products which have been extensively utilized in the automotive industry during recent years is the malleable iron casting. The history of the technical and commercial development of the malleable casting, moreover, indicates that comparatively meager information has been widely published concerning the methods by which it is manufactured, the reasons underlying its reputation for lack of uniformity, and the methods by which distinct improvements have been brought about in its qualities during the last seven years.

The special interest in quality and standards of materials which is being taken just at this time by engineers and purchasing agents renders of special interest an examination of the malleable castings industry in its relation to the automotive industry from an engineering and commercial standpoint.

Up until three or four years ago, the malleable iron industry was in a more or less chaotic condition. The process of making malleable iron had been known in a general way, of course, ever since 1722, but the early development of the industry, even in this country, was characterized by rule-of-thumb methods, lack of scientific data, and much secrecy about what scientific facts were known by individual manufacturers.

Among the pioneers of the industry in America, the name of Seth Boyden stands out prominently. Boyden performed his work in Newark, N. J., about 1820-1835. In attempting to duplicate the European practice in making malleable, by chance he hit upon the practical method of the graphitizing anneal. This he accomplished after six years' work trying to duplicate European castings. His discovery marked the beginning of a new process and formed the basis of the present malleable castings industry in the United States.

The early uses of malleable castings were chiefly for agricultural implements. Here malleable castings replaced cast and wrought iron to a large extent. About 1880, malleable castings began to be utilized in railroad car construction. For a considerable period of time the railroads absorbed a large percentage of malleable production.

This demand did not continue, however, and had fallen off very materially just about the time the automobile industry began to absorb a large number of malleable castings.

The reason for this falling off in railroad demand is worthy of special note, since it bears to a large extent upon more recent developments.

Until seven or eight years ago, the manufacture of malleable castings was supposed to be by means of a secret process. A few large organizations were equipped for research work, but the smaller companies were forced to go along as best they could. H. A. Schwartz, of the National Malleable Castings Co., wrote recently: "During all this time the results of none of these investigations became publicly available and therefore it is difficult to accurately chronicle the scientific development of the art. The organizations collecting scientific and research data did not feel it to be sound business policy to make public disclosures of their work. Regardless of whether or not this policy was fundamentally sound from the manufacturers viewpoint, it certainly proved a handicap to the consumer, who remained in ignorance both of the theoretical principles and practical applications of the manufacture of malleable castings.

". . . There still persisted in the engineers' handbooks and in the technical press a mass of ill-supported conceptions largely predicated upon a confusion with the white heart process. . . . Since none of those who knew better felt called upon to publicly combat statements of this character, it is not surprising that the engineering public was left in ignorance and hence in distrust of the qualities of the material.

"Moreover, it is not surprising that in the absence of guidance by those better informed, some of the less intelligent and progressive manufacturers did not clearly understand the principles of the process they practiced and therefore produced unsatisfactory castings."

The result of this condition was that so many poor castings were produced by those firms which did not have facilities for scientific research, that even those firms which did produce a more uniform product found themselves unable to market it properly because of the almost universal distrust of the malleable casting in general. As one writer put it, the users seem to blame the failure of a steel casting upon the way it was manufactured, while they blamed the failure of a malleable casting upon the inherent nature of malleable.

These factors are largely responsible for the falling off in the use of malleable in those lines which had formerly utilized it extensively. As engineers know, the chief faults attributed to malleable castings have been:

1. Lack of uniform quality; undependability.

2. Lack of ductility.

Facing these facts, together with the necessity for meeting the new problems brought up by the extensive use of malleable castings by the automobile industry, the malleable producers recognized the necessity for a definite effort on their part to restore confidence in their product through eliminating so far as possible the valid objections recorded above.

This was the condition of the industry about 1915 before extensive efforts in scientific research and testing of materials through co-operative action had begun. There were at that time about twenty-five members in the American Malleable Castings Association which had been formed some ten years before. This group of representative manufacturers determined to enlarge their past field of co-operative action and to take certain definite steps in advance. They determined:

1. To go the full road along the lines of metallurgical research, regardless of cost.
2. To make every public statement regarding progress conservative, and accompanied by data which would substantiate in detail every statement made.

The research and testing work was placed in the hands of a consulting engineer, Enrique Touceda, of Albany, N. Y., and extensive work has been carried on along these lines ever since. A careful analysis of the situation indicates that the importance of this work is relatively very great in considering the present status and future possibilities of the malleable casting. For this reason, an account of the general nature of the tests together with the results obtained will be of interest.

"When the research work was started," said Mr. Touceda recently, it was found that by far the majority of the members had no system of testing the quality of their product, aside from the twisting and bending of a casting, in order to ascertain its ductility, or the bending of test lugs attached to the castings. Consequently there was no way in which could be compared the quality of the product of one member with that of another. To be candid, there was available no information of value that could be given to the engineer who might be seeking information of this character."

The first step, then, was to standardize tests so that comparative records could be made and kept. This was accomplished and at the present time tests are made for ductility, tensile strength, and elongation. It is outside the scope of this article to describe in detail the methods by which these tests are made. It is worthy of note, however, that a visitor is welcomed very heartily at the testing laboratories by the consulting engineer and is given every facility for examining the methods and equipment used in making the various tests. A detailed description of the tests may be found in the paper on "Research Work on Malleable Iron," presented by Enrique Touceda before the A. S. M. E. at the Spring Meeting in 1919.

One tensile-test bar and one test wedge from some one heat of each day's run are sent by each member to the consulting engineer. Accurate records of all tests are kept, and by this means the following factors can be determined:

1. The quality of each member's product.
2. The quality of the product of the society as a whole.
3. The comparative progress of the quality in each case.

Each month a report is made of the results of the tests. This report is printed and is distributed in the form of a bulletin. The members are classified into those who make railway castings and those who do not. To the former is assigned a number and to the latter a letter. Thus each producer can identify his own record, but not that of anyone else. In this way he is able to compare the standard and quality of his own work with that of his competitors.

A certificate is issued to each foundry which for three months has sent daily samples for test, in cases where every one of these samples has met the requirements of the association as to physical qualities. The requirements of the association are identical with the standard specification for malleable castings set up by the American Society for Testing Materials which require a minimum tensile strength of 45,000 pounds per square inch and an elongation of 7.5 per cent in 2 inches.

It is worth analyzing just what this certificate means. In the first place, it obviously means that the holder for the last three months has done consistently high quality work. It is an indication that the vast majority of castings going out from that foundry are of a uniformly high quality.

Certain "loop-holes" appear, however, which must be considered:

1. The test bar sent to the consulting engineer is taken from only one heat of the day. There may be several heats, the test bar having been taken from a selected heat.
2. All bars from the same heat may not be of uniform quality because of defects in the furnace.
3. It might be possible for special bars to be laid aside to be sent for testing purposes.

On the other hand there are certain definite factors which offset these objections to a large extent. The consulting engineer maintains a force of four inspectors who spend their time going about from one to another of the 75 foundries comprised in the association membership. The inspectors mark and place certain bars in various heats and later choose samples from those placed for further inspection.

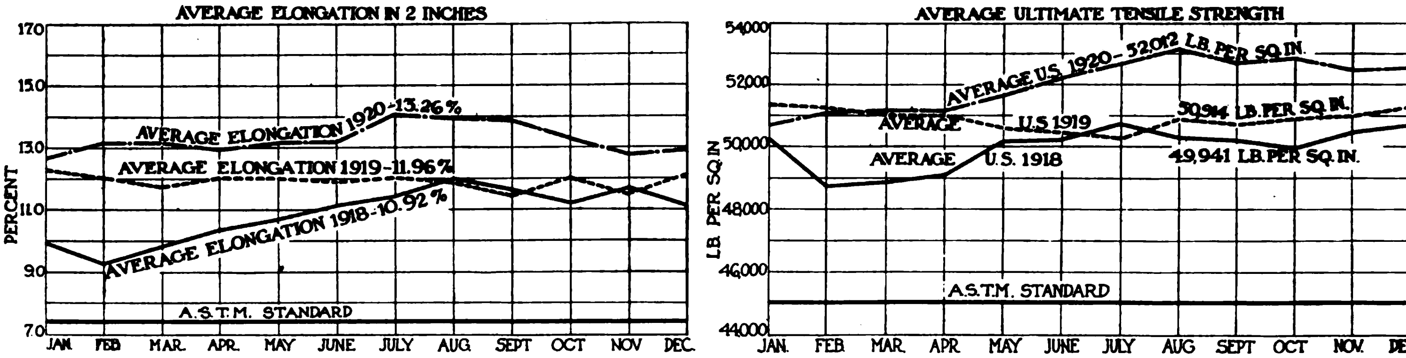
More than this, however, is to be considered the basic principle upon which this testing and research work was founded. It was begun because the producers realized the existence of a lack of confidence in their product. It was decided that the only possible way to rebuild the industry was to restore confidence. And that confidence could be restored in only three ways:

1. By scientific research to determine the way to make uniformly high grade castings.
2. By disseminating that knowledge among all members so that the entire association could make such castings.
3. By treating the engineering public with utter honesty in the publication of results.

In other words, these producers realize that any attempt to "beat the game" would be merely an act of fooling themselves; that it would really be very bad business for them in the long run. It was because they were sold on this idea that they undertook the research and testing work in the beginning.

There is no "hedging" in connection with the granting of a certificate. Some producers often miss by a very small margin, but the certificate is not granted in such cases. Moreover, a certificate granted for one quarter can be retained by the producer only during the next quarter. He must then return it to the consulting engineer. Then he receives a new certificate, if his record warrants it.

When a producer is not coming up to standards, the consulting engineer attempts to help him in every way



Charts showing a comparison between the results obtained by the association as a whole during the period shown above, and the requirements of the A. S. T.M. standard specification for malleable iron castings

possible, that his product may be brought up to the proper quality. Such advisory work is constantly going on.

New furnaces are now being designed in many cases by the consulting engineer in accordance with standards determined after a long period of scientific research.

It is worth special notice, in connection with the granting of this certificate of quality, that there are several firms, members of the association for a number of years, which have never yet obtained this certificate indicative of uniformly high quality for a period of three months. This fact in itself indicates that the certificate is awarded only on the basis of merit and that it may play an important part in the mind of the engineer and purchasing agent when determining the producer with whom to place orders. The certificate may be said in a general way to be a strong indication of the uniformly high quality of the maker's product.

The research work has resulted in the determination of standards for practical use and in the raising of the quality and uniformity of the castings produced.

The accompanying chart, Fig. 1, shows the comparative test records as regards elongation and tensile strength of the castings produced by members of the American Malleable Castings Association since 1918.

The chart shows a very definite rise in the quality of malleable castings since the beginning of the research work. The increased percentage of average elongation is specially to be noted. Before the research was undertaken many firms were producing castings with a very high ultimate strength but with an average elongation of something like 3½ per cent.

Another factor to be considered in examining this chart is that the membership of the association has been constantly increasing during the period covered. New firms were coming in which had not had the benefit of the results of the research work and which were in nearly every case "weak brothers" for a certain period. This fact tends, of course, to reduce somewhat the average rise in quality.

It will be noted that no very definite increase in tensile strength is apparent in 1919. According to officials of the association this is attributable largely to the fact that the material available for manufacture was so poor as to make it a very difficult task to keep castings even up to the former standard. Some users of the product, on the other hand, lay the blame at the door of lowered standards of manufacture. These users claim that because of excessive bidding for the product on the part of automotive manufacturers, the demand became so much greater than the supply that malleable producers yielded to the temptation to shorten the time of annealing and in other ways speed up production at the expense of quality. The 1920 curves, however, show a marked increase both in tensile strength and elongation.

The automotive industry has undoubtedly played a large part in the recent development of the malleable castings industry. W. G. Kranz told the American Foundrymen's Association several years ago that "It was not until the automobile industry sprang up that the physical properties of malleable iron received very much consideration from the consumer. The automobile engineer appreciated the necessity for a material to withstand shocks and yet be easily machined, and found in malleable castings exactly what he wanted. It is gratifying to note that to-day a very large tonnage is going to that industry."

It is not the purpose of this paper to attempt to discuss the relative efficiency of malleable castings as opposed to other materials for specific automobile parts. It was thought, however, that the extensive work which has been done during recent years by malleable makers in regard to scientific research, standard tests and definitely attempting to maintain and reward uniformity of high quality would be of special interest to automotive engineers and designers just at this time.

The claims of the malleable manufacturers as regards the adaptability of their product in certain cases are well known to engineers. Briefly, the chief properties claimed may be listed as follows:

1. Ability to be poured thin and to be flowed into more intricate designs than steel.
2. Ease of machining.
3. Ductility.
4. Light weight in relation to ultimate strength.
5. Relative cheapness under ordinary market conditions.

The following list of automobile and truck parts to which the malleable manufacturers consider their product adapted is of interest:

Steering wheel spider.	Control rod levers and clevises.
Differential housing.	Wheel hubs.
Transmission housing.	Robe rail fittings.
Rear axle brake housing.	Clutch parts.
Timing gear housing.	Radiator inlet and outlet pipes.
Universal joint bearings.	Hand brake and gear-shift levers.
Tire rack supports.	Pedal pads.
Door hinges.	
Steering post bracket.	
Windshield fittings.	

Concerning the increased use of malleable in the automobile industry, Robert C. Bell, secretary of the American Malleable Castings Association, writes:

"We attempted about two years ago to ascertain the production of malleable castings that were used in the automotive industry, although the questionnaire sent out at that time did not produce satisfactory results for the reason that so many of our members do not differentiate between the production of different classes of cast-

ings. We know, however, that from 1914 to 1919, and the same is true of 1920, that the production of malleables for use in the automotive industry showed a steady increase in tonnage. This statement is borne out by the fact that the foundries which specialize in automotive work have steadily increased their tonnage covering the past five or more years."

The automotive industry started to buy malleable castings at a point when the malleable industry was in a rather critical position. The malleable industry had multiplied its capacity by 5 between 1900 and 1913 and its productive capacity had risen accordingly. With the decrease in railroad and agricultural implement work, the automotive industry played a large part in utilizing the productive capacity that had been built up. And it may be said, that the malleable industry has in return been doing its part by the investment of large sums in research and experimental work to bring its product up to the standards of uniformity and quality necessary to meet the requirements.

Mr. Bell states that "There are no figures available to show the effect on the malleable castings industry by its contact with the automotive industry. We can say this, however, that the development of the automotive industry has been quite beneficial to the malleable castings industry both in volume of business and especially in the desire of the automotive buyer for better grades of malleable and the desire of the principal malleable foundries specializing in automobile work to constantly give the automobile manufacturer a more uniform and more dependable product."

The steel casting and the drop forging are considered to be the chief competitor of the malleable castings, although each product has certain individual properties which render it superior for specific purposes. In an effort to make the product more popular during recent years, the malleable producers have made a definite effort to bring to the attention of engineers the efforts which are being made to standardize its quality and render it more uniform.

The consulting engineer of the Association has been encouraged to explain the research and testing work before various engineering bodies and considerable literature has been built up in various trade papers by different members of the industry. In certain instances papers read before the American Foundrymen's Association concerning malleable have been reprinted and distributed to purchasing agents and engineers who might be interested. In brief, it may be said that during the last seven years the veil of secrecy has been lifted to a large extent from the malleable process and industry and considerable data are available concerning both the technical and commercial development of the industry for those interested to investigate the subject in more detail.

This work of the Association, together with the development of the malleable industry, has been discussed here because the automotive industry has played such an important, though an indirect, part in it, and because the factors behind the development of the industries contributing to the automotive industry may form a very valuable background for production and engineering men when discussing the relative merits and possibilities of the different materials which are to be utilized. The history and line of development followed by an industry is likely to have a more direct bearing upon the quality and properties of its product than is generally recognized.

Properties of Ordinary Wood Compared with Plywood

WOOD, as is well known, is a non-homogeneous material, with widely different properties in the various directions relative to the grain. This difference must be recognized in all wood construction, and the size and form of parts and placement of wood should be such as to utilize to the best advantage the difference in properties along and across the grain. Were wood a homogeneous material such as cast iron, having the same strength properties in all directions that it has parallel to the grain, it would be unexcelled for all structural parts where strength with small weight is desired.

The Forest Products Laboratory has found that the tensile strength of wood may be twenty times as high parallel to the grain as perpendicular to the grain, and its modulus of elasticity from fifteen to twenty times as high. In the case of shear the strength is reversed, the shearing strength perpendicular to the grain being much greater than parallel to the grain. The low parallel-to-the-grain shearing strength makes the utilization of the tensile strength of wood along the grain difficult, since failure will usually occur through shear at the fastening before the maximum tensile strength of the member is reached.

The large shrinkage of wood across the grain with changing moisture content may introduce distortions in a board that decrease its uses where a broad, flat surface is desired. The shrinkage from the green to the oven-dry condition across the grain for a flat-sawed board is about 8 per cent and for quarter-sawed board about 4½ per cent., while the shrinkage parallel to the grain is practically negligible for most species.

It is not always possible to proportion a solid plank so as to develop the necessary strength in every direction and at the same time utilize the full strength of the wood in all directions of the grain. In such cases it is the purpose of plywood to meet this deficiency by cross banding, which results in a redistribution of the material.

In building up plywood a step is made in obtaining equality of properties in two directions, parallel and perpendicular to the edge of a board. The greater the number of plies used for a given panel thickness, the more homogeneous in properties is the finished panel. Broadly speaking, what is gained in one direction is lost in the other. For a very large number of plies it may be assumed that the tensile strength in two directions is the same and that it is equal to the average of the parallel-to-the-grain and perpendicular-to-the-grain values of an ordinary board.

An Electric Truck for Industrial and Street Use

(*Continued from page* 693)

all electrical mechanism without the use of a key. It is noteworthy that anti-friction bearings are used throughout the truck, the armature shaft bearings being of the ball type, and the bearings on the intermediate dash and the axles, roller bearings.

Regular practice is to provide wheels on the legs on one end of the platforms, the other pair of legs being left plain. This has been found convenient should it be desired to move the platforms while the truck is busy elsewhere, since one end can readily be raised and the platform handled like a two-wheel wheelbarrow. The plain legs make an effective brake so that the loaded platform can be safely left on any grade. For special purposes wheels can be provided on all four legs, but this is not ordinarily done because of danger of rolling away unless left on a level surface.

Incentives to Better Workmanship Appeal to a Variety of Instincts

When the management is interested in the individual worker only to the extent of his immediate quantity of production, the workman probably will be interested in the company to the same limited extent. The incentive plan described here gives the worker numerous motives to strive for greater personal development, increasing his ultimate value.

By Norman G. Shidle

THE special production value of a willing and enthusiastic worker is pretty well recognized by industrial managers. Likewise the impossibility of producing such workers under conditions of continuous monotony work and without the use of incentives other than wage payments is becoming increasingly evident. Despite the realization of these facts, methods of effecting remedies for present difficulties have not yet been worked out except to a very limited degree.

Experiments of one kind and another have been tried in various plants, some with good results, others less successfully. Yet it is only through making such experiments and analyzing the results that standards for future procedure can be established. For that reason an examination of the methods utilized by certain firms which have based their action upon a carefully planned, intelligent basis is of special value.

Too many so-called incentive plans have revolved about the appeal to the single instinct of desire for monetary gain. This appeal is undoubtedly a very strong one, and works to a decided advantage in every case, but where it is the only appeal, there are very likely to arise storms which it cannot successfully weather. This fact must be recognized even though it is fundamental that satisfactory wages are a prerequisite to gaining the active co-operation of a worker.

A Varied Appeal

To successfully analyze the other instincts to which an appeal may be made, however, and to determine methods by which such an appeal can be made is not an easy matter. This is one of the important tasks which confronts the industrial manager in his study of the human element in industry.

A plan by which individual abilities can be rated in a general way and rewarded according to merit has been worked out at the Sperry Gyroscope Company. It involves a number of those factors just discussed and indicates certain practical methods of enlisting more active co-operation from the workman through an appeal to other instincts in addition to that for money.

Each employee is rated as regards four characteristics, each of which bears a definite relation to his job and on the basis of this rating his rate of pay, opportunity for advancement and several other factors are determined.

Before it is possible to rate a man as to his ability on a job, it is necessary, of course, to determine the requirements of the job itself; to outline the qualifications necessary in a man, if he is to fill that job in a first-class manner. In other words, an accurate job analysis is necessary upon which to base any estimate of the man's proficiency and possibilities.

Such an analysis can take any of the common forms; many firms already have on file job analyses for a majority of the jobs in their shop. The particular type used at the Sperry company is detailed in analysis, but brief in summary. The summary serves as a basis for the rating. Following is a sample which shows the job analysis summary used for all-round machinists:

Duties

Perform operations in the manufacture, assembling, erection and repair of various kinds of machinery and direct the work of helpers in this connection.

Qualifications

Machinists in this class must be thoroughly dependable, able to work rapidly with commercial accuracy from blue prints and sketches as well as to lay out the work, carrying it to completion on bench or machine. Must be able to operate as an expert all of the usual machine shop tools and be competent to do the work without the use of jigs or fixtures, checking dimensions with the proper measuring tools. Must have a thorough knowledge of various tools, speeds, feeds for different materials. Worker should possess a knowledge of the use of lubricating, cutting and polishing compounds. Must have a knowledge of such shop arithmetic as common fractions, decimals, simple algebra and trigonometry or be able to use hand books intelligently for the solution of problems in connection with his work.

On machine repair, erection and assembling work, worker must in addition to the above be competent to do the necessary filling, scrapping, fitting and assembling of machined parts making the necessary mechanical adjustments to secure the proper functioning of the apparatus. Must know how to babbitt and condition bearings and be able to do the necessary rigging work.

The requirements of the job having been accurately determined, the workman is rated on the basis of four characteristics:

1. Experience and Education
2. Knowledge of Work
3. General Value to Company
4. Physical Qualifications

Each of these four characteristics are understood to include certain definite factors, while each of them has been included after careful analysis for a specific reason.

"Experience and Education" is understood to apply only to his education as applied to that work which he will be called upon to do. A toolmaker, for instance, would require a knowledge of common arithmetic to

qualify for a high rating, but his knowledge of Latin would have no bearing upon his rating.

Under this head, too, is considered the length of time a man has served in a given trade. This counts for something, since a long experience gives a certain background and breadth of knowledge that is certain to be of value. In this connection, also, are considered the companies with whom he has been associated and the length of service with each. It is believed that a worker's connection with a concern known for a high standard of product and efficient production furnishes an important indication of his ability.

"Knowledge of the Work" comprises somewhat different factors. Although a person acquires knowledge of his work through experience and education, some persons acquire it much more rapidly than others. Under this head are considered familiarity with hand tools, measuring devices, machine tools and materials common to the trade. The worker's ability to plan and execute his work from given instructions, whether oral, written or in blue-print form, is also judged.

"General Value to the Company" is an important consideration. A man with excellent ability and qualifications may be of little value to the company unless he applies that knowledge in an effective manner. A man of less ability may surpass a better equipped man in value to the company simply through the energy and effort with which he goes at his work. Under this head quality and quantity production are taken into account; the ability of a man to maintain a high point of accuracy and skill, combined with speed, is important in determining his ultimate value to the concern.

Dependability and general attitude toward the work are considered under this head and go toward determining the final rating. It is recognized that a worker's disposition, habits and general attitude toward conditions have an influence upon his associates and also reflect directly in his work.

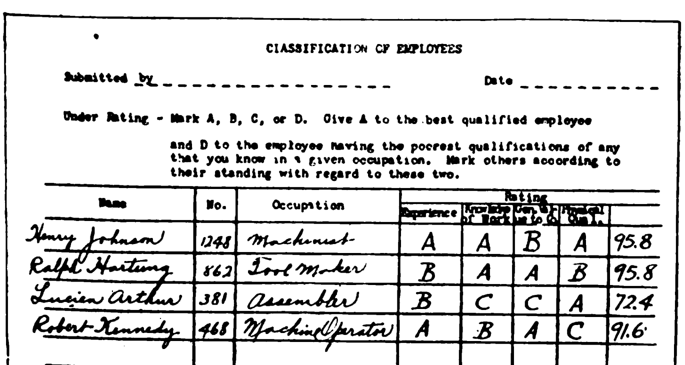
"Physical Ability" is often a vital factor in the effectiveness of a manual worker. His physical qualifications, as to general health, age, etc., are given due consideration.

The four factors are not considered as being equally important; in making up the final rating for the man, a weighted average is used, as follows:

Education and Experience	15%	Value to Company	25%
Knowledge of Work	50%	Physical Ability	10%

The values of the various factors were determined by the personnel manager after conference with the various executives and department heads of the concern, so that they represent the composite view of a number of men, each in a position to judge competently.

Upon the basis of the job analysis and these four factors just described the workman is rated by his foreman and division superintendent. The rating is made on an A, B, C, D basis and appears on a chart as follows:



CLASSIFICATION OF EMPLOYEES

Submitted by ________________ Date __________

Under Rating - Mark A, B, C, or D. Give A to the best qualified employee and D to the employee having the poorest qualifications of any that you know in a given occupation. Mark others according to their standing with regard to these two.

Name	No.	Occupation	Rating: Experience	Knowledge of Work	Gen. Val. to Co.	Physical Qual.	
Henry Johnson	1248	Machinist	A	A	B	A	95.8
Ralph Hartung	862	Tool Maker	B	A	A	B	95.8
Lucien Arthur	381	Assembler	B	C	C	A	72.4
Robert Kennedy	468	Machine Operator	A	B	A	C	91.6

The percentage value of each worker is determined, to quote from a recent article by M. R. Lott, Superintendent of the Personnel Department, in this way.

"It is assumed that in order that a man should be considered as belonging in a trade, he must possess at least 50 per cent of the qualifications of the ideal man for each general consideration in that trade. In order that the results may be unbiased, the foreman consults with the supervisor and the results are reviewed by a third person. . . .

"The A man would receive the full value for each of the qualifications according to the weighted average noted previously, while the D man would be given half the values of the A, and B and C would be rated in proportion. A score, then, is available for each worker and his rate of pay may be gaged accordingly. The actual values assigned to the groups really have no significance other than providing the same standard of comparison for all. They would be:

A worker scoring between 95 and 100 would receive the maximum rate
A worker scoring between 85 and 95 might receive the next lower rate
A worker scoring between 75 and 85 might receive the next lower rate
A worker scoring between 65 and 75 might receive the next lower rate
A worker scoring between 50 and 65 might receive the lowest rate

"While the plan is not perfect, it has assisted in arriving at a more consistent consideration of the merits of an indivdual and has been the means of correcting, in a manner very advantageous to the worker, discrepancies that existed when there was no standard for analysis and comparison."

This completes the plan insofar as the methods of rating the men is concerned. The man is given a temporary rating when he is employed with the company. This initial rating is made by the employment manager on the basis of the man's past record and the general impression which he makes.

All ratings are checked over, however, on an average of once every three months, so that a man has an opportunity to better his position within a comparatively short period of time.

But of what use is this rating plan? If operated simply to provide an interesting course in mental gymnastics for the personnel manager, it is obviously a waste of time and money. The chief value of any such plan lies in the effectiveness with which it is used. An analysis of the use in the Sperry plant indicates the possible value.

In the first place it is used in connection with wage rates to furnish an incentive for increased pay. All the men at this plant work on day rates, and the wages for each trade are graded from a given base in accordance with this rating plan.

The wage scales are laid out on a form similar to the one given here to illustrate more clearly just how the system is worked out.

Rate Schedule

Occupation	95–100	90–95	85–90	75–85	65–75	50–65
	Rate per Hour as per Score					
Trade No. 1	$0.80	$0.77	$0.73	$0.70	$0.67	$0.63
Trade No. 2	.73	.70	.67	.63	.60	.57
Trade No. 3	.80	.77	.73	.70	.67	.63
Trade No. 4	.73	.70	.67	.63	.60	.57
Trade No. 5	.53	.50	.46	.43	.40	.36
Trade No. 6	.73	.70	.67	.63	.60	.57

The plan, then, is useful in grading rates of pay in accordance with all those factors which go toward making

the workman of real permanent value to the company. When wages are dependent entirely upon quantity of production the management may be said to be emphasizing to the worker that this is about the only factor regarding his performance with which it is concerned. In such case, the worker is very likely to have his attention centered almost entirely on this single point and to disregard very largely those other factors which undoubtedly enter in to his ultimate value to the management.

In other words, this system of rating tells the worker, in effect, several things that tend to make him feel like actively supporting his company. Among these are:

1. That the management is interested in him as an individual; that his work is really being watched, and that when he does good work it is immediately recognized. He knows that he is being regarded as an individual personality and that he is not looked upon as merely one cog in the machine.
2. That the management appreciates the development in him of certain qualities which go toward making him a bigger, broader man. The mere fact, for instance, that he takes up some outside course to help him with his work is likely to raise his score, since it indicates a real interest in his task.
3. He knows that the management is interested in his personal development and that in a very practical, immediate and concrete way he can benefit by attempting to develop himself along a number of lines. He is encouraged to grow larger by this consideration which the management takes of a number of factors in adjusting his wage. Where there is but one consideration—quantity production on a single machine, for instance—he is encouraged to grow smaller so far as personality and mental development are concerned.

Every workman knows what his rating is. After it his been made up his foreman notifies him of it. And in this way another benefit of the system is brought out. Every man is not satisfied with the rating that is given him. In such cases he is privileged to go personally to the foreman and then to the personnel manager if he is still unsatisfied. The various factors considered are then discussed with him, his weak points are pointed out and he is encouraged to overcome them that his score may be raised.

Since the whole matter is on a frank and open basis with the workmen, the management is able to talk over strong and weak points with them. In this way the individual worker has been able to understand his own deficiencies and to correct them through personal effort. This is not merely a theory, but a statement of fact made on the basis of numerous cases recorded in Lott's office.

Another advantage of the plan has been to interest the foremen in the human elements of their supervising task. While there was some difficulty at first in convincing them of the practicability of the idea, the results achieved within a short time aided materially in this task. Moreover, the matter of rating men under supervision carries with it some very interesting features which appealed to the foremen and superintendents once they caught the idea.

With this increasing interest of the foremen has come, necessarily, an increased study of men and the human factors as related to production. This in itself is a notable achievement and ultimately will be worth many times the trouble and expense of the rating system.

Other uses are also made of the rating scale. Promotions are made from within the shop whenever possible, and the rating scale is used as a basis for making such advancements. When business depression necessitates laying off men, the rating scale is used again. The score of each man has been used recently as the prime consideration in keeping him or letting him go. The factors regarded in the order of their consideration have been:

1. Rating
2. Home responsibilities, family, etc.
3. Length of service .

Thus a high rating gives a man the best possible insurance against unemployment. It practically insures him permanent work, even in bad times, and thus adds another incentive to make him strive for a good score.

The broad scope and vision of the factors considered in making up the score must constantly be borne in mind when discussing the incentives given the men to attain a high score. In other words, the achievement of a high score by the employee means real personal development, both mentally and spiritually for himself, as well as increased value for the company. It is for that reason the high score is worth striving for; and some might say, for that reason alone.

To sum up, the following advantages may be listed as accruing from this rating plan and its intelligent utilization:

1. To the management:
   a. Good will and co-operation from the workmen, because of the practical demonstration of its interest in his personal all-round development and growth
   b. Better quality and quantity production
   c. Decreased labor turnover
   d. Increased study and knowledge of the human element on the part of foremen
   e. Gradual raising of level of ability of workers through understanding and remedy of personal defects
   f. Better and more pleasant "atmosphere" about the plant because of closer personal contact between management, foremen and workmen.
2. To the workmen:
   a. Increased wages through personal development
   b. Unemployment insurance through same means
   c. Opportunity to see his weak points clearly, to have them discussed sympathetically and to better himself through remedying them.
   e. An opportunity to have merit rewarded; the danger of being buried in the mass is eliminated.

There are other good features in the plan, some of which go far deeper into the fundamental factors of human relationships in industry than a superficial survey of the rating plan itself would indicate. The plan, though dealing with only a minor part of the industrial relations problem, furnishes an excellent means of meeting one of the questions which arises. Its practicality is attested not only by its success and continued use at the Sperry Gyroscope Company, but also by the fact that the Standard Oil Company of New Jersey is about to put into operation a plan moulded along somewhat the same lines. Since the latter company is instituting the plan at this time of business depression, there is a strong indication that it is regarded as a definite production and financial asset to the management.

A COMBINATION of several manufacturing concerns for the purpose of manufacturing automobiles and trucks has been effected in Poland, and the new concern will be financed by a number of leading Polish banks. Work will begin the coming spring, and it is planned to turn out 1000 complete trucks the first year, about one-half of which will be taken over by the Polish army. Assembly work will be carried on at the factory of Borman & Szwede, Warsaw, while the other factories in the combine will manufacture the parts. For the first year, however, probably 75 per cent of the parts will have to be imported from the United States.

Is the Dealer an Important Cog in the Wheel?

Dealers often express the doubt as to whether they are appreciated by the heads of the organizations of which they are a part. They quote many instances to support this doubt. Here is some evidence as to their standing as business men and of the amount of business they should do.

By Clyde Jennings

A CAR manufacturer's organization can be no stronger than its dealer organization will let it be. The dealer organization cannot develop beyond the limitations set by the manufacturer. Development must be mutual. All concerned will admit this. Neither organization can be paramount, although many situations will arise where the burden, for the time being, will fall most heavily upon one of these two organizations.

With this rather positive basis it is interesting to note the attitude taken by some manufacturing organizations. Recently the man responsible for the functioning of a rather large dealer organization said:

> **"We conduct our dealer operations on the Statler Hotel principle, that the dealer is always right. Sometimes the burden of the proof shows that the dealer is not right, and then we handle the situation as an individual case. It is the exception, not the rule, and it is not allowed to sway our policy or operation."**

Only a few months ago a man who has a considerable voice in the operation of a dealer organization talked at considerable length on his problems. All through the conversation he spoke of the dealers as "poor boobs," and always referred to their inability to select the proper papers for advertising, and an inability generally to handle the affairs connected with the selling of cars.

As a bit of pertinent comment on these contrasting attitudes, it can be remarked that the factory represented by the former speaker is now running on a very high percentage of the 1920 production, while the other factory was recently reported to be flat, and it has had some financial tribulations. **The present prosperity of these factories may, or may not, be in any measure due to the sales attitude.** You can draw your own conclusion.

Rushing Into Business

HERE is an incident worth considering:

A short time ago a man in a western city had something like $150,000 surplus in his selling business, let us say it was lumber. For reasons perfectly satisfactory to himself he did not want to put the surplus back into that business, but wanted to find another merchandising proposition. He investigated many lines and decided upon automobiles. He then studied the list of cars, eliminated those he knew to be well represented, and, after consultations with several persons, selected five makes, with a view of getting the local representation of one of the lines.

He sent out his letters, and waited. Within a week he had definitely turned down three of the factories to which he wrote. This is how he tells of his experience:

"The first man to see me in response to my letters came to my office at 9:30 a. m. I learned later that he had arrived in town at 8 a. m. First he told me how much money the company thought would be required to swing the deal. I agreed. He asked me if I had the money. I put my documents on the table and right away he accepted me as the future dealer.

"Then it became my turn. I wanted to know something about his company but he did not appear to know much. I asked him what investigation he had made concerning me. He said my letter was sufficiently convincing to his company.

"Long before noon I had turned down his proposition. I could not see that I cared to do business with a company that was so willing to accept a dealer merely on the looks of his bank account.

"Two other companies went the same way. The fourth, after a long period of correspondence and inquiry, offered me the dealership on conditions that I could not then meet. I am now looking for the man to get to join me in this dealer proposition who knows enough about cars to meet the requirements. I think the proposal is a fine one.

"The fifth company eliminated itself, as they did not have production to go into the territory I had asked for."

The net result of this effort to enter the dealer field was three companies out of the five did not make sufficient inquiry concerning the future dealer as to command his respect; a fourth made strong exactions and commanded the entire respect; a fifth showed a very sensible determination not to spread its distribution too thinly.

The question is:

> **How nearly does this incident show the trend on motor dealer selection?**

Size of Establishments

NOW as to the dealer.

Recently a number of distributors were asked to estimate the average number of persons employed by the dealers in their territory. The estimates are so close as to supply a very definite idea. The lowest number is 6 to each dealer and the highest is 12. A majority of the answers say 7. So let it be agreed that the average number of employees is something above seven.

One of these answers reads:

"The general average of employees in a town of 5000, handling about 100 low-priced cars annually, would be

seven. In a town of 25,000 handling 500 cars, 25 to 30; 100,000, handling 750 to 800 cars would be 40 to 50."

The point here is that a business establishment that employs an average of more than 7 persons is of a considerably higher rating than the average of mercantile establishments. The man in charge must be a man of some business ability and of some financial standing in his community.

How Many Cars?

THE question as to how many cars a dealer in a certain sized city should sell is a moot one. From the opinions heard here and there it is to be feared that some manufacturers, at least, have not given much thought as to whether their dealers were assuming a sufficient sales load to enable them to maintain an establishment in keeping with the merchandise they represented. Following are a number of opinions of distributors who have had a long experience in automobile wholesaling as to the number of cars necessary to maintain an adequate establishment in cities of certain size.

—

1—In towns of 5000 persons, the number of cars would depend largely upon the price of the car. Taking them at the average of $1,000 he must sell at least 25 cars to make any money. In towns of 25,000 persons this number should be doubled. In towns of 100,000 persons he should sell a minimum of 126 cars. He must do this in order to conduct a satisfactory business. Assuming, of course, there will be small towns to bring up the population to greater than this in centers of this kind.

—

2—It is difficult to estimate the number of car sales required to support a dealer in towns of 5000, 25,000 and 100,000. This all depends on the methods of doing business, whether they conduct a garage in connection and whether they conduct a repair department, accessory department, and so forth. I believe it is possible in any of the towns mentioned for a dealer to go into business and, providing his business is properly conducted, make a profit without selling a single automobile; therefore, his car sales should be his real profit. At present the average car dealer hardly takes time to wait on a customer who wants a tire or anything else at a small sum. We dealers have allowed ourselves to think in too large sums, that is, from a volume standpoint and have been negligent toward the small items which really constitute a profit in this business.

—

3—It depends altogether on the car handled. In the South the medium-priced car always will be the biggest seller. A dealer in the town of 5000 should sell 25 cars to make it profitable, if he looks after his customers and renders any service.

—

4—A dealer in a town of 5000 should retail no less than 25 cars. A town of 25,000 not less than 50 cars. A town of 100,000 from 150 to 200 cars.

—

A Low Estimate

5—In a town of 5000, a dealer can probably get along with selling 12 or 15 cars because his rent and overhead are very low. He will be his own salesman, and his expenses will be divided between the repair shop, sundry sales, as well as selling cars. In a town of 25,000, if he is an up-to-date dealer, has a good service department and devotes his exclusive time and ability to pushing his car, and it is a good make, carrying not more than two makes of cars and one light truck and his reputation is established, he should sell 60 cars and trucks, providing the territory immediately adjoining his town can absorb some of his production.

—

6—In a town of 5000 population the dealer would have to sell 50 cars or more. In 25,000, 150 or more, and 100,000, 300 or over. This applies, of course, to standard lines that are selling at a good price retail and with a reasonable profit.

—

7—Using a popular low-priced car as a basis, a dealer should handle 100 cars in a town of 5000, 500 cars in a town of 25,000 and 750 to 900 cars in a town of 100,000.

—

8—It would be my guess that a dealer in a town of 5000 could sell from 60 to 100 cars and make money constituting about three lines ranging in price from $1,000 to $3,000. A town of 25,000 population—80 to 200 cars; 100,000 population, 150 to 300 cars.

—

9—The dealers in the 5000 town should sell at least 40 to 50 average-priced cars. In towns of 25,000 the market should be proportionate, and in cities of 100,000, if he cannot sell $400,000 in the year he will waste his time.

There are two sides to this question, just the same as to most questions. It certainly is a problem as to whether the small city dealer is doing as much business as he should, and could do if he put forth the proper effort. The other side is as to whether the manufacturer is supplying him with as many cars as the dealer is entitled to if he maintains a proper establishment. There are obligations on both sides.

This article, except as to the average number of employees, does not consider the dealer in the town smaller than 5000 inhabitants. There are points about the small-town dealer that deserve separate consideration, which will be given in due time.

Denaturants for Industrial Alcohol

A SUB-COMMITTEE of the (British) Empire Motor Fuels Committee has been studying the problem of the most suitable denaturants for power alcohol. In a memorandum drawn up at a conference of the sub-committee with the Board of Customs and Excise it is stated that the denaturant should be soluble in alcohol, benzole and gasoline and in certain mixtures of these; it should not readily be separable from the solutions, but be stable, cheap, plentiful, of nauseous taste and, if possible smell, but not poisonous, readily detectable in traces, and unaffected by metals which its combustion products should, of course, not corrode. J. Stanley has experimented at the Imperial College of Science, and has found that redistilled bone-oil, light caoutchoucine and certain shale-oil products appear best to comply with the desiderata. Bone-oil can be detected in traces of 0.001 per cent, and is less likely accidentally to occur in potable alcohol than some of the other denaturants, pyridine, etc. Bone-oil is a by-product of the animal charcoal manufacture; it contains pyridine (a coal by-product) which is found in some crude spirits. Experiments are also being made on the cracking of petroleum for the production of a denaturant; castor oil yields such a body, but it would be too expensive. It is further mentioned that a substance, capable of imparting to water certain characteristics at a dilution of one part in a million occurs "in certain roots growing in localities where alcohol may eventually be produced."

The FORUM

Manufacturers' Parts Service Plan

Editor AUTOMOTIVE INDUSTRIES:

I have read the article "Parts Service Cuts Profits of Dealers" appearing in your issue of March 3 (page 534).

Our company was represented at the meeting held at the La Salle Hotel in Chicago referred to in your article, and as a member of the Parts Manufacturers' Committee conferred with the Truck Manufacturers' Committee.

As a commercial engine manufacturer, I would like to present the position of the Parts Manufacturer, as it appears to me. My company (The Buda Company) realized some time ago that eventually the parts manufacturer, with some exceptions, would be obliged to establish their own parts station, if their product was to be properly serviced. With this thought in view we established our first parts station some two years ago and have been gradually establishing new locations since that time.

The object of these parts stations is to provide an adequate stock of parts for all models of engines as have been and are at present manufactured by this company and the principal distributing points are located in zones where the greatest number of trucks using our product are located, and such sub parts depots located in that vicinity are under the direction of the principal distributing offices, much the same as the parts as are furnished by the electric and carburetor companies. Consideration should be given to the fact that these parts depots simply sell parts and do not undertake any work of placing them in the product of our manufacture.

The article starts with the assumption that parts stations of this character will cut into the profits of the dealers. I would like to point out that so far as our plan is concerned, we do not cut into the profits of the dealers, but rather we work closer and assist them so that their profits are increased.

I am very strongly of the opinion that the business should be handled through the dealer and he should be considered as the logical medium for distribution of parts. In our own case over 95 per cent of parts sold is done through the dealers, and it is only in cases where no dealer is established in a particular locality or in the case of the orphan truck that we deal direct with the owner.

Not a single objection on the part of the dealer to this method has been registered, in fact the dealers are enthusiastic over the service station idea, as it allows them to discontinue tying up a considerable portion of their working capital in repair parts and they are able to employ this money to better advantage in the sale of trucks. Supposing, for example, in a certain distributing center, there are located 15 truck agencies handling trucks equipped with a certain make of motor. It is certainly more economical for one parts station to maintain a complete stock of parts rather than have 15 stocks of parts maintained by the truck agents, probably none of which are really adequate.

Further, numerous truck manufacturers have been using certain units for 10 or 15 years. This unit has been improved as to design during this time, so that the unit being supplied the truck manufacturer to-day may be entirely different from the unit that he used two, three or more years ago. Does the agent who has just taken on a line of trucks wish to carry repair part stock for models of trucks that are now using a redesigned unit when he can depend on getting his parts promptly from a service station, and the cost to him being little or no more than he would pay by purchasing direct from the truck manufacturer?

The second-hand truck is becoming a problem to be reckoned with; in fact, there are cases where good-sized fleets of trucks are operated, all of which have been purchased second hand. One of the first things a purchaser of a second-hand truck wants to know is where he can purchase repair parts for the different units in his truck. If he finds that repair parts are not easily available, he will not purchase this truck, but will purchase a truck where he has the assurance of getting parts promptly when necessary.

It may be argued by the truck manufacturer that the establishing of parts stations will cut him off from all profits formerly derived from the sale of parts. While this could seem to be true, it is recognized by the parts manufacturers that the truck manufacturer should be compensated in some way for this loss, and a plan was suggested at the meeting which seemed to solve this condition.

Such truck manufacturers who still wish to maintain their own supply of parts at their branches or in the hands of their distributors are at liberty to do so, and the parts station plan does not contemplate the elimination of such stocks if the truck manufacturer desires to maintain same.

The logical development of the parts station idea in the writer's opinion would be to have certain groups of parts manufacturers have their parts handled by the same organization. In this way one series of parts stations might handle parts for a certain motor, axle, transmission and clutch, while another series of stations might handle parts for another series of units.

The plan, if worked out on a broad basis, would tend to infinitely strengthen the position of the assembled truck manufacturer, as the purchaser of any make of assembled truck would know that he would be able to get necessary repair parts for any of his units promptly at any time.

THE BUDA COMPANY,
Harvey, Ill. L. M. Viles, President.

Fitting Traction Devices to Disk Wheels

Editor AUTOMOTIVE INDUSTRIES:

We have been much interested in the editorial on page 35 of your issue of Jan. 6, entitled "Fitting Traction Devices to Cast Disk Wheels." This editorial seems to assume that equipment for such wheels has not been designed by any manufacturers of traction devices, and that the difficulties connected with applying equipment to such wheels have not been solved.

As you know, many trucks equipped with disk wheels

were used by the army during the war, and our equipment known as No. 66 was designed particularly for use on army trucks. After the army had adopted this equipment the disk wheels furnished on trucks on their orders were drilled for the attachment of the equipment.

Some manufacturers of disk wheels are still furnishing their wheels with holes bored to fit this equipment. However, where disk wheels are not drilled in this way, it is a very simple matter to drill the six holes necessary on each rear wheel to accommodate this equipment.

"Fuel Economy Comparisons"

Editor AUTOMOTIVE INDUSTRIES:

The truth of the general proposition that comparisons are apt to be odious has never been so forcefully presented to me as in a reading of your editorial comment under the title "Fuel Economy Comparisons," in the March 10 issue. These comparisons are the more odious because they will convey a half truth, or less than that, to many of your readers.

There seems to be but little justice or advantage in comparing the *overall* fuel consumption performances of tractors, involving their crudities of power transmission, and the great losses therein, with what is known to be an extra special performance of a highly developed aircraft engine operating *without power transmission losses*. Perhaps it was merely sought to set a mark at which the builders of tractor engines might shoot. But it must be recognized that the aircraft engine can show such results with only certain special grades of fuel. If aircraft engines were operated on commercial or car grades of gasoline, their performances would be very little if any superior to those of good tractor engines; and it is safe to say that their trouble-free working lives, under this condition, would be materially less than those of good tractor engines.

While it will not be attempted to argue that the results of the tractor tests named in your editorial are a credit to the tractor industry, it seems, on the basis of our own work with this class of engines, that the apparently poor showings discussed must be largely attributable to transmission losses, of which no mention is made in your comments. It is obvious that it is entirely unreasonable to have a mean consumption of 1.35 lb. b.hp.-hr. at rated load, considering the power to have been measured at the engine crankshaft.

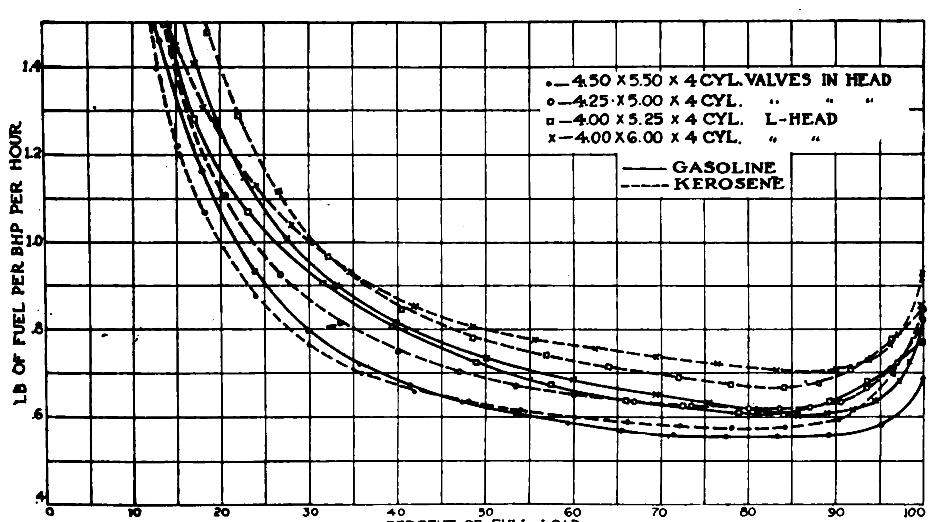
Accompanying this letter is a graph of fuel consumption vs. per cent of maximum load, for four tractor engines, operating at governed speed on both gasoline and kerosene. Two of these engines were valve-in-head and the other two L-head designs. It will be seen that in two cases the performances are superior on kerosene, on the basis of horsepower-hours per gallon (gasoline = .75 sp. gr. = 6.25 lb. per gallon: kerosene = .84 sp. gr. = 7.00 lb. per gallon). Assuming that a tractor engine is rated at 85 per cent of its full load capacity, these four engines stand as follows, on the basis of b.hp.-hrs. gal. and maximum B.M.E.P. developed:

Engine	Kerosene B.H.P. hrs./gal.	Kerosene B.M.E.P.	Gasoline B.H.P. hrs./gal.	Gasoline B.M.E.P.
(a) 4.50 x 5.50 x 4 cyl., overhead valves	12.05	83.0	11.15	84.5
(b) 4.25 x 5.00 x 4 cyl., overhead valves	11.29	74.9		
(c) 4.00 x 5.25 x 4 cyl., L-head	10.42	70.0	10.08	71.0
(d) 4.00 x 6.00 x 4 cyl., L-head	9.88	72.2	10.22	73.1

The test conditions under which these results were obtained were of the same order of excellence as those in the tests of the aircraft engine cited in your editorial comments. And the results cannot but lead to the conclusion that good tractor engines are not so far behind the best in aircraft engines, for which latter the value of 13.7 b.hp. hrs./gal. is admittedly a record.

The writer holds no brief for kerosene or other heavy distillate as a general engine fuel, since the conditions that must surround its satisfactory use demand the best there is in engine design. It has often been found to be much easier, as a way out, to condemn the heavier fuels than to make the necessary reorganization in engine design details. However this may be, it is a certainty that the heavier fuel distillates are not quite the pariahs some would have us believe.

P. S. TICE.



Fuel economy comparisons of tractor engines at governed speeds

Automobile Electrical Systems

FROM the time that the first combined starting and lighting system made its appearance on the market, about 1912, many systems have been brought out and have disappeared; that is, these systems are no longer being manufactured, but in many cases they are still doing service in cars and have to be looked after by the owners or operators and repaired and overhauled by garages. In some instances the manufacturers have gone out of business and it is very difficult if not impossible to get detailed information on their systems, such as would be helpful in making repairs.

A book that should be of considerable help in such cases is Automobile Electrical Systems, by David Penn Moreton and Darwin S. Hatch, published by the U. P. C. Book Co. This is a sequel to the volume on Electrical Equipment of the Motor Car by the same authors and deals particularly with individual systems. It must not be understood from the above that only obsolete systems are described. No less than fifteen chapters are devoted to descriptions of special systems for Ford cars and nineteen to systems for general use. There are also chapters devoted to a general discussion of wiring diagrams, to the maintenance and repair of electrical apparatus and the diagnosis of troubles. The book is of pocket size and bound in flexible covers.

Standardization Without Understanding Is Harmful

Knowledge of the fundamental elements involved in human actions and relationships is so very limited at present, that attempts to standardize practice and methods of handling this factor are premature. Development lies in closer study of the elements. A noteworthy commentary.

By Harry Tipper

THE following abstract taken from a New York newspaper may not appear to be interesting to the average business man and yet it is one of the symptoms of development in this kind of work that should be noted and considered in its relation to the study of the human side of industry.

> Plans for standardizing methods of selecting men and women for vocations to which they are best fitted were discussed yesterday at a luncheon in the Keen Chop House, 72 West Thirty-sixth Street, and a committee appointed to go further into the matter, led by George Kingdon Parsons, president of The G. K. Parsons Corporation, who was the host.
>
> The committee will confer with the Personnel Research Federation, organized in Washington last Tuesday at a conference of the National Research Council, attended by representatives of some thirty scientific and welfare societies.
>
> Dr. Beardsley Ruml of the Carnegie Corporation agreed that what Mr. Parsons had said reflected a general feeling and described the origin of the Personnel Research Federation as a result of the conference in Washington a week ago. He said that the federation was still in a formative period and that he had been chosen as acting director. He added that it was planned for the federation to keep records of as complete a nature as possible regarding all agencies fitted for specialized research in connection with questions of personnel.

The first sentence in this article is perhaps the most significant because it is the general tendency of all organization work of an abstract character in connection with these problems. It states that plans for standardizing methods for selecting people were discussed.

> **This idea of standardization runs through all the discussions which have taken place in connection with the organizations of employment managers, personnel directors, industrial engineers and the innumerable other societies springing up with the idea of taking care of the human side of the industrial problem. I am reminded of the statement which I quoted about two years ago in one of the first of these articles:**
>
> **"In their meagre imagination uniformity seems a lovely thing—when it is only the night in which all cows are black."**

It is true that there are certain fundamental elements of similarity in human reactions, but the principal possibility of development lies not in these fundamental similarities but in the endless individual variation which develops an infinite variety in the quality of action and thought. We do not even know with any certitude the fundamental elements of similarity and what they mean in practical action. We have no understanding of the way in which these fundamental elements govern the endless individual differences, and we are utterly without information as to the potential powers which exist in these variously combined qualities.

We have already standardized to such a degree in our attempt to use human beings easily in industry, that standardization has in many cases developed into a dangerous suggestion of uniformity. This standardization has grown up out of the ignorance of fundamental human requirements, and it has been one of the chief elements in the growth of trade unionism and the development of socialism.

All methods of examination of human beings which are standardized are inefficient to that degree—the most desirable method of selection, like the most desirable method of education, is the one which is individual and arises out of the instinctive capacity to draw the individual out.

As a matter of fact, this idea of standardization in human relationships is simply another way of attempting to do by system what we have not sufficient knowledge to do by understanding, and the result is likely to be more confusion and more difficulty, because these organizations of various kinds will be limited by the systems which they have adopted.

> **It is a sufficiently hard matter to standardize effectively the technical practice in a business which is dealing with understood mechanical principles. Every step in the progress of such technical practice demands the elimination of old standards and the readjustment of standards to the new state of knowledge. We are thoroughly well informed regarding mechanical principles, and are able to govern the results with a fair degree of accuracy and with a fair degree of foresight.**
>
> **Our knowledge of humanity is meagre and we have not made any notable progress in this respect in the growth of our mechanical convenience. To attempt to standardize and to classify into systems in our present ignorance of human relations is to assume a knowledge which we do not possess and seriously impede the possibility of progress.**

Equally significant is the indication in this report concerning three or four additional organizations with the sole object of establishing new systems of dealing with the human being. This multiplicity of organizations is leading already to a great deal of confusion and to the development of a large amount of unnecessary propaganda for this or that method of increasing the efficiency in dealing with the human side.

If these groups were based upon discussion and the gradual illumination of the matter by the definition arising out of the friction of the discussion there would be

some valuable progress in their development. Almost all of them have been formed by people who are not only interested in the subject, but who are also interested in certain systems of development—of which each system, of course, contains the only elements of thorough value in dealing with the situation.

Such organizations have a tendency to establish a terminology and a technique of operations long before they have thoroughly illuminated the principle upon which such a technique should be built. They may be of some value in a limited way, but their constant multiplication is of no advantage and may be a great disadvantage.

No operating technique or system of dealing with the selection or co-operation of workers is of any particular importance at the present time. The co-operation depends largely upon the development of a spirit of fairness among all parties, and the selection depends upon an increase in the measure of understanding on the part of those who must select. Selection must always take place because of the fitness of the individual for the work, in his skill and the quality of his mental development.

The total efficiency of the group is the average of the value of each individual in the group. A thorough understanding of the individual, his skill and his quality will automatically raise the average possible efficiency of the group, while neglect of the individual, in the attempt to standardize and provide easy systems for mass selection will merely bring the individual quality to the average upon which the system is based: Practically all of these organizations act as though the individual was no longer the basis of human development and efficiency was no longer a question of the individual capacity.

The very necessities of our organization have driven us to standardize work and pay, the unions have attempted to make skill a uniform matter and these things are disturbances enough to our present system of organization. To organize for the purpose of furthering these standardizations and elevating the neglect of the individual into a scientific technique, seems to be a method of improvement by increasing the present difficulties.

It may be imagined from this discussion of organization that I do not favor special study of the human side. This is not so. No man can expect to understand humanity even in a slight measure without giving it a great deal of study. The lack of definite knowledge on the subject means, in fact, that this study is more severe and more laborious than any other study in the attempt to acquire definition. My objection is that these organizations are systematizing on too little study and too little understanding of the matters with which they are dealing. Their efforts at organization are based upon the most fragmentary and partial examinations of the matter.

The systems are not based upon much more knowledge than the course which undertakes to teach all about handling humanity in six months. In thirty centuries we have not been able to define the frame work of fundamental human principles and determine the elements of human co-operation. Under these circumstances, it seems unlikely that organizations can be started after a few months or a few years fragmentary study of the question and build up systems of operation which will be of great moment in dealing with the subject.

It would be better, for a time at least, if the systems grew out of the individual methods of operation in each case, and were discussed in the endeavor to find those principles which threaded through all systems. Some real progress might be made in an organization by such discussions and the understanding of the human side would be greatly forwarded.

It is not standardization we need, but definition. What is a square deal? I have been unable to secure the same definition from any half dozen men. Most of the time the square deal we talk about is concerned about what the other fellow should do to us, and doesn't refer very much to what we should do for the other fellow.

I have yet to find a dozen men who can agree upon the term fair wages. Efficiency, alertness, initiative and all these other words which we use to describe human qualities, lack definition entirely, and their meaning is so vague that no two men translate it into the same actions.

There can be no standardization of effort worth while without a definition of fundamentals so clear that the terminology is thoroughly understood. With the present vague, indefinite, fragmentary ideas of human quality and action, systems based upon such ignorance are not likely to be of any importance and they may be dangerous.

Air Service Engineering School

A SCHOOL at which officers of the Air Service may learn the engineering principles of airplane construction, tests and maintenance is conducted by the Service. Requirements for admission include a rating as an air pilot and one of the following three educational tests: (1) Graduate of naval or military academy; (2) graduate of recognized technical college or (3) a thorough high school education and well versed in the fundamental sciences and exceptional experience along lines of special importance to the Air Service.

It is hoped that as a result of this instruction the student officers will get a point of view and a sufficient knowledge to allow them to speak the language of engineering and that a deep interest in mechanical matters will be instilled in them which will result in their returning to their stations with an educational foundation and an interest in technical matters which will cause them to continue reading, studying and constantly improving themselves as Air Service officers.

Following is a list of the topics covered by the course: Mechanics; Shop Work (machine tools, wood work, metal construction, plane construction and maintenance, inspection); Business Administration (scientific factory management, cost accounting, business law, patents, contracts, civil service); Armament (machine guns and synchronizers, bombs and flares, cannon); Strength of Materials; Materials Laboratory (chemistry, metallurgy, physical testing, wood, fabrics, rubber); Electricity (direct currents, alternating currents, miscellaneous airplane electrical problems, radio); Thermo-dynamics and Engine Design (heat engineering, steam power plants, radiators, engine design); Gasoline Engine Laboratory (ignition, power tests, general engine data and repair and upkeep, accessories and power plant installation inspection); Theoretical Aviation (aero dynamics, airplane design, propeller design, performance tests, airship theory, meteorology, navigation, airplane accessories, equipment, photography and instruments, camouflage).

Increasing Interest in Costs

AN increasing number of the letters received at this office are concerning the cost of manufacture and of merchandising. This indicates a healthy frame of mind as to business of the immediate future. There has been an inclination on the part of some persons, during the recent era of free selling, to conduct their business on the principle of "charge all that the traffic will bear."

If the signs that are pointing to the immediate future can be read at all, they say that the principle of business must be "charge as little as the traffic will bear." This means that the manufacturer and merchandiser must know what his costs are, add a reasonable profit, and put all possible energy into his work.

But when it comes to discussing costs there is an almost insurmountable barrier. There is lacking a recognized terminology of costs. When two men meet to discuss costs they do not call the same thing by the same name, nor do they charge it in the same division. Cost discussions are not effective until the definitions have been fixed, and that takes so much time that the real facts are left undiscussed. The Industrial Cost Association, which is composed of cost executives, chief auditors, works managers and similar executives of manufacturing and mercantile firms, has undertaken to establish a terminology for cost accounting. The members of this association also hope to agree eventually on where the items represented by these terms shall be charged. When this is accomplished, the Association will have accomplished a great work, for then two men can meet and discuss costs intelligently.

Automobiles and Necessity Again

A FREQUENT topic of conversation in the automotive industry is the great battle that was waged in Washington several years ago to establish the automobile, and its kindred vehicles, as necessities. In these conversations it is always assumed that this battle was won and a favorable peace treaty adopted.

There are some of us who have always doubted that the favorable verdict was as well grounded as it might have been. Now it appears that the "luxury" forces in this battle are comparable to the Germans. They recall something about this battle, but since the smoke was cleared away they are rather in doubt as to who was the victor. Indeed, some of them are calmly assuming that the battle was merely a skirmish with the laurel wreath awarded to the other side.

Representative James W. Good, chairman of the House Appropriations Committee, has put himself forth as spokesman for the luxury side and has sounded a call to arms for those efficient orators and economists who made such a good showing for the automotive industry at the time America went into the war. Mr. Good says:

"We have in the United States more than 8,000,000 passenger carrying automobiles. Practically every one is a luxury, and if we placed a tax upon the passenger carrying vehicles and made the amount of the tax dependent upon the horsepower, a reasonable tax, we could easily collect $200,000,000 from that source."

That is an average of $25 a year for each automobile, as Mr. Good presents the numbers, with enough additional tax to pay for the political machinery set up to make the collections—an average of $5 a seat in an already well taxed automobile. All of this tax would act as a brake on the sale and use of motor equipment.

This statement from Mr. Good confirms what a number of investigators have said recently concerning the stand of bankers, legislators and others in a position to do the automotive industry great harm. C. C. Hanch, after an extended investigation for the National Automobile Chamber of Commerce, said that he had found that even the bankers, who appeared to be most soundly converted to the automotive industry, still held back in their minds a suspicion that the industry was not well established upon a necessity basis.

Mr. Good's statement should at least serve as a sufficient warning of what the position is in Washington and that most of the basic work thought to be completely accomplished must be done over.

The British Tractor Trials

EVIDENTLY the British tractor industry has come to the conclusion that tractor trials are a paying proposition, for it has been decided to repeat the annual trial this fall. Originally the Lincoln trial was held under the auspices of the Royal Agricultural Society; last year that organization and the Society of Motor Manufacturers and Traders stood sponsor jointly for the event, but this year the last-mentioned Society will have sole charge. The joint sponsorship was accompanied by a good deal of friction, and as most of the tractor manufacturers are members of the S. M. M. & T. the latter body probably had little difficulty in securing exclusive control. Whether the farmers will have as much faith in the trials with the Agricultural Society excluded from the affair remains to be seen.

National tractor demonstrations, which evidently are a thing of the past in this country, are apt to flourish in Europe during the next few years. A national trial naturally has a much better chance of success in a country of relatively small area than it has here. Moreover, the tractor industries in the different European countries are quite young and the manufacturers individually (as tractor manufacturers at least) have little to lose and everything to gain.

From the rules of the British 1921 trials, which have just been received in this country, it is seen that an endeavor is being made to extend the scope of the trials, motor cultivators and garden tractors being provided for in addition to regular farm tractors, cable sets and farm implements. The tests which will be made will yield information similar to that given by the Nebraska tests, and the fact that the Nebraska results are available to any prospective purchaser is another reason why we are not likely to have national demonstrations in this country again, at least for some years to come.

Save the Patent Office

THE last Congress adjourned without legislating for the benefit of the Patent Office. Because of certain quibbles between members of the Senate and the House, the Nolan bill died between these two branches of Congress.

The neglect of this important branch of the Government by Congress should stand as an indictment of every member of both branches. There is no branch of Government activity that can do as much to promote the engineering and mechanical development of this country as the Patent Office. Its best services are needed as an aid to the advancement of all engineering work and to the great task of efficient production.

The Patent Office is not an expense to the Government. It pays its own way and industry does not object to this fact. It would not even object to the Patent Office making a safe profit on its operations. But industry does demand that the Patent Office shall be efficient, that it shall be permitted to spend enough of its own money to pay the technical men who work there a decent salary.

No other industry is more interested in an efficient Patent Office than the automotive industry. It would be within reason for every manufacturer and engineer in this industry to inform his representatives in Congress that unless proper Patent Office legislation is passed at the coming session, that the participants in the deliberations of the session will be classified as unfavorable to business interests.

This matter is important. Write to your Congressmen to-day before they again become involved in the activities of the coming session.

Low Mechanical Efficiency at Part Load

AMONG the many factors which adversely affect the fuel economy of the conventional passenger car and truck engine, the loss due to engine friction is ordinarily considered to be of small moment. Broach the subject to the average engineer and he will as a rule draw attention to the fact that the mechanical efficiency of a well-constructed automobile engine is around 90 per cent, and so it is—at full load. At part load, however, the situation is quite different. Friction losses, in which are included the very important items known as pumping losses, do not decrease, at a given speed, as the load decreases. In fact, they increase, as a result of throttling, until at no load, that is with the engine running idle, they absorb the entire amount of power developed in the cylinder. At intermediate points friction losses become a very important factor. In the case of the class B truck engine, for example, at quarter load, when running at 1000 r.p.m. the brake hp. developed is about 12, while the friction hp. is over 6, or more than one-third of the total indicated power developed. At lower loads the condition is worse, especially if the engine speed is high. Yet these are the conditions under which the average passenger car engine operates most of the time it is in use.

Under the average operating condition, perhaps about one-fifth load, it frequently happens that half or more than half of the total power developed in the cylinder is used in simply turning the engine over. This is a bit startling, but it certainly points to the need, now more than ever apparent, of providing means whereby automotive engines can not only be operated at more efficient loads, but be run at lower average speeds, for friction losses in the engine increase rapidly as the speed increases. It may, in fact, prove to be better economy to use larger and slower speed engines together with high gear ratios and consequent better load factor, than to continue in the other direction, as we have so long been going. In any case there is food for thought along this line.

Too much is now being sacrificed in respect to fuel economy in order to secure good acceleration. This is a good time to investigate every factor that will make for better economy.

Sales Show General Improvement

New Orleans Finds Keen March Demand

New Business Much More Stable Than Formerly—Tractors Gain in Favor

NEW ORLEANS, March 28—The first 21 days of the month of March showed greater improvement in the automobile industry than did the entire 30 days of any previous month since the first of November, 1920. The period of depression reached its lowest ebb in December, revived somewhat around Christmas and the holidays—due largely to the pre-Christmas show—and then dropped again in January. Sales for the first three weeks of March, however, exceeded those of October, 1920, the last month before the period of depression set in, by about 20 per cent, which is considered a remarkable showing by the majority of the sixty-odd automobile dealers in this city.

The return to the normal of 1920 was a surprise to many dealers, who had expected an improvement in the spring, but had not looked for so great an advance. Truck and tractor men, who have not felt the depression so heavily as the passenger car dealers, have not noted much of an upturn for March, though their sales have remained steady, and there are prospects that their business will improve later in the summer and this fall.

Greater diversification of crops, succeeding the hard lesson the one-crop cotton planters learned when cotton dropped from 45 cents to nine cents, is making the use of tractors and trucks almost imperative in the agricultural regions of the South, and is having a direct effect on orders for tractors for future delivery, but most of the planters are not in condition just now to accept immediate delivery on either trucks or tractors.

Conditions General in South

These conditions, both in the truck, tractor and passenger car fields are true in much of Alabama, all of Mississippi and Louisiana, and parts of Arkansas and all of eastern Texas, which territory is tributary, in the automobile industry, to New Orleans. While the farmer has not made much money on his cotton, sugar or rice, the brokers, forwarders and other intermediate handlers of these crops have made some money; salaries in these industries, for the majority of those who work in them, have remained high, and the consequence is that numbers of the city people have been able to buy passenger cars, and have bought.

TRADE STUDY SHOWS INCREASES GENERAL

Dispatches from correspondents of AUTOMOTIVE INDUSTRIES in representative sections of the country indicate steadily improving sales conditions. The improvement this month has been much more marked than was expected.

For example, the first three weeks of March showed a greater improvement in the New Orleans district than any full month since November. There also is a steady upward trend in the Atlanta territory.

Even in Des Moines there has been a great improvement. One distributor sold more cars the first 15 days of this month than in all of January and February.

General merchants in the rural districts of Kansas and Missouri report improved business.

Sales conditions are getting better on the Pacific Coast, as shown by reports from Los Angeles and Portland.

Dealers in Montana have decided there is business if they have the energy to go out and get it.

Sales in New York, which fell off during the income tax paying period, have begun to mount again.

Parts makers in the Milwaukee district report substantially increased orders in the last four weeks.

Cleveland and Detroit passenger car manufacturers are adding more names to their pay roll. The same condition prevails in other automotive centers.

Altogether the situation is decidedly encouraging.

UNEMPLOYMENT HURTS SALES

FORT WAYNE, IND., March 26—Sales of popular priced cars are picking up to a certain extent here, although it is still difficult to make sales readily. It is believed that business here and in this generally prosperous northeastern section of Indiana will get much better within a few months. At the present time the fact that so many people are out of work locally makes business far from good. The local branch of the Indiana free employment bureau reports that there are 4000 more men out of employment there now than there are at normal times. Most of these men are from the Pennsylvania shops, General Electric Co., Dudlo Manufacturing Co., Fort Wayne Rolling Mills and Wayne Knitting Mills, where a strike is on.

New York Visions Big Selling Months

Effect of Income Tax Period Passes Quickly—Cheaper Cars Popular

NEW YORK, March 28—The metropolitan area is recovering from an acute attack of incomtaxitis, which slowed up passenger car sales, particularly in the high priced lines during the early part of March. Sales, which dropped off from the February level during the first 20 days of this month, have begun to pick up again and the prospects for April, May and June business are bright.

As an instance of the psychological effect of the filing of income tax returns and the payment of the first installment, One dealer handling a $3,000 car had sales during March numbering 51, as compared with 86 during February. Several other dealers in high priced cars had similar experiences, though two or three with decidedly popular makes had a March business considerably better than February. The income tax period seems to have had little effect on the sales of low priced cars and in several lines these are running very strong. One dealer in a popular priced car had sales for March running only a little below 200, as compared with 150 in March a year ago.

Practically all dealers have intensified their canvassing and mail solicitation efforts, and several have been added to the list who keep their establishments open evenings, with good results so far, according to reports. The junior salesman idea, under which quite young men are used to develop information on prospects later to be canvassed by senior salesmen, is spreading and general good results have been obtained. Used car sales prospects have picked up with those in the new car line, despite the fact that used car prices have shown little disposition to decline.

Truck sales have improved materially in the light truck classes, and there is an upward slant in the heavier duty field.

EARLY SPRING HELPFUL

PORTLAND, ORE., March 25—The early spring has proved a distinct boon to the automobile industry in the Portland district and during the past week business has picked up in a decided manner. Spring this year promises to be nearly a month in advance of last year and the country motoring should start correspondingly early. Comparatively few cars are held in storage here and dealers have been placing orders with the manufacturers during the past two weeks in a more substantial way.

Factories Reflect Growing Demand

Milwaukee Factories Report Steady Gains

Capacity Production Within Sight in Some Plants—Truck Demand Certain

MILWAUKEE, March 28—Companies in Milwaukee and vicinity manufacturing motors, parts and equipment for the automotve industries report a substantial increase of orders during the last four to six weeks, according to the current issue of Business and Financial Comment, monthly review of local business conditions issued by the commercial service department of the First Wisconsin National Bank of Milwaukee. One concern reports that its January sales were equal to those of the same month in 1920; its February record is better still, and March business shows accentuation over both. This concern is running at 85 per cent of capacity, and orders for immediate shipment are of such volume that it is two weeks behind in deliveries.

It is significant that the stimulus which brought this new business was a substantial cut in prices made possible by lower costs. Another company making motors has recently received some good-sized orders for immediate delivery. Still another large firm doubled its sales in February and expects enough business in April to run at full capacity.

The motor truck business seems also to be on the mend. Orders have been increasing and there are almost no cancellations. The truck industry is, however, not taking anything for granted. Selling trucks may be hard work, but the future of the industry is assured, the review says:

Must Distinguish Between Prospects

"In discussing the motor car situation, one must be careful to distinguish between immediate and long run prospects," it continues. "Everybody knows that there will be a good future market for passenger cars and also that motor trucks are pretty sure to be more in demand as more good roads are built and farmers and business men are convinced of the economies of motor truck transportation. In the immediate foreground manufacturers see about 50 to 60 per cent of the business done last year. One production manager puts it well when he says that 'the automotive industries are facing a sales problem after twenty years of production problems.'

"Some discontent is being expressed at the slowness of trade improvement. General revival, at first predicted for early spring, is now scheduled for late spring or summer. The best opinion is that the return of normal conditions will not be in the least spectacular. Each month will see steady gain. By the end of the year, barring the unforeseen, business should be on its feet again. It is not good sense to look for the fortuitous and unexpected in business. This is not real optimism. The confidence of reward from unremitting toil is the only kind of optimism that has any certainty of winning. The sooner everybody in trade and industry makes up his mind that he will have to work for what he gets, the easier it will be to get over this period of readjustment."

Los Angeles Business Makes Rapid Strides

LOS ANGELES, March 29.—Automotive sales conditions in this part of the country are showing a pronounced improvement. Passenger car business is advancing quite rapidly and truck sales likewise are showing increased activity. There is a certain backwardness shown by truck buyers, however, that is attributable to prospects of unfavorable legislation. Some bills now before the state legislature would tax truck owners very heavily.

A recapitulation of February registrations of passenger cars shows that some Los Angeles firms enjoyed the greatest business in their history. A total of 1913 new passenger vehicles were registered by purchasers during February. This was 145 less than the total for January, but this discrepancy undoubtedly was due to February being a short month. The truck registrations for Southern California during February totaled 277, which figure included the Fords and other light commercial cars.

Reports from dealers state that March will show a pronounced improvement over February in almost all lines.

VICTOR RUBBER SPEEDS UP

SPRINGFIELD, OHIO, March 28—Starting to-day, the Victor Rubber Co. will speed up its output to a normal basis, which is 500 cord tires per day, according to announcement made by Treasurer H. H. Durr. Since the first of the year the company has been turning out an average of 400 tires daily. The business of the company has been steadily improving, it is stated.

PIERCE OVER 50 PER CENT

BUFFALO, March 28—There has been a substantial improvement in the business of the Pierce-Arrow Motor Car Co. so far as passenger cars are concerned but few trucks are being sold. The company is operating at something over 50 per cent of capacity.

Schedules Increased in Cleveland Plants

Growth of Sales Results in Reemployment of Many Men Laid Off

CLEVELAND, March 28—Within the present week the automobile factories in this city have given signs of a business revival and have restored several thousand employees to positions that they left weeks ago. The automobile industry is setting the pace for a general comeback in production in this city.

The Peerless Motor Car Co. is employing 1500 men, and the number is being increased daily. Orders have come in increased number each week since the first of the year. More than 150 men have been hired in the last 30 days. The company is now increasing its force by taking on 10 to 15 daily.

At the Jordan plant the statement was made that more automobiles are being shipped than the company is building at the present time. Although the pay roll has not been increased since the first of the year, the force of employees will be augmented on April 1.

The Chandler Motor Car Co. started on Feb. 1 to increase its working force. During March a marked addition was made to the pay roll. The week of March 21 to 28 brought about a substantial increase. The company expects to see pre-war conditions restored before the spring ends.

The White Co. has added no employees since Jan. 1. Working hours were decreased since then and shifts have been shortened in order to give as many employees as possible an opportunity to earn money. While other companies were curtailing production the last half of 1920, The White Co. operated at capacity. Prospects at this plant are brightening daily, it was said.

Harvester Employees Agree to Reductions

CHICAGO, March 25 — The Works Council, as the supreme body governing the operation of the International Harvester plant, has accepted the company's proposed cut in wages of 10 to 20 per cent. Reasons for the reductions were explained to the council at a conference with officials.

Wage reductions were decided upon by officials of the company after analysis of business possibilities, working conditions and the present cost of living. In determining for reductions in wages it was agreed that the cut should be made indiscriminately, affecting everyone from the president down.

April Schedules Revised Upward

General Expansion Meets Sales Trend

Dodge Makes Increase to 60 Per Cent Capacity—Expectations Surpassed

DETROIT, March 28—Rapid improvement in the automotive industry is reflected in the big step-up in production in most of the factories in and around Detroit. This is true particularly in the case of Maxwell-Chalmers, Studebaker, Hupp and Dodge. The only instance where there has not been increased production is at the Reo Motor Car Co. at Lansing where the time and working force were cut 50 per cent last week. This, however, was not due to sales recession but rather to permit factory readjustments. Return to a full time schedule is expected next week.

Dodge opened on a 10 per cent schedule recently, but last Thursday started on a 60 per cent production basis, which means close to 400 cars daily. Arthur T. Waterfall, assistant general manager, made the announcement regarding the production increase.

"The country is well out of the depression," said Waterfall, "and even in foreign countries conditions that have affected the automobile industry are beginning to improve. We are now operating on a 60 per cent basis with all indications pointing to a gradual return to normal. That is the best indication I can give of a change for the better. Other lines of business seem to be following the turn in the automobile industry."

Charles Adams, production manager of Maxwell-Chalmers, said to-day rapidly improving conditions had brought about a readjustment of Maxwell-Chalmers schedules, and with the step-up during the last part of March, the total figures for the month would show an output of 1500 Maxwells and more than 500 Chalmers. This schedule will be increased the first of April, and efforts will be made to reach a total of about 300 cars in the next month.

Cars Sell Fast as Made

The best feature, Adams said, is the fact that the cars are being sold as rapidly as they are being turned out. Maxwell-Chalmers virtually has been closed down for several months pending reorganization activities, but the sales demands, Adams said, forced the increased schedule in February, followed by another increase in March, with indications that within the next 40 to 50 days both plants will be running close to normal.

The completion of the new pressed steel plant, which now is about ready for manufacturing activity and which covers 217,000 feet, will take care of the work for both Maxwell and Chalmers cars, and will permit of greatly increased production. The main building contains two craneways each with a double row of presses 300 feet long, and each equipped across its entire span of 60 feet with a crane capable of picking up material, or even the presses themselves, and moving them to any other part of the building. The presses are so placed that the steel passes from one to another without the need of extra men, and the working force is thereby greatly curtailed.

Hupp April Schedule, 2000

Hupp Motor Car Corp., which built 700 cars in February, increased the schedule in March and the month probably will close with a total around 1400. April schedules at Hupp called for a production of 2000 cars, which rapidly is nearing the peak of last year.

Hupp officials a short time ago announced that while the factory had not been closed throughout the depression and was increasing gradually, there was nothing to indicate that production above 50 per cent of normal would be reached this year. Sales activity, however, has shattered that belief. The more than doubling of production during April, as compared with February, and the great increase over March, is due entirely to sales demand.

Studebaker to-day started in on a production in the Detroit plant of 800 cars for this week, and 500 in the South Bend plant. Next week Studebaker has scheduled 830 cars in Detroit and 575 in South Bend. "And the best of it is they are all being sold," said A. J. Chanter.

Buick Motor Co. at Flint, which had been employing about 12,000 men on a three-day a week basis, to-day started a schedule of 5½ days a week. This will mean that Buick in April will almost double its production. Buick was building about 200 cars a day in February and March, and indications are that the April schedules will run between 350 and 400.

Operations in the Hudson plant were resumed to-day upon a 100 per cent basis. The company has been operating with a curtailed force on a reduced working schedule for several months.

Federal Truck on Increase

Federal Motor Truck Co. is another Detroit factory that has made a remarkable jump in production in the last few days. A full time operating schedule was announced Saturday by M. L. Pulcher, vice-president and general manager, who said the plant beginning today would be on a 50 per cent basis.

Durant Takes Over Long Island Plant

Former Ford Assembly Factory to Supply Eastern States and Export Trade

NEW YORK, March 28—Production of the new Durant car which will be put on the market about August 1, will begin in the eight story factory building of the Goodyear Tire & Rubber Co. in Long Island City which has been purchased by the Durant Motor Co. of New York for $2,000,000. Preliminary operations already have been begun and the first cars will be under test in a few days.

The first real estate acquired by W. C. Durant for his new venture was erected by the Ford Motor Co. for an assembling plant but later was sold to Goodyear. It is located at Jackson Avenue and Honeywell Street. The structure has a floor area of approximately 500,000 sq. ft., is of reinforced concrete and steel construction, and is located on the Long Island Railroad. Not all the space will be required by Durant for some time to come.

The main plant of Durant Motors, Inc., will be located in Flint, Mich., but negotiations for its construction still are pending and considerable time must elapse before a factory can be established there. The Long Island City factory will be one of a chain of independent organizations to be located at strategic distribution points. It will be operated by the Durant Motor Co. of New York, a $3,000,000 corporation, and each assembling plant will be under the control of an individual company to be operated under contract with Durant Motors, Inc., which will supervise and direct the production.

When operations are fully under way it is expected 25,000 Durant cars a year will be assembled and shipped from the Long Island City plant, which will supply the New England and Atlantic Coast territory and the export trade.

Details of Car Not Available

No details are available as yet concerning the new Durant, but it will be largely an assembled product and will be made in two models, one of which will sell at something less than $1,000. It is being designed by the designers of the Chevrolet.

The capitalization of Durant Motors, Inc., the parent concern, is $5,000,000, consisting of 1,000,000 shares of no par value. The initial offering made in January amounted to 500,000 shares, which was immediately over-subscribed at a price around 12. The stock now is selling on the curb at 21.

Ford April Orders Approximate 90,000

Predicts Time for Full Operation Near—Financial Position Much Improved

DETROIT, March 28—Ford Motor Co. orders total approximately 80,000 for March delivery and 90,000 for April, according to figures furnished by Henry Ford personally, while on the trial trip of the Dearborn, his gasoline propelled railroad coach. That means, he said, that nearly every car and bit of finished stock on hand when the depression set in has been sold.

"The time is not far off," he declared, "when we will have to begin full operation to produce new cars and new parts to take care of the host of orders that come rolling in. Indications are manifest," he asserted, "that the bottom of business depression has been reached and passed, and the trend of industry is now definitely upward."

The annual report of the Ford Motor Co. for 1920, filed at Lansing, shows total assets of $384,554,941, as compared with total assets of $332,998,121 in the report for 1919. All of the outstanding stock in the company is shown held by the Ford family—Henry Ford, 95,321 shares; Edsel B. Ford, 71,911, and Clara J. Ford, wife of Henry Ford, 5413 shares. The amount outstanding totals $17,364,500 of $100,000,000 authorized.

Chief items shown on the balance compared as nearly as possible with similar items in the 1919 balance sheet, are as follows:

CHIEF ITEMS OF BALANCE SHEET

	1920	1919
Real estate	$50,861,000	$54,975,541
Cash in banks....	13,557,244	156,011,984
Credits owning corporation	54,438,633	
Merchandise, equipment, &c...	124,350,295	100,612,925
Goodwill	21,262,833	......
Investments	20,084,033	20,903,512

Large sales of cars in the past few weeks have put the company on a much sounder footing than the annual report might indicate. The position now is considered so good by officials at the factory that they think it quite probable no bank loans will be required at present. This possibility was indicated in AUTOMOTIVE INDUSTRIES in the report of negotiations between Ford and New York financial interests.

It is also declared to be likely that when the $35,000,000 in Federal taxes and outstanding bank loans become due May 1 the company will be in a position to meet the demands in cash. In the event that recourse has to be made to bankers, Mr. Ford has been assured that ample funds may be had. Recent short extensions granted by New York and Detroit bankers are said, however, to be the last for some time.

Ford to Make Plate Glass

ROCKFORD, MICH., March 26—Henry Ford's new factory here will begin the manufacture of plate glass within a few weeks. Equipment is on its way from the Highland Park plant, where it was made, and engineers are preparing to set it up quickly.

Chemists recently made a survey of the silica deposits in the vicinity and reported them particularly suitable for making glass for Ford cars.

Mr. Ford's engineers say they have a new method of making plate glass which is cheaper than ever before known.

Ford Irish Plant Closed

CORK, March 28—Fifteen hundred workers have been made idle through the closing of the Ford Tractor Works here. It was stated that the plant might be shut down for several months.

Ford Railroad Coach Damaged in Accident

SPRINGFIELD, OHIO, March 26.—Henry Ford, owner of the Detroit, Toledo & Ironton railroad, had visions of a high speed inspection trip over the road this week, but was disappointed owing to an accident to his new gasoline propelled railroad coach which was derailed at Quincy, north of here. The trial trip of the coach known as the Dearborn, was made Wednesday out of Detroit.

The new coach, which is equipped with a high power engine, was going at a mile-a-minute clip when it had to be stopped near Jackson Center. As it was approaching the Big Four railroad crossing at Quincy the brake on the Dearborn failed to work and the car went through the derail, but Ford and party including his son Edsel Ford, escaped injury. The car was pulled back on the tracks and the journey southward was resumed under difficulties.

On Thursday the Dearborn met the party at Kingman and continued the inspection trip south. At Jeffersonville more engine trouble was experienced and the party secured automobiles and returned to Springfield. On Friday the party started for Detroit, the coach being hooked on behind a steam locomotive. It is expected that Ford will make another test of the car as soon as the engine is put in condition again.

It has a seating capacity of 50 and resembles a street car.

Ford Plant Increases Tractor Production

DETROIT, March 28—Tractor production at the River Rouge plant of the Ford Motor Co. is now progressing at the rate of 150 machines daily. A rate of 100 daily had been continued to March 1 when this was stepped-up to the present figure. Officials say tractor demand is increasing largely and shipments have been made to New York, Pennsylvania, Massachusetts, District of Columbia, North Carolina, Indiana and Wisconsin. Michigan is taking hundreds of tractors, all of which are being driven away from the factory.

N. A. C. C. Committee to Work with Hoover

Accepts Suggestions to Form Part of Advisory Board—Will Study Markets

WASHINGTON, March 28—Herbert Hoover, Secretary of Commerce, has announced that automobile manufacturers will be the first to co-operate with his department in obtaining accurate statistics of production, consumption, exports and other details. He has taken up with J. Walter Drake, chairman of the foreign trade committee of the National Automobile Chamber of Commerce, the question of appointing a small committee to represent the industry in its relations with the Department of Commerce. The suggestion will be accepted and a committee will be named in a short time. This committee will form a part of Hoover's advisory board, which will consist of representative business and industrial leaders. The work of this board will be supplemented by that of service committees from the trade associations.

One of the plans proposed by Hoover is a survey of world markets to ascertain the best fields for commodities available for exportation from this country. He believes that a scientific survey of world markets is one of the pressing trade needs of the country. The first survey will include foreign markets with respect to automobiles, cotton and cotton products and a few other commodities. Government commercial officials abroad will be requested to report all available data as to the trade possibilities for particular commodities in the principal foreign markets.

It is the intention of Secretary Hoover to obtain full information direct from producers and distributors as to production costs, credits, financial standing, trade routes, markets, transportation, surpluses here and abroad, dumping and other important subjects. Whatever legislation may be required to assist in the promotion of trade will be recommended to the Congress by Secretary Hoover after he has studied the problem thoroughly.

Export Interest Keen

Automobile exporters have evinced a lively interest in the efforts of the Department of Commerce and the Federal Reserve Board to lessen the damaging effects of cancellations. Complaints have been received by the Department of Commerce of cancellations which put American manufacturers in a delicate financial condition. The Federal Reserve Board believes that uniformity in foreign trade and foreign banking practice is essential to minimize the possible scope of cancellation of orders and in order to fix more definitely the responsibility of banking institutions which have opened confirmed credits. It is stated that advantages would accrue through emphasizing the binding force inherent in commercial letters of credit.

Tractor Factories Increase Production

Minneapolis Finds Business Far in Excess of Expectations Earlier in Year

MINNEAPOLIS, March 26—As a part of an enlarged program for the manufacture of tractors, the Minneapolis Steel & Machinery Co. will reopen its foundry early next week, it is announced by George M. Gillette, president. One hundred to 200 additional men will be employed, this number to be increased gradually.

"We have an order for every tractor we have made," said Gillette. "Our people feel that the business situation is greatly improved. Trade is far beyond the expectations of sixty days ago."

Demand for tractors for spring farm work is good in sections where the crops matured early last year and where the growers had the opportunity of selling before the slump in the price of farm products came, Gillette said.

This company recently made a shipment of tractors to Venezuela and Czecho-Slovakia, but, according to Gillette, no great improvement in the export business is anticipated until rates of foreign exchange become more normal.

Other tractor firms in Minneapolis report good business.

The Shaw Enocks Tractor Co. is operating its plant on a twenty-four hour basis, turning out tractors for road maintenance work. Many of these machines are being sold direct to county commissioners.

Reports received from dealers indicate that there will be a marked improvement in the demand for tractors after the first of the month, according to R. C. Brewsaugh, sales manager of the Toro Motor Co.

Plenty of Farm Funds, Says Wisconsin Banker

JANESVILLE, WIS., March 28.—Formal announcement of a 20 per cent reduction in the price of the Samson Model M tractor, and 10 per cent in all power plows and harrows was made at a big Farmers' Day demonstration at the works of the Samson Tractor Co., division of General Motors, in Janesville, Wis. More than 5000 people, mostly farmers, were present. President James A. Craig, in announcing the reductions, which make the list price of the tractor $995 instead of $1250, said:

"The cost of production does not justify these reductions, but they are effected to meet the popular sentiment among farmers and dealers to help bring conditions back to normal as rapidly as possible. During the day there were talks by bankers and business men. F. H. Jackman, president of the Rock County National Bank of Janesville, said: "There has been a lot of loose talk about Janesville banks not lending money to farmers. I do not know of a single instance of a farmer in need of money being refused reasonable money credits.

"Any substantial farmer who needs money to buy tractors, implements or motor cars can get it at Janesville banks. There never have been any regulations put on the lending of money to farmers. We realize that banks are dependent upon farmers as well as business men and so much so to the former that we never have been inclined to discriminate against them."

Southeastern Towns Show Steady Gains

ATLANTA, March 26.—The automotive industry continues its gradual but steady improvement throughout the Southeast, especially among the dealers in the smaller towns who, for the first time in some months, are beginning to report something substantial in the way of sales. Since the first of March a number of Southeastern newspapers have published Associated Press dispatches emanating from some of the smaller towns in Alabama, Georgia and Tennessee, the gist of which indicate that the automobile business in the small towns has taken on a brighter tone, that real sales are being made and that there is a much better feeling among the small dealers as regards the outlook for the future.

Distributors in Atlanta report a substantial increase in the volume of business during March as compared with the two previous months, with the promise that April and May will see the industry in this section more nearly normal than it has been since the period of depression first made its presence felt last fall.

HART-PARR GIVES BONUSES

CHARLES CITY, IOWA, March 29—The Hart-Parr Co., manufacturers of tractors, distributed to its employees who were eligible under their continuity-of-service participation plan for 1920, checks for their share of the 1920 business of the factory at a banquet given Friday evening. The bonus plan applies only to employees who have been in continuous service for a period of two years prior to 1920. Checks were given to individuals ranging from $10 to $500 each according to the length of period of continuous service with the company.

TO FORM REVERE COMMITTEE

FORT WAYNE, IND., March 28—An abandonment of the bond sale plan for the saving of the Revere Motor Car Corp. of Logansport has been announced by the board of directors. A committee will be selected to draft a reorganization plan, it is said. Attorney M. L. Fansler, of the company, said that at least one member of the committee will be a resident of Logansport, another will probably represent the Chicago interests, another the southern Indiana interests and another the eastern stockholders.

First Akron Plant Starts Three Shifts

American Rubber Begins Maximum Production—Other Factories Ready for Increases

AKRON, March 25—The fact that the American Rubber & Tire Co. has gone to maximum production with three eight hour shifts at work in the plant, is taken here as an indication that the dealers have begun to feel the shortage of tires predicted during the last month. The company is working the maximum number of men and is producing 600 tires a day. Practically all the orders which have occasioned the increased production have come from the dealers. H. L. Houk, general manager, said in a statement to-day:

"We do not care to say that we will continue on this basis indefinitely. We are proceeding with cautious optimism. We will if business continues as at present. We made no strenuous fall efforts to sell tires for spring delivery, and as a result our dealers are badly in need of tires."

Other companies are known to be making plans to increase production, and announcements are expected daily. Many of the companies have received large orders from the automobile manufacturers who are resuming production.

Oshkosh Truck Reports $4,000,000 Rush Order

OSHKOSH, WIS., March 28.—A contract involving approximately $4,000,000 worth of quadruple drive motor trucks has been closed by the Oshkosh Motor Truck Co., and will be put into production immediately, according to official notice given stockholders. The company recently completed a new plant costing about $250,000 and the contract will require a capacity of four trucks a day for twelve months.

This output will go to a large distributor, the name being withheld for the present because of a reorganization now being effected. It calls for both commercial vehicles and special fire fighting apparatus. The Oshkosh company intends to start work on a second unit, 50 x 200 ft., which was to have been erected last fall but was postponed because of conditions in building construction as well as the general situation in the motor truck industry.

HARVESTER PLANT BUSY

SPRINGFIELD, OHIO, March 26—The busiest place in Springfield is the Springfield works of the International Harvester Co. It is now turning out 50 high speed motor trucks per day. These are being shipped about as fast as they are manufactured. The men identified with the works state that there is a general demand for the motor truck. About 1000 men are employed at the local plant.

Minnesota Licenses Based on Car Price

Decreases Allowed Under New Bill for Cars Three Years in Service

MINNEAPOLIS, March 26 — The Child's motor tax bill fixing automobile license fees in Minnesota under the Babcock good roads amendment has been passed by the lower branch of the Legislature without a dissenting vote and indications point to its acceptance by the Senate next week. The bill provides a tax within the average of $18, as promised by the proponents of the amendment at the last elections.

According to the measure, the tax for passenger cars is fixed at 1.8 per cent of the factory price and for trucks at 2 per cent. The minimum tax on passenger cars under 2000 lb. is $12 and over 2000 lb. $15. The minimum on trucks is $15, with an increasing scale for heavier vehicles. Decreasing fees based on percentages of the original price are provided for cars after three and five years' service.

These license fees are in lieu of the present tax and the personal property tax.

Based on figures compiled by a subcommittee, the bill will yield $4,939,344 from passenger car licenses, $600,000 from trucks, about $500,000 from chauffeurs' licenses at $2 each, and an undetermined amount from trailers, motorcycles, bicycles and other vehicles.

The tax was computed to raise $3,000,000 for maintenance and $2,840,000 to meet Federal aid for road construction.

BAY STATE PROTESTS NEW FEES

BOSTON, March 26—For nearly seven hours this week the Joint Committee on Ways and Means at the State House listened to arguments for and against a proposal to increase the State fees for motor vehicles, as proposed in a bill submitted by the Department of Public Works.

Chairman Cole of the Department of Public Works, spoke nearly two hours, giving an exhaustive analysis of the problems of his department and of the costs of building highways and their maintenance.

Showing that the industrial life of the State depends upon transportation, he said that the railroads have lost the short haul work, which has been taken over by the trucks and that hereafter the railways must depend upon long hauls.

KILL CAR COMPENSATION BILL

ALBANY, March 26—The Assembly Committee on Labor and Industry to-day returned an adverse report on the Stitt motor vehicle compensation bill which provides for compensation for personal injuries or death from the operation of motor vehicles and for obtaining payment as a condition precedent to registration of motor vehicles.

FINANCIERS DECLARE CARS HAVE MADE GOOD

NEW YORK, March 28—The current issue of The Financier, a magazine going to several thousand bankers, contains a long article under the title, "Rural Bankers Find Cars Are Business Builders." It states that thrifty country bankers are enthusiastic motorists because by their use of automobiles they can save much valuable time. The article also quotes prominent New York bankers who have declared the automotive industry has made good. The list includes J. P. Morgan, George E. Roberts of the National City, A. Barton Hepburn of the Chase National and Francis H. Sisson of the Guaranty Trust.

New Orleans Finds Keen March Demand

(*Continued from page* 724)

The attitude of the banks toward automobile paper—though possibly not toward automobile credits—has become more free. That is to say, it is easier for the salaried man in good standing in a community to obtain the backing of his bank in the purchase of an automobile than it was three months ago, but it is just as hard for the dealer or distributer to get a large amount of credit to handle a number of automobiles as it ever has been.

The reason for this is not just clear, but it appears to be that the banks are treating the automobile dealers on a strictly business basis rather than as a sort of gambling prospect, as they were treated up to about a year ago. This very action by the banks seems to have created a healthier condition among the dealers themselves. Buying an automobile nowadays in the country tributary to New Orleans is much like buying a piece of valuable real estate, or a housefull of furniture, in that the dealer is 100 per cent more careful.

Payments Made in Shorter Time

This means that more passenger cars are being paid for in shorter time, and more promptly than ever before, since the dealer—unless he be of long standing and full of capital—has to have money of his own with which to get his cars out of the railroad terminals. Consequently, he calls on the individual buyer, not only for money down but for larger and more prompt payments.

The new Foreign Trading Corp., the bank formed under the Edge Act recently, to aid shipments of Mississippi Valley manufacturers to foreign ports, is extending assistance to automobile shipments with about the same freedom as to cotton and to other manufactured goods, so that considerable shipments of cars are going foward, especially to Latin-American importers.

Underwriters Drop Fixed Value Risks

Fire and Theft Losses in Future to Be Adjusted on Value When Lost

NEW YORK, March 28—The National Automobile Underwriters' Conference has unanimously passed a motion to abandon the valued policy for fire and theft risks. The measure takes effect May 1.

The value policy is one in which the amount of insurance is specifically named instead of depending on an adjustment to determine the actual value of the automobile at the time of loss. During the recent decline in values insurance companies found themselves carrying insurance far in excess of market values. This is a dangerous situation, as it makes the companies most tempting "customers." Statistical analysis attributes much of last year's heavy losses to this evil.

On the ground that tires, motor meters and spare parts are also poor moral risks and that insurance losses are suffering from the multiplicity of claims they involve, many companies will not include them in the policy. The conference declined to make this compulsory.

The National Automobile Underwriters' Conference has decided to continue writing full coverage on automobile collision insurance. The majority of the fire insurance companies disapproved making the deductible clause compulsory, but recognized that rates would have to be increased for full coverage, and instructed the rate and statistical committee of the conference to determine the proper rate revision upward.

Tampico Oil Fields Offer Big Tire Market

TAMPICO, MEXICO, March 28.—According to George N. Anderson, sales manager for the Goodyear Tire & Rubber Co. for the northern district of Mexico, no area of corresponding size in the world offers a better market for automobile tires and accessories than Tampico and the adjacent oil fields.

"In the Tampico district," said Anderson, "there is an enormous demand for tires. This comes from the fact that here as nowhere else is time considered as of such great importance, and from the further facts that roads are bad, shelter not to be had, and drivers reckless.

"But there is strong evidence of a tendency toward economy in the use of automobiles. Buyers are talking quality now as never before and accessories, particularly tire savers—patches, boots, etc.—are being used more than ever before. The conditions in the automobile trade are becoming much more normal."

There are more motor trucks employed in the Tampico district than in all the rest of the Republic of Mexico.

British Cut Prices Despite Guarantees

Vauxhall and Rover Choose Refunding Money to Losing New Car Sales

LONDON, March 20—(*Special Correspondence*)—While no general landslide is occurring in the prices of British cars, notifications of reductions are occasionally being issued. One of the biggest drops recently announced is that of Vauxhall cars, the decreases range from £250 (say $1,200) in the case of the 25 hp. chassis (£1050 to £800) to £375—approximately $1800—for the 30-98 hp. open four passenger. These drops have come on top of the Vauxhall reductions in October last, which were of only slightly smaller amounts.

Rover has knocked nearly $200 off the price of the 8 hp. air-cooled light car (approximately $1500 to $1300); Arrol Johnston and Vulcan have reduced their five passenger car prices $120 and $370 respectively—these are 15 hp. and 20 hp. cars, the A. J. now selling at $3500 and the Vulcan $3370.

Vauxhall and Rover were two of the firms to adopt the price refund guarantee scheme. Rover is continuing it on the lower figure, but Vauxhall has decided to give no guarantee from now on. Both apparently felt quite safe a couple of months back in offering to refund to purchasers meanwhile the amount of any reduction made before June 30th next; but circumstances have been too strong for them, and they have been faced with the choice of two evils—either refunding to purchasers who have bought under the guarantee or losing the sale of many new cars during the rest of 1921.

Obviously the reimbursing of part of the cash already received is not going to ease the financial stringency which so many firms in all industries are still experiencing.

Belgian Shop Seizure Meets Quick Action

PARIS, March 18—(*Special Correspondence*)—Refusing to work with an ex-soldier who was not a member of their labor union, the workmen at the Metallurgique automobile factory at Marchienne-le-Pont, Belgium, took possession of these works and turned out the entire technical staff, the office employees, and the caretaker.

The occupation was short lived, for threatened with a new law which punished by prison any attempt to interfere with the liberty of labor, the men undertook to negotiate. The result was a complete climb down on the part of the workers, who recognized their mistake in refusing to work with a non-union man and the illegality of the seizure of the shops. In consequence the men abandoned the shops without any guarantee as to the future policy of the directors and work was resumed twenty-four hours later.

FIJIANS QUIT EATING TO TAKE UP SPEEDING

AKRON, March 26—Shades of the Polynesian aborigines!

The heathen Fiji Islander has given up his time honored sport of eating missionaries, and has gone in for automobiling.

Figures obtained by one large Akron tire company show that about 150 automobiles now are operating in the Fiji Islands, whose inhabitants for decades have been classed with the "wild man of Borneo" and the bushman of Tasmania.

The Fiji Islanders show a preference for American cars and American tires. A Goodyear dealer who had courage enough to penetrate the Fiji Island jungles, and to establish an office at Suva, the capital city of the Islands, has just been rewarded by orders from the native islanders for 500 tires and 1000 tubes.

Business Methods Hurt American Goods in India

NEW YORK, March 28.—The practice of changing agencies without sufficient provocation has been detrimental to the good-will of American automotive companies doing business in India, is the opinion of Innes Randolph, who is in charge of Far Eastern affairs for the General Motors Acceptance Corp. The Indian dealer in American automobiles feels, Randolph says, that he simply is being used and that as soon as the manufacturer can make a more advantageous connection he will be thrown aside. He cites an instance of one company which took an agency away from a man who handled its car for 10 years and gave it to another man who agreed to take a larger quota of vehicles.

Randolph's investigation has convinced him that India does business with the United States not because it likes Americans but because it likes our products. As soon as some other nation comes into the field with equally good products at a similar price, America will lose its business in India. Indians do not like American business methods.

ALUMINUM TARIFF OPPOSED

WASHINGTON, March 28—When the work of framing tariff legislation begins at the extra session of Congress, a spirited fight will be made by automobile manufacturers and other industries against the proposal to increase the tariff on aluminum. The entire supply in this country is controlled by the Aluminum Co. of America which has made enormous profits in the last seven years. Manufacturers feel that if aluminum is not placed on the free list the present tariff of 2 cents a pound should be left undisturbed instead of being raised to 7 cents as the company is urging.

Dealers in China Form Association

Will Boost Industry Through Organization—To Hold Show and Foster Roads

SHANGHAI, CHINA, Feb. 18—(By Mail)—A dealers' association, embracing all of the motor interests of the Central China territory, has been organized in this city and will begin operations within a short time. The association is now in a tentative form but will be placed on a firm basis by spring. Among the proposals which are to be taken up is that of an annual motor show.

A separate company is being formed to finance the show and stock is being taken by all of the principal distributors of Shanghai. A representative is being sent to the United States to interview the manufacturers represented in this field and to obtain their assistance in the way of exhibits and advice. The show will probably be held in October and will be the first of its kind in the Orient, with the exception of small exhibits in India and the Straits Settlements.

The good roads movement will also be fostered by the new association, and it is probable that its formation will lead to similar organizations in the North and South China territories, and the linking of the three into an organization that will embrace all of the motor interests in the nation.

Wolseley Production on 175 Weekly Basis

LONDON, March 11—(*Special Correspondence*)—The Wolseley Co. of Birmingham is now producing at the rate of 175 cars weekly on a 47 hour week, with 7000 to 8000 men employed, according to a statement given out at the Adderley Park works of the company this week. The company expects to reach a 250 weekly output when it will institute the conveyor system of assembling the chassis.

The molders' strike imposed a loss of about $5,000,000 in production, the company declared, to the corresponding advantage of importers of cars. The management made it clear that it was not out for mass production and that there is no margin for reducing prices.

TRACTOR MARKET IN INDIA

OTTAWA, ONT., March 26—H. R. Poussette, director, Commercial Intelligence Service, says that a market exists in India for farm tractors. According to his report to the Trade and Commerce Dept., Ottawa, the Director of Agriculture of the Madras Presidency is also very sanguine as to the future of tractor plowing. Demonstrations are necessary to convince the agricultural population of the very great advantages to be secured from this method while the extra profits are the strong dealer point.

Imports to Dwindle Under New Tariffs

Application of American Valuations to Foreign Cars Expected to Reduce Market

WASHINGTON, March 28—Imports of automotive products which have increased of late are expected to dwindle when Congress enacts amendments to the Customs Administrative Act, effecting the transfer of the basis for the estimation of ad valorem duties from foreign to American wholesale market value. This change would automatically increase the price of foreign cars on American markets.

Judge Marion De Vries, of the United States Court of Custom Appeals, has been consulted by the House Committee on Ways and Means as to the proposed amendment. He has recommended the adoption of the language of the existing law in every possible detail, adding only where absolutely necessary, changed words to effect the new purpose, and thus avoid any possible uncertainty as to the new phrases.

Upon the insertion of the words United States alone, the basis of valuation is made the American valuation unqualifiedly and without any deduction. He further suggests that the actual duties levied upon the imported goods should be deducted after the American market value is properly determined. Otherwise, importers would be paying duties on duties so that it would approach an embargo.

The American valuations would be calculated on the wholesale market value of such merchandise in the principal markets of this country. The value at the port of importation or entry is not the dutiable value. The importer would be required to pay duty on the American valuation taken at the time of exportation to the United States. In the case of automobiles the customs officials would have to take into consideration the prices on markets throughout the country, noting the differences in quality, make and value. The details as to application will be determined by the Committees shortly.

Truck Manufacturers Look for Better Sales

NEW YORK, March 28.—Twenty-four truck manufacturers whose production has just been checked up are making an average of 33⅓ per cent of their normal output, as compared with 16⅔ during the period when production was at its lowest ebb. The latter period in some cases dated back as far as August, and in others began in December, but the average low month for these manufacturers was December.

Most of these manufacturers expect the next step upward in production to be made in April, and while a good many state frankly that they don't know how greatly production will be increased, several expect to reach 50 per cent of normal and a few 75 per cent. The average forecast of these manufacturers for the latter part of 1921 is a production of between 50 per cent and 75 per cent of monthly averages early last year. All of these manufacturers report encouraging indications from the retail field of a decided improvement within 60 days.

Car Production Brings Increased Tire Business

AKRON, March 29—The Goodyear Tire & Rubber Co. announced to-day plans to materially increase production early in April with the re-employment of at least 1200 men. The opening up of automobile factories and the general increase in orders from all parts of the country have stimulated both original equipment business and sales direct to consumers, necessitating larger production.

Under present plans, Goodyear will go to basis of 16,000 casings and 16,000 tubes daily, as compared to present production of 12,000 casings and 13,000 tubes. They will continue the five day week for the time being, but hope soon to go to five and one-half days, with possibly two eight-hour shifts.

The increase in production, amounting to about 33 per cent, is brought about by a 70 per cent increase in April orders over March orders for original tire equipment of automobile manufacturers. Notices are being sent to former employees to return to work early in April. The company will rehire only former employees.

The meeting of Goodyear stockholders called for to-morrow to act on the reorganization plan has been postponed until April 6.

WESTCOTT ON FULL TIME

SPRINGFIELD, OHIO, March 28—"April promises to be the best month since last July," said General Manager H. G. Root of the Westcott Motor Car Co. "Dealers in some parts of the United States report a steady demand for cars. This is especially true in Chicago. The East is also showing a revival in business and the outlook is encouraging. In the Far West it is not so good." All departments of the Westcott plant went on full time to-day. Some of the departments so far have been running about four days a week. While all departments started full time, only about 75 per cent of the normal force is at work.

LUCIEN PERISSÉ DIES

PARIS, March 10—(*Special Correspondence*)—Lucien Perissé, vice-president of the Technical Commission of the Automobile Club of France, died here to-day at the age of 53. Perissé was a leading figure in French automobile technical circles, and in addition to his work at the technical commission was secretary of the Syndicate of Automobile Transportation.

French Exports Gain 854 Per Cent in Year

Great Britain, Spain and Belgium Best Customers—American Gain 600 Per Cent

PARIS, March 18 (*Special Correspondence*)—French automobile exports for the year 1920 show an increase of 854 per cent compared with the preceding year, the total figures being 124,509,000 francs for 1919 and 1,187,972,000 for 1920. The greatest volume of business has been done with England for a total of 265,599,000 francs, Spain coming second with nearly 219 million francs' worth of automobiles, and Belgium a very close third. French automobile exports to the United States have jumped from 2,187,000 francs in 1919 to 15,705,000 in 1920.

French automobile imports have decreased 45 per cent during the year, dropping from 383 million francs in 1919 to 211 millions last year. The following table gives the details of French exports to the leading countries, the values being in francs:

FRENCH AUTOMOBILE EXPORTS IN 1920

	Frs.
Great Britain	265,599,000
Germany	10,361,000
Belgium	217,361,000
Switzerland	36,533,000
United States	15,705,000
Argentine	17,313,000
Italy	22,649,000
Spain	218,949,000
Brazil	10,955,000
Other Countries	138,475,000
French Colonies	234,072,000
Total	1,187,972,000

City Business Best in Missouri District

KANSAS CITY, March 28—Motor car dealers in small country towns and larger cities inland from distributing centers, can get inspiration from a condition in merchandising other commodities, revealed this spring.

It is said that volume of business of country merchants, especially those in cities of the interior, has increased more rapidly in February and March, than the business of merchants in the "distributing centers."

So far, to the end of March, the reverse has been the case in the motor car business. The Kansas City dealers, it is reported, have had better retail trade than have the dealers of interior towns. The natural query is whether the country dealers have been asleep and have missed an opportunity that dry goods and clothing merchants have grasped?

Analysis of developments in general merchandise lines tends to show that the public in smaller cities and rural communities have patronized more largely than last year the stores which have built up local prestige and have apparently spent almost as much money as a year ago.

Rumanians Bring Cars to U. S. Free

Branch Bank Here Gets Army Trucks

Buys American Made Vehicles from British in France—Come in Duty Free

(*By Cable to* AUTOMOTIVE INDUSTRIES)

PARIS, March 28.—The British army's automobile park at Abbeville, comprising 1000 trucks and passenger cars, has been purchased by the Banca Marmorosch Blank & Co. A majority of the vehicles are of British make, but in the lot are 350 trucks of American manufacture, including Peerless, F. W. D., Locomobile, Pierce-Arrow, Packard and Riker as well as a considerable number of Studebaker and Cadillac passenger cars.

The bank will ship most of the American vehicles to the United States for sale there. The first lot already has left. The sale will be handled through the New York branch of the bank.

Banker "Not Interested"

NEW YORK, March 29—The Banca Marmorosch Blank & Co. occupies ornate quarters on the first and second floor of the new building at 31-33 Broadway. The bank, controlled by Rumanians and representing the Rumanian government in financial transactions, has obtained permission from the New York State banking commissioner to do business in this State. Its headquarters are in Paris, but it has important branches at Constantinople, Saloniki, Avlona, and many of the important towns in the Balkan states.

The manager of the New York branch is Dr. Zeltner. When asked to-day by AUTOMOTIVE INDUSTRIES for a statement regarding his plans for disposing of the American made motor vehicles which are being brought into this country duty free, he had much difficulty comprehending the purpose of the information, and stood pat on the statement that he was "not interested."

It was claimed, however, that the first lot consists entirely of trucks and that they will be sold through the United States Truck Sales Corp.

N. A. D. A. Roused to Action

ST. LOUIS, March 29—Resolutions adopted by the directors of the National Automobile Dealers Association protesting against the reimportation of American made motor vehicles duty free, from France and England to be sold at low prices in competition with American dealers, have been forwarded to all the State associations of the N. A. D. A. to be discussed and acted upon by them. When the State associations have gone on record on the subject, United States Senators and representatives will be informed of the position taken.

Attention of the Iowa Automobile Dealers Association has been called by Moock to a recent statement by Representative James W. Good of Cedar Rapids, chairman of the House Appropriations Committee, in which he declared practically all the passenger carrying automobiles in the United States are luxuries and should be taxed accordingly. Good asserts that a horsepower tax should be imposed on automobiles to bring in revenue of $200,000,000 a year.

M. A. M. A. FINDS TRADE STEADILY IMPROVING

NEW YORK, MARCH 31—Optimism with a capital O has been radiated at the last group meetings of the Credit Dpartment of the Motor and Accessory Manufacturers Association. These are some of the rock bottom facts brought out by the reports of members:

Business in March has been better than January and February combined. Orders already received make it certain that April will exceed March and that May will be at least equal to this month.

Collections are quite a bit better than they have been. Motor vehicle manufacturers who have given notes are whittling them down with greater rapidity.

There has been a substantial number of releases on old orders and some new orders.

A considerable number of passenger car manufacturers are operating at 50 per cent of capacity or better.

Several parts manufacturers now are operating at above 50 per cent of capacity, but the majority of plants are running about 25 per cent.

All the parts manufacturers are agreed that motor car prices must come down before there can be any more stimulation of business.

Nearly all parts manufacturers have reduced wages but are getting greater efficiency. A few have cut the salaries of office employees.

It was reported that factories operating at more than 75 per cent of their capacity include Franklin, Cadillac, Reo, Nash, Studebaker, Ford, Autocar, Velie and International. Oldsmobile and Grant are rapidly getting into this class.

Plan Special Clause on Rebuilt Trucks

Congressional Leaders Recognize Importance of Protecting Home Market from Flooding

WASHINGTON, March 30—It seems quite likely that the House Committee on Ways and Means will insert a clause in the proposed anti-dumping law which will effectively block English and French exporters from selling rebuilt trucks and cars of American manufacture on local markets at prices below production costs. Senator Penrose, chairman of the Senate Finance Committee, advised AUTOMOTIVE INDUSTRIES to-day that ample protection would be given domestic producers from all forms of foreign competition in this bill which must originate in the House.

The Congressional Draft Bureau, a new organization created to assist the various committees in preparation of legislative measures, has not taken up the anti-dumping bill yet. The committees will frame the bill when it has disposed of the emergency tariff and American valuations amendments. It is believed that representatives of automotive organizations will appear before the Senate and House committees before the bill is written in order to have their recommendations incorporated in the draft as it will be reported out to the Senate and House early in the session.

John E. Walker, chief of the Senate Draft Bureau, in an interview with AUTOMOTIVE INDUSTRIES declared that the question of reimportation had not been considered because of the pressure of other work. The agitation in behalf of this measure has found many willing advocates in the Senate and House. The fact that the Army sold this surplus equipment abroad at low prices in order to prevent an economic depression by dumping in this country is recognized as an important reason why foreign dealers should not be permitted to take advantage of present customs laws and sell at prices below labor costs here.

Will Ask Specific Proviso

There is some question as to the probability of proposed American valuations effecting the desired protection. It is argued, however, that customs officials would find it difficult to appraise these trucks on the new valuation basis which is reckoned from wholesale prices prevailing on principal American markets. Truck dealers insist that a proviso should be included in the anti-dumping bill which would cover this item specifically. The Treasury is expected to recommend certain paragraphs in the bill when the Ways and Means Committee asks for advice.

Parts Service Plan Starts Storm

Fight Threatened by Manufacturers

Truck Assemblers Declare They Will Not Tolerate Units Station System

DETROIT, MICH., March 30—Bitter opposition to the direct parts servicing plan proposed by prominent unit parts manufacturers and under which they propose eventually to cover the entire country with a chain of service stations, was displayed by members of a committee representing the Motor Truck Manufacturers Association, at a meeting here yesterday. The conference was called to discuss the plan and make recommendations to the association.

At the close of an all-day session at which several representative truck manufacturers were heard, a resolution was adopted to be presented at a meeting of the membership of the association to which parts makers and others interested will be invited. This meeting will be held April 12 at the Detroit Athletic Club.

The text of the resolution will not be made public until after it is presented at this meeting, but it can be stated that it expresses strong and unalterable opposition to the plan as being detrimental to the interests of the truck manufacturer, dealer and distributor as well as to the parts manufacturer.

The resolution was adopted by unanimous vote of the committee which was composed of B. A. Gramm, chairman; J. W. Stevenson of the Indiana Truck Corp.; M. Cook, general manager of the Service Motor Truck Co., and Otto Armleder, president of the O. Armleder Co.

Not the Function of Parts Maker

Recognizing the fundamental right of the owner to demand parts standardization, prompt service and reasonable costs, and admitting the present condition of the truck industry is due to woeful lack in that regard, members of the committee and other executives insisted it was not the function of the parts maker to attempt to remedy the existing evils but a duty up to the manufacturer.

Declaring their views represented the opinion of 90 per cent of the truck assemblers, members of the committee described the parts station plan as a "selfish and arrogant attempt" of the parts manufacturers to take advantage of conditions. They declared the plan, if permitted to operate, would strike at the very heart of their business in that it would put a premium on the curbstone dealer and the mushroom manufacturer and drive the legitimate manufacturer with heavy investment into bankruptcy.

The man who wanted a truck under such conditions, it was asserted, would simply go to the parts depot, secure the necessary units, purchase blueprints and build his own truck.

"That is our greatest objection," said one member of the committee. "The fact that 20 per cent of our profit comes from the parts and service end, which necessarily would be eliminated, is but a minor consideration."

Must Give Owners Service

Back of all the discussion, however, stalked the ghost of the owner demanding prompt, efficient and reasonable service coupled with the fact that more than 30 major parts depots now are functioning successfully. Committee members, while very willing to speak freely with regard to the action to be taken to check the progress of the plan, would not speak as official representatives of their organization. They declared it would be their plan to go to the parts manufacturers participating and demand that they renounce affiliation with the group participating, and in the event of refusal, simply to cancel contracts and cease to do business with that manufacturer.

It was even suggested unofficially that truck manufacturers go to the parts makers in a body and make the demand, holding out the threat of establishment of co-operative parts manufacturing concerns or diversion of their business to independent concerns now existing. No action was taken, however, on this proposal.

Parts makers interviewed after the meeting did not appear perturbed by the veiled threat. They take the position that the owner is the man who must be satisfied, and they declare that the owner is going to demand the standard parts now being marked in his car or truck. They assert that when a man contemplates a purchase, no matter how little he may know about the automobile or truck, the first thing he is going to ask is regarding the make of engine, axle clutch, transmission, etc., and that he is not going to buy the car or truck that is not built of standard and well known units.

Read Letters from Makers

Practically the entire day was spent in reading letters from truck mnaufacturers and assemblers. Committee members said the tenor of a great majority of the letters was the same—violent and unalterable opposition. The morning session was confined to committee members and truck executives, including M. L. Pulcher, vice-president of the Federal Motor Truck Co.; J. F. Bowman, sales manager of the Garford Motor Truck Co., and R. M. Reid, secretary of the Master Truck Corp.

Telephone messages were sent to parts

Earl Chosen Head of Briscoe Motors

Former Willys-Overland Executive Succeeds H. F. Wardwell —To Push Production

JACKSON, MICH., March 30—Clarence A. Earl, former executive vice-president of the Willys-Overland Co., has been elected president and general manager of Briscoe Motors Corp. He will succeed H. F. Wardwell, who retires from the presidency to become a vice-president and member of the board of directors.

K. R. Jacoby, formerly vice-president in charge of purchases at the Willys-Overland, will also go to the Briscoe.

There have been persistent rumors for several weeks of impending changes in the Briscoe company. The plant recently closed for inventory following announcement of a largely increased production schedule and this aggravated the reports regarding its affairs. This was followed by a report that W. C. Durant had made an offer for the property. President Wardwell admitted the Durant report was correct but declared there was no possibility of a sale.

Earl was called to Chicago Monday by the financial interests back of the company and announcement of his election to the presidency was made yesterday. As executive vice-president of the Willys-Overland Co. he became widely known and is regarded as particularly strong as a production man. Earl left the Willys organization several months ago after a disagreement with Walter P. Chrysler and was succeeded by C. B. Wilson.

Earl said to-day the Briscoe company now was assured of ample financing and that production would be maintained at a pace to meet the increasing demand.

Fort Wayne Tire Files Petition in Bankruptcy

FORT WAYNE, IND., March 31—The Fort Wayne Tire & Rubber Co., which has had a very checkered career since its organization two years ago, has filed a petition in bankruptcy in the Federal court. According to the petition the concern's assets amount to $427,976.42 and its liabilities total $246,496. The assets consist principally of open accounts, tools and machinery and stock in trade.

The assets listed included ground and buildings valued at $59,095; stock in trade, $104,449.46; note receivable, $6,071, and machinery and equipment $172,881. Unsecured claims amount to $210,236.22.

Penrose Declares for Unit Hearings

Opposition Is Declared to Separate Presentation of Taxation by Organizations

WASHINGTON, March 30—Assurances have been given business interests of the country that improper taxes will be abolished and income taxes reduced all along the line to the collection point which is almost equivalent to relief legislation, according to Senator Penrose, chairman of the Senate Committee on Finance. He believes that this definite statement should be sufficient to inspire the business world into renewed activity and confidence in the future.

As the various organizations in the industry have expressed a desire to speak independently on tax proposals it is of importance to note that the chairman of the Senate Committee and other Congressional leaders are opposed to proposals of this kind. In an interview with AUTOMOTIVE INDUSTRIES to-day, Senator Penrose stated that the committees would insist on short hearings when internal revenue revision is considered. "I regard the individuals and associations demanding special hearings as enemies of their own interests," he said, "for they often insist on presenting their views on frivolous grounds and generally we find wide-spread duplication."

The Senator makes clear the need for few witnesses in the fact that the testimony taken by the Senate Committee will be used by the House Committee on Ways and Means in the formulation of tax schedules. The fact that the Senate conducts the tax hearings first and the acceptance of this testimony by the House is a new departure which is accepted by both bodies in the interest of expediency. The House Committee will call only such witnesses as are necessary to clear up points in the testimony adduced before the Senate Committee. Treasury tax experts will be called into executive sessions of these committees before the schedules are submitted to the House and Senate.

Revisions to be Non-Partisan

The tax revision will be carried out in a non-partisan spirit, Senator Penrose says, and therefore it should encounter but little delay when the committee reports are placed before Congress. Senator Penrose believes that the collection point on income taxes must not be prohibitive. He contends that the wheels of industry will be stopped when the amount of tax robs the taxpayer, who is an investor, of all initiative and enterprise.

The chairman holds that the Government will ultimately gain in tax reductions where it restores sufficient incentive to the taxpayer to invest in industry and other forms of development. An effort will be made to determine the collection point on various commodities on a plan similar to that used before the prohibition period, when the tax on whiskey was known almost to a mathematical point. Experts argued, and experience has proved, that the revenue decreased as the rates were increased.

Because of the expensive litigation which developed from the uncertainties as to the intent of Congress in framing fiscal legislation, Senator Penrose has announced the creation of a Congressional Draft Bureau which will determine the phraseology of all laws.

Associations Oppose Single Hearing Plan

NEW YORK, March 29—Announcement by Senator Penrose that each industry should present its taxation views to the Senate Financial Committee through a single spokesman instead of having a presentation by each branch of the industry, runs counter to the plans of the various automotive organizations. All these associations with the exception of the Motor & Accessory Manufacturers Association have adopted virtually the same platform. It calls for strict governmental economy, funding of the war debt and a general retail sales tax. The M. A. M. A. is in accord with these plans except that it favors a turn-over tax.

It has been proposed that the various tax committees present their arguments individually instead of through a spokesman for the whole industry. The National Automobile Chamber of Commerce would speak for the passenger car and truck manufacturers; the Rubber Association of America for the tire makers; the M. A. M. A. for the parts manufacturers, and the N. A. D. A. for the dealers and garage men. It is the contention that each in itself is a big industry and that each is entitled to sufficient time to present its program.

Information gathered to-day indicated that the associations would not recede from their determination to have individual hearings at Washington notwithstanding the attitude of Senator Penrose, and there was a disposition to take the position that they were entitled to adequate time to present their arguments in the most forceful way. It is probable a conference will be held soon of representatives of the national associations to determine upon a plan of action.

To Push Tax Resolution

The tax committee of the N. A. C. C. will submit to the Chamber of Commerce of the United States at its annual meeting at Atlantic City beginning April 27, a formal resolution in conformity with its own tax program which has already been submitted to Congress. The resolution will call upon Congress to reduce Governmental expenditures to a sane, normal standard at once; fund the cost of the war and repeal all special taxes growing out of the war including excess profits, surtaxes, transportation and excise taxes. The resolution will assert that if further revenue is necessary after the adoption of a "moderate, scientific-

February Exports Drop to 40 Per Cent

Passenger Cars Show Greatest Loss Compared with 1920 Shipments—Engines High

WASHINGTON, March 28—Automotive exports from the United States during February of this year were approximately 40 per cent in comparison with exports the same month a year ago. Including trucks, motorcycles, passenger cars, parts and engines, the exports for February this year totaled $10,400,168 in comparison with $26,186,399 for the same month of 1920.

These figures, announced to-day by the Bureau of Foreign and Domestic Commerce, are preliminary totals and do not show the detailed exports to the various countries. Consequently, it is not possible to determine what territories are chiefly responsible for the decline.

The export trade in all products from the United States showed a decided falling off for this month and the course of automotive trading apparently was in sympathy with that of the broader markets. However, February is the shortest month of the year and this naturally would bring about a lower total than in the preceding month of January. Furthermore, shipments would not be made in February to countries south of the equator, as they would arrive at their destination too late for the normal sales season, which is the reverse of that in the northern countries.

As was to be expected, the shipments of passenger cars showed the largest decline, the comparative values of the two months being $3,165,170 and $11,604,622. The slumping off of motor truck sales was much less, being $1,952,736 for February, 1921, and $4,161,494 for February, 1920. The shipments in parts and equipment, not including tires, were slightly more than 50 per cent.

The totals for engine shipments, which include automobile, marine, stationary and tractor gas engines, were $1,523,408 as against $2,291,507 for February of 1921, the exports in this category showing the smallest decline of any of the lines. The shipments of stationary gas engines were, in fact, of a slightly higher value for the month of this year than they were for last year.

The sales of gas tractor engines were about 66 per cent in comparison with last year, dropping from $1,247,431 to $827,694. This is the item which covers farm tractors. According to unofficial estimates of the Bureau, about 90 per cent of all the shipments coming under this head are tractors.

DEALER GETS BARLEY VERDICT

DETROIT, March 28—C. C. Stubbs, a Kansas City dealer, was awarded a verdict of $3,692.68 in the Federal Court for eastern Michigan against the Barley Motor Car Co. of Kalamazoo for cancellation of contract.

INDUSTRIAL NOTES

Hydraulic Steel Co. has been assigned the Frayer and Howard patent by the Phelps Mfg. Co., Columbus, for a consideration of approximately $50,000. The patent is for a wire wheel with spokes laced in the side ring grooves. The rims will be manufactured and marketed through the Cleveland Welding & Mfg. Co., a subsidiary.

Hercules Steel Casting Co., Milwaukee, which operates one of the largest exclusively electric steel foundries in this district, is increasing its capital stock from $300,000 to $400,000. The new issue, consisting of 7 per cent preferred stock, will be used to purchase additional land and equipment and to increase the working capital.

Lee Tire & Rubber Co. reports net sales for the first two months of the current year as about $1,500,000. This is about the same as sales for the corresponding period in 1920. The plant is now running at about 75 per cent of capacity.

Jefferson Rubber Co., Jefferson, Wis., has made its first deliveries of tires, and by April 15 or May 1 production is expected to be on a regular quantity basis. Orders on the books will require maximum capacity to July 1.

Connersville Foundry Corp., a subsidiary of the United States Automotive Corp.. which makes the Lexington car, is completing extensive additions to its already large plant.

Goodlin Automotive Equipment Co., South Bend, Ind., has been organized for wholesale distribution of automotive equipment. Operations will be started April 1.

Storm King Mfg. Co., Hartford, Wis., probably will relocate its plant and office in Winneconne as the result of negotiations with the Commercial Club.

Sidney B. Bowman Automobile Co. has been appointed New York distributer for Briscoe. In addition to Briscoe, Bowman handles Grant and Kissel.

Bonney Vise & Tool Works, Inc., has changed its name to the Bonney Forge & Tool Works.

Parenti Motors Corp., Buffalo, is planning the location of a branch factory in Atlanta.

Towmotor Co., Cleveland, has re-elected officers and directors.

FINANCIAL NOTES

Fisk Rubber Co. in its report for 1920 shows surplus earnings, following inventory adjustments and Federal taxes, of $2,130,133. After payment of preferred dividends, this was equal to $1.68 a share on the $15,494,000 common stock of $25 par value. In 1919 the company reported earnings of $3,994,657, equal to $5.99 a share on the $12,254,500 stock in that year. Net profits for the year were $5,034,950. The profit and loss surplus Dec. 31 was $7,789,085.

Timken-Detroit Axle Co. reports net profits for 1920 after reduction of inventories and Federal taxes of $712,509 and a total surplus of $17,820,062. Cash on hand was shown as $671,151 and inventories $10,932,521. The land, building and equipment account totaled $8,357,801, of which notes to banks were $3,000,000 and accounts payable $387,480.

Hupp Motor Car Corp., in a balance sheet as of Nov. 30, shows total assets of $16,119,-231, which includes cash of $281,542 and inventories of $5,232,145. This is an increase in assets of $1,351,424. The net assets applicable to common stock amounted to $7,296,472, or $14.05 a share of $10 common stock.

American Bosch Magneto Corp., in a balance sheet as of Dec. 31, shows total assets of $9,896,083 for 1920 as compared with $7,655,-044 for 1919. The cash balance at the end of the year was $332,596 as compared with $88,379 in 1919. Inventory totalled $4,344,727 as against $2,928,582 the year previous.

Gray & Davis for the seven months ended July 31, 1920, reports net loss of $463,109 and for the five months ended Dec. 31, 1920, a net loss of $4,998. This does not include depreciation of about $93,000 in the earlier period, which should have been charged.

H. H. Franklin Mfg. Co. reports net profits for the year ended Dec. 31 as $2,225,625 and net addition to surplus for the year of $696,515. Inventories Dec. 31 totaled $7,614,-696, compared with $11,100,000 in September last.

Times Square Automobile Supply Co. for the year ended Dec. 31, 1920, shows net sales of $5,456,953, which after deductions for cost of sales, Federal taxes, expenses, etc., leaves a net profit of $9,952.

Kelsey Wheel Co. reports gross sales of $25,200,913 for 1920 and net operating profits of $3,325,804. Net profits for the year after all charges were $1,916,008.

Handley-Knight Co. will float a $200,000 bond issue, which will be taken up by present stockholders and will not be offered to the general public.

Thomart Motor Co. reports the sale of $750,000 of the $1,000,000 stock of the first issue, sold between August, 1920, and March, 1921.

Moon Motor Car Co. has declared a regular quarterly dividend of 1¾ per cent on preferred stock outstanding, payable April 1.

F. B. Stearns Co. will pay the regular quarterly dividend of $1 a share on April 11.

Parts Service Plan Arouses Truck Makers

(*Continued from page* 733)

makers asking their attendance in the afternoon, but Fred Glover, general manager of the Timken-Detroit Axle Co., was the only one who responded. It was said G. W. Yeoman, general manager of Continental Motors, credited with evolving the parts servicing idea, was ill. Glover said after the meeting that his company was in a neutral position and would await the outcome of the meeting April 12 before making any statement regarding its position.

"If it is the best thing for the industry," he said, "then we will be in, but until there is something more of a unanimity of opinion we will remain neutral."

Glover voiced the sentiment of everyone present that the time has come when adequate service is demanded. Committee members, admitting the truth of the statement, declared it was a matter clearly within their province and expressed assurance that in future every truck manufacturer would see to it that every dealer and distributor gave the major portion of his attention and a big part of his investment to the parts and service end of his business, guaranteeing full protection to the ultimate consumer.

METAL MARKETS

WHILE the larger part of steel shipments going forward to automotive consumers continues to be on account of previously suspended and lately reinstated orders, a fresh buying movement, modest in scope but nevertheless evidence of a genuine demand, is beginning to crystallize. Especially gratifying is the representative number of automotive interests that are renewing their interest in the steel market. Much misinformation has been spread abroad with reference to prices applying to shipments on account of reinstated suspensions. In some quarters it is sought to create the impression as though all such shipments were being billed at last year's obsolete contract prices. In fact, however, reinstatements have been as much a matter of individual negotiation with reference to the price at which they are to be billed, as have been fresh orders of late. In all representative shipments of such reinstated orders the price was one resulting from a mutually agreeable compromise between seller and buyer. Stocks of automobile sheets in consumers' warehouses, which have been admittedly large, are beginning to shrink, and sheet makers are trying to ward off encumbrance of their order books by sacrifice commitments when a turn for the better might be just around the corner. This, at least, is the producer's point of view. He is not so eager for more business at prevailing price levels as he is for more business at prices that will be expressive of the better demand. Clear understanding of this frame of mind, in which sheet producers and, for that matter, steel producers generally are at this time, should help the automotive purchasing agent in planning his buying campaign. In the pig iron market automotive foundries, in spite of the fact that most of the buying is in carload and 100-ton lots, continue to play first fiddle, because of the lack of demand from most of the other iron consuming industries. The non-ferrous metal markets show a somewhat steadier tone, but absorption by consumers is still light.

Pig Iron—Better demand for foundry and malleable from Middle West automotive foundries is noted. Cleveland melters are turning out more castings than they have in weeks. Two automotive interests are inquiring for from 500 to 1000 tons each. Furnaces are rather reserved when it comes to accepting contracts for future deliveries at current prices, which are nominally $25 for both No. 2 foundry and malleable, valley basis.

Steel—Youngstown sheet mills will make no quotations except on individual specifications. This does not imply, however, that the market is higher than the previously quoted 4c. basis for No. 28 black. A small amount of business in No. 22 gage automobile body sheets is reported to have been done at 5.20c. Automotive demand for cold-rolled strip steel is steadily improving and sales at 5.85c. were reported.

Aluminum—The market remains dormant for the time being. There is, however, quite a little activity in Middle West aluminum foundries in the preparation of patterns, and a steady improvement in the demand for No. 12 alloy is looked for. Quotations are unaltered.

Copper—Chicago reports state that automotive buyers have resumed buying of radiator tubes and radiator brasses. The copper market shows a somewhat steadier undertone, sales of casting metal being reported at very close to the prevailing 12c. quotation in the "outside" electrolytic market.

BANK CREDITS

Written exclusively for AUTOMOTIVE INDUSTRIES *by the Guaranty Trust Co., second largest bank in America.*

NEW YORK, March 31—Last week was marked by noticeably easier money, and a more active stock market, with rising prices and one "million-share" day. The bond market, on the other hand, was still irregular with no pronounced trend. Call money ranged from 6 to 7 per cent, with a ruling rate of 6½ per cent, while "outside" money was said to be available at from 5 to 5½ per cent. There was little business done in the time money market, and rates were unchanged from the week before.

The Federal Reserve note circulation of the Federal Reserve System as a whole declined $32,151,000 last week, making a total reduction of $474,200,000 from the December high. Federal Reserve bank notes declined $3,760,000; and gold reserves increased $5,226,000, and cash reserves $7,188,000. Total bills on hand, however, increased $62,005,000, and total gross deposits $66,252,000. As a result of these changes and of the new method of computing the ratio, the ratio of total reserves to deposit and Federal Reserve note liabilities combined declined from 51 per cent to 50.8 per cent. The ratio of gold reserves to Federal Reserve notes in circulation, after setting aside 35 per cent against net deposits, on the other hand increased slightly, from 60.6 per cent to 60.7 per cent.

For the two weeks ending March 12, there was a 61½ per cent increase in building plans filed in New York City, an increase which reflected the stimulus of the tax-exemption subsidy granted on new structures for residential purposes. Reports from the various sections of the country indicate a general increase of activity in the building industry. From some points reported estimates of costs range from 15 to 25 per cent lower than those of a year ago.

Associations Oppose Single Hearing Plan

(*Continued from page* 734)

ally regulated protective tariff" it should be secured "through a consumption tax on all commodities based on retail sales to the consumer." This presentation will be made by C. C. Hanch, chairman of the tax committee.

Another resolution which will be submitted at the Atlantic City meeting will deal with discriminatory duties in relation to the tariff. It will declare that a request should be addressed to the "legislative bodies of the United States urging provision in the general tariff for application of additional duties on products imported from countries that directly or indirectly discriminate against the trade of the United States in favor of that of other nations."

This subject will be taken up by J. Walter Drake, chairman of the foreign trade committee of the N. A. C. C. He will outline the discriminatory duties imposed on American made automobiles by Canada, Australia and other portions of the British Empire. It will be contended that the tendency to extend the British preferential policy to the disadvantage of American commerce justifies a provision for additional duty on products from countries which discriminate against American trade.

Advance-Rumely Shows Surplus of $1,277,231

LA PORTE, IND., March 28—The annual report of the Advance-Rumely Co. for the year ended Dec. 31 shows a surplus after charges, Federal taxes, inventory adjustments, etc., of $1,277,231, equivalent after deduction of preferred dividend to $3.84 a share earned on the $13,750,000 common stock. This compares with a surplus of $2,401,907, or $12.02 a share in the previous year.

Finley P. Mount, president, in his report showed that mark down of inventories which are carried at cost or market value, whichever is lower, necessitated a deduction of $837,936 from 1920 earnings. A loss of $279,336 was also taken on account of Government bonds, which were entirely disposed of. With another crop nearly due, President Mount said the outlook was good.

Receivers Are Named for Liberty Starter

NEW YORK, March 26—Receivers have been appointed for the Liberty Starter Corp., manufacturers of starters for automobiles and airplanes with a plant at Poughkeepsie and a sales office in this city. The liabilities are listed at $62,748 and the assets are said to be in excess of this amount. The company controls the Delano starter.

The company was organized Oct. 4, 1918, and has an outstanding capital stock of approximately $1,000,000 common and $1,000,000 preferred. The petition for receiver alleges that the corporation received about $700,000 for the stock sold and has still due it $92,000 on subscriptions. The patent rights to the starter which the company manufactured are listed as valued at $1,000,000.

Fred S. Taggert as trustee for Howard S. Borden, principal creditor of the company, instituted the proceedings. James J. Lyons and John Inwood were named receivers.

COURT RULES ON PATENT

CHICAGO, March 28—Judge Carpenter in the Federal District court has handed down a decision holding that the Grosvenor patent, No. 1,186,477 is valid and has been infringed by the Rockford Bookcase Co. The patent covers a varnish drying process and it is owned by the Wenborne-Karpen Dryer Co. of this city. The owners state that the only manufacturers of drying equipment now licensed under the patent are Drying Systems, Inc., Chicago, and the A. S. Nichols Co., New York.

THE MOTOR STOCKS

By JACQUES S. COHEN, of J. S. Bache & Co.

NEW YORK, March 31—Some time ago, at the request of AUTOMOTIVE INDUSTRIES, we prepared a statement on the automobile industry from the banking point of view and at that time we saw constructive elements at work toward the cleaning up of unsold stocks of automobiles throughout the country. At that time we also stated that we believed there would be a consistent improvement from that point, but that, as the year advanced, there would be a tendency toward concentration of the business in the hands of a few large, efficient and well-financed companies, while the smaller companies would be obliged either to consolidate for their own protection or go out of business altogether.

We see no reason to change this opinion at the present time. As stated above, we have seen distinct improvement in the automobile situation as a whole. Production schedules have consistently increased to a point where some of the larger companies are now operating anywhere from 50 per cent to 65 per cent capacity. From what we can learn sales have also been picking up and the momentum thus developed can very well carry an optimistic feeling through the first six months of this year. Thereafter, we should not be surprised to see a considerable falling off in the demand for passenger cars.

While it is accepted that the first six months of any automobile year usually produce 65 per cent of the total year's business, we cannot see how enthusiasm can be kept up beyond July 1. The purchasing power of the farmer and the planter has been reduced to a minimum by reason of extremely low prices for cotton and grain. The general purchasing power of the country, because of a substantial reduction in wages in all industries, has been considerably impaired.

So far as automobile security prices are concerned, the recent improvement in motor stocks seems to be discounting the favorable atmosphere during the first six months. However, we believe that as we near the end of this period, prudence would demand extreme caution regarding further commitments, pending the readjustment of the country's purchasing power to a basis somewhat nearer normal.

ASK FOR TIRE RECEIVERS

HOUSTON, TEXAS, March 30—Stockholders of the Universal Tire & Rubber Association, capitalized at $500,000, with a plant in this city, have filed application for the appointment of a receiver. An injunction has been granted restraining several persons named as defendants from disposing of bonds held by them as collateral. It is alleged that a receivership is necessary to conserve the assets of the company. The plant has been leased for one year to the Standard Rubber Co. at a rental of $21,000.

Men of the Industry

E. A. Taylor has assumed his duties as works manager in charge of production for the Liberty Motor Car Co. To take up this work he resigned as production engineer for the Pierce-Arrow Motor Car Co., where he was responsible for all standard and special tools, plant layout, arrangement of machine shop and assembly departments, and for the installation of progressive assembly. His duties at Buffalo consisted of criticism of design from a manufacturing point of view and the determination of all mechanical processes. Before going with the Pierce-Arrow Co., Taylor held executive positions with the Cadillac Co. for three years and in 1912 took charge of the Detroit plants of the Maxwell Motor Co. A year later he was transferred to the Maxwell plant at Dayton, where he was in charge of the entire factory, and in 1917 he became general superintendent of the Chalmers plant. He remained there two years.

George H. Hannum, general manager of the Saginaw Products Co., has been placed in charge of the Michigan Crankshaft Co., a subsidiary of General Motors Corp. The Crankshaft company operates plants in Saginaw and Lansing for the manufacture of crankshafts for General Motors cars. By this action the corporation consolidates all its Saginaw plants under one management except the National Plate Glass Co. plant, which is controlled by Fisher Body Corp., also a General Motors subsidiary. J. W. Wilford, who has been general manager of the Crankshaft company with headquarters in Lansing, is to become general manager of the Central Axle Gear & Products Co. when Hannum assumes his duties as supervisor in both crankshaft plants. The local crankshaft plant will continue under the active direction of T. M. Carpenter, local manager.

B. F. Page, formerly manager of the truck department of the Maxwell Motor Sales Corp., has been appointed supervisor in charge of the Omaha district for Maxwell-Chalmers, and S. W. Munroe, who was for several years in charge of the New England district for the Maxwell Motor Co., Inc., is appointed supervisor of the Boston district for Maxwell-Chalmers.

W. C. Petersen has been placed in charge of the metallurgical department of the Atlas Crucible Steel Co.'s mills at Dunkirk, N. Y. He was formerly associated with the Packard Motor Car Co. doing similar work. His work at Atlas will include research and standardization of the new chrome-molybdenum products.

G. W. Machtreib, formerly of the B. F. Goodrich Co., has been made general sales manager of the Detroit Trailer Co., taken over recently by the Mansfield Steel Co. Machtreib was connected with the Goodrich company several years, and is well known to passenger car and truck manufacturers.

Charles H. Keel, patent counsel for Curtiss Aeroplane & Motor Corp., and formerly in charge of the Washington office of General Electric Co., has opened a law office in New York.

John F. Creamer is now associated with Thomas J. Wetzel, New York, as manufacturers' agent. Creamer was formerly with the Firestone Steel Products Co., Akron.

Leroy Kramer, formerly vice-president in charge of production at Willys-Overland Co., has taken a position as vice-president of the Pierce-Arrow Motor Car Co.

Carl H. Becker has been appointed assistant sales manager of the Saxon Motor Car Corp., and Charles P. Ackerson has been appointed supervisor of dealers.

D. P. O'Keefe has been appointed general purchasing agent of the Chevrolet Motor Co. He has been assistant purchasing agent of Buick for the past ten years.

F. E. Badger, formerly general manager of the Canton plant of the Standard Parts Co., has joined the Detroit Steel Products Co.

R. E. Carpenter to Head Hartford Parts Company

HARTFORD, CONN., March 28.—R. E. Carpenter of Boston, has been elected president of the Hartford Automotive Parts Co. to succeed Jarvis McA. Johnson who has resigned because of ill health. James M. Carney also has retired as general manager and chairman of the board of directors. He is an expert in efficiency engineering and it is understood he will return to this work. Carpenter has taken active charge of the plant. He will be assisted by L. J. Harley, Jr., of Springfield, Mass., who has been elected vice president, and by H. W. Bigelow, re-elected secretary and treasurer.

For ten years Carpenter was connected with the Taft-Peirce Mfg. Co. of Woonsocket, in charge of the research and development laboratories. Early last year he went with Hollister, White & Co. of Boston with whom he will retain his connection. He is optimistic over the future of the Automotive Parts Company and predicts an entirely satisfactory business this year. It is understood he was selected for his present position by Boston bankers who have been financing the company.

Houston Buys Up Cars; Truck Business Slow

HOUSTON, TEX., March 29—The automobile industry has revived unexpectedly fast in Houston, which is in the best position of any city in Texas as it is the center of the oil industry. Ford dealers here are sold out and Cadillac has more prospects than at any time in two years while Buick and Nash report a heavy sales increase in the last three weeks. Several medium priced lines are moving more slowly. A few lines are heavily stocked but there has been a general improvement in all makes.

The rural districts are not buying as rice and cotton farmers will be out of the market for some months. Houston is filled with used cars and sales of these are slow. Most cars are selling for one-third cash and the balance in 10 or 12 months.

Truck sales are very slow and several dealers are heavily stocked. Probably 50 per cent of the present truck dealers will give up their agencies when the stocks they now have are sold. Several are reducing prices.

There have been no tractor sales in the rice area south of Houston, but vegetable crops between this city and Brownsville are being marketed and are helping car sales. The repair business has been slow but is improving.

Receivers Are Named for Empire Rubber

TRENTON, N. J., March 30—On complaint of the Big Bend Mining Co. which has a claim of $12,710, Arthur H. Wood and C. Edward Murray, Jr., of this city have been appointed receivers for the Empire Tire & Rubber Co. The complaint filed by the coal company charged that while the rubber company was solvent, its obligations amounted to more than it had the ready cash to pay. It was asserted that unless receivers were named litigation would result which would dissipate the assets.

The complaint requested the court to enjoin all persons from levying attachments against the rubber company. The papers in the case stated that the plant is appraised at more than $2,000,000 and that with merchandise and other assets amounting to about $3,500,000 it would eventually be put on a paying basis. The liabilities, excluding capital stock, were given as $1,500,000.

The decree of Judge Bodine in naming the receivers stated that the company was judged solvent but had no funds to meet its obligations. The receivers, who were required to furnish a joint bond of $100,000, were authorized to borrow not more than $50,000.

Sterling Ends Sales Contract

RUTHERFORD, N. J., March 30—The Sterling Tire Corp. announces the termination of its arrangement whereby Sterling tires and tubes, during the past year, have been sold exclusively through the Rubber Corp. of America, which also was the selling agent for products of the Empire Tire & Rubber Corp.

There has never been any connection between Sterling and Empire except that both employed the same selling agent.

The Sterling Tire Corp. has never been financially interested in Empire, and no one connected with Empire has been interested in Sterling.

HARES ADVANCES PRICES

NEW YORK, March 28—Production is steadily increasing in the plants of Hare's Motors, but particularly in the Mercer factory which is now somewhat behind its orders. The engineering department of the corporation is continuing its experimental work on a car which will be in a lower price class than either Locomobile or Mercer. Hare's Motors has found it necessary to revise its prices. The Locomobile is selling now at $8600 as compared with the old price of $8900 and $7750 when the first big slash was made. The Mercer, which was reduced from $4950 to $3950 now is selling at $4500. Production at a profit was found impossible at the lower prices.

Calendar

SHOWS

April 3-9—Denver, Annual Automobile Show, Auditorium.

April 4-9—Seattle, Annual Automobile Show, Seattle Motor Car Dealers' Ass'n, Arena Hippodrome.

FOREIGN SHOWS

April, 1921—Sofia, Bulgaria, Tractor Trials, under the Bulgarian Ministry of Agriculture.

Apr. 20 - May 5 — Mexico City, Mexican Automobile Show, National Theatre Bldg.

May 28, 1921 — Czecho-Slovak International Automobile Exposition of Cars, Trucks, Tractors, Motorcycles and Equipment. Prague.

May 28-June 8—International Automobile Exhibition, Basle, Switzerland.

June, 1921—Reykjavik, Iceland, Agricultural Exhibition—Agricultural Machinery—Icelander Agricultural Society, Reykjavik, Iceland.

Oct. 5-16—Paris, France, Paris Motor Show, Grand Palais, Administration de l'Exposition Internationale de l'Automobile, 51, Rue Pergolèse, Paris.

Nov. 4-12 — London, British Motor Show, Society Motor Mfrs. and Traders.

CONVENTIONS

May 4-7 — Cleveland, National Foreign Trade Council.

May 17-19—Buffalo, Convention of Factory Service Managers, Auspices of Service Committee, N. A. C. C.

May 24-28 — West Baden, Ind., Summer Meeting Society of Automotive Engineers, West Baden Springs Hotel.

Oct. 12-14, 1921—Chicago Twenty-eighth Annual Convention National Implement & Vehicle Ass'n.

RACES

June 18—Uniontown, Pa., Speedway Events.

July 25—Grand Prix, Le Mans.

Labor Day—Uniontown, Pa., Autumn Classic.

S. A. E. MEETINGS

Buffalo section—April 19—Paper on "Carbureter Performance," by F. C. Mock.

Dayton section—May 3.

Metropolitan section—April 14—Paper on "Low Grade Fuel Carburetion," by A. H. Beach.

Minneapolis section — April 6 — Discussion of repair equipment.

Washington section—April 1—Aeronautical Engineering Session.

General Motors Export Names New Officers

NEW YORK, March 31—At a meeting of the directors of the General Motors Export Co., Paul Fitzpatrick, who recently resigned as a vice-president of the General Motors Acceptance Corp., was elected a director and vice-president.

The board of directors is now constituted as follows: J. Amory Haskell, Curtis C. Cooper, Paul Fitzpatrick, Alfred P. Sloan, Jr., Peter S. Steenstrup and Alfred H. Swayne.

The officers are as follows: J. Amory Haskell, president; Peter S. Steenstrup, vice-president and general manager of sales and service; Paul Fitzpatrick, vice-president and general manager of operations; Alfred H. Swayne, vice-president directing financial policies; Curtis C. Cooper, vice-president; Alfred P. Sloan, Jr., vice-president; Austin S. Murray, treasurer; Thomas S. Merrill, secretary; George S. Bartholomew, assistant secretary.

Fitzpatrick while vice-president of the General Motors Acceptance Corp. was in close working agreement with Steenstrup of the Export company, thereby gaining an intimate knowledge of the export trade.

Steenstrup as vice-president and general manager of sales and service, relieved of such duties as have been transferred to Fitzpatrick, will be free to devote his whole time and attention to the development of sales and the problems incident to service which are ever present in conducting successfully an overseas business involving as many problems as the motor car business.

Under this new plan the Export company is enabled to care for the enlargement of its organization both at home and abroad through division and realignment of duties and responsibilities.

TO BUILD TAMPICO HIGHWAY

MATAMOROS, MEXICO, March 28—Construction of an automobile highway between Tampico and Matamoros will be started soon. According to advices received from Tampico the work of securing the right of way for the proposed road from that city to Victoria, capital of the State of Tamaulipas is already under way. Large American oil interests and the American chamber of commerce of Tampico are promoting the proposed project by the state government. The necessity for a highway that will accommodate automobile traffic between the two points is keenly felt. It will be about 325 miles long.

Regulations Revised for Pulitzer Trophy

NEW YORK, March 28 — Revised rules and regulations have been announced for the second annual Pulitzer Trophy contest to be held at Selfrudge Field, Mt. Clemens, Mich., on Sept. 8, 9 and 10, 1921. In order to arouse the widest possible interest in flying and to stimulate the development of commercial aviation, the plans have been elaborated since last year so as to include diversified types of planes.

The intention is to attract a varied field of entries to compete for prizes to be awarded for desirable airplane performance apart from high speed. For this purpose there will be a series of contests comprising four distinct events in one or another of which there will be opportunity for any type of airplane to compete.

The trophies for the three contests besides the Pulitzer race have not yet been announced, but will be specified later.

UNIVERSAL INCREASES OUTPUT

GARWOOD, N. J., March 28—Steady and growing increases in orders are noted by the Universal Tool Co., Inc., manufacturers of automotive equipment and tools, after a period of depression which extended up to the last week of February. The company, formerly a Detroit organization, is now in extensive operation in its new plant in this city.

A continuance of orders as at present leads the company to the declaration that it will within a short time be doing more business than it was at the pinnacle of the automobile rush last spring.

Court Order Stops Interlocking Action

AKRON, March 26—Efforts of a group of stockholders of the defunct Interlocking Cord Tire Co. of Akron and Mogadore, to reorganize the company under a new name, have been blocked by order of the Summit county common pleas courts, upon petition of Elihu Harpham, receiver for the company. The court order enjoins the stockholders from making any further collections of stock subscription amounts due the company from stockholders. The injunction also restrains the Ohio Savings & Trust Co. from serving further as collecting agency for the stockholders reorganization project, and requires an account of all moneys collected be made to the receiver.

The stockholders reorganization committee is composed of C. A. Rukamp, R. E. Cartledge, Karl A. Dorn and Herman Gustave who recently were named temporary officers of the company at a stockholders meeting.

Receiver Harpham in formal court charges against the stockholders committee, alleges that there are open accounts on unpaid stock subscriptions, amounting to more than $242,000. He charges the committee with misrepresentation of facts and with violation of the order of the court in naming him as receiver.

Under the court injunction Harpham will proceed to collect all unpaid amounts due on stock subscriptions, and will proceed at once to liquidate the firm's affairs. Creditors have presented claims for over $150,000. The Interlocking plant at Mogadore has been shut down for several months.

FINANCE OFFICES MOVED

NEW YORK, March 28—The Colonial Finance Corp. and the Republic Acceptance Corp., both under the same management, have moved their executive offices from Pittsburgh to this city and are now located at 300 Madison Avenue. The companies are engaged in the automobile and general finance business with branches in Pittsburgh and Detroit.

AUTOMOTIVE INDUSTRIES
THE AUTOMOBILE

VOL. XLIV. NEW YORK—THURSDAY, APRIL 7, 1921 NO. 14

The Crime Against the Small Town Dealer

Present distribution of ownership of automotive vehicles indicates where the dealer problem is the greatest. Factory sales managers have not appreciated this fact. Why neglect 55 per cent?

By Clyde Jennings

THE National Automobile Chamber of Commerce recently issued an estimate of the ownership of automobiles which indicates that 33 per cent of the cars are owned in the towns of less than 1000 inhabitants and 22 per cent in towns of 1000 to 5000. This, of course, represents a large percentage of farm ownership.

Coincident with this comes a report from the Southwest that cites many instances like this:

> **A Texarkana distributor, representing a good medium priced car, had 18 dealers in 26 counties a year ago and only three have survived.**
>
> **A Little Rock distributor for one of the leading cars has lost three of his five smaller city dealers.**

If these two instances indicate anything like a general fatality among small town dealers it is pertinent to ask who is going to sell the cars in the small cities. Still more pertinent might be the question as to **who is going to service and supply parts for the cars already sold.** It seems that this service question will not down, and any experienced automobile salesman will tell you, without hesitating, that unserviced cars are an exceedingly strong sales resistant.

Still another complaint is frequently heard from the West. It is that many companies are inclined to treat the small town dealership as a good deal of a joke. For instance:

Numerous cases are reported where a local banker has been named as dealer for a certain car. This banker wanted a car for himself and one for each of his several friends. He gets himself named as the dealer, gets the dealer discount on the wanted number of cars, sells them to his friends at a very mild profit and then shuts up shop as a dealer.

The result is that within a comparatively short time these cars **become orphans and will not take the road when they are wanted.** As a result, the owners and their neighbors place the blame entirely upon the manufacturer, for, of course, their profit-evading stunt was not bad business in their eyes. The matter of business ethics does not appeal to them.

Now, really, is it not right and just that the manufacturer should take the blame for oversight of decent business methods?

It is not by any means a new statement that a manufacturer will:

> **Spend a lot of money getting a proper design of the article that he is to manufacture, then spend a lot more money perfecting the best method of making this article and then**
>
> **Dump it on the market without any study of the market or,**
>
> **Without any definite policy of marketing it.**

Only such foolishness as this can explain some of the stunts similar to that of letting a banker supply himself and friends with cars at dealer rates.

There has been, is and will be for all time to come

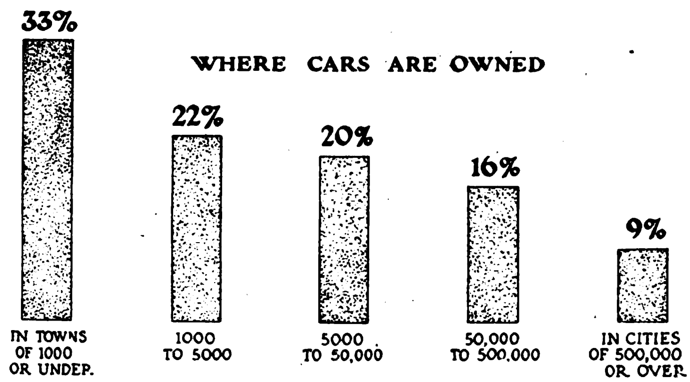
more or less academic discussion as to who is to blame for the disastrous experiences of small merchants, not only in automotive products, but in other lines.

This discussion is practically useless if one will take time to consider only briefly the broad justice that should govern business. It is an axiom that none can successfully dispute that:

A business contract is helpful only in that it benefits both parties to the contract.

Certainly no manufacturer of automotive products can afford to go about the country establishing dealers in small (or large, for that matter) towns who cannot make a living and who, after they have made a few sales, will go broke and leave this equipment standing in sheds just like so much junk. Automotive equipment is much too valuable to be deserted when the first accident happens to some minor part—and yet the country is spotted with just such junk piles.

It is plainly the duty of the manufacturer to insure that his dealer can and will make a living. If the individual established in trade is found to be lacking in the qualities necessary to conduct such a business, then another individual should be substituted, but the business should go on and make a profit for the person in charge.



Analysis of present ownership of registered automotive vehicles published by National Automobile Chamber of Commerce, based on a survey made by J. M. Gunn, president of U. S. Tire Co.

It has been a mistake to insist upon exclusive representation down to the point that this has been the practice. If the community will not buy enough Sennett cars to make a living for the dealer, then let him add the Rolls-Royce or some other car for a side line, but insist that he provide adequate service for the number of cars in his vicinity.

It is a fact to-day that a number of car manufacturers will establish a dealer in a more or less isolated community and not talk to him about parts until after he has sold several cars. It is quite likely that this man, especially if he is a novice, as so many dealers have been at the time they first signed dealer contracts, will not have thought of the necessary investment in parts, at least he will have no idea as to how much parts cost in sufficient number to safeguard his cars.

It is fortunate that this method of establishing dealers is less frequent than formerly, but it has not disappeared, nor will it disappear as long as there are adventurers in the vehicle manufacturing field, nor as long as manufacturers put all of their attention onto the designing and production of cars, and consider the marketing incidental.

To-day many men are made factory sales managers because they have been successful individual salesmen. That is not the test.

Perhaps they sold successfully, so far as total sales were concerned, but sold wrong so far as future was concerned. Time was when salesmen changed employers very often. In many cases it was because they had worn out their welcome. In some cases these very men have used their long list of former employers and their total sales in short periods with each as the means of getting a factory job, when, in fact, that record was the very reason they should never have had an opportunity to get an executive sales job or any other kind of a selling job.

There is no valid reason why almost any hamlet in the United States should not support a progressive, intelligent automotive dealer—provided he combines the selling of differently priced cars with service and accessory selling. Why not add the motorcycle to his list of products for sale? Some time ago a motorcycle concern did seek to interest small town dealers in cycles, but eventually they gave it up. The dealers had no special encouragement to round out their line; if anything, the car influence was against their branching out. If the car influence had been otherwise, the motorcycle manufacturers would probably have succeeded.

It appears to have been a mistake to have encouraged the small town dealer to undertake the sale of trucks. He can sell the delivery wagon type—which is much like passenger car sales—all right, but when it comes to the slow-moving vehicles he does not seem to have been able to measure up. He has not been able to analyze his customer's need for transportation, which must be the keynote of successful truck selling. Besides, until truck transportation is better understood, a small community cannot absorb enough trucks to support an active dealer.

As to tractors, the evidence is very spotted. It seems to be a case of individuality rather than of location, previous experience or environment. Some small town automotive dealers sell tractors like the country merchant buys eggs; they just naturally understand the tractor problem. These men, of course, are successful even if they only sell a few tractors a year, because they estimate the possibilities of their communities fairly accurately, make money on each vehicle and then make service an asset rather than a liability.

There is a very great difference in the attitude of elements of the automotive personnel toward their business representatives. During the last winter J. D. Dort made the dealer circuit and met and talked with every dealer who wanted to talk to him. The comment that this action caused is evidence of the unusual character of such a course. In contrast we will here print some comment that originated in the sales department of an automobile manufacturing company. It is self-explanatory:

> To quote a specific instance—a certain dealer in a given locality writes to the sales manager of one of the large corporations, complaining about his low car discount, stating that he discussed this at length with his distributor, but in vain, and now appeals to the factory for a fair deal.
>
> The sales manager never sees this letter.
>
> It is sorted out in the morning by one of the lesser mail clerks, who passes it on to one of the zone correspondents, and he, in turn, forwards it to the field man, who is requested to look into this matter at his convenience.
>
> Sometimes the correspondent acknowledges the dealer's letter. Other times he does not think it is worth while, depending largely on his mental attitude at the time the letter is placed on his desk.
>
> The field man places the letter from the zone correspondent in one of his many folders and if he is a systematic and aggressive sort of a fellow he so

arranges his files that this letter will come to his attention upon his next visit to the distributor's place of business, which may be within two weeks or two months.

When he finally arrives at the point of discussing this with the distributor the subject has grown cold, and at the very best all he can hope to get from the distributor is that the dealer is only a small town fellow, not worthy of any particular investigation.

In other words, the field man gets the distributor's side of the story and the matter is dropped there. He reports to the factory accordingly.

But what about this poor little dealer out in the "sticks" who probably doesn't write more than two or three letters a week and has been waiting anxiously for some word from the manufacturer that would make him feel he was really worth while in the organization. Days, weeks, finally a month passes without even an acknowledgment.

How would you feel if you were that dealer? Draw your own conclusions. Further elucidation is unnecessary.

The man who contributed this illuminating information was presenting the idea that this system did not prevail at the Elgin Motor Car Corp. and we are glad that it does not. It is not good business, but it is exactly what does prevail wherever an attempt is made to organize a system to function in matters where only the spirit behind the action can adjust the situation.

This is merely one of many phases of the situation that could be brought to bear to explain why the small dealer is not up and going.

Here is another contribution. This is from a man who has made a study of selling. He writes:

> One of the mistakes frequently made by manufacturers is to assume that they know all there is to know about the business. Recently a well-known truck manufacturer held a conference of dealers and told them how the merchandising effort was to be carried out during the coming year.
>
> One of the older dealers was then called upon to express his views on the subject. This man, who had been in the automobile business for nearly twenty years, and knew something of both manufacturing and retail selling ends, began by saying that he objected being told exactly how to do everything by someone who perhaps did not know as much about the business as he himself did.

The manufacturer can, of course, be a great help to the dealer in many ways; he can assist him in his merchandising efforts; he can offer helpful suggestions. But he cannot always assume that the dealer is a novice in merchandising methods and practice. It is undoubtedly true that many dealers to-day hold a really big conception of the automobile industry and are impressing their capabilities and their industry upon their respective communities in a very favorable light.

One really constructive piece of work was accomplished a few years ago by a distributor who had some southern states in his territory. He found that this territory had not been educated to pay the price for a car that his vehicle must sell for. So he decided to feed that territory on used cars.

He arranged his own repair shop to turn out overhauled cars and these he shipped into this territory. They were sold with certain guarantees and in opposition to cars of considerably less value as new cars. This trade thrived and had the advantage of clearing the distributor's best new car territory of used car problems.

After two or three years of this work this southern territory developed into a fine new car territory. Of course a distributor who would do this sort of a thing encouraged proper service.

A New Test for Motor Fuels

IN Europe considerable use is now made of blended fuels comprising members of the paraffin group (pentane, hexane, heptane, octane and nonane) on the one hand, and members of the benzene group (benzol, toluol, xylol) on the other. When buying such fuels in large quantities it is, of course, desirable to have some means of checking the composition of the fuel, especially as to the proportion of these two groups of components. This can be done by means of a refractometer, as the paraffin series has a higher refractive index than the benzene series. The Abbe refractometer, made by Adam Hilger, Ltd., is specially recommended for this purpose. The refractive indices of liquids give valuable information concerning the purity of oils and other substances, and the strength of aqueous, alcoholic, ethereal, and other solutions. Mixtures of two liquids are also readily analyzed by the use of the refractometer.

While determining the refractive index, another physical property, the dispersion, is obtained at the same time. Only one or two drops of liquid are required. So thin is the film of liquid employed that turbid and highly colored liquids, notwithstanding their absorption of light, can be investigated. Wherever the proportion of solvent to substance dissolved is often required to be known, a refractometer affords the quickest means of obtaining the information.

Measurements can be made using either daylight or artificial light, and the refractive index is read directly on the scale. Dispersions are obtained by reference to a printed table. The liquid to be investigated is enclosed as a film between two prisms of dense flint glass. The upper prism has a polished face in contact with the liquid, and it is the ray which grazes this face which is utilized in making measurements. Each prism is enclosed in a hollow jacket through which water at constant temperature can be circulated. The interior faces of the water jackets are gilded to prevent corrosion. The use of daylight is made possible by employing a compensator to neutralize the dispersion of the liquid and thus to give an achromatic field. The compensator consists of two direct vision prisms, which are rotated at equal rates in opposite directions by turning a milled head, and together form a system of variable dispersion. The compensator is provided with a scale, readings on which give dispersions by reference to printed tables provided with the instrument.

To make a measurement, a drop of the liquid to be investigated is introduced between the prisms. On looking through the eye-piece and moving the index, a dark shadow with a sharply defined edge comes into the field of view. This edge is brought onto the cross lines in the eye-piece and the corresponding refractive index read off on the divided scale. A test piece of glass, on which is engraved its refractive index, is supplied with the instrument, for the purpose of checking the setting, and simple means are provided for correcting the setting should it become necessary.

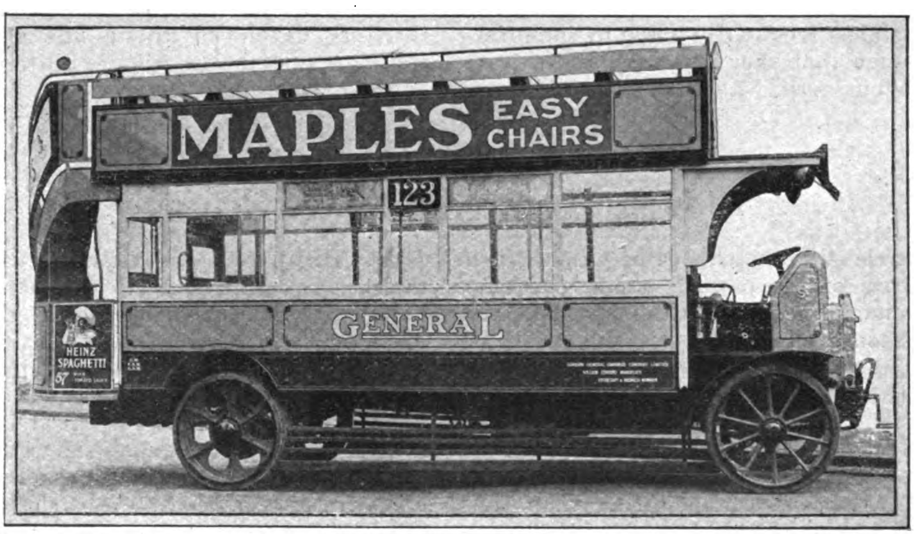
New British Bus Chassis Is Equipped With Body Seating 54 Passengers

New type will supersede model "K" heretofore described in these columns, and will accommodate 8 more passengers. Since the crew and the fuel consumed per mile are the same as that of earlier type the margin of profit is greater. Changes in construction include use of larger wheels and a single plate instead of multiple disk clutch. Half elliptic front and rear springs are supplemented with volute springs.

By M. W. Bourdon

PRACTICALLY the whole of the fleet of London buses now in use will eventually be superseded by a new model known as "S" type, which has a longer wheel-base, larger engine and a double-deck body seating 54 passengers. This new model has been running almost unnoticed on the London streets for the past few months, fifteen experimental chassis and bodies (with 57 seats in these first few examples) having been completed early last autumn. The first batch of production chassis is now in hand, and the last fifty of the preceding type are being finished off, making 1000 to be completed in all.

It will be recalled that in AUTOMOTIVE INDUSTRIES of Aug. 12 and 19, 1920, there were given particulars concerning the "K" type chassis and body which at that time represented the last word in London bus construction and had a seating capacity for 46 passengers, as compared with 34 of the pre-war "B" type bus. The latest increase in size and passenger accommodation has been made possible by a relaxation of the regulations laid down by the Metropolitan police, this variation being made at the instance of the new Ministry of Transport.

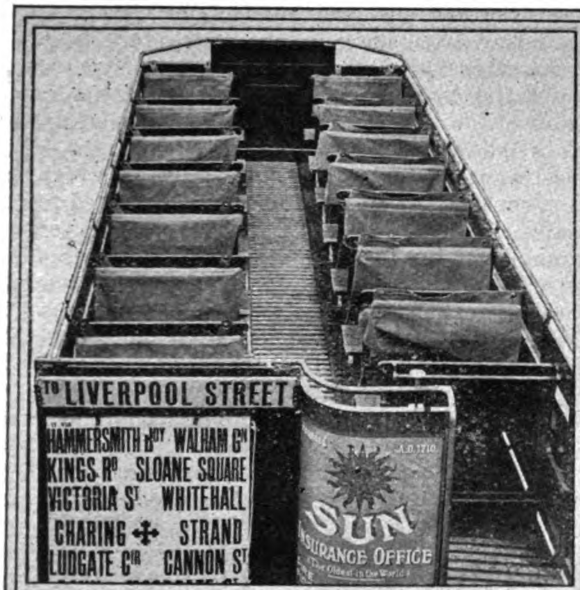


Side view of the new 54-seated London bus, known as the "S" type

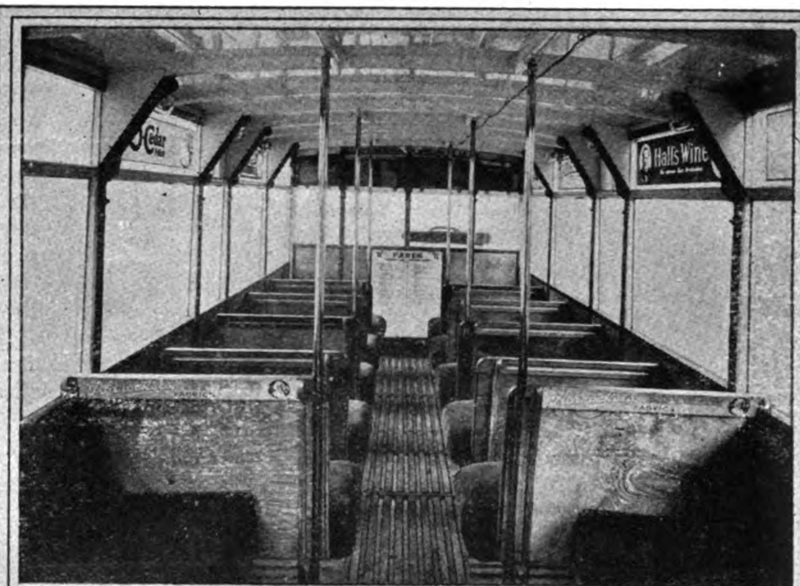
The "K" type (1920 model) chassis represented an endeavor to fulfil the stringent requirements of the police authorities in regard to weight, simultaneously increasing the passenger capacity, but in endeavoring to comply with these requirements it was necessary to cut down chassis weight to an extent which, it must be admitted, rendered the chassis less reliable and durable than might otherwise have been the case. In the new "S" type the designers have been given more latitude, and in respect to both unladen and laden weights the old standards have been exceeded. Thus, not only has still greater accommodation been provided, but chassis details have been strengthened and, incidentally, the size of the road wheels has been increased.

A four-cylinder engine is used. It has a bore and stroke of 108 x 140 mm., approximately 4¼ x 5½ in. as against "K" type, 100 x 140 mm. The new S type engine develops 34 hp. at 1,000 r.p.m. The L head cylinders are in pairs on an aluminum crankcase, while the valves on the left are inclosed. The "K" type were not inclosed. The engine as a whole is suspended by means of four bolts from a pair of H section drop forgings resting on brackets secured to the side members of the flitch plate frame. In general construction the latter is unchanged, but, although the overall width of its members remains as before, the steel plates are now 3/16 in. thick as compared with 5/32 in.; they are also 2 in. deeper midway between the wheels and are slightly inset at the front to give the necessary steering lock. The top of the frame members is 3 in. higher off the ground, this being mainly due to the use of wheels of 1050 mm. (42 in.) diameter in place of those of 920 mm. (37 in.) diameter on the "K" type.

Reverting to the engine, this has hollow crankpins, a feature which is not, however, made use of to provide hollow-shaft lubrication, for the latter is on the circulating splash system with direct leads to the three crankshaft bearings. A separate lead is also taken to a point over the timing chain, which is rendered adjustable by mounting the magneto on a slotted bracket behind the timing case on the left side and this providing means to take up slack. In addition to the driving sprocket at the front end of the crankshaft there is a worm wheel engaging below it a worm gear on a trans-



Upper deck with seats for 28 outside passengers on the new "S" type London omnibus



View looking forward inside "S" type bus, showing seating arrangement in the 54-passenger body

verse shaft. This drives through a flexible coupling, the lighting dynamo which supplies current for interior and exterior illumination.

The grouping of the engine accessories and valves is entirely on the left side of the engine, so as to make these accessible upon raising that side of the hood, for, as in the "K" type bus, the driver's position is slightly above and alongside the engine on the right. Thus we find the exhaust manifold carried higher than the inlet branch on the left. The two are separate units and the inlet branch is completely water jacketed almost down to the carbureter flange. The carbureter is a Zenith without hot air supply, the jacketing of the branch being alone depended upon for vaporization of the fuel. Oil filler and oil level rod are also on the left. The magneto is entirely inclosed by a cast aluminum cover, which not only protects the magneto from water, but prevents the driver from tampering with it. The magneto has fixed timing; a throttle governor is not provided, but a slow running stop for the throttle pedal is fitted on the back face of the dashboard.

Oil is circulated by a pump driven by helical gearing from the camshaft, which is carried on three plain bearings and operates the slightly inclined valves through roller ended tappets of 1 1/16 in. diameter, drilled throughout practically the whole of their length to an internal diameter of ¾ in.

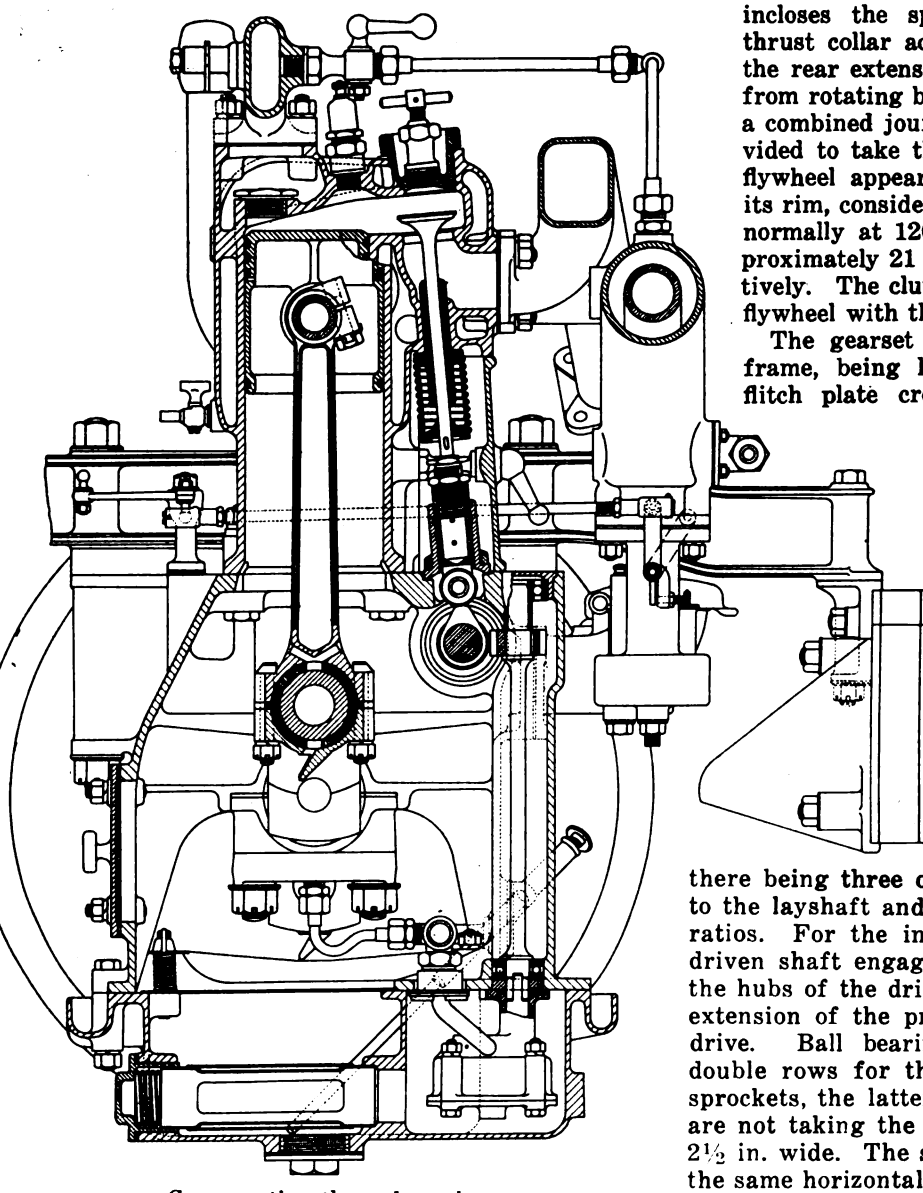
A point worthy of note is the position of the spark plugs in the cylinder heads; they are not screwed as usual into the castellated valve caps, but directly through the cylinder head toward the center of the bore, where they are in a better position for firing the charge and more intimately water-cooled. Four-bolt plain bearing big-ends are used on the 2⅛ in. diameter crank pins. Dippers are formed integrally with the big-end caps, but adjustment is provided for the troughs by holding each one, at its right hand extremity, down to a compression spring by a bolt. The H section connecting rods have 300 mm. centers, the upper end of each being split and provided with a pinch bolt to secure the hollow piston pin. The latter oscillates within unusually large bosses in the aluminum pistons, the dimensions of these bosses being such as to allow of their being bored out when worn after considerable use for the insertion of phosphor bronze bushes.

There is nothing remarkable in the design of the pistons, the axially split skirt with internal ring having been discarded in favor of a plain straight-side design. Three compression rings are fitted, with the land below the bottom one reduced in diameter so that this lower ring can form a scraper returning oil to the interior through small holes drilled radially. There is a second scraper ring in the skirt. No difficulty has been experienced with the use of aluminum for these heavy duty engines, and it is asserted that even with 0.003-in. clearance there is neither piston slap when cold nor a tendency to seize when the engine is hot—and it may be mentioned that these engines are more often than not running with the cooling water at approximately boiling point. In the latter connection it may be said that the V-shaped leather link belt driving the fan is kept under tension automatically by means of a loose front flange on the driven pulley, a volute spring keeping it constantly pressed toward the belt and the rear flange, an arrangement which has been found to be entirely satisfactory.

Water circulation is by a pump located on the front of the cylinder casting, its shaft being a continuation of that on which the driven fan pulley is mounted; thus the pump is belt driven. No underpan is fitted when the engine is assembled in the frame. Oil dripping is prevented by a trough which passes completely around the detachable aluminum sump, an arrangement which is also used in the case of the gearset.

In the "K" type chassis, which the "S" type supersedes, a multiple disk clutch is used, but in the new model a single plate pattern has been adopted. This has its central steel plate bolted to a flange on the clutch coupling shaft. At the friction surfaces the driven plate is reduced in thickness, the object being, of course, to reduce inertia as much as possible. Eight adjustable springs are used to clamp the driven plate between the fabric surfaces riveted to the rear cover and floating plate respectively. Four multiplying levers serve for disengagement purposes, but take no thrust from the spring when the clutch is engaged.

Lubrication of the clutch coupling shaft is accomplished by oil periodically fed by hand through a tube and cup, the latter being made readily accessible by passing through the pressed steel rear dust cover which



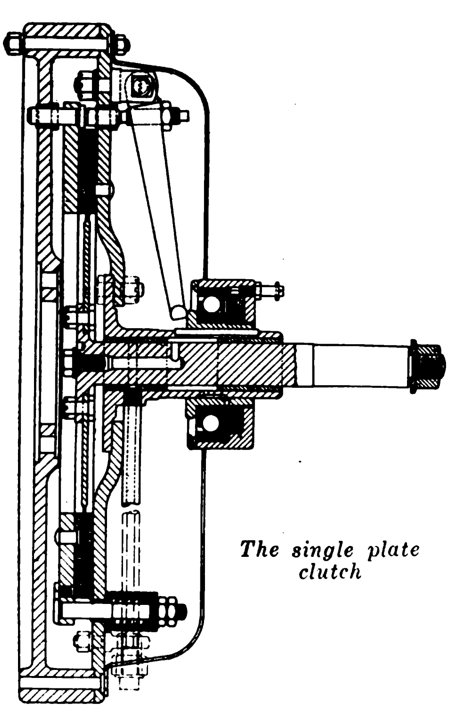
Cross section through engine

incloses the springs and multiplying levers. The thrust collar acted upon by the clutch fork floats on the rear extension of the back plate and is prevented from rotating by means of a link carried to the frame, a combined journal and thrust ball-bearing being provided to take the end thrust of disengagement. The flywheel appears to be unusually light in weight at its rim, considering that the engine is designed to run normally at 1200 r.p.m., but with a diameter of approximately 21 in., it seems to serve its purpose effectively. The clutch as a unit can be detached from the flywheel with the springs retained under compression.

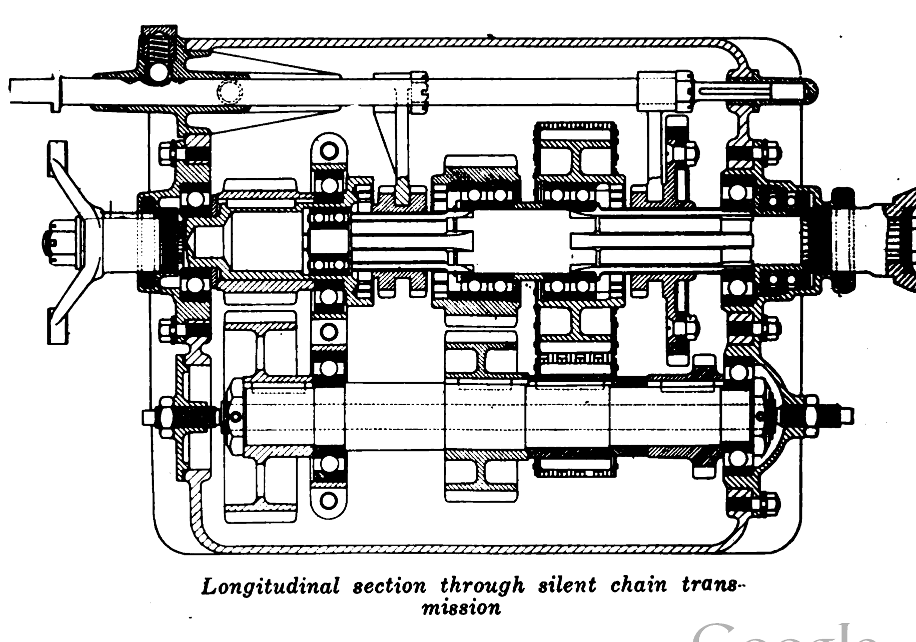
The gearset casing is separately mounted in the frame, being hung by three bolts from a pair of flitch plate cross members. Between it and the clutch is a coupling shaft at present fitted with flexible joints having steel disks, but these are to be displaced in the production chassis by fabric disks, trouble having been experienced through the steel plates cutting into and tending to shear off the bolts holding them to the star pieces.

Like the engine, the gearset is slightly inclined rearwardly so as to provide a straight-line transmission when the bus is loaded. There are three forward speeds with selector change. The indirect ratios, with the exception of the reverse, are obtained by silent type chains, there being three of these, one from the primary shaft to the layshaft and the others for the second and third ratios. For the indirect drives sliding sleeves on the driven shaft engage with internal teeth formed within the hubs of the driven sprockets and within a rearward extension of the primary chain sprocket for the direct drive. Ball bearings are used throughout, including double rows for the pilot bearing and for the driven sprockets, the latter, of course, rotating idly when they are not taking the drive. The chains in each case are $2\frac{1}{2}$ in. wide. The shafts have $5\frac{1}{4}$-in. centers and lie in the same horizontal plane; the casing, of cast aluminum, has an oil level inspection and filling hole in the center of the overall lid.

From the rear end of the driven shaft the drive is taken by a ball-bearing star or cross-pin type of uni-



The single plate clutch



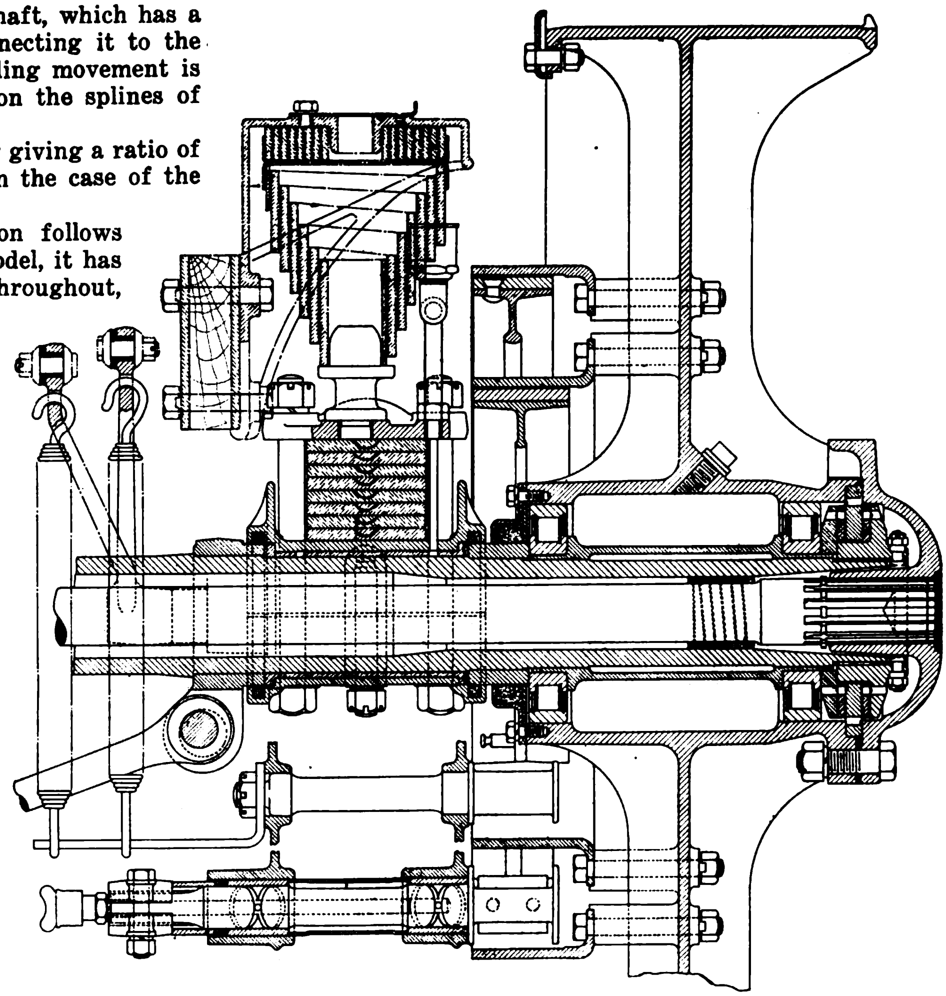
Longitudinal section through silent chain transmission

versal joint to the tubular propeller shaft, which has a similar type of joint at the rear connecting it to the worm shaft below the rear axle. Sliding movement is permitted at both ends of the shaft on the splines of the solid extensions.

A straight worm is used, the gearing giving a ratio of 9.3 to 1 as compared with 8.25 to 1 in the case of the "K" type chassis.

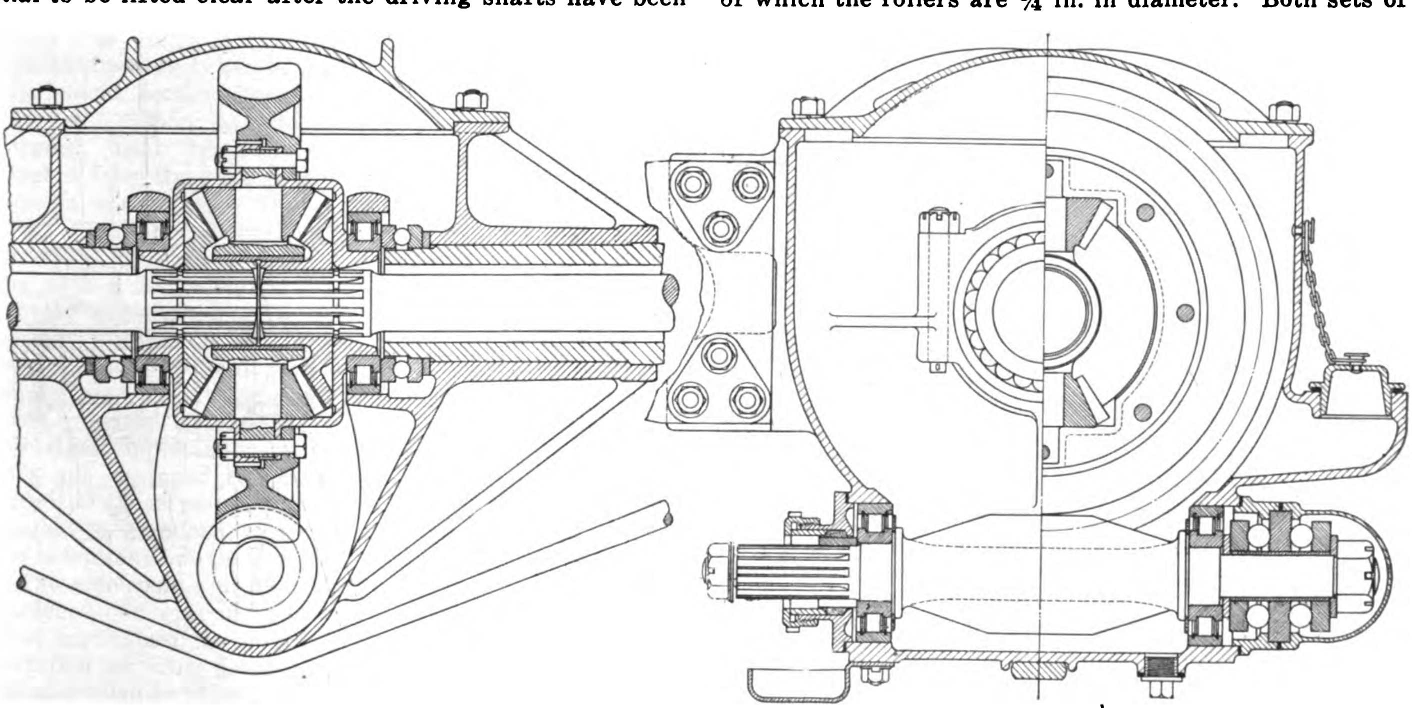
Although the rear axle construction follows generally the lines of the preceding model, it has been very considerably strengthened throughout, and, while the previous model had conical roller bearings for the differential casing and wheels, the "S" type has straight rollers with ball thrusts at each side of the differential and plain thrust washers for the hubs. The worm shaft also is mounted on straight roller bearings with ball thrusts. The axle center is a unit steel casting with webs on the horizontal and vertical center lines. It has its extension tubes pressed directly into the center, with a tie rod below mounted at each end on eccentric pins for maintaining the tension.

A special feature is the triangulated steel plate torque member, which is bolted to the front of the axle center; a forward extension is suspended between bronze blocks in which it can slide fore and aft or partially rotate, these blocks being supported above and below by rubber buffers in the supporting bracket. The plate is of spring steel, and the sliding motion permitted in its anchorage and the lateral "give" of the plate allow for axle movement due to equal or unequal spring deflection.

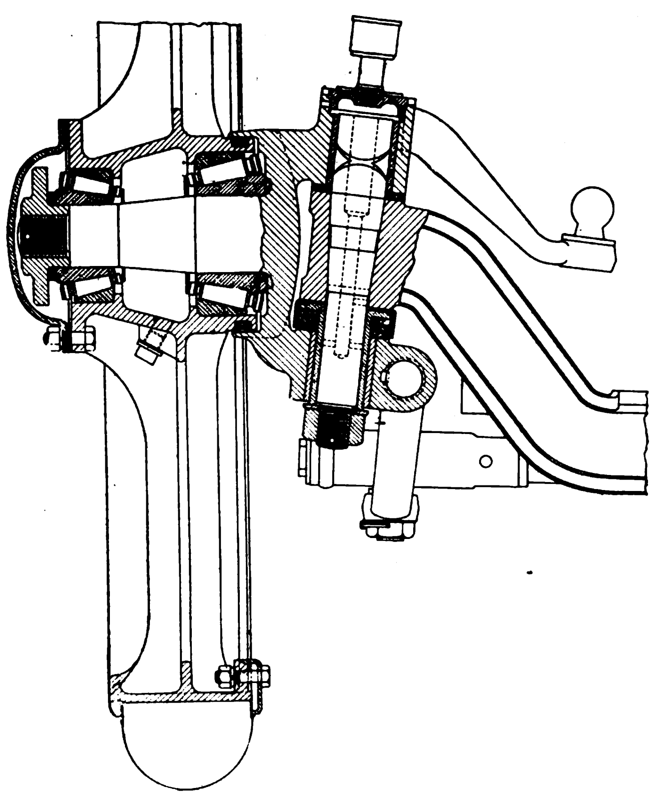


Rear axle end, spring and cast steel wheel

The rear axle casing has an overall cover plate, the removal of which allows the worm wheel and differential to be lifted clear after the driving shafts have been withdrawn. The latter have splined outer ends engaging with the hub caps which convey the drive to the wheel hubs, the latter, as already mentioned, being mounted on widely spaced (7-in. centers) straight roller bearings of which the rollers are ¾ in. in diameter. Both sets of



Rear axle center and undermounted worm drive



Front axle end and front wheel

brakes apply within concentric drums on the rear wheels, the latter being of the cast-steel web-spoked type with twin solid tires each of 120 mm. cross section. The brake shoes are faced with fabric, the outer sets being pedal applied; the inner drum has a diameter of 13½ in. and the outer 18 in., the width of the friction surfaces being 2⅞ and 2⅜ in. respectively.

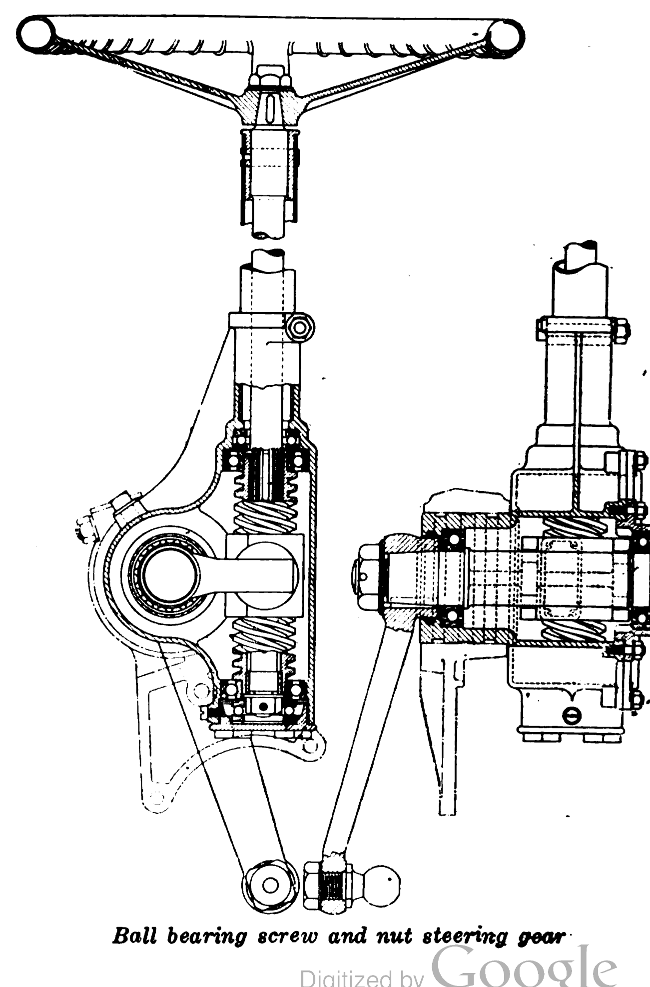
One of the most interesting features of the chassis is the spring suspension. Half-elliptic laminated springs are used fore and aft, but supplementing these to take an increasing proportion of the load as the bus fills up with passengers is a series of volute springs backed by brackets above them attached to the frame; the springs at their lower ends encircle studs or bosses projecting upward from the center clamping plates of the laminated springs. Each supplementary unit consists of two volute springs, but the first of these is merely a buffer spring for the second, serving to keep the latter always in firm contact with the axle so that it cannot lift away from the central stud. The main volute spring varies both as to section and width of the strip of which it is formed and it is in the "grading" of the spring in these respects that the main advantage of the arrangement is derived. Provision for introducing lubricant occasionally to prevent squeaking occurring due to the frictional contact between the coils is made by a swing lid surmounting the bracket attached to the frame.

In regard to the laminated springs themselves, the second main leaf is continued so as partially to encircle the eyes of the upper one at each end, while the center of each leaf is "pipped" to lock it in relation to the others and prevent end movement on the axle.

The front axle is an H section drop forging of 3 per cent nickel steel. Plain bushes and a plain thrust ring are used for the swivel pins, the latter being tapered where they pass through the ends of the main axle and drilled for lubrication of upper and lower bearings from the grease cup at the top end. The front wheels run on roller bearings, which supersede the floating phosphor bronze bushes of the "K" type chassis. Worm and nut steering gear is continued, with the lever shaft mounted on ball bearings. The wheel shaft is similarly supported with ball thrusts above and below the thread. In the "K" type chassis the steering link passed from the steering lever located on the right to the left-hand wheel swivel lever, the motion then being taken back to the right-hand wheel by the coupling rod; but in the production model "S" type chassis, this arrangement is being varied and the steering housing is supported at the front extremity of the frame immediately behind the radiator, with a short drag link running back over the axle to the right-hand swivel lever, this arrangement having been found to give easier and more precise steering control than the transverse drag link.

In regard to the bodywork, this follows very closely the arrangement and methods of construction adopted for the "K" type bus, described in detail with drawings in AUTOMOTIVE INDUSTRIES of Aug. 19 last year. The variations in the seating arrangement giving accommodation for 11 additional passengers in the fifteen experimental buses of the series consist of (1) a transverse seat for five passengers facing rearward immediately behind the driver within the interior, (2) two more two-passenger transverse seats added inside after reducing the longitudinal seating capacity from six to four, and (3) two more two-passenger seats outside. But the rearwardly facing seat has not been found completely satisfactory and the final decision is to eliminate it and return to the longitudinal seats, each accommodating 3 passengers. Thus, although the intention all along has been a 57-seated bus, 54 seats only will appear in the production model—eight more than in the "K" type bus.

The lengthening of the body has, of course, necessitated additional side pillars, but other variations are purely matters of detail. To relieve the body of the stresses due to overhang at the rear, the left-hand chas-



Ball bearing screw and nut steering gear

sis frame member is extended beyond the right-hand unit; the former therefore supports the loading platform and staircase, enabling the superstructure to be appreciably reduced in weight at this point.

The running of the fifteen experimental buses during the past six months or so has not merely been for the purpose of testing out the chassis, but also to ascertain various points of doubt in connection with the running of such comparatively large units; for instance, whether it is a paying proposition to run a larger type, whether the conductor could collect all the fares, etc.

Actually, it has been found that the margin for profit is greater with the larger unit, and for some reason, which is as yet obscure, the fuel consumption of the 57 seater has proved to be almost exactly the same as the 46-seated bus, approximately 5.8 mi. per gal. Obviously, with the wages of driver and conductor the same, this result cannot be viewed as other than extremely satisfactory.

As is probably known, the vast majority of London buses are operated by the London General Omnibus Company, which is one of the units of the combine having control also of the Underground Railways, but the chassis manufacturing concern is the Associated Equipment Company, which has a modern plant at Walthamstow, London, E., where, when in full swing manufacturing bus and truck chassis, some 3000 hands are employed. The output at the present time of bus chassis alone has been worked up to 50 per week. The Resident Director in charge of the plant is H. Kerr Thomas, who for some ten years prior to 1920 held a similar position with the Pierce-Arrow company.

All units—engine, gearset, back axle, steering, etc.—are made in the Walthamstow plant, for although until a year or so ago engines were bought outside, the conclusion was then reached that it was preferable to produce all components under the one roof.

The Associated Equipment Company are also makers of chassis for provincial buses and 3 to 4-ton trucks, which vary in certain details from the bus chassis; for example, they have pressed steel frames and 4-speed spur pinion gear-boxes. Why the London Omnibus Company still continues the flitch plate frames is not made clear, and their preference is the more peculiar because the cost of these is admittedly 50 per cent more than that of the pressed steel variety.

The following comparative dimensions and weights of the three types of London buses referred to in the foregoing will be of interest.

	"B" Type*	"K" Type†	"S" Type†
Seats	34	46	‡57
Overall length	22 ft. 6½ in.	22 ft. 4½ in.	24 ft. 7 in.
Overall width	6 ft. 10 in.	7 ft. 1 in.	7 ft. 1 in.
Wheelbase	12 ft. 10⅝ in.	14 ft. 2¼ in.	14 ft. 11 in.
Track	5 ft. 8 in.	5 ft. 10 in.	5 ft. 10 in.
Rear overhang	7 ft. 7⅝ in.	6 ft. 8 in.	7 ft. 2¾ in.
Body length	11 ft. 9¼ in.	13 ft. 10¾ in.	16 ft. 1 in.
Weight of chassis	5,590 lb.	5,150 lb.	6,500 lb.
Weight of bus (unladen)	9,000 lb.	8,400 lb.	9,800 lb.
Weight of bus (laden, 54 passengers, driver and conductor, gasoline and water)	14,240 lb.	14,850 lb.	18,000 lb.

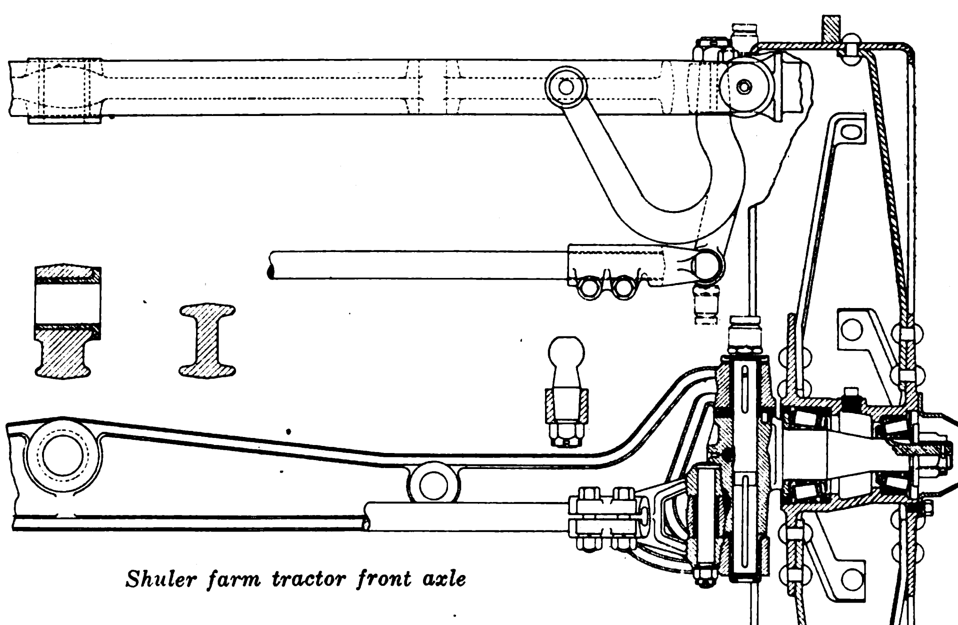
Front Axles for Tractors

TWO sizes of front axles for farm tractors have been put on the market, one for 2-3 plow tractors and the other for 3-4 plow. The former has a load capacity limit of 2000 lb. and the latter of 3000 lb., the whole weight at the forward end, including axle and wheels, being considered.

In order to permit vertical oscillation of the axle it is pivoted under the frame at the center. The axle center is of the customary I-beam section, made from a 0.30-0.40 carbon one-piece drop forging, heat treated, and is tapered from the yoke to the pivot boss in the center. The central pivot boss is provided with a hardened and ground steel bushing with a flange on the aft side to take the thrust. The axle is pushed almost entirely through radius rods secured to it at points near each yoke and converging to an axial point some distance behind the pivot boss. The I-beam is thickened appreciably at the points where the radius rods are fastened in order to resist any stresses induced at those points. The balance of the axle is very similar to standard motor truck axle construction with the exception that the camber is taken out of the spindles.



Shuler farm tractor front axle

The axle center at the steering heads is bushed with hardened and ground steel and the king pin is of nickel steel carbonized, hardened and ground, the whole construction at this point being inclosed. The thrust is taken on two hardened and ground steel washers of large area. The steering knuckles and steering arms are low nickel chrome steel drop forgings, heat treated, the steering arms being bushed with steel. The cross rod is of cold-rolled steel. The rod ends are drop forgings, tied to the arms with a hardened and ground pin. The steering arm ball is of 3½ per cent nickel steel, hardened and ground, and may be located on either side of the axle with either the fore and aft or cross type of steer. The tie rod, however, is always placed behind the axle. The wheel spindles are equipped with Timken roller bearings.

The Shuler Axle Mfg. Co., who build these axles, supply wheels of their own design also if desired, these being either a fabricated type of wheel or an integral cast wheel of malleable iron.

A Device for Automatic Control of Airplanes

Is designed to relieve the pilot from fatigue in long flights. Pendulum, usually employed in devices of this character, is replaced by a mercury column which, by means of electric contacts controlling air valves, operates ailerons and elevator. Control equipment weighs about 150 lbs.

IT is quite obvious that controlling an airplane continuously for long periods of time places a heavy strain on the pilot, especially in a gusty atmosphere, and many attempts have been made in the past to render airplanes self-righting or provide them with automatic stabilizers. Most of these have been based upon the pendulum principle, but these encounter the difficulty that in describing a curve the pendulum is subject to centrifugal force and tends to assume an inclined rather than a vertical position.

A French aircraft engineer, Georges Aveline, has invented a rather ingenious device in which the effect of centrifugal force is compensated for, and this has recently been fitted to a Handley-Page passenger airplane in England and tried out with apparent success. In piloting a machine so fitted, the pilot does not have to bother with the aileron and elevator controls, except in getting off and in landing, and has only to control the rudder to maintain the desired course.

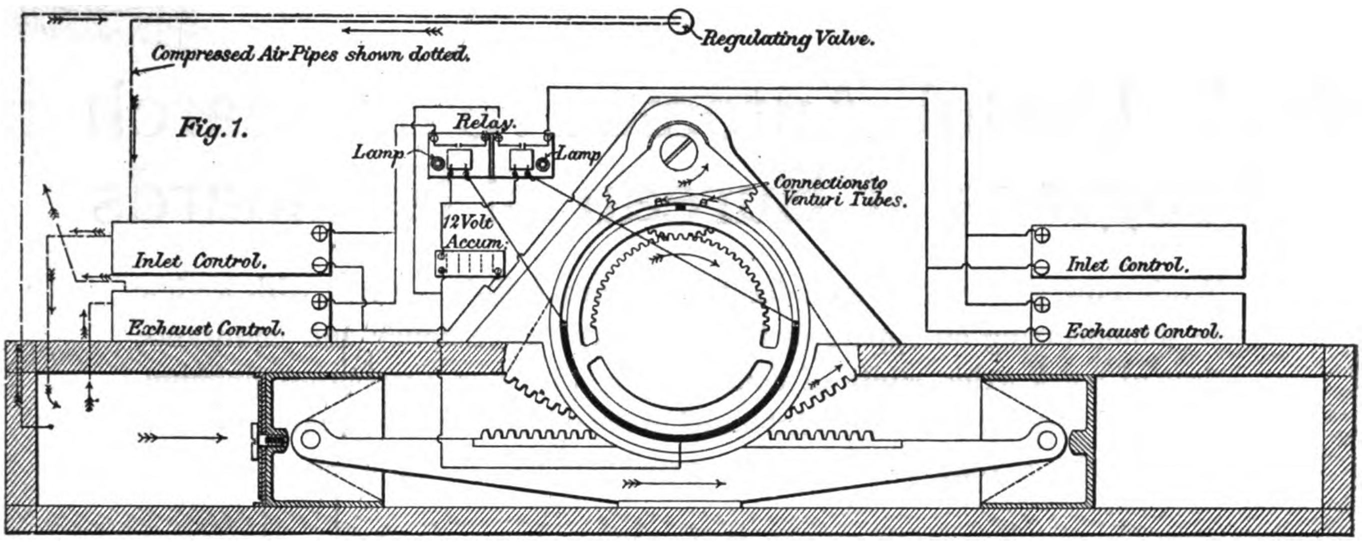
The mechanism employed for controlling the ailerons, shown in Fig. 1, is mounted transversely in the cockpit. It comprises a disk of red fibre in which is formed a circular channel that is half filled with mercury. There are three electric contact terminals in the channel, one at the lowest part and one just above the level of the mercury in each branch. If the machine tilts to one side the mercury on that side of the circular groove will come up to the electric contact and the electric circuit will be completed from the bottom contact through the mercury. Each of the two circuits which can thus be completed contains a relay, and these relays each control a 12-volt circuit including electro-magnets which in turn control the inlet and exhaust valves of a compressed air servo motor. A section of this servo motor is shown in Fig. 1, and it will be seen to be of the single cylinder, double piston type. The two pistons are connected by a toothed rack which meshes with a quadrant to which the aileron control wires are connected.

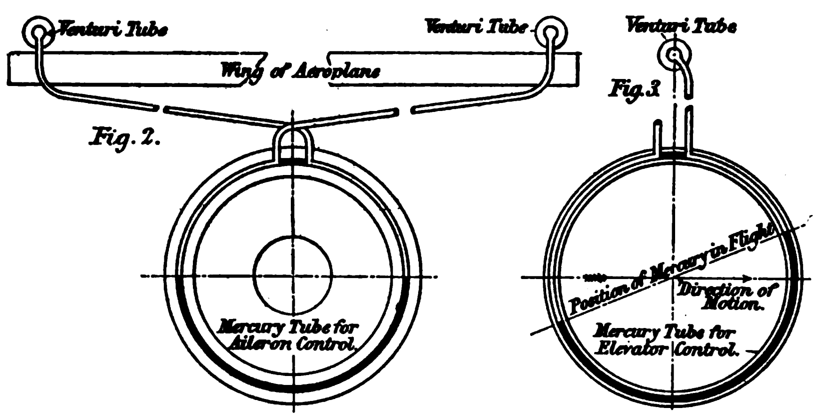
When air is admitted to one side of the servo motor and the exhaust valve at the other end is opened, the pistons move, turn the quadrant, and so operate the ailerons to correct the tilt. The disc containing the mercury channel is also geared to the quadrant, so that it turns in the opposite direction and, by this means, the contact is broken and the pistons are brought to rest after moving through an angle corresponding to the amount of tilt. By means of a valve fitted in the exhaust pipes the rate of movement can be regulated as desired.

It is obvious that this is a gravity mechanism like a pendulum and that centrifugal force has an influence on the level of the mercury. To overcome this Mr. Aveline has provided suitable means which form one of the most ingenious features of his device. To turn the machine the pilot moves the rudder bar with his foot, and the machine immediately commences to swing around in a more or less horizontal plane—say to the right. The resulting centrifugal force causes the mercury to rise in the left-hand arm of the mercury channel, making contact on that side, and the effect of this is to pull down the outer aileron and raise the inner aileron, thus causing the machine to bank in the correct manner. The fibre disc, of course, moves in the opposite direction to the quadrant and would break the electrical connection and leave the ailerons in the positions above described but for the special means referred to.

As soon as the correct banking is reached, it is necessary to replace the ailerons into the neutral position, otherwise the banking would become excessive and the machine would probably side slip. To avoid this the arrangement illustrated diagrammatically in Fig. 2 is employed. A Venturi tube is mounted on each tip of the upper wing of the machine and the throats of the tubes are cross-connected to the arms of the mercury tubes as indicated in the diagram. Obviously, the suction from the Venturi tube on the outer wing tip will be greater than that from the other tube, since the former is moving faster than the latter, and the effect of this will be to raise the mercury in the inner arm and make an electrical contact on that side. By this means the ailerons are returned to the mid position, and the machine continues to travel on a properly banked turn until the rudder bar is again moved by the pilot, when the reverse action takes place, bringing the machine back on to a horizontal straight-line path.

The apparatus for controlling the elevator is generally similar in principle to that used in connection with the ailerons, the main distinction being that the plane of the mercury channel is in a fore and aft direction and that one arm of the mercury tube is connected to a Venturi tube in the centre of the machine, while the other arm is open to the atmosphere. The arrangement of this part of the apparatus is indicated by Fig. 3. In normal flight the position of the mercury would be as shown in the illustration, the forward arm being at a higher level than the after arm, owing to the suction of the Venturi tube. The pilot has to adjust the fibre disc so that the electrical contacts are just above the level of the surfaces of the mercury in the arms and any alteration in the speed, or fore and aft inclination of the machine will then complete the circuit to a relay and servo-motor similar to that already described, thus effecting the necessary adjustment of the elevator. It is equally possible for the pilot to set the disc for any desired angle of climb and the machine will then continue to climb at this angle until the disc is readjusted for horizontal flight. In the event of engine failure while the fore and aft automatic control is in use, the drop in speed and the consequent diminution in the suction from the Venturi tube will allow the mercury to fall in the right-hand arm of Fig. 3 and rise in





Aveline automatic control apparatus for airplanes

the left-hand arm. In this way the servo-motor will be operated to put the machine into a downward glide without any action on the part of the pilot, who would only have to steer the machine to a possible landing ground and flatten it out just before alighting.

If it is desired to control the machine in the ordinary way, either or both of the servo-motors can be instantly put out of action by the pilot, without leaving his seat, by means of valves fitted in the compressed-air pipes or by slackening the cables connecting the quadrants with the main control cables. If the former method of disconnection is adopted, the apparatus can still be employed as an inclinometer to indicate a tilt in either the longitudinal or lateral directions. This is due to the fact that small incandescent lamps are included in the circuits connecting the mercury channels with the relays. The lamps are fitted in the front of the relay casings, which are mounted on the instrument board in the cockpit in full view of the pilot. When the machine is flying level laterally, or at the correct longitudinal inclination, all the lamps are extinguished, but a slight tilt in either direction, by disturbing the level of the mercury, will cause one or other of the lamps to light up and indicate the existence of the tilt to the pilot.

The compressed air required to operate the servo-motors is provided by two small wind-driven rotary pumps mounted on the bottom longerons on both sides of the fuselage. These pumps maintain a pressure of about 60 lb. per square inch in a cylindrical reservoir placed inside the fuselage. The reservoir also serves as a receptacle for oil for the rotary pumps, these, of course, requiring constant lubrication. A maximum pull of 500 lb. can be produced in the cable attached to the quadrant, this pull being ample for the control of the largest machines at present in use.

The apparatus complete, as fitted to the Handley-Page passenger-carrying machine, weighs 150 lb. This, of course, is considerable, as it reduces the carrying capacity by one person, but it is argued that on long trips the fitting of this automatic stabilizer permits of dispensing with a reserve pilot which would otherwise be needed. It is, moreover, hoped to reduced the weight to 100 lb. by refinements in design. A company to exploit the invention has been formed in England. The drawings herewith are reproduced from *Engineering*.

THAT a rush for oil leases in the Brazeau Forest reserve, west of Edmonton, Alberta, is being experienced is indicated by the payment of nearly $25,000 in fees to the Aines Branch of the Edmonton office within the first two weeks of December. Land Office officials estimate that nearly 95,000 acres have been filed upon, half of which, under the new regulation, is reserved to the right of the Crown. Chief among the interests which have filed on this property are the Imperial Oil Company and the Oliphant Manson Collieries. It is stated that the Imperial Oil Company will set aside $2,000,000 for development in the Alberta oilfields this year, and that, if results warrant, the appropriation will be increased.

A PROCESS for reducing tungstic acid into tungsten powder and molybdenum sulphide into metallic molybdenum has been worked out by a Norwegian firm. It claims that the final products, which are in the form of small tablets, are of the most superior quality, being completely free from sulphur, carbon, or oxygen. It also says that the price for converting the ores into metal is lower than by any other method known by it. It is at present projecting a plant for the reduction of tungstic acid in Norway.

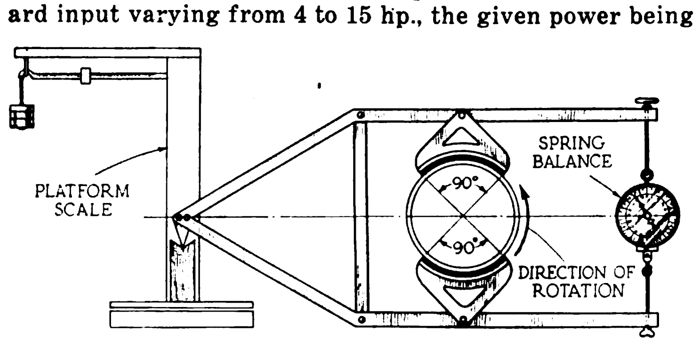
Much Useful Automotive Research in Progress at Bureau of Standards

Work now proceeding includes tests of brake linings made with a view to standardizing an apparatus for this purpose, efficiency and endurance tests of truck axles, study of flame propagation and detonation phenomena, and tests of lubricants intended to determine definitely what physical characteristics render an oil best suited for use in automotive engines.

By Herbert Chase

AUTOMOTIVE organizations which have been sufficiently interested in the research work being undertaken at the Bureau of Standards to urge upon Congress adequate support of this work, should find in the results being attained ample justification for their efforts, even though Congress has not yet voted the funds necessary to continue much of the work now in progress. Quite a large proportion of the latter is being done for other departments or bureaus, but the results are certain to be of general value in most cases.

One line of work which will be of immediate value to automotive manufacturers is that being undertaken for the purpose of standardizing tests and test apparatus calculated to determine the relative merit of various brake-lining materials. This work is being done in co-operation with the Motor Transport Division of the Quartermaster Corps and the S. A. E. Standards Committee. The apparatus used is illustrated in the accompanying cut. It consists of a 2½ x 14-in. brake drum such as is used on Dodge cars, arranged to be driven by any convenient means, such as an ordinary automobile engine. Bearing on the drum are two external shoes to which the samples of lining to be tested are riveted in the conventional way. The shoes are carried by a linkage (as shown in the cut) one end of which forms a brake arm resting on platform scales used to measure the torque applied by tightening the hand wheel, at the other end of the linkage. A spring balance placed between the upper and lower members serves to measure the total pressure exerted on the two brake shoes. It will be seen that the apparatus is simply a prony brake, by means of which the power input to the brake facing is readily measured. The facings are each cut of such length as to cover one quadrant of the drum. Tests have been made at selected constant speeds from 200 to 1000 r.p.m. and with a standard input varying from 4 to 15 hp., the given power being



Apparatus used for tests of brake lining

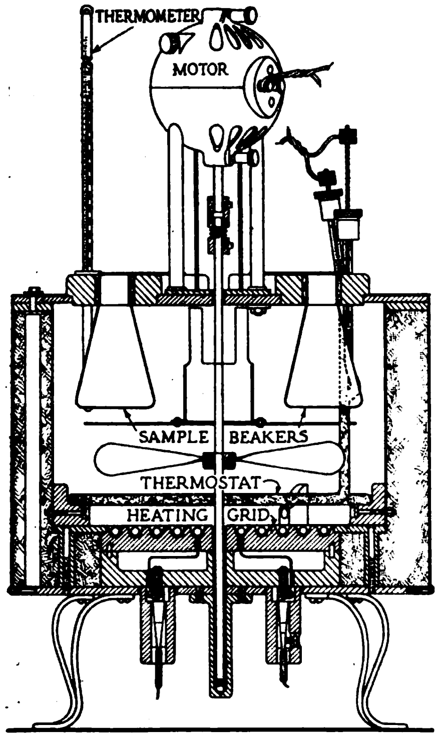
maintained by applying to the brake shoes the necessary pressure by turning the hand wheel.

The linings are run until worn away to one-half their original thickness, the power absorbed and the time required for wear being measured. These tests are being tried with various power inputs and various speeds in order to determine the speed and power which will enable a fair comparison to be made of wearing quality without requiring an undue amount of time for the test. When a sufficient number of tests have been made on the various makes of lining it is proposed to establish a standard test, the application of which will make it possible for users of brake lining to intelligently specify the properties that an acceptable lining must have. At present so many kinds of tests are employed that the lining manufacturers find it impossible to predict in advance what performance can be expected of their product. Some tests have been made, for example, in which the lining was simply allowed to run against a pulley traveling at a given speed, while a weight tied on the end of the lining was used to pull it taut. In this test account was taken only of the time before the sample wore in two, without regard to the power absorbed, with the result that the sample which had a certain amount of material, such as paraffin, which acts as a lubricant impregnated within it showed the best performance, whereas other samples were better suited to perform the function for which brake lining is intended. It should be noted that the apparatus described enables determination of the coefficient of friction as well as of the wearing qualities of the lining.

Axle Tests

Tests for the purpose of determining the efficiency and durability of various types of final drive in truck rear axles are proceeding and should also furnish much data of value to manufacturers and designers. The axles under test include for the present only those types intended for use on army trucks, but the apparatus being used is applicable to test of any axle. The axles undergoing test include the White double reduction type, and the worm gear type used on Class B army trucks, the latter being fitted in various tests with Timken roller bearings, ball thrust bearings, or deep-groove ball bearings, in order to determine which of the three bearing types is best suited for the service in question.

The layout of apparatus is as follows: Power is supplied by an electric dynamometer, running as a motor, on current supplied from an external source. To the



Standardized apparatus for Waters carbonization test

field frame of the dynamometer is rigidly connected a four-speed gearbox such as is used in the Class B truck, the outer end of the transmission being supported in a ball bearing trunnion similar to that used on the field frame of the dynamometer. The driven shaft of the gearbox is attached to the dynamometer shaft, and the driving shaft of the gearbox to the driven shaft of the axle to be tested. The purpose of the gearset is to enable direct drive, or drive through either of three sets of gears with reductions of 1.76, 3.23 or 5.93 to 1, as desired. In every case the torque delivered at the final driving shaft of the transmission is the torque measured on the dynamometer arm, the losses in the transmission being automatically deducted by the expedient of carrying the gearbox on the field frame of the dynamometer. This enables accurate measurement of the power input to the rear axle to be tested, and a wide range of torque output.

In order to enable measurement and absorption of the power output from the axle, the differential is locked and two large prony brakes are applied to the rims of the driving wheels carried by the axle, the rubber tires having been removed and the rims machined to afford a smooth surface for the bands of the prony brakes to bear upon. Each brake carries two bands, one bearing upon each of the dual rim bases. Chattering of the brake, which at first gave some trouble, is prevented by lubrication with graphite grease. Load is applied by tightening nuts on eyebolts attached to each of the bands. The wheel drums are kept cool by evaporation of water fed to their inner surface.

Each prony brake is provided with a long arm extending the entire length of the testing apparatus to a point near that end of the dynamometer shaft furthest from the transmission. The combined torque of the two arms is transferred to and weighed by a system of linkage with counterpoise arranged adjacent to the scale used for measuring the torque output of the dynamometer. By properly proportioning the length of the various arms and weighing the difference in torque it is possible to determine directly and accurately the efficiency of the axle under test. The method employed is identical in principle with that used by Prof. Allen of Worcester Polytechnic Institute.* Efficiency tests are being made with power input varying from 5 to 55 hp. The speed of the electric dynamometer is maintained constant at 1200 r.p.m., this corresponding to the governed speed of the Class B truck engine.

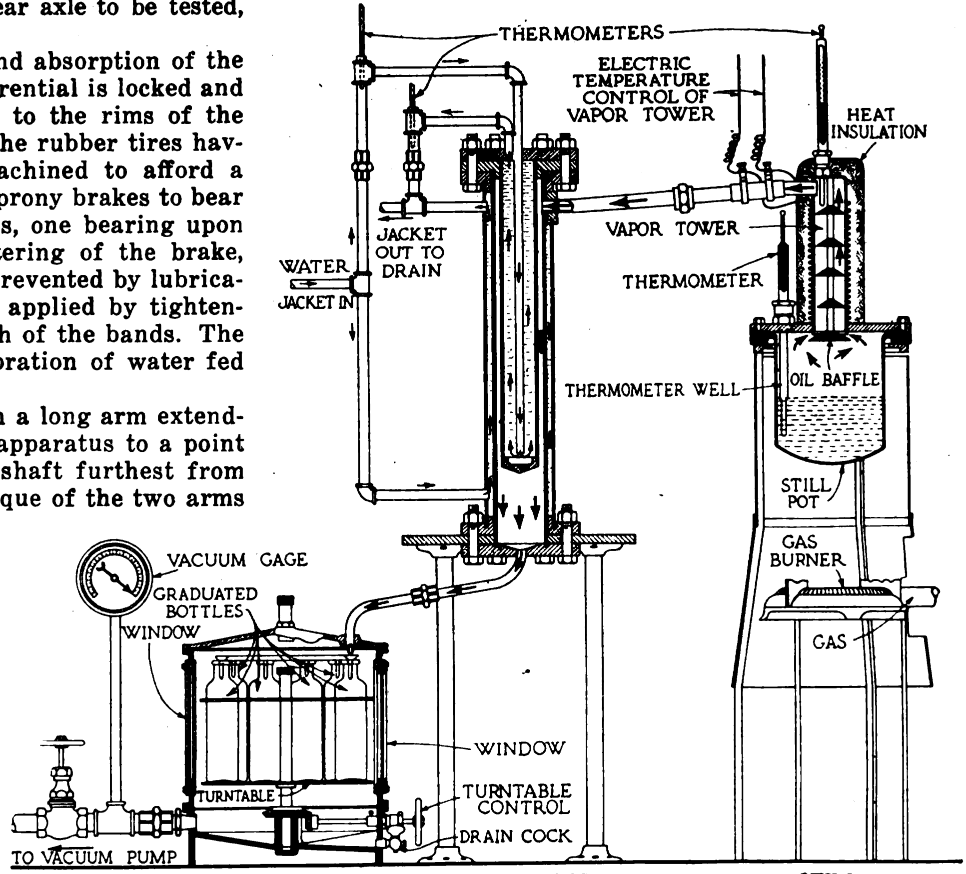
By use of the transmission gears, a wide range of torque is obtained in the same manner that it is obtained in truck operation. The lubricant used in the rear axle is 600 W cylinder stock. The temperature of the lubricant is maintained constant in various tests at 80 deg., 116 deg. and 212 deg. Fahr. respectively by a spray of water on the outside of the axle housing, the temperature being measured at the thrust bearing and in the sump below the worm gear.

Following the efficiency test it is planned to make an endurance test in which the transmission will be set in low gear and the dynamometer adjusted to deliver 55 hp. continuously until breakage of some axle part occurs, thus similating the most severe condition possible in actual service with the Class B truck.

Tests of Lubricants

Tests of lubricants which have been proceeding for many months have been much handicapped by lack of sufficient personnel, but these tests are going forward as rapidly as possible under the conditions prevailing. The program of lubricant tests includes tests of trade oils, standardization of Waters carbonization test, physical properties of lubricating oil when diluted with engine fuel, investigation of tests for greases, investigation of bearing friction, fractionation of finished hydro-carbon lubricants to find original constituents of blended oil, effects of temperature on oil film adhering to a hot plate, engine tests of hydro-carbon oils and absorption of gasoline vapors in hydro-carbon oils:

Among the items which it has proved possible to give most attention to are the following:



Vacuum still for fractionation of lubricating oils

*See AUTOMOTIVE INDUSTRIES for June 13, 1918.

The apparatus developed for the purpose of standardizing the Waters carbonization test is shown in the accompanying cut. It consists of a double compartment cylindrical air bath, the walls of which are made of sheet iron with heat insulating material between them. This apparatus was built around a hot plate having a low heat capacity in order that changes in the temperature of the heating element will be quickly felt in the air bath. Directly above the heating coil is located the bulb of an adjustable mercury thermostat of special design, which serves to keep the temperature of the bath at 250 deg. C. and constant to within ½ deg. C.

The thermostat is not designed to carry the total heating current, but a commercial type relay is interposed in the circuit to interrupt the current passing to the heating element. A closer degree of regulation can be obtained by connecting a variable resistance in series with the heating coil, and allowing the relay to short circuit this resistance upon closing.

The cover of the bath consists of a circular sheet of hard asbestos board and is bored to hold six glass flasks and thermometer. The flasks are held in place by split collars so arranged that no leakage of air around either the flask or the collar can occur.

The air in the bath is stirred by a two-bladed fan, driven by a motor vertically and centrally mounted on the asbestos cover and connected thereto by a shaft and flexible spring coupling. The lower bearing of the shaft is an ordinary single ball thrust type. The air in the bath driven by the fan is forced to circulate around the flasks by baffling, and is returned to the center of the chamber through a cylindrical spider which also serves as a mount for the baffle plate.

In making a determination of the carbonization value, 5 g. samples of the oil to be tested are weighed to the nearest drop in the flasks. The bath is heated to 250 deg. C. and the flasks containing 5 g. samples inserted. The temperature of the bath is then kept constant to within ½ deg. C. for a period of 2½ hours. The technic of operation thereafter is practically the same as described by Dr. C. E. Waters in Bureau of Standards Circular No. 99.

Fractionation of Finished Hydrocarbon Lubricants

In order to find the original constituents of blended oil and determine other qualities by means of distillation, it has been necessary to develop an apparatus for low pressure distillation, since complete distillation, if attempted at atmospheric pressure would require temperature sufficiently high to decompose or crack the lubricant.

This apparatus is similar to that employed in research work conducted for the Tidewater Oil Co. and others by C. W. Stratford, but has been improved in detail. Referring to the diagram:

The vacuum distillation apparatus in use at the Bureau consists of a steel still having a 2½ liter capacity and a still head. The still head is connected with a vertical water jacketed condenser which in turn leads to a receiver holding ten graduated bottles, each having a capacity of 200 c.c. These bottles are arranged on a turntable brought into position without alteration of the pressure in the distillation system. The whole system is connected with a pump capable of maintaining a vacuum of 1.5 mm. absolute pressure. For recording the pressure, a manometer is placed between the pump and the receiver. The temperature of the oil in the still, the vapor temperature and also the temperature of the condenser water are measured by standardized thermometers. Violent boiling or bumping occurs in distillation under reduced pressure. At times this bumping becomes so violent that unless special precautions are taken to prevent it, oil is carried over into the condenser, thus contaminating the distillate. This can be overcome by using conical screens attached to a steel rod suspended in the still head and a steel baffle plate attached to the bottom of the still head.

The still is charged with 2000 c.c. of the oil under examination. Great care is taken to have all connections and joints air tight to prevent oxidation of the oil, due to leakage. The pump is then started and when the manometer indicates the desired pressure, heat is applied. A ring type gas burner is used which is set low so that no fire touches the still bottom, thus preventing localized heating and consequent coking or cracking. When the first drop of distillate comes over, the temperature is read and recorded as the initial boiling point. Thereafter the temperature is recorded for every ten per cent of distillate, and when 200 c.c. of distillate have been collected a new bottle is brought into place. The rate of distillation is easily controlled. The time for a complete distillation varies with different types of oils, the usual time being from 2 to 2½ hours.

The fractionation of finished lubricating oils under vacuum is a satisfactory method for determining the boiling point limits with the least decomposition of the product, provided, however, that the distillation is not carried on after a temperature of 300 deg. C. has been reached in the still. Experiments have been made in which it was attempted to distill oils above 300 deg. C., but it was found that above this temperature cracking occurred; more extensively in some cases than in others. When cracking takes place, the heavier hydrocarbon molecules break up and are altered so that low boiling hydrocarbons are formed. Temperatures above 300 deg. C. are favorable to this reaction.

There are several means of determining whether or not cracking occurs during distillation. When cracking takes place the distillation continues for some time with little or no increase in temperature. Specific gravity, flash point and viscosity measurements would indicate cracking if the suspected fraction showed marked variations with regard to these properties. Cracked distillates have a disagreeable burnt odor.

Gasoline engine tests are being run at the Bureau of Standards to compare the lubricating qualities of paraffin and naphthene base motor oils. These tests are being run with a view to answering the following questions:

1. How long can an oil be used in service?
2. At what rate does lubricating efficiency decrease?
3. What are the causes of decrease in lubricating efficiency?

In connection with these engine tests, the vacuum distillation test will enable a selection to be made of a series of oils from both paraffin and naphthene bases having a known boiling point range. The vacuum distillation test also determines the loss of volatile constituents of motor oils during use in an engine by comparing the volatility of the oil before and after use. The difference in volume of the distillates up to 300 deg. C. is taken as a measure of the loss due to evaporation of the light constituents of the oil during exposure to the high temperatures of the engine. This test also serves to indicate the relative consumption to be expected with various oils.

The distillation of finished lubricating oils under vacuum as described meets all the requirements of a successful routine method for the examination of lubricating oils determining of what groups of hydrocarbons, highly volatile or less volatile, they consist, and permits separation of these portions into graduated fractions. It also shows the quantity and quality of the component light, intermediate and heavy oils used in blending.

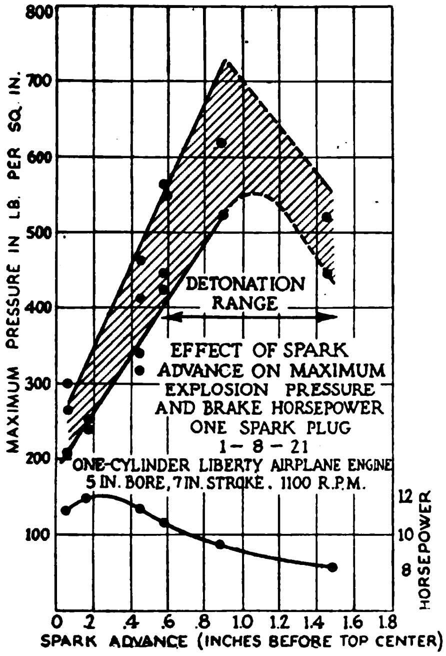


Fig. 1

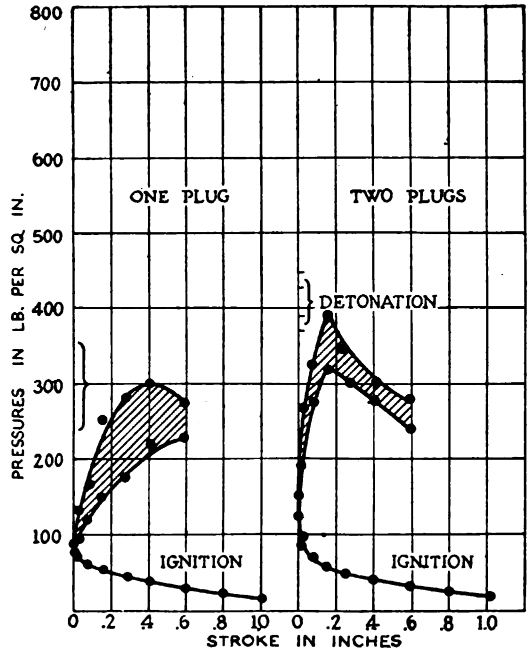

Fig. 2

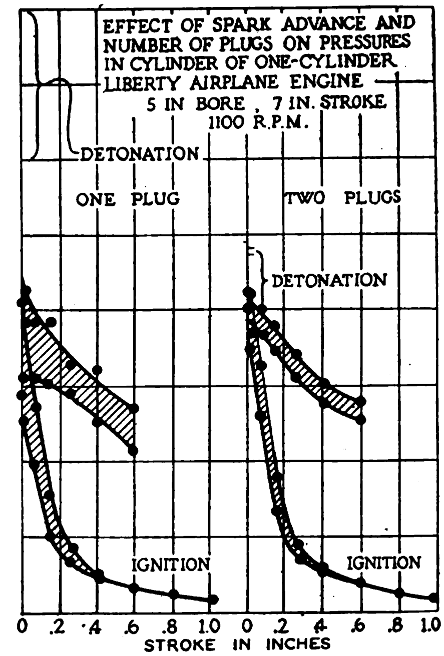

Fig. 3

Curves showing effect of spark advance and number of sparks on maximum pressure, detonation and power output of a single-cylinder Liberty engine

This method is one of the most valuable means of identifying the source of crude from which lubricating oils are derived, as there is a marked difference in the boiling points and the yields of distillate obtained between paraffin and naphthene base oils.

Engine Tests of Hydrocarbon Lubricants

It is the purpose of the Bureau to test numerous different oils on the market before and after use for considerable period in automotive engines. In order to do this engines are run under constant test conditions and change in the character of the lubricant noted by collecting representative samples at various stated intervals during the test. The lack of personnel has prevented completion of many tests of this character, but some work in this direction has been done.

It has been found that the fit of pistons and rings plays a very large part in determining the oil consumption of a given engine. In order to prove this, pistons and rings, with various qualities of fit, have been tried in an engine arranged to measure the oil in the exhaust from the engine when driven by an electric dynamometer. In this way some of the relations between ring fit, piston fit and speed have been determined, but the results obtained to date are too far from complete to draw any general conclusions. In some cases very low oil consumption has been obtained by pinning the rings in order to prevent them turning to such a position as to bring the ring slots into approximately the same plane. When they turn to this position the oil consumption is much higher than when they are pinned to prevent this occurrence.

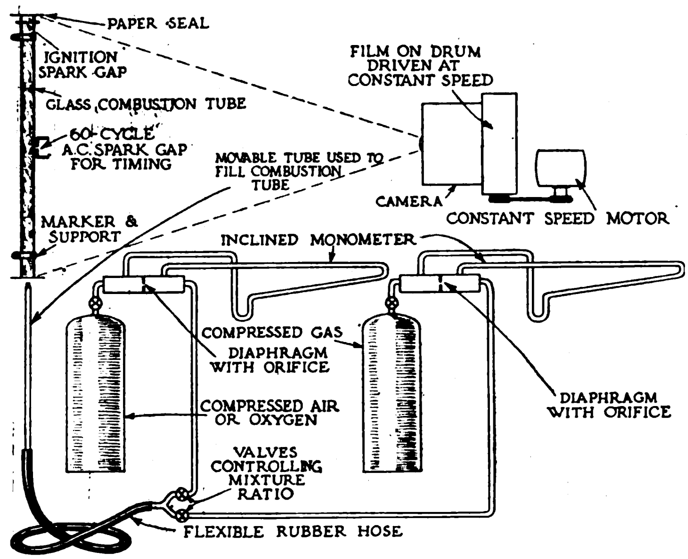
In addition to the tests of lubricants above mentioned, the Bureau is, of course, equipped to make the ordinary flash fire, viscosity, gravity and cold tests, as well as the Waters carbonization tests, the Conradson carbon residue tests and the Herschel demulsibility test to determine rate of separation from water.

Tests of Fuel

Tests of fuel with respect to their utilization in automotive engines are not proceeding rapidly, owing to the lack of appropriation for such tests, but many interesting results have been obtained in spite of this fact. It has been found, for example, in studying the effect of detonation that, with an engine having a 5 to 1 compression ratio, maximum pressures in excess of 1300 lb. per sq. in. are developed when using kerosene for fuel and pressures in excess of 1200 lb. per sq. in. with commercial gasoline. These pressures do not occur with regularity, but are the result of occasional detonations much more violent than others.

Other tests have proven definitely that spark advance is at least to some extent a controlling factor with respect to the occurrence of detonation. The effect of spark advance on maximum pressure is shown clearly in the attached curves. Fig. 1 is plotted from the results of tests on a single cylinder Liberty engine of 5-in. bore and 7-in. stroke. The effect on horsepower output is also to be noted. It will be seen that the maximum power is developed when a spark advance of approximately ¼-in. piston travel is used. An advance beyond this point causes detonation and a falling off in power, but the maximum pressures are not reached until a spark advance of 1 in. is used. Beyond this point the maximum pressure decreases though detonation continues. The range of pressure recorded is marked by the upper and lower curve.

It has sometimes been said that an engine which will knock badly with a single spark will cease knocking when two sparks are applied by plugs in different parts of the cylinder. This is true within certain limits, but from tests made at the Bureau it becomes evident that the determining factor in this respect is in reality what may be termed the effective spark advance. Suppose, for example, that in the case of the engine referred to detonation occurs with a single spark at a point 0.6 in. before center. (Fig. 1.) Using two sparks at this point will in effect advance the spark and cause more violent detonation. If, however, the engine is knocking badly with an advance of 1.4 in. on a single spark, and 2 sparks are applied, knocking will cease, due again to the earlier effective advance. Hence it is clear that the effective advance is the controlling factor and not the mere occurrence of one or two sparks.



Apparatus used in study of flame propagation phenomena

This is further illustrated in Figs. 2 and 3. Under the conditions obtaining in Fig. 2, it will be noted that with one spark detonation does not occur, the range of maximum pressure, from cycle to cycle, varying as shown by the bracket from about 240 to 350 lb. per sq. in., while with two sparks, and the same actual advance, maximum pressures due to detonation, as shown by the bracket, run from about 370 to 450 lb. per sq. in. On the other hand when the spark advance is increased and ignition occurs nearly 1 in. of piston travel before center (see Fig. 3), violent detonations resulting in occasional maximum pressures (as shown again by the bracket) of 600 to 800 lb. occur, whereas, when two sparks fired simultaneously occur at the same advance, the maximum pressures are much less, although detonation is not entirely absent.

Other tests made with varying ratios of air to gas indicate that the detonation is also dependent upon the proportion of fuel in the mixture, under a given spark advance.

With a constant velocity of cooling water through the jacket of a cylinder it has been noticed that a very rapid rise in temperature takes place when detonation occurs, this indicating that considerably more heat is lost to the jacket under this condition.

A quartz window in the cylinder reveals the fact that detonations are accompanied by extremely brilliant flashes of light. It is thought quite probable that carbon particles cracked out of the fuel during the process of combustion are heated to incandescence by the sudden liberation of energy which accompanies the detonation. It seems likely that the radiant heat liberated under these circumstances accounts, in part at least, for the rise in temperature of the jacket walls. It has generally been supposed that the amount of energy released during detonation is small, although the rise in pressure is extremely rapid. The foregoing phenomena indicate, however, that detonations are accompanied by very considerable energy liberation, but that this energy produces only a small equivalent in work, the bulk of it going to increase jacket losses.

It appears that there is still a considerable difference of opinion regarding the cause of detonation and the resultant knock or ping. Some still think that the knock is due to the impact upon the combustion chamber walls of gas molecules in the rapidly moving wave front. In this case it would be expected that the maximum pressure would occur on the combustion chamber wall opposite to that in which the spark plug is located. Tests made at the Bureau indicate, however, that the maximum pressures generated are the same in different parts of the cylinder.

Others attribute detonation to the following phenomena: a charge compressed in the cylinder is fired, say at one point. The combustion of the gas through which the flame travels during the earlier stages of burning results in a rapid rise of pressure and consequently of temperature in the remaining unburnt gas, until finally a temperature high enough to cause auto-ignition throughout the entire mass is attained, this resulting in very sudden release of energy and corresponding temperature and pressure rise. Whether or not either of these theories will stand or one or both of them prove to be incorrect remains to be seen.

Study of Flame Propagation

One of the interesting activities in progress at the Bureau is that in which a study of flame propagation is being made. Two methods are being followed in the prosecution of this work. One of these involves the use of a photographic means for determining the rate of propagation in a glass tube which can be readily filled with a mixture of the desired richness. The proportion of air to combustible gas is determined by allowing streams of each to flow through calibrated orifices. The two are then mixed and introduced into the tube. The mixture can be pre-heated if desired. After the tube is filled with the mixture the ends are sealed by a soap film or very light tissue to prevent diffusion of mixture into the air of the room. The mixture is then ignited by a spark at one end of the tube. The tube is located near one end of a darkened room, and at the other end of the room a camera is set up. The film is mounted on a drum driven at constant speed by a small electric motor. The film is allowed to turn continuously with the shutter opened during the time that the room remains dark. When the gas is ignited and the flame travels through the tube the photograph is taken on the film, the moment of passing of the ignition spark being clearly visible. Alternating current is passed through a second spark gap placed near the tube. The sparks resulting from alternations at known frequency show on the film and enable accurate measurement of the time interval for passage of the flame between markers placed a known distance apart on the tube. To date only fixed gases have been used in these experiments, but tests with vapors of gasoline and other hydrocarbons are to be conducted later.

It appears that it is possible to accurately duplicate, with tubes of given diameter, tests made in this manner, but that the results vary considerably with change in diameter of the tube. For this and other reasons another method of measuring the rate of flame propagation is being employed. This consists of photographic means for measuring the angle of the flame contour in a jet of combustible mixture issuing from a tube at known speed. Knowing the mixture speed and the angle it is possible to determine accurately the rate of propagation.

The process of combustion is evidently gravely affected by temperature and pressure of the explosive gases as well as by their composition and mixture ratio. The presence of inert gases and the size and shape of the container have also their effect. The difficulty has been to determine with certainty the individual effect of these factors; for, in the engine cylinder they are massed together and are constantly changing. The same gaseous mixture, for instance, under one condition, may give an

apparent rate of flame propagation of ten meters per second. Under another set of conditions, it may show a rate of sixty meters per second; or, it may detonate and travel at a rate of 2400 meters per second. The conditioning factors seem to be chiefly those of pressure and temperature. The methods of study of these phenomena have been carried out, for the most part, in spherical bombs and the results analyzed from imperfect pressure records. The movement of the flame in glass tubes has also been observed and accurately measured; in both of these cases, however, there is a mass movement of the charge masking the true flame velocity. In the case of the tubes, a profound cooling effect is present, and the pressures and consequently temperatures are not continuously determinable with the changing rate.

The direction of the investigation of this subject at the Bureau of Standards has therefore been to seek the effect of these factors on the rate of combustion. The flame angle method referred to has been chosen for following these reactions at constant pressure. It seems to meet all the ideals of this condition as completely as the spherical bomb does those of constant volume. It has the further advantage of being wholly visible and of allowing the apparent flame velocity to be corrected for the mass movement of the charge, together with a high accuracy of temperature determination. There is also being developed a method of determining the effect of temperature (preheating) upon the rate of combustion at constant pressure, and for varying pressure at constant initial temperature. For adiabatic conditions, velocities and pressures are simultaneously recorded.

Tests, the purpose of which was to measure the impact effect of gas molecules traveling at high velocity in a flame front, have been made in the following manner: A metal tube of known weight about 30 in. long is suspended in a horizontal position from the ceiling by two fine wires, thus forming a ballistic pendulum. The tube is filled with the combustible mixture and lightly sealed with a soap film at the open end. A spark, igniting the mixture near the open end, causes the flame to travel toward the closed end and react thereon. This causes the tube to swing backward as a result of the gas impact. The energy of the impact can then be determined by carefully noting the distance the tube moves.

Tests of Aviation Engines

Exhaustive tests of a 180 hp. Hispano-Suiza aviation engine are being made for the National Advisory Committee for Aeronautics for the purpose of determining accurately the effect of varying compression pressures and mixture ratios upon power output at atmospheric pressures corresponding to different altitudes from ground level to 25,000 ft., in steps of 5000 to 10,000 ft. The speeds used are 1,400, 1,600 and 1,800 r.p.m. At each altitude five different mixture ratios are employed, the spark adjustment in each case being that necessary to give maximum power. Tests are also made at ½, ¾ and full load. Friction hp. is also determined and the actual compression pressure at 1,600 r.p.m. on all cylinders is measured. When completed this test, which is conducted in the laboratory especially designed for the purpose, will be the most complete of its kind ever conducted. It should prove of great value to designers of aviation and other types of automotive engines.

Tests of Ignition Apparatus

Work is now proceeding for the purpose of determining mathematical expressions for the electrical characteristics involved in the design of magnetos.

Certain tests recently made on spark plugs indicate that the voltage necessary to break down a spark gap is lower when the electrodes are hot than when they are cold, this condition being independent of the temperature of the gas between the electrodes.

Much other work along automotive lines is in progress, but most of this is being done for various branches of the service and it is not permissible at the present time to describe the work or outline the results being obtained. Ultimately, however, it is expected that these particulars will be made available for publication.

A Drop Forged Steel Wheel

A NEW type of wheel has made its appearance on the market—the drop forged steel wheel. As compared with wood wheels, the forged steel wheel has the advantage that it consists of only a single piece and therefore has no joints to come apart. Being made of wrought steel, it is practically unbreakable. Even the brake drum is made in one piece with the wheel and where it fits to the spokes the joints are nicely rounded so as to prevent the accumulation of mud and dust at these points. All trouble due to the shrinkage of wood is eliminated, and if the wheel is made true in the first place it should remain true.

It is always difficult to make a comparison of the weights of wheels of different kinds, as the comparison should be made between wheels of exactly equal strength, and as the strength of wheels in different planes is not always proportional, this is difficult to do. It is stated by the manufacturer that the wheel in question is practically as light as the standard wood wheel and of much greater strength. The wheels are said to be easy to clean. Soft mud will stick to the concave side of the spoke, but when it has dried it will be thrown off by centrifugal force, it is claimed.

The drop forged steel wheel should prove particularly popular in arid sections where wood wheels give trouble, owing to shrinkage. The wheel is designed to carry the standard demountable rim and it is not necessary to carry a spare wheel on the car. It is manufactured by The Jefferson Forge Products Co. and at present seems to be made chiefly for replacement on several makes of small, popular-priced cars.

The Jefferson drop forged steel wheel

Utilization of Special Machines in Cylinder Block Production

One of the distinguishing factors of the cylinder block production described in this article is the use of specially simple jigs, while an effective location system permits positive alignment of all faces and finish surfaces. The various machining operations are discussed in detail.

By J. Edward Schipper

THE manufacture of the Paige cylinder blocks is distinguished by the use of very simple jigs and by an extremely simple system of location which permits positive alignment of all faces and finish surfaces, and renders unnecessary complicated means of determining location.

The cylinder block is for the Paige little six, which is manufactured in the Paige Motor Car Co. plant. Normal production on this model runs 100 per day, and the shop is tuned up on a 9 hr. basis, which gives a production through the machinery of nine pieces per hour. The operations are so arranged and the machinery has been selected in such a way that no particular machine runs ahead of the rest of the shop. Thus all piling up of parts is avoided and the floor kept absolutely free from accumulation of parts around any one machine. This idea is carried further than in most plants, as instead of cylinder blocks entering a finished stock department, or at least accumulating beyond requirement, they are passed immediately to the engine assembly line. In other words, there is no definite hiatus between manufacture and assembly on these blocks. The floor is so laid out that the final manufacturing operation on different parts takes place adjacent to the point at which they are required for the assembly line.

The raw castings for this cylinder block average 240 lb. apiece, and the finished casting 200 lb. Thus, about 40 lb. of metal are cut from each block during the various processes of manufacture, or 4000 lb. of metal per day in the cylinder block machining department. As the operations are followed through this article, it will be noticed that no deep cuts are taken at any particular point along the line. The rough casting is very closely approximate to the finished casting in its exterior and machining dimensions.

The cylinder block is checked over in a rough inspection jig before any operations are performed. This jig has stops between the No. 3 and 4 cylinders and the top and bottom. The amount of metal required endwise is checked by the stop between the third and fourth cylinder, and the depth of these castings is checked by the top and bottom stops, which indicates that there is sufficient metal for all of the machining operations made.

The first machining operation is located in exactly the same manner as the casting check on the rough inspection jig. In other words, the stops on the jig for the first operation are duplicates of the stops on the rough inspection jig. The machine is an Ingersoll reciprocating miller which mills the valve side of the casting. This machine has three cutters and is capable of handling nine blocks per hour. All faces on the valve side are finish milled in this operation.

The second machining operation is on an Ingersoll of the long table type, capable of carrying five blocks at a time. There are double rows of cutters in this machine, giving first, a rough, and second, a finish cut on the three faces of the block not milled by the first machine. Location for this work is from the top and bottom flanges. This machine leaves the block with all four sides finish milled.

After the milling operation, the next operation is to drill two dowel holes from which every subsequent machining operation is located. In drilling these dowel holes on a Cincinnati-Bickford radial, the block is located from the milled faces and from a V-block between the third and fourth cylinders. Besides the dowel holes, which are ½ in. in diameter, the main feed holes for the oil line and the oil pump holes are drilled and reamed on this machine.

A special Ingersoll miller with a traveling cutter takes care of the next operation, which is milling both ends of the block. On one end, the cutter is designed to rise and fall. It is timed so that as the table feeds, the cutter travels over the surfaced portions of the rear face in what is, roughly speaking, a three-sided figure. The cutter rises, milling one face, then remains stationary while the table travels, milling the top face, and then descends, milling the third face. The table for this machine takes two cylinder blocks at a time and the machine makes the finish cut. Location is from the dowel pin holes.

Three Foote-Burt cylinder boring machines give the cylinders a rough, semi-finish and finish bore respectively. After the final bore, 0.020 in. is left in for reaming. On the finish bore, the limit is 0.0005 in. Location for this operation is from the dowel pins only. The cylinders are then left in their finish bored condition to go through the remaining operations, the final surface being put on the cylinder walls later, as will be described subsequently.

Two American radial drills take care of the next operation, which is drilling the fan stud holes and the Hubbard plug holes, as well as the cylinder drain holes. In this same operation, the intake passage in the top of the cylinder is drilled out and also the stud holes for the carbureter.

As an economy measure, a preliminary water test is given the cylinder block at this point. This is done on a jig which seals all of the water holes and allows the application of a 60-lb. hydraulic pressure. Only relatively few operations have been taken up to this point and leaks can be detected at a time when it is not expensive to salvage the block. This is only a preliminary water test, of course, as a later test is necessary after other cuts have been made.

Milwaukee millers are used for milling the water pump

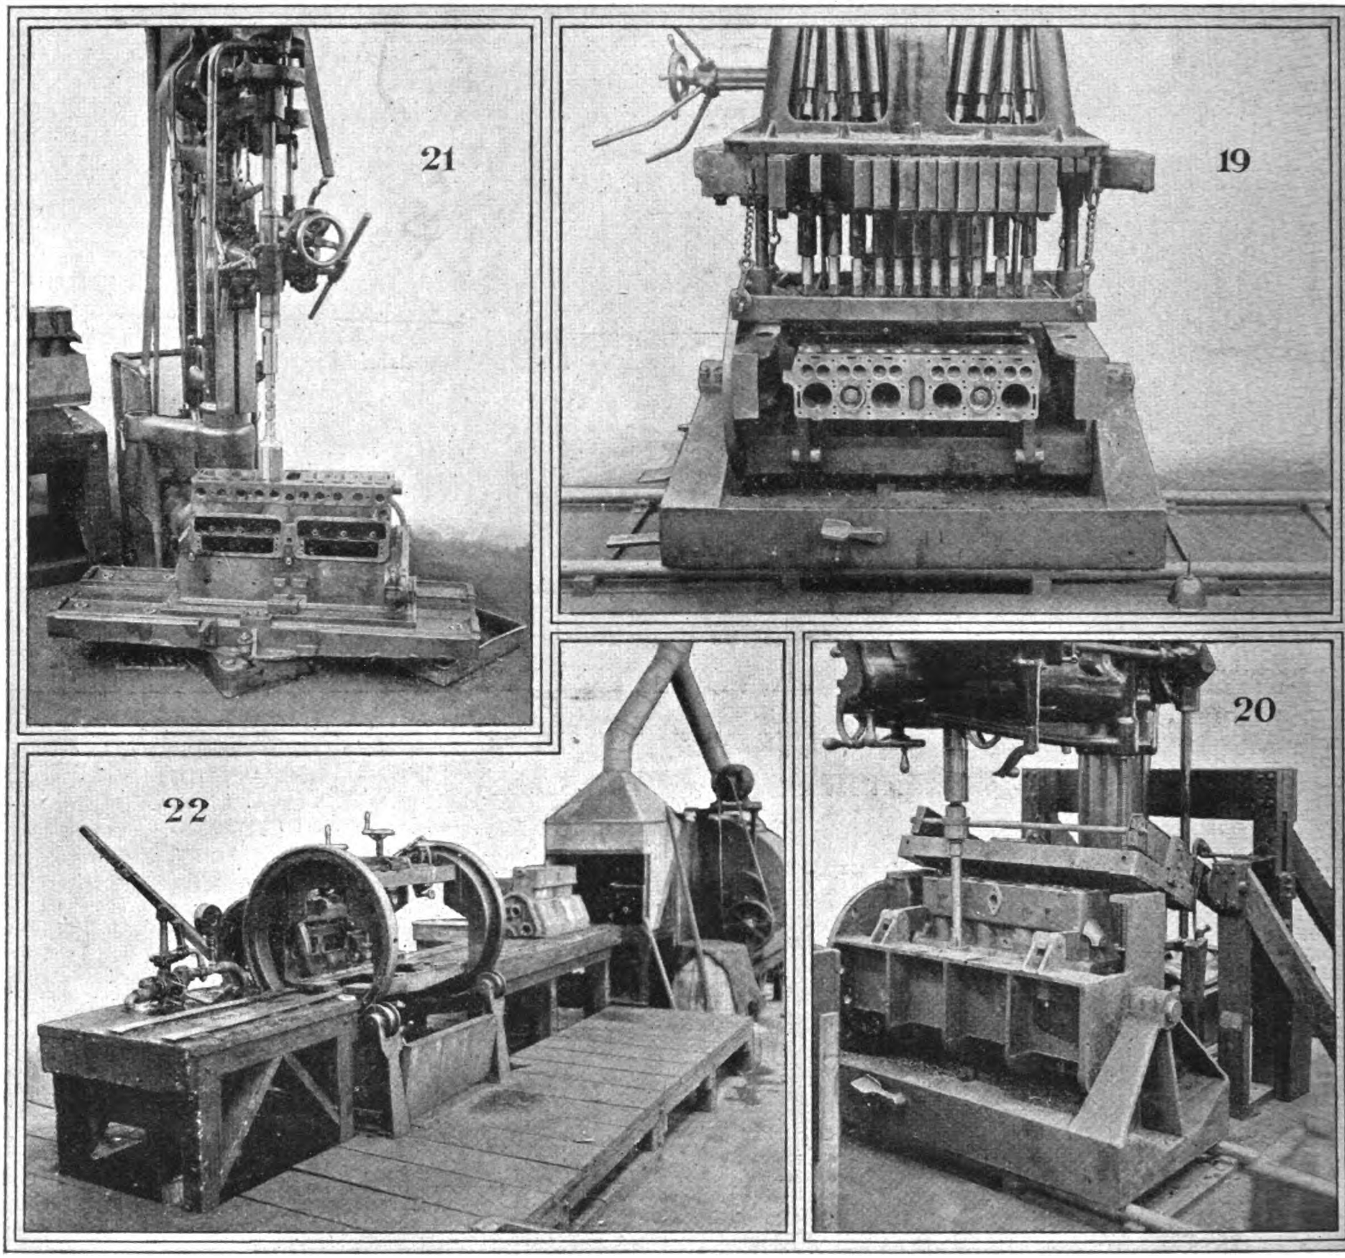
The jig is then thrown over on the shaft A, assisted by the counter-weight B, and the second series of spindles at C brought into operation.* (15) *American sensitive drill press used for tapping some of the holes in the previous operations, employing the turnover jig.* (16) *Barnes power-feed drill press which drills, reams and spot faces the distributor holes. Similar machines are used for spot facing the valve seat and for milling the clearance in the timing gear case.* (17) *Barnes power-feed machine spot facing the top of the valve seat.* (18) *First of a series of five machines operating on one jig carried along on roller tracks. This is a Baush thirty-six spindles*



(19) Baush thirty-three-spindle, the second in the line of five machines taking care of the intake ports, water inlet holes, etc. (20) American radial drill press indexed for the breather holes 2 deg. and 20 min. off the vertical. (21) Cylinder bore lapping machine. This is a special carborundum stone machine with spring-out pieces to put the finish surface on the cylinder bore. (22) Washing the cylinder blocks in a Blakeslee washer. This is the last operation before the block goes to final inspection from which it is passed on to assembly

pads (this being a finish cut located from the dowels) and for straddle milling the main bearings and the oil thrower grooves. A battery of three Foote-Burt multiple spindle drills is required for the valves and valve guide holes. The first of these three machines, all of which are exactly alike, is for the valve holes and valve guide holes for six of the cylinders. There are twelve spindles for this operation, taking care of six alternately faced valves. It is impossible to machine all twelve holes at the same time because the tools cannot be brought close enough together, therefore two machines are required. The block is shifted to the second machine, which also has twelve spindles for the six valves. The third machine, however, reams all of these holes at once. A very noteworthy jig is used for these operations. It is an indexing type which comes forward for the six valve holes and moves back for the six guide holes on each of the first two machines. On the third machine, the same type of jig is used except that all of the holes are taken care of on the one machine.

Nothing has been mentioned regarding location of the last few operations, but as indicated, these are all from the dowel holes cut for this purpose. This same applies to the series of operations which are done on a jig which travels along a track in front of four machines, performing the next series of operations. These four operations are all drilling and the jig rolls from one to another on a track before them. The first drill is a Baush multiple spindle drill with forty-seven spindles which take care of practically all holes in the bottom of the block. This is followed by a Hammond radial which taps all of the holes necessary, after which the block is rolled through a Barnes sliding head drill press which chamfers the bottom of the cylinder bore. The last operation in this train is performed on a Hammond radial which screws in the main bearing cap studs and fastens these caps in place.

After the main bearings are in place, the block is passed to a Moline boring machine which rough bores the main bearings, the camshaft bearings and water pump support

holes. There are three cutter bars on this machine which operate horizontally. After the rough boring operation, a finish cut is taken immediately after by a built-up compound tool; that is, the bar which holds the cutter is equipped with gun locks which hold both the rough and finish cutters which follow each other through the bearing.

One of the most interesting jigs in the entire manufacturing scheme is used in the next series of operations. This is a turn-over, indexing jig fitted with counterweights so as to permit ready handling of the block. There are five of these jigs which permits of one being loaded, passed along through the five operations which are in the series, and then being unloaded ready for the next block. These jigs, of course, follow each other through in rapid succession, the entire series of operations being timed so as to meet the nine per hour schedule. The first machine in this series of five is a Baush multiple spindle. The spindles are divided into two parts, the left half taking care of the drilling on the rear end of the block and the right half on the front end of the block. The turn-over jig allows the block to be swung over, first on the rear end, so that these holes can be drilled, and then to the front end, so that the other set of holes can be drilled on this same machine. The loaded jig is then passed along on its roller carrier to the next machine, which is an American radial. This taps some of the holes which were drilled on the previous operations. These include the flywheel housing cap screw holes, timing gear cover holes, etc. On this same machine, the main bearing groove for the oil thrower rings is chamfered also.

The loaded jig is then hauled along to the third machine in the series, which is an American sensitive radial. This drills and taps the water pump body bracket holes and drills the packing holes for the rear main bearing. The fourth machine in the series is a Barnes power-feed drill press, which drills, reams and spot faces the distributor holes. The fifth machine is also a Barnes power feed drill, which spot faces the top of the valve seat, this machine being tilted to take care of the angle of inclination of the valve. The sixth machine is similar to the fifth, being a Barnes power feed type which mills the clearance for the timing gears in the timing gear case. This is merely a precautionary operation, as on a great many of the cylinder block castings this machine does not have to take a cut as there is already sufficient clearance for the gears. On all of these operations, in all holes that the depth is fixed, the drilling is held to a positive stop.

Another traveling jig of the indexing type takes care of the next series of operations, the track along which the jig rolls passing before five machines. The first of these is a Baush multiple spindle drill with thirty-six spindles. On this multiple the jig rolls back and forth so that it is first rolled out for twenty-four stud holes and then moved back in against a rear stop for twelve water holes. The rolling is done on a track on the table of the machine. On this operation, locating is done primarily from the dowel pins and checked by plugs in Nos. 1 and 6 cylinder bores.

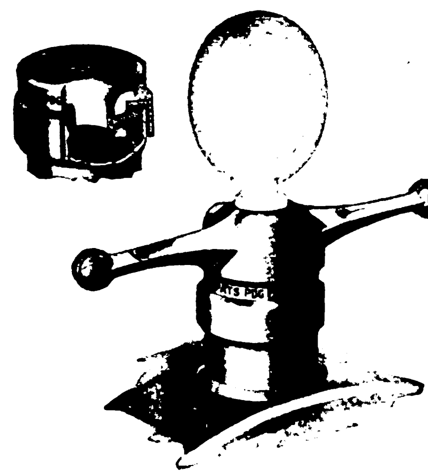
The second machine in this line is exactly the same as the first, being a Baush multiple spindle drilling thirty-three holes at once. These include the exhaust and intake ports, water inlet holes, manifold stud holes, stud holes for the valve cover plate, tappet bracket cap screw holes, generator cap screw holes and camshaft bearing set screw holes. The third machine in the series is an American radial drill in which the throttle control cross-shaft hole is drilled and six stud holes for the valve cover spot faced. The breather hole is drilled and tapped. These operations are located from the casting by a V-block.

The block is then passed to a Hammond radial drill, which taps and spot faces the distributor setscrew holes. It also drills four dowel pin holes for the tappet bracket and drills and reams two dowel pin holes for the generator bracket. Another Hammond radial takes care of the final operations in this series, which are to chamfer and tap the cylinder stud holes, exhaust manifold stud holes, generator bracket and tappet bracket stud holes, the cover plate stud holes and the setscrew holes for the camshaft bearing.

The cylinder blocks are now through the main machining operations and are ready for the final surfacing. This is done on a Barnes power feed drill with a lapping cutter specially designed by the Paige company. This lapper is really an oil stone proposition with the segments of oil stone set into a plug which fits the cylinder bore. The lapper takes care of any size cylinder, so that the same tool may be used for oversize cylinders. This is accomplished by setting the carborundum segments on springs with about 15 lb. tension. These springs hold the stone segments in contact with the cylinder walls and a few revolutions is sufficient to lap the cylinder to size. It is merely a finishing operation for the bore.

The remaining operations are minor in character, consisting of air drilling a diagonal oil hole, pressing by means of a Metal-wood hydraulic press all of the valve guides, making a final water test at 60 lb. pressure, washing the block in a Blakeslee washer and then passing it along for final inspection. Final inspection is done by special inspection gages in the usual way, a very interesting gage used on this work being the Walker micro gage, which measures the cylinder bores for taper as well as out-of-round. It is a dial instrument which affords an exceptionally ready means for checking the accuracy of the cylinder barrel.

Locking Radiator Cap



A locking radiator cap to prevent theft of motometer

AS an outcome of frequent thefts of motometers and radiator caps, the Zinke Company is putting on the market a new Protex-A-Cap that is locked in place by an eight tumbler lock with over one thousand key changes and no master key, precluding the possibility of professional thieves being provided with one or a set of keys to fit. The action of the lock forces a hardened steel bolt into a slot in the adapter ring, which is secured to the radiator neck by three cup point set screws, seated from inside the ring. These screws are forced tightly into the inside of the neck by means of an "L" wrench furnished with the cap. The adapter fits all radiators with screw caps except a few with caps of abnormal size. It is claimed by the makers that the Protex-A-Cap is one of the most attractive radiator trimmings.

Helping Workers to Be Proud of Their Skill

A customer made a complaint. Two workmen were called in to discuss it with him. They felt their employer had confidence in their knowledge, and learned as well some of the troubles of the management. This article traces the development of a labor policy and a plant "personality."

By Norman G. Shidle

MANUFACTURING firms in many ways resemble individuals as to characteristics, habits of thought and mode of action. Most of us are creatures of habit to a large extent, the difference between those who are successful and those who are unsuccessful being somewhat a matter of good habits and bad habits. Being sober with some men is simply a habit; being drunk is a habit with others (or was until Jan. 16, 1920, since when it has been an evidence of one kind of intelligence). Some men are habitually pleasant, others habitually gruff or grouchy. Whatever our habits are, they cast about us a certain atmosphere—which is usually called personality. And that atmosphere, though intangible, admittedly plays an important part in determining our progress or success in life.

So with manufacturing plants does the atmosphere or personality affect definitely the quality and quantity of the work done. The personality of the chief executive may determine this atmosphere to a large extent, but the traditions of the firm itself—how and why and for what purpose it grew—always make a marked impression. Especially is this true in regard to human relationships within the factory. Sometimes an opportunity given to workers to express pride in and knowledge of their work helps materially.

The basis for much industrial unrest is that the human and personal touch of the small shop has been lost in the growth of many modern plants. Not only have some plants lost that touch, but many, especially in a young industry which grew rapidly like the automotive industry, have never had it to lose.

A factory starting to manufacture automobiles to-day cannot, for the sake of human relationships or any other reason, afford to start in like the craftsmen of old with one or two skilled workers and a few apprentices. It is often necessary to start on a comparatively large scale. Nevertheless, tradition and habit of the plant begin to grow with the first day's production. Usually the growth is unconscious. Perhaps better results would be obtained if actions were sometimes regarded as being parts of tradition and an effort were made to build that tradition accordingly. It is perfectly possible, though more difficult, to build good habits and good tradition when starting manufacture on a comparatively large scale. It is possible because it involves no other fundamental factors than when starting on a small scale; it is more difficult because these factors are all infinitely larger and more complex.

To examine human relationships in an individual plant from this point of view, however, an example of the growth of a firm from the old to the new times is of value as illustrating the principles involved and suggesting lines of thought for application on the problems of plants whose difficulties differ to some extent. Such an example was described recently in AUTOMOTIVE INDUSTRIES, in telling the story of industrial relationships at the Brewster factory.

A somewhat similar story is recorded in the interesting development at the Rubber & Celluloid Products Company. This company began many years ago to make hard rubber covered harness and coach hardware. The process consists of covering the metal, on door handles, for instance, with a hard rubber coat, which will not chip off and which presents a good appearance while removing the necessity for constant polishing.

The process requires very careful workmanship and consists entirely of hand work. When the business first started, a few men were trained in the work. They were skilled craftsmen and were proud of their knowledge of a trade in which few of their fellows were capable of working.

Shop discipline in the old days was lax; it would probably be branded as utterly inefficient to-day, but this very inefficiency had its part in building up the tradition which has stood the company in such good stead during recent years. The story is told that it was even necessary on more than one occasion for the boss to run over to the neighboring public house and get Bill and John back to work on an order that had just come in.

But Bill and John always came and worked with a will for they were justly proud of their skill, were always fairly treated in the matter of wages, and felt themselves to be very definitely a part of the company for which they were working.

Because the work is so specialized and because it requires personal skill on the part of the worker, it has been necessary to train all the new workers who come to work in this establishment. Consequently, practically every man now working here learned his trade and gained his working knowledge within the plant.

These old workmen, some of whom have been there for fifty years, brought their sons in to work as they grew up, following the usual custom of the old days. As a result, the spirit of good fellowship and co-operation throughout the shop has been preserved intact through all these years. All the foremen were trained in the shop, and consequently take pride and pleasure in instructing and teaching the newcomers.

The labor turnover is very low, despite the fact that hiring is still done by the various foremen. The success of this policy, however, can probably be attributed

to the fact that the foremen understand thoroughly the ideals, policies and requirements of the company—in fact, they themselves create and carry on those ideals to a large extent. For this reason their success in hiring the right men for the right jobs cannot really be taken as a general argument in favor of this method.

Among other desirable labor results that have been achieved is a sound and intelligent attitude among the men on the wage question. Wages were advanced during the war by the management voluntarily to meet the rise in the cost of living. They were not changed violently and rapidly back and forth as was common in many places. The men were satisfied because the tradition behind them taught that fair play had always been a characteristic of wage adjustments there. Tradition gave them no cause for suspicion. This fact should be recognized as important.

In analyzing the factors of interest and importance in the success of this labor development the following stand out:

1. A healthy and favorable tradition, built up from the inception of the company—a tradition built upon fair-play and honesty in every industrial relationship.
2. Steady employment. The working force at this company had not been cut at the time this article was written, some seven months after the beginning of the present business depression, nor during previous periods of a similar nature. The men here know that their job is good as long as they do conscientious work. In depression periods it is often necessary to shift skilled workers from one kind of task to another, but the men understand the conditions and are glad to do their part in alleviating them.
3. Interesting work. The work is of such a nature that skill must be exercised in every operation. The finished product bears the stamp of personal skill on every piece, and the interest of the workman in making the product perfect is accordingly enhanced. Moreover, his interest is constantly kept alive; it is not dulled and blunted by monotonous work.
4. The men know and are made to feel that they are important, individually and collectively, in the business.

An interesting incident occurred in this plant recently which illustrates strikingly the last point mentioned. A shipment of door handles had been covered according to specifications which required working to extremely close dimensions. When the handles were received by the customer and inspected, very slight variations from the desired proportions were noted in inspection—variations not visible to the eye, but apparent when measured with accurate instruments. A complaint was made about the discrepancies.

The company explained to the customer the nature of the process, the difficulty of working in rubber to thousandths of an inch and the necessity of doing the entire process by hand. The customer was not quite satisfied yet and finally sent a representative to the factory.

The company executive, instead of explaining the matter to the customer himself, called in two or three skilled workmen from the shop. He explained the difficulty to the workmen and asked that they explain to the customer just how the process was done, what the difficulties were and what were the entire facts of the case. This was done and the customer satisfied.

The significant feature of the incident, however, is that this executive showed by his action more clearly than he could have done in any other way, the confidence felt by the company in these workmen and the importance which he attached to their intelligence and skill. The incident is unimportant in itself, but it brings to light a policy and an idea of great significance.

A plant with a good personality is likely to have not only harmonious industrial relationships, but an exceptional vigor and interest in production among its employees. A bad personality or "atmosphere" can be as harmful in the case of a manufacturing plant as in the case of a salesman.

Engineers and Commercial Training

SOME interesting suggestions to young engineers were made in the course of a lecture before the (British) Institution of Electrical Engineers by Llewellyn B. Atkinson. Mr. Atkinson said that although a commercial engineer generally obtained more compensation than a purely scientific engineer, he did not think that the latter had much cause for complaint, as he was engaged upon work which gave great mental and intellectual pleasure. He nevertheless urged engineering students to study the principles of business, finance and economics. Some thirty years ago, the speaker said, methods of organization, both inside works and on outside contracting jobs, were in a very crude and chaotic state, and little information was available relative to the cost of doing work or the output of tools and plant. In these days, however, costs were accurately ascertained and checked by a special staff, and young engineers should on no account neglect that side of their profession.

The training which engineers received, Mr. Atkinson said, should lead to accuracy in thought and expression, but there were little lazy habits of thought and expression which often spoiled otherwise useful work. Language was made to express ideas and thought. The English language was not so full of fine shades of meaning as the French, but it nevertheless offered a great choice of words suited to express kindred ideas. The taking of trouble in thinking out and framing expressions was rather out of fashion, but that made it easier to acquire distinction. When writing letters or reports, young engineers ought to read them over several times in order to be sure that each phrase had only one meaning. It was a good plan to consider oneself as being the receiver of the report or letter and as knowing nothing about the matter. Care came with age and experience. He remembered reading in his father's diary in which he wrote of his engineering work: "It is a pity X. is so careless; we had to re-level a whole section of the railway again, owing to his inaccuracy." Such carelessness might easily have lost X. his advancement at some critical moment, but, as a matter of fact, he became a celebrated engineer and a president of one of the engineering institutions.

As far as possible young engineers should make the acquaintance in proper ways of men of ability and position in their own and allied professions. Such men were usually anxious to help young engineers in their profession, especially if they knew that they were working seriously at the problems of science and industry. One of the greatest powers to be cultivated was an unfailing good temper in times of difficulties and annoyance. A good temper not only saved nerve strain and exhaustion to oneself, but it also helped others to accomplish difficult tasks. Few men realized the power that lay in a smile. It was also good to take part in the social amenities of one's work and the activities of professional societies. The latter afforded a means of bringing young engineers into touch with men they might not otherwise meet.

286 Tractors Average 30.8 Full Days Work a Year

Detailed account of farm owned machines by Federal investigators indicates that in actual operation, the farm power plants are not coming up to the advance announcements of what a tractor should do.

DURING October and November, 1920, representatives of the U. S. Department of Agriculture visited 286 tractor owners in Ohio, Indiana and Illinois. A complete record of all the work done during the year both with tractors and horses was obtained from each farmer. Information from which the cost of using the tractor and the cost of maintaining the workstock could be determined was also obtained.

The investigation was made through the co-operative efforts of the Bureau of Animal Industry, Office of Farm Management and Farm Economics and the Bureau of Public Roads, in accordance with plans outlined at the Farm Power Conference at Chicago, in October, 1919. The object was to obtain information in addition to that already available in the Department of Agriculture and the various State Colleges of Agriculture, which would aid in determining advantageous forms of power for different farms and different conditions.

The average size of the farms visited was 258 acres. This is considerably above the average size of all farms in these States. The following tractor equipment was found on the farms:

- 1-plow tractor on 1 farm;
- 2-plow tractors on 174 farms;
- 3-plow tractors on 104 farms;
- 4-plow tractors on 6 farms;
- 5-plow tractor on 1 farm.

Two-plow machines were found on 75 per cent of the farms with less than 160 crop acres, and on 53 per cent of those with 160 or more crop acres.

One hundred and six of the tractors had been in use 1 year, 100 had been in use 1½ or 2 years, 49 had been in use 2½ or 3 years, and 31 had been in use more than 3 years.

On the average the tractors were used for 30.8 full days during the year covered by the investigation. Twenty-three and five-tenths days of this was drawbar work on the home farm, 2.7 days was belt work, and 4.6 days was custom work. Seventy-three of the 286 tractors did less than 20 days work during the year and 26 did 50 or more days' work.

The number of workstock still owned varied from 2 head on 11 of the farms to more than 15 on 5 of the large farms. On the average there were 6.8 head per farm at the time of the survey, and their value was $145 per head. In all there were 1878 head of workstock on the 286 farms and 111 colts less than 1 year of age.

Farm Horse Works One Day in Five

The average number of full days work per year per horse, for all farms was 68.6. On 20 of the farms the workstock did less than 40 full days' work and on 27 they did 100 or more days' work per year.

The tractors did 85 per cent of the plowing on these farms, 73 per cent of the disking, 43 per cent of the harrowing, planking, rolling and packing, 41 per cent of the grain cutting and about 15 per cent of the loading and hauling of hay.

Of 267 men who did spring plowing, 142 did it all with tractors, 121 used both tractors and horses and 4 used horses only.

Of 225 who did fall plowing, 190 did it all with tractors, 27 used both tractors and horses and 8 used horses only.

Of 284 men who did disking, all but 15 used tractors for at least a part of it. One hundred and thirty men used their tractors for cutting grain and 37 for drawing the hay loader. A smaller number used their tractors for any other drawbar operation.

In all, the power for 30 per cent of the drawbar work on these farms, as measured by days of horse labor required for it, was furnished by tractors and the remainder by horses.

The average cost per head of keeping workstock on these farms for the year ending Nov. 1, 1920, was $159, and the average cost per farm was $1,076.

This cost includes charges for feed, at the average price for the year, chores at 25 cents per hour, shoeing, veterinary, harness, interest at 6 per cent and depreciation. A manure credit of $15 per head was allowed.

Feed and Depreciation

Exclusive of grass and stalk pasture, the average ration per horse consisted of 1.3 tons of hay, 1.2 tons of straw, .2 acre of stover, 37.8 bushels of corn and 22.3 bushels of oats. The total cost of feed per head was $134. Based on present prices (March, 1921) the cost of feed per head would be about $80.

The average cost per day of horse labor for the year of the survey was $2.43. Based on present prices the cost on these farms would be not far from $1.50 per day.

The average first cost of the 2-plow tractors was $972, of the 3-plow tractors $1,354, and of all tractors $1,140. The average amount spent for equipment, mostly plows and disks, for use with tractors was about $340. The average value of the horse-drawn implements disposed of after the purchase of the tractors was $12.

The average life of these tractors, as estimated by their owners, is 6.7 years. The annual depreciation of the 2-plow tractors amounted to $164, and of the 3-plow, $217. The annual cost of repairs, including the value of the owner's time spent in repairing the tractors, was $39 for both the 2-plow and 3-plow sizes. The tractors had been out of commission when needed, an average of about 2 days during the year. A little over 50 per cent had not been out of commission at all when needed, and about one in seven had been out of commission five days or more.

The fuel consumption per day for the 2-plow tractors varied from about 18 gallons for fall plowing to about 11

gallons for drawing the hay loader. For the 3-plow tractors it varied from 23 gallons for plowing to 15 gallons for drawing the hay loader. The 2-plow tractors covered 6.6 acres per day in plowing and the 3-plow machines, 8.6 acres. The amount of fuel required per acre by the two sizes was practically the same, 2.8 gallons for the 2-plow and 2.7 gallons for the 3-plow tractors.

Little Difference in Plowing Costs

The average cost per acre of power for the plowing done with 2-plow tractors was about $2 and with the 3-plow about $2.20. The cost of power for the plowing done with horses on these farms was about $2.90 per acre. Based on the present costs of keeping workstock, the cost of power for plowing with horses would be about $1.90 per acre. For most of the other operations the cost of power when furnished by horses was slightly less than when furnished by tractors. The cost per acre of power for disking with tractors was 67c., with horses, 64c.; for cutting grain with tractors, 67c.; with horses, 59c. These figures represent the cost of power only and do not include either the cost of man labor, or that of the implements used.

The average cost per day of 2-plow tractors for drawbar work on the home farm was about $12.65 and of 3-plow tractors about $17.75.

The total cost of power furnished by the tractors for drawbar work at home during the year averaged $341. This drawbar work on the home farm constituted 76 per cent of the total work done by the tractors, and only 76 per cent of the total annual charge for depreciation, repairs and interest on investment, is included in it. No charges for taxes, insurance or shelter are included in the costs for either the tractors or workstock.

Nine of these men had started farming with tractors and the remainder had increased the size of their farms by an average of about 20 acres since the tractors were purchased. There had been no change in size of 172 of the farms, 81 had been increased in size and 24 had been decreased. It is probable, however, that in most cases the tractor was not primarily responsible for the change in size of the farm.

Keeping the Horses

On the 172 farms where there had been no change in acreage the number of workstock had been reduced by 2.2 head, an average reduction of 26 per cent. Forty-four of these 172 men had not reduced the number of workstock, 62 had disposed of 1 or 2 head, 43 had disposed of 3 or 4 head and 23 of more than 4 head. On these 172 farms one horse had been kept for each 28 acres (total acres, not crop acres) before purchase of tractors, and at the time of the survey there was one horse for each 37.7 acres. For all the farms there had been an average of one horse for each 27.6 acres before purchase of tractors, and there was one for each 37.9 acres at the time of the investigation.

On the farms where there had been no change in acreage there had been one horse for each 21.5 crop acres before the purchase of tractors, and there was one for each 29 crop acres at the time of the investigations.

With the tractors doing the bulk of the work of plowing and fitting the ground, the cultivation of corn is the operation which requires the greatest amount of horse labor in the shortest time on most of these farms. However, on only 105 of the 286 farms were all the workstock used for cultivation, and on only 38 of the remainder were they all used for any other one operation. On just half of the farms all the workstock were not used for any one operation.

There were great variations on individual farms in the cost of power furnished by both horses and tractors; and by more careful management many farmers could doubtless reduce this cost. Repair costs and fuel consumption of the tractors could in many cases have been reduced by more careful operation. The cost of keeping workstock could have been reduced on many farms by more careful feeding practices. The facts that on 20 of the farms the workstock did less than 40 days of work per head during the year, and that on half of the farms they were not all used for any single operation, indicate that on some farms there are still more workstock than needed for the system of farming being practiced.

Comparative Cost

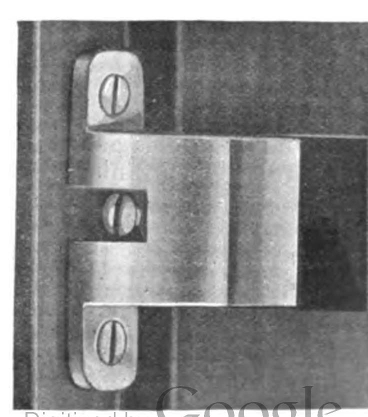
The average annual cost of power for the drawbar work on the home farm which was done with tractors was equal to the cost of keeping 2.1 head of workstock and this is practically the average number displaced per farm. On the basis of present prices, however, the cost of keeping workstock has declined considerably more than the cost of operating tractors.

Since, during the year covered by the investigation, the cost of power on the average farm was no greater than if it had all been furnished by horses, any saving in man labor costs, any gain due to getting a larger amount of work done in a given time and any other advantages connected with the use of tractors which can not be measured directly in dollars and cents might be considered clear profit. It is doubtful, however, if such gains were great enough to balance the cost of operating the tractors on many of the farms where there was no change in acreage and where no workstock were displaced.

An Adjustable Striking Plate

AN adjustable striking plate designed to replace the old non-adjustable plate or catch on automobile doors is manufactured by Franklin Williams, Inc. The old-style catch is made with one or two non-adjustable steps and must be fitted very carefully to the jamb of the door, so that when the door is closed it is held firmly against the rubber bumpers. Any wear of the rubber bumpers, lock bolt or catch permits the door to vibrate or rattle.

The Franzen adjustable striking plate can be fitted after it is in position on the jamb. Any wear which has a tendency to loosen the door and cause it to rattle can be compensated for by means of an accessible adjusting screw. By turning the screw to the left the second movable step of the striking plate is moved in. This adjustment again brings the door when closed into intimate contact with the bumper.



The Franzen adjustable striking plate

Closer Observation in 1921 British Tractor Trials

New regulations provide for the gathering of additional data in tests and require more detail as to the competing machines. Promise that Judge's decision will be promptly published upon conclusion of tests.

By M. W. Bourdon

THE rules and regulations relating to the 1921 British tractor trials embody a number of new features which will have the effect of enabling closer observation to be made of the competing machines and enable the Judge's Report to provide more information for prospective buyers than in previous years. The tightening up of the conditions of the trials should also assist competitors and other tractor manufacturers to make useful comparisons between the performances recorded and those of which their own machines are or should be capable.

The most important addition to the regulations is one which specifies that each tractor throughout the whole of the six hours' continuous plowing test which will occur during one of the allotted days shall have a dynamometer permanently in series with the drawbar, so that a continuous record of work done can be obtained to form the basis of the subsequent report. The dynamometers will be supplied by the organizing body, the Society of Motor Manufacturers and Traders, who will not, as last year, be acting in co-operation with the Royal Agricultural Society.

For Draining Machines

In order to facilitate the measurement of fuel and water used in the plowing, all the competing machines must be fitted with drain cocks not less than 3/8-in. diameter clear bore, and each cock must be provided with a nipple to accommodate a 1/2-in. rubber tubing. It is also specified in this connection that the drain cock must be placed in such a position that the whole of the fuel or water may be drained off without tilting the machine.

Whilst competitors will be allowed to enter two identical machines, but not more, only one machine of each make and type will be under close observation in order that its fuel and water consumption, feed, and width and depth of plowing acreage and negative work at headlands may be recorded. The regulations do not specify whether the trials officials will select the specific machine, or whether competitors will be allowed to indicate which one should have its work recorded in detail.

A modification in the rule relating to fuels states that while the organizing society will provide one grade each of gasoline, benzole and kerosene—the class of fuel to be selected by the entrant at the time of entry—an entrant desirous of running on special fuels may do so, providing the machine be entered accordingly and that the entrant finds his own fuel and sufficient surplus to enable analysis and tests of it to be made.

Among the additional items to be recorded in the report are the best horse-power developed at the declared engine speed, results of tests of winding gear (if fitted), the time required for preparing the machine for plowing, including the fitting and removal of spuds, driving bands, etc., the minimum width of headland required for turning when plowing, and the maximum drawbar effort obtained with the makers' standard spuds or strakes, but without wheel extensions.

A separate report, which will be issued by the Organizers' engineer, will consider the following points in regard to the work done by plows, cultivators and other implements entered independently of tractors: ease of turning; clearance between plow bodies; clearance beneath plow bodies when plow is fitted; range of adjustment to hitch and adjustability to various types of tractors; weight; drawbar pull required per square inch of furrow section, and adjustment for different width and depths of plowing, pitch of body and width of breast.

In order to enable more reliable comparisons to be made between the work done by various machines, tests will be made to ascertain the land resistance in different plots by means of a special plow and dynamometer, while an endeavor will also be made to ascertain the resistance of lands in various fields at varying depths.

Complaints have been made in previous years that, as the trials extended over three or four days, certain tractors were not to be seen at work by the visitors on every day of the trials. To overcome this the organizers will endeavor to keep every tractor at work throughout the whole four days, although they make no guarantee.

As to the Tractor

Besides the points already mentioned to be recorded in the report are the following: weight of tractor; weight per square inch of wheel area bearing on the ground, allowing a sinkage of 1 in.; number of attendants required for plowing; units of work performed during the observed six hours' continuous plowing test; fuel cost per acre per unit of work; water consumption per acre and per unit of work, and price of machine with standard equipment.

The trials this year will have a fresh scene of operations, a point near Shrewsbury instead of near Lincoln. The actual plowing will commence on Tuesday, Sept. 20, though preliminary tests will take place on the preceding Saturday and Monday; Saturday, Sept. 24, will be reserved for final inspection.

Unlike last year, no prizes or monetary awards are offered, the advantage to be derived by competitors whose machines operate successfully lying in the publication of the official report, which will, it is promised, on this occasion be issued within a fortnight of the conclusion of the trials. If this promise can be carried out it will be a considerable improvement, for the Report of 1919 trials required some six months to issue from the press, while the report of last year's trials has not yet appeared.

An Importer's Experiences with Exported American Cars

Much has been printed about automotive export practices and remedies that must be applied, but here we print the effect of bad practice on the man at the other end of the line. How many similar tragedies could be written, due to failure of the manufacturer to follow a definite policy?

By Clyde Jennings

WHAT follows here are the strange experiences of an importer of American cars. It is only fair to say that this man had gained an excellent standing in his own country as an importer long before the comment here was written. It was a fortune of business that circumstances over which he had no control deprived him of the car he had been selling and left him with considerable money, more credit and wide experience to enter the market with another car. He has since been endeavoring to find the proper car for his market.

The experiences here were not written for publication. They are taken from letters to a personal friend in America, with the consent of both parties to the correspondence. For obvious reasons reference to individual firms are omitted.

SOON after this experienced importer began his search for a suitable car he saw the announcement in an American business paper of a car that appeared to meet his needs. He sailed for America and, on arrival in New York, wired and wrote to the factory. He received no reply. It was a long journey to the factory, so he went elsewhere. He found a manufacturer who said he wanted export trade and had a satisfactory car. The importer then returned home.

Imagine his surprise, three months later, when he received a mimeographed letter with his name and address written in ink that differed from that of the body of the letter from the factory he had first communicated with. This letter follows:

> "Kindly pardon our seeming neglect on account of not answering your correspondence, telegrams, etc., more promptly. We have been reorganizing our company here and we are now all ready to do business in foreign countries and have cars to make deliveries. We are painting our cars now ——— and are going to put on the market the classiest —— cylinder manufactured in its class. If you are ready to do business with us and can take cars, we are all set to go.
>
> "We wish to sell our cars f. o. b. ———, and if we make any changes, such as right-hand drive and magneto on the car, we will have to ask an advanced deposit before making any deal whatsoever.
>
> "If interested, we are now ready to take the matter up promptly and your correspondence will have immediate attention."

WE have said that this experienced importer found a manufacturer who said he wanted export trade and was making a suitable car. He returned to his home in fine spirits and prepared to begin an active campaign for the sale of this car at the beginning of 1920. For several months his letters were hopeful, but late in the summer he wrote a letter which contains a review of his situation to that date. In subsequent letters he traces his experiences through to a more or less disastrous finish. Comment on these letters is superfluous. They tell the story:

Sept. 24, 1920

WE started off at the beginning of the year with a tremendous amount of enthusiasm, but our prospects were diminished by the fact that even our first demonstration car did not reach us until June, and finally the first batch of cars for delivery reached us August 13. The situation at that time can be shown by the fact that of the **thirty provisional orders for sample cars that we had for dealers, we were only able to get six of them converted into money, the trade view being that the year was dead and gone,** and it would be hopeless for them to interest themselves in a new car, when, in view of the bad trade situation, they had to fight hard to liquidate their existing contracts.

So there we are to-day, working like Trojans to sell one car here and one car there—a job which would have been delightfully simple if ——— had fulfilled his promise which he made so firmly in person, viz., that he fully realized the importance of early delivery for the export trade. There is no doubt but that we could have had many cars delivered during the spring season of this year. Of course, every factory has its troubles and it is difficult to apportion the blame. All we know is that if the cars had arrived when they were promised we would have had a fine business by now, whereby, on the other hand, we have a load on us which is very hard to carry, and are right at the tail of the procession instead of being well up in the middle, where we expected to be by now.

Equally, too, the non-arrival of any cars and the gradual wasting away of our prospects disgusted the people who were backing me financially, and they have turned their attention to other matters. ——— is astonished at this, but I am afraid in a country like this, where capital

is short and everyone is hard put to it, it is quite unreasonable to ask financial men to sit down with money waiting in the hope of what they style a mythical car turning up some day.

Our attitude is that ——— should take a personal interest in this business until we get started. I have put all my energies and all my money into this business, and have not handled any other vehicle at all (except a few ——— which have just arrived and which were equally such a doubtful starter that we did not include them in our plans), and so it has not been for want of effort that the ——— has not had a good start, **but simply the unfortunate fact of the delivery of the cars to us now, at a time when no one will buy at all.**

American products are not in too great favor. Every importer is full of bitterness with regard to the incomplete condition and bad finish in which the products are shipped overseas, and so, if the American industry is as keen for export business as is commonly alleged, there was never a more important time than now for the American industry to take a collectively and individually strong personal interest in keeping the job going.

Nov. 11, 1920

THE ——— Company has seemed to fail to get a grasp of conditions here. They do not seem to realize the length of time that any new car requires in this conservative market before it can gain popular support. It seems that they expected our public to turn their backs immediately on the Sunbeams and Rolls-Royce and other well-known cars long sold here. Actually the trouble is that there are so many American cars over here that the public will take a long time before they can distinguish between the ——— car, which is obviously good, and all the other nondescript productions which have the advantage over us, in that they have been selling for a year or more and are frequently to be seen on the road.

Obviously it is a case for the American manufacturer to decide whether he believes sufficiently in the future of this market to give whatever measure of temporary support is needed to tide over present conditions. In our own small company we have worked real hard for the past year, we have drawn no salary, we have put all our money into the job and we have marked the cars down to a competitive price level in order to get them established—a price, indeed, which shows us no profit under present circumstances. It is not a case of our having put the price too high that the cars are not selling. We believe that if we can continue in business for another few months we could turn the corner and then go ahead, but we cannot raise any capital here on an American proposition, and we maintain that ———, if he is interested in the export business, should be willing to invest whatever sum is necessary to get this English business established. He would certainly have his full share of profits when they are made, but we tell him strongly that he should meantime take a share of the load.

We maintain what you say in your letter, that ——— is a real fine fellow, but it is impossible to disregard the fact that we would be in a far better position to-day if ——— last November, when he knew that we or somebody else was going to handle his cars in this market, had got some of his staff on the immediate job of getting the right-hand drawings through and getting the necessary parts made, instead of which they were only just starting their experimental work when I visited the factory at the end of January; the sample cars did not leave there until March, and the first batch of regular cars got here in the latter half of August, which meant that this year's business was over before even we got our first cars. On that point I think ——— slipped up.

No doubt the demand for home business was such that the demand at this end became of lesser importance, but that undoubtedly has been our biggest handicap. At the beginning of the year we had the fullest trade support, in the middle of the year the enthusiasm had tapered down, but we were able to get a certain number of provisional orders even on catalogues without seeing a sample car, but when the end of August came dealers' stocks were piled up and they all had to plead that the delay in delivery had spoiled their chance of business. Frankly, I am quite puzzled by the present situation; the factory sales department imagines that we are sitting down at the club drinking tea all day, but it is hardly necessary to remind you that a young and enthusiastic outfit like ourselves, who started in business and put the whole of our personal capital into the job and our reputations as well, we are not going to let the job slip for want of personal energy.

Nov. 25, 1920

WE know that the business has been disappointing to ———, but in addition to being disappointing to us, it has cost us all our capital as well, and it seems now as if his short-sighted action in withholding further advertising support may ruin our plans altogether.

Dec. 1, 1920

OUR situation is as follows: We have had a thin time of it during the past year; we have had many dealers keenly interested and accumulated quite a lot of orders by the middle of summer. As there were no deliveries, these gradually faded away, and when the cars reached us in September, when the year was over, the slump was on, and all our efforts and expenditure of many thousands of pounds only moved half a dozen cars, which was six more than some of the importers moved in the same time. We finally came to the conclusion from undeniable evidence that it was hopeless to attempt to sell at a price which would give to us a reasonable profit.

Unfortunately, just when the clouds are beginning to roll away, ——— has cast us adrift, so to speak, and has withdrawn the advertising and financial assistance which he definitely promised when the writer was at the factory at the beginning of September and on which we banked, because it is quite impossible at the present time to get any financial support for an American car proposition such as ours.

——— has been paid in full for all the cars he has shipped. We, on the other hand, have got all our available capital locked up by the bank which financed the imports, and it seems to us that it is very short-sighted for him to step back now and throw us to the wolves, when we have got the thing just starting to go, and when all that he has promised to do is to reinvest a portion of the money which he has already received from this side in full payment for his cars.

It is no use your manufacturers going into the export business unless they fully understand:

(a) That the export business involves a considerable lot of trouble;

(b) The markets are much more conservative and patience is required, and

(c) When you have got a good dealer, stick to him for a few years.

You cannot change on short notice. For example, in the present instance I am quite sure that ——— does not appreciate that if he lets us go bust on his proposition he will be right out of this market for a long time. The car would have too bad a reputation as a losing proposition for anyone else to take it up.

Cars are not shipped in good condition, and it is very rarely that we get a car of any make but has to be revarnished and the black parts repainted. We unboxed some ——— the other day. (We have not concluded any arrangements with the company—their demands for a contract were excessive and so we are letting the matter simmer until they see daylight.) And, after all their boasted twenty years' experience in export, we find that each car had three separate places where the cross-members of the boxes rubbed up against the panel and not only wore the paint right through, but nearly wore the panel through as well, and so we had a repainting for each of these cars, costing us $120 per car. Also, on two cars the steering gear was so tight that it had to be taken down and the bushings reamed out, showing that the alleged factory test is purely an invention of the publicity manager.

To cut a long story short, the $10 per car which the factory (when basing selling prices here) reckons that we ought to allow to cover the cost of painting up, etc., has been over $170 average on each car, so you can see what a mess this makes of selling prices which have been worked out on a fine limit.

——— shipped us some coupés. When we complained of the paintwork, they put their hands on their hearts and swore to heaven that they had never had a complaint from anybody in all the years they had been doing business. Actually their own representative was with us when some of the cars were unboxed, and he himself was able to pull off the paint a square foot at a time by the simple process of peeling it from the rusty surface underneath. **If the representative had not been here, what a job we would have had to get back the $185 per car which it cost us to repaint and fit up!** The moral is, of course, that if the paint will not stand the sea air, ship them in the gray and make the importer a reasonable allowance, so that the vehicles can be painted over here. As we stand to-day, it is usually a denial of the facts and then an allowance of probably 10 per cent of what it costs to put the job right.

> **I am bound to give my own opinion, as one who has had past experience of dealing direct with the factory and later of dealing with export agencies and branches, that the man in the foreign field derives no advantage whatever from dealing with an export house, but has rather the contrary, since he now has a barrier which prevents free communication with the factory and also the expenses of the export corporation have naturally to be charged to the product and thus become a factor in lessening sales.**

The alleged close connection between the export corporation and the foreign field and the service which it can give to the dealer abroad is more or less a fallacy, and I firmly believe that those factories who establish direct connections with dealers abroad are doing the right thing.

THERE is one other bit of comment in these letters that does not exactly belong in the story that is unfolded above. It is a general observation that is well worth while reading by any exporter of American vehicles, coming as it does from a man who has devoted a number of years of an active and successful business life to the problem. It is quoted below:

> The export trade is going to need a lot more specialization, much more careful handling and some entirely new treatment along the lines of credit. If your people want to have their full share of export business they have got to get away from this cash against document at the factory or at New York. It means that we importers have the whole of our credit locked up for months at New York waiting for shipment, and it is impossible for the business to expand in the way it should.
>
> Take my own case as an example. I have had a large credit established at New York now for eight weeks to take care of cars which were due for shipment; the cars have not materialized and, therefore, the credit is not yet used, but as long as the credit is established at New York it is no longer available here, and so other work that might have been done here **with the same credit has** been standing by. In other words, this means that that portion of my business has been dead for two months.
>
> If, on the other hand, cars were shipped (of course, only to approved persons with all the necessary safeguards) on the 60 days' sight draft or any other form of credit which might be agreed, I could be going on here full speed with the other necessary developments and would have ample time, once I knew that the cars had been shipped, to take care of the payment for the shipment when they arrived.

Certainly there is much in these communications that is worthy of careful reading by American automotive manufacturers who are engaged in or are contemplating the entry into foreign trade. The trader who is wise profits by the experiences of others wherever possible. Certain fundamental mistakes are pointed out here that will make it entirely wasteful for other manufacturers to repeat them.

What British Experience Indicates

No economic difficulty in England to-day can be separated from the political program of the British Labor Party. Such a development in this country is very undesirable. But it will not be stopped by fighting it; it can be stopped by making it unnecessary.

By Harry Tipper

A GOOD many years ago, sufficiently long ago for the exact number of years to be unimportant, I was engaged in factory work in the North of England. At that time the trade unionists of the district had just decided to secure their own representative in Parliament and had agreed to pay their candidate his expenses and salary while representing them in Parliamentary Council.

A meeting was called to listen to the man who had been chosen by the trade union officials as the most likely representative. This meeting occurred in the town in which I was located, and as it was a public meeting, I found myself sufficiently interested in the matter to attend.

The hall which was chosen for the meeting was capable of seating five thousand people and it was filled, largely by members of the various unions. The man who had been chosen was a Mr. George Hodges, who became a member of the coalition cabinet during the war, and after he was through with his main speech he was very thoroughly questioned from the floor.

Two things impressed me very definitely about the meeting. First, the intense interest displayed by the audience in the political questions brought up, or rather in the political aspect of the economic questions brought up, and secondly, the keen and practical character of the questions. It seemed to me that these men knew what they wanted, very definitely, and they were prepared to pursue their objects in a practical way with vigilance and with care.

I recognized the fact that meetings of a similar character were occurring in a good many parts of Great Britain and that a definite program, so keenly approached, must develop a large force, influencing the actions of the nation. Since that time it has been interesting to watch the way in which every advantage has been seized upon to secure a little more of the program so definitely begun when the labor unions entered into politics with their own representatives. It was interesting to see the political program itself enlarged in its conception as the power of the labor party defined itself.

The present strike of the coal miners is a case in point. For a long time the nationalization of coal mines has been an important part of the program of the labor party in Great Britain. It is probable that the difficulties imposed by the old land laws and their effect upon the mining towns and villages have had more influence upon the program than the economic differences between employers and employees. The nationalization of mines is not a new desire nor a new platform with the labor party. Every advantage has been seized upon to further this program. In the early part of the war the Government was supported by the labor groups in its program of taking over the control of the mining industry. In the latter part of the war the conclusions arrived at by Sankey Commission were used by the labor party to bring the nationalization of coal mines again to the fore. The strike which occurred since the end of the war, while ostensibly a matter of wages, was in reality another attempt to press the nationalization of mines and bring it more definitely into the foreground.

The present strike is based upon the action of the Government in returning the coal industry to the private owners without giving consideration to the conclusions arrived at by the Sankey Commission and without attempting to confer with the labor party upon the program it constantly advocated.

At the same time the labor party is preparing for the general election, which cannot be avoided much longer. At that time it is likely to put forward a more definite outline of its reconstruction program in the hope of securing the balance of power in the next Parliament.

The condition as exhibited in the present character of the political struggle in Great Britain emphasizes the danger in the complete separation of the workers from the other classes or groups within the population and their cohesion as a separate body in the political groupings within the nation itself. Under such conditions every economic struggle is likely to become a political struggle and every political question is likely to be used to further the economic ends of the party. Instead of being organized more definitely for co-operation, co-operation is made well nigh impossible by the sharp division between the groups and the insistence upon a program of development suitable only to the aspirations of the larger group.

The strong definition of labor aims by the complete trade union organization in Great Britain, coupled with the strong power in the political councils of the country, have gradually developed the allegiance of the individual worker to his union and his party so that it almost overshadows his allegiance to his country.

It is to be observed that the adoption of the Whitley plan of adjustment, the government committees for the settlement of these problems and the willingness of the cabinet to spend time and effort in adjusting economic difficulties have not lessened the number of strikes in Great Britain, nor have they diminished the serious character of the difficulty.

Manufacturers have fought labor unions in Great Britain many times in the past with great severity and they have discarded the elements of co-operation which might have established unity within the individual industrial organization at one time. In this country we should very carefully note the ef-

fect produced by a complete warfare between the wage earners and the owners in developing a more complete state of organization and bringing the questions to a more acute crisis each time difficulties occur.

Our best efforts should be given over to the development of methods of understanding and co-operation within the individual factory so that the trade union would become unnecessary in the individual case.

The completely organized and consolidated organizations in Great Britain, developed on the basis of warfare to seize all the advantages which may be secured, bring the country into the constant danger of anarchy and confusion in the attempt to settle the economic problems by the political action of the labor party.

Under present conditions no economic difficulty in that country can be separated from the political program. The labor organizations are using economic interruptions to force political consideration just as they are using political power to secure economical advantage. Such a growth of organization would be a bad thing for the United States. It will not be stopped by fighting it, but it can be stopped by making it unnecessary.

If confidence and trust in the individual factory is improved by fair dealing and a reasonable measure of discussion and agreement, the program of unionization will become unnecessary to the individual worker and the growth of this cumbersome machinery of development will be prevented from reaching dangerous proportions.

In Great Britain it will require, probably, the advent of the labor party into political power to remove the chaotic condition existing at present and the experiment of a labor government may prove to be almost as expensive to progress as the continuance of the present difficulty.

Causes of Roadside Breakdowns

OUR modern cars have attained such a high degree of reliability that the average automobile owner starting on a trip seldom thinks of the possibility of a breakdown, necessitating a tow to the garage, and it is comparatively rare nowadays that one meets a car stopped at the roadside unable to proceed. Breakdowns, however, do occur, and the necessity of having to be towed home still occasionally confronts the motorist.

In Great Britain the Royal Automobile Club, with a view of being of greater service to its members, has inaugurated a "get you home" scheme whereby it assists stranded motorists to get their cars to the garage and repairs made. It is possible that in Great Britain, where cars were not used much during the war period and where, consequently, a great many machines of early model are still in use, the danger of breakdowns on a tour is a greater bugaboo than it is here. At any rate, it is never pleasant to be compelled to have repairs made in some shop far from home, because of the inclination of repairmen to take advantage of the chance customer in trouble.

In connection with this service the Automobile Club has been keeping account of the troubles causing the breakdowns and has recently issued an analysis of same, which is of considerable interest. In this report the term breakdown refers to a case of mechanical trouble which could not be repaired on the road with the tools ordinarily carried on the car but necessitated the removal of the car to a repairshop.

The breakdowns are classed under seven heads as follows: Power unit, transmission, front axle and steering, road wheels, suspension and brakes, electric lighting failures and accidents. It will be seen from the list that the term transmission includes both the change speed gear and the rear axle. There will probably be no surprise that the first two items together accounted for 77.5 per cent of all the breakdowns. In the great majority of cases when a car is incapacitated, either the motor will not furnish any power or else the power cannot be delivered to the driving wheels. The power unit alone was the cause of 39.6 per cent of the breakdowns, of which ignition failures constituted 13.4 per cent. With one exception this is the highest percentage due to any particular cause. Ignition trouble was very frequent in the earlier cars when the old, crude battery systems of ignition were used. Their frequency dropped a great deal when the high tension magneto with its simplified wiring system and substantial connections became the standard method of ignition, and in view of the fact that British passenger cars almost without exception are fitted with high tension magnetos, the percentage seems abnormally high, especially in view of the high state of technical efficiency which the British magneto industry claims to have attained. The explanation has been offered that the incompetence and feeling of helplessness of the average owner in electrical matters often causes him to give up even though the trouble is of a minor character.

The largest percentage of trouble due to any one cause was due to rear axle shaft breakage—13.9 per cent. It was found that in a great many instances the wheels were loose on the driving shafts, and the play thus created, of course, resulted in the breakage. A further explanation is that it is customary to allow an unusually low factor of safety in the axle shafts, because a slight increase in the shaft diameter means a relatively large increase in the weight of the rear axle. Having a factor of safety of not much over 2 under full load conditions, it does not require greatly abnormal conditions to cause the shafts to snap.

Lubrication failures accounted for 7.5 per cent of the troubles, and undoubtedly the majority were due to neglect of the operator. An equal percentage of breakdowns were due to the universal joints and propeller shafts. These, too, may be largely due to neglect, because the universal joints are mostly rather accessible and their supply of lubricant is not renewed as often as it should be.

Of the remaining cases, the front axle and steering gear were responsible for 5.1 per cent, and road wheels, suspension and brakes for 7.8 per cent. Stoppages at night due to lighting failures accounted for 9.8 per cent, and accidents for 8.8 per cent. This latter figure seems very low, but a logical explanation is that in case of accident to a car covered by insurance the machine is usually hauled to the garage under the terms of the accident policy and no claims are made under the "get-you-home" scheme.

The automobile industry pays the railroads freight charges of $100,000,000 annually.

Profitable Co-operation

THE interdependent nature of the various units of modern industrial organization has been emphasized on various occasions. The necessity for a recognition of a moral obligation between manufacturers has been discussed as an essential to industrial progress. The term "obligation," however, usually raises in the mind a picture of something to be given up in favor of someone else. This is not always, nor even usually, the case.

There is an obligation on the part of those supplying the automotive industry, for instance, to render to the industry the best service at the lowest cost; to help the automotive industry to make its product of good quality at the lowest cost consistent with such quality. The strange thing is that such service is being offered by many manufacturers but that automotive engineers and designers are not, in some cases, taking advantage of it to the fullest extent.

In the field of castings and forgings, for example, automobile manufacturers have spent considerable money during recent years which might have been saved had the engineers co-operated more fully with the technical staffs of the castings producers and accepted more fully the services which many of them have to offer. Often a casting or forging design can be altered slightly without affecting its essential nature, but in such a way as to reduce considerably the cost of manufacture.

The drop-forging, malleable casting, die-casting, steel casting and other similar concerns have come to the point where, through enlightened self-interest, they are capable of and willing to aid the engineer materially and perhaps save money for him through explaining the various limitations of their individual practice and in suggesting slight readjustments in design to lower production costs without affecting the characteristics of the piece.

Few automotive engineers can be expected to be thoroughly familiar with the details of practice in all of these subsidiary industries, but considerable progress can be made as the constructive co-operation, already manifest to a large extent, is increased and the relations between the engineer or designer and the firms which are to manufacture the parts designed become closer.

Index to S. A. E. Transactions Needed

EVERY member of the Society of Automotive Engineers receives annually two volumes or so-called "parts" of Transactions of the Society containing a large amount of useful engineering data, comprising in fact all matter considered of permanent value which has appeared in the Journal or been presented before meetings of the Society and its sections during the preceding year. Each volume has an index of its own contents, which except in recent volumes is not extensive or well classified, but no general or cumulative index has ever been published by the Society.

As a result it is a tedious and more or less laborious process to locate the information on any particular topic, as this can be done completely only by a search through the twenty-odd volumes.

The Society has recently had compiled in its New York office a complete index covering all its regular publications issued to date. This should be printed in convenient form and be placed in the hands of every member who desires a copy. The need for the index is well recognized. We have yet to hear of an engineer at all familiar with S. A. E. publications who would not be glad to have such an index. The cost of publication appears to be the only reason for not sending the index to press at once, but this cost we feel should not stand in the way for the value of the index will far exceed the cost.

The Society has in the past few years accumulated a considerable reserve fund out of which an appropriation of $30,000 was recently made toward the expense of research work to be fathered by the Society. It is generally conceded that a considerable proportion of this fund can well be spent in making available to Society members existing information on

automotive engineering subjects. A first and very valuable step in this direction would be publication of the index in question. This, however, need not and should not be delayed until the new research work is organized. Now is the time to do it. Funds of the Society are available and simply need to be appropriated for the purpose by the S. A. E. Council.

Factors in Production Costs

THE experience of many workers has been that their wages were maintained only so long as the employer had to maintain them to meet competitive bidding for labor; a cut was made as soon as such competition ceased. This fact has emphasized the theory of perpetual struggle between the employee and employer groups. The result, in such cases, is likely to be unsatisfactory production and financial loss to the employer in the long run, since the type of work produced by grudging workers is never as profitable as that given by enthusiastic workers.

One automobile manufacturer in particular has recognized these facts, although he is not alone in his broad vision of the situation. When the recent depression set in, this manufacturer set his production engineers to work intensively on the task of eliminating small wastes, improving production methods, and thus reducing unit costs. The necessity for such cost reduction was explained to the men, and they were led to understand that the maintenance of their present wage scale depended largely upon the success with which these efforts were rewarded. In this way the assistance and co-operation of the workmen were gained.

The production manager of this concern recently presented to the management a comprehensive report, showing the various ways in which it had been possible to improve production methods and thus reduce unit cost. The wages of the workmen have thus far been maintained without decrease.

At some future time it is altogether probable that this manufacturer, like most others, will find it necessary to reduce wages. But he will be in a position to do so without losing the valuable enthusiastic co-operation of his workmen, because he has already demonstrated in this very practical manner that his honest desire is to keep wages high as long as possible, rather than to lower them on the first excuse that may present itself.

And this ability to maintain wages is obviously due to the saving made possible by production improvements, since the selling price has not been increased. The price of the product has in fact been reduced.

Isolated Plant Battery Rating

A STORAGE battery rating means little unless the basis of the rating is accurately specified. Realizing this fact, the Standards Committee of the S. A. E. has evolved standard rating rules for the various classes of batteries used in automotive practice, namely, lighting batteries, batteries for both starting and lighting and batteries for isolated plants. The necessity for having different ratings for batteries for the different uses arises from the fact that the rating test must, if possible, simulate the operating conditions for which the battery is intended.

The ratings for both lighting and combined lighting and starting batteries have proven entirely satisfactory, but there has been considerable dissatisfaction with the rating standard for isolated plant batteries. This rating standard calls for an intermittent discharge at a 24-hour rate extended by three periods of rest to a total time of 72 hours. The idea in view in adopting this intermittent rating was, of course, to approach in the rating test as closely as possible to service conditions.

Most of the early small isolated plants were sold mainly with a view to their use for farm lighting, but recently the use of these plants as a source of current for heating (sad irons and various electric heating apparatus) and for power has assumed considerable importance. It is evident that where there is sufficient power load on the circuit of the plant to load the battery to capacity, it may easily happen that the battery will be completely discharged in from six to eight hours or in even shorter time. Of course there will always be some plants which carry practically nothing but lighting load, in which case the intermittent rating will more nearly represent the conditions of actual use.

It will thus be seen that the conditions of storage-battery operation in small isolated plants now vary so widely that no single rating rule can possibly parallel all of them, and in view of this fact it would seem advantageous to return to the 8-hour continuous discharge rating standard. To do so would lead to two desirable results: It would be a simpler matter to check up the rating and, owing to the fact that such a rating approaches closer to the conditions of most severe service, there would be less chance of misunderstanding and disappointment on the part of those not familiar with storage battery characteristics.

Business Men Reading Books

THERE is in New York a small and informal club of business executives who have known each other for many years. They meet occasionally and discuss business frankly. At a recent meeting only one of these men was able to say that his business curve was maintaining the proper slope. This man is a publisher of business books. During the recent let-up in many business activities, his products have been in greater demand. He said that especially the younger men in industry are buying and reading books on topics bearing on their business specialty.

This is certainly a good indication.

A BRIEF card from Carlisle P. Winslow, director of the Forest Products Laboratory, brings the welcome intelligence that the appropriation for this institution was increased approximately $100,000 by the last Congress. In addition to congratulations to the laboratory staff itself, AUTOMOTIVE INDUSTRIES wishes to congratulate those of its readers who acted upon the suggestion made some weeks ago that they recommend such an increase to their congressmen.

Willys Takes Field to Force Sales

Carries to Dealers a Fighting Message

Declares He Is Just As Able As Ever to Keep Overland in Front Rank

TOLEDO, April 4—After spending ten days in the company of dealers and bankers in Western and Northwestern States, John N. Willys stopped here to-day on his way to New York, more enthusiastic than since 1916 and assured that "vigorous prosperity" is on the way.

He reported that he had met more than 2000 of the Willys-Overland salesmen and distributers, and that everywhere business is going forward. Reports indicated that the company sales had increased 94 per cent last week over the second week preceding.

"I am returning with greater enthusiasm and more optimism over the future of Willys-Overland than I ever felt before," declared Willys. "Conditions in the West and Northwest are already much improved—far more than I expected to find.

"During the past two weeks I have talked with our dealers gathered in Chicago, Kansas City, Oklahoma City, Dallas, St. Louis, Omaha and Minneapolis. The meetings are the most enthusiastic I have attended since 1916.

"Anyone who has any doubts about Willys-Overland coming back strong after this readjustment is due for a surprise.

"I found that the rumor manufacturers had circulated a lot of wild yarns about my own plans and I took a lot of pleasure in telling my old friends—among them hundreds of dealers who have been with me from the beginning—that I'm just as determined to-day as I ever have been, and just as able to keep Willys-Overland in its front rank position.

Willys Overland First Interest

"Willys-Overland is my first and my outstanding interest. During the past few years expansion and financing have occupied most of my time.

"To-day Willys-Overland, and every other automobile company, needs a reawakening of enthusiasm among its dealers and salesmen along the firing line. So now I'm trying to be useful in the sales department.

"Yes, I'm going to be on the road again in a few days to talk with more dealers. It stimulates me and encourages me more than I can describe to see the wonderful response our dealers give when they know we are all set and our program is straight ahead.

"I believe to-day, as I have for years, that Willys-Overland has the most able group of real go-getting automobile dealers in America. And while I don't expect nor do I predict any rushing return of business, I know that the Willys-Overland sales organization still has its oldtime wallop.

"Every dealer has a lot of hard work ahead, but we all have something well worth working for.

"In both cars we are building now in Toledo, we are putting forth the best product we have ever had in our history. Orders show a steady increase. Last week's retail reports from the field show a gain of 94 per cent.

"I have found, too, that our time payment plan, which is extremely liberal to the public, is a great help to the dealers right now. In short, every factor is helping us now toward prosperity."

VOLUME OF BUSINESS EQUALS YEAR AGO!

NEW YORK, APRIL 5—Sales managers who are mourning because "there is no business" might do well to go off in a corner and quietly consider these facts:

Business today, in spite of all reports to the contrary, is moving at a pace only 20 per cent slower than that of a year ago.

General sales in the United States for January, 1920, amounted to $45,-178,711,000. This was considered a phenomenal showing.

Notwithstanding the "depression" sales in January, 1921, amounted to $38,506,907,000. This was 85 3/10 per cent of the business done a year ago.

Bradstreet's commodity index shows a 43 per cent decrease in prices over the same period a year ago and, since the country is doing 85 per cent as much business in dollars as it did a year ago, the figures indicate an increase rather than a decrease in the number of sales.

Somebody is getting this business. More business is being done by some organizations than they ever did before.

The sales manager who is waiting with folded arms for "better times" and charging small sales to stagnant business conditions, might well adopt this motto:

"Let's Go!"

WAR DEPARTMENT BUYS PLANES

WASHINGTON, April 4—The War Department has ordered 200 pursuit planes and 35 bombing planes for the use of the American army. The pursuit planes will be the Thomas Morse type and will be built by Boeing Airplane Co. of Seattle. The bombing planes will be of Marlin type and will be built by the L. W. F. company of College Point, N. Y.

Car Plants Leading Cleveland Industry

Employment Gains 24 Per Cent for March—Other Lines Show Falling-off

CLEVELAND, April 5—The automobile industry continues to set the pace for business in this city. On April 1 the automobile plants of the city were employing 1500 more men than they were Feb. 28. That is a gain of 24 per cent and outstrips gains by various industries. The survey was made by the Cleveland Chamber of Commerce in cooperation with the United States Labor Department, and the figures are genuine. The eighteen plants in the automobile industry that reported had 8103 employees on April 1, as compared with 6532 on Feb. 28 and 5940 Jan. 31.

Comparing the figures for the automobile industry with the record of all other lines of production in the city, shows the progress made in the automobile industry to be remarkable. There are 97 plants reporting to the committee in charge of the survey. These plants under normal conditions employ approximately 100,000 men. The total number on the rolls April 1 was 59,202. That is 470 less employees in April than were working on Jan. 31 of the present year.

The Stearns factory is being operated at 100 per cent production; Winton, which has been idle for some time so far as production of new cars was concerned, will be in capacity production of 10 cars daily on May 1; Peerless is operating at 50 per cent of capacity, and the Kurtz plant, which is a newcomer in the local field, is turning out five cars a day and selling all of them. Grant has been enjoying a gradual increase in business in the present year; April orders assure production on a larger basis than in March, and this is also true of Chandler, Cleveland, Templar and other cars.

A trip to the dealers disclosed that all are optimistic and are selling cars, although they are hustling harder for business than they did a year ago.

FORD MAY BUILD CARS AT TROY

TROY, N. Y., April 5—After inspecting the site at Green Island on which he will build a large plant, Henry Ford stated to-day it was quite likely the factory would be used for the manufacture of automobiles rather than tractors as has been predicted. He added that Thomas A. Edison would construct a plant adjacent to the Ford factory which will be operated by power taken from the Ford power house.

Would Divert Car Tax to Highways

Senate to Get Bill Changing Fund Plan

Proposal Is Digest of Legislation Long Approved by Industry —Aids Forest States

WASHINGTON, April 4—Senator R. N. Stanfield of Oregon has prepared an amendment to the Federal highway bill providing that the application of receipts from a sales tax on automotive products should be used exclusively for the construction and maintenance of highways. This plan would abolish the present system of making highway appropriations out of general funds as called for under Federal Aid legislation. Briefly, the proposal is a digest of plans advocated by automotive organizations for several years though there is no specific provision for a system of national highways.

Basing calculations on Treasury receipts for the last fiscal year, it is estimated that a sales tax would yield approximately $145,963,035.62. With the various tax proposals calling for a higher rate on automotive products a larger sum would be available under the Stanfield amendment. The Federal Government under the Federal Aid Act has been appropriating $100,000,000 for good roads. The distribution of this fund has provoked widespread opposition and proposal for the national highway system was the outcome.

Senator Stanfield is a newcomer to Congress and is a wealthy sheep-grower. E. J. Adams, his secretary, is largely responsible for the measure, as he assisted in framing the good roads plank in the Republican party platform at Chicago last summer. He was also State Highway Commissioner for Oregon for several years and is familiar with the highway transportation problems.

Apportionment Difficult

One of the great difficulties or inequities of the Federal aid plan has been the apportionment. For instance, New York state with millions of automobile users could obtain but a small portion of the Federal aid. Another amendment in addition to the tax plan provides that after deduction not to exceed 5 per cent for administration, 12 per cent of the funds available annually for the Federal highway activities should be apportioned to Federal Land states in proportion to the number of acres in the reserves of each State and providing that the amount so apportioned shall not be less than 10 cents per acre per annum, these funds to be used for construction and maintenance of roads wholly, or partly, within the Federal Forest reserve and the remainder, or 88 per cent of the funds available annually, to be apportioned to the States in proportion to the number of motor vehicles licensed during each year.

Senator Stanfield says that the apportionment for the Forest Reserves is to carry out the pledge of the Republican party adopted at the Convention which provides that these public lands shall be a controlling factor in the apportionment of Federal highway funds. He contends that it is clearly unfair to withdraw from settlement large areas exempting them from taxation within these States thus preventing their development without providing some adequate means of extending aids equal to what they should but do not receive in taxes.

Approximates State Tax

The 12 per cent is approximately equal to what these lands would pay in state and county taxes if they were privately owned and subject to taxation. The apportionment of the remainder of the funds (88 per cent) is made according to the vehicle licenses used in each state. "If the funds are raised by sales tax imposed on motor vehicles, cars, and accessories," he said "then this method of apportionment is exact and equitable which merely means that the contribution by the manufacturer to the Government at the time the vehicle is sold follows the vehicle into the State and is there used for construction and maintenance of roads for the same vehicle to run on."

In support of this plan, the Senator asserts that "if the funds are raised by an appropriation of the general fund this method of apportionment is still as nearly fair and exact as may be written

FARMERS FORM LEAGUE TO FIGHT SALES TAX

CHICAGO, April 4—While sentiment in favor of imposition of a Federal sales tax in lieu of imposts which now are a drag on industry is growing steadily in the industrial districts of the country its proponents will have a hard time getting it through Congress. One of the formidable obstacles in its way will be the opposition of the farmers. The Farmers Federal Tax League, with headquarters here, has been organized for the avowed purpose of fighting a sales tax. This organization contends that "powerful interests are preparing to shift further the burden of taxation upon the farmers and the farmers must organize to make felt their influence if this attempt is to be prevented."

N. A. D. A. Strongly Protests Dumping

Congress to Get Nation-wide Appeal for Protection from Unfair Competition

ST. LOUIS, April 4—Harry G. Moock, general manager of the National Automobile Dealers Association, has sent a letter to the secretary of every dealers association, local and State, urging the adoption of a resolution protesting against the reimportation from England and France of American made motor vehicles which are being brought into this country duty free and thereby competing unfairly with dealers in this country.

In his letter, Moock points out that American business needs "stimulation and not further depression; confidence and not doubt; enthusiasm and not apprehension." After telling briefly of enormous quantities of American made automotive equipment which has been purchased for a song by British and French speculators with the expectation of dumping it on American markets, he says:

"Congressional leaders do not fully know how their program menaces our industry. So it's up to us to acquaint them with it. It's up to us to ask Congress to give us such protection as will equalize the prices of these re-imported goods with the prices of American manufactured goods. We want you to ask Congress to enact anti-dumping legislation which will put a tariff on this re-imported material so that it cannot be sold at a half or a third of the value of American products."

To Notify Representatives

Each association is advised to send to its United States Senator and representative copies of the resolution it adopts. The resolution proposed by the national association follows:

"WHEREAS, American business has been seriously stricken during the recent period of post-war adjustment,

"WHEREAS, in addition to the natural depression resulting to the automobile business from this fact, the motor vehicle industry has been an especial target for discrimination, and

"WHEREAS, the automobile industry paid in Federal excise taxes in 1920 the sum of $144,000,000 to the Government, license and registration fees to the state governments of $100,000,000 and personal property taxes of approximately $80,000,000, a total of approximately $325,000,000.

"WHEREAS, the prosperity of the in-

Erskine Not After Studebaker Control

Denies Alliance With Durant and Fish—Company Has Record Business

> **"THE sales of our cars for delivery in the months of April, May and June are far in excess of any previous year in our history and we are trying to increase production at all plants with the expectation of producing and selling 20,000 cars in the second quarter."**
>
> **—Statement by President Erskine of Studebaker Corp. to stockholders.**

NEW YORK, April 5—Official denial that control of the Studebaker Corp. now rests with W. C. Durant, F. S. Fish, chairman of the board, and himself, was made to-day by A. R. Erskine, president of the company, in a statement read at the annual meeting of stockholders held in Jersey City. After referring to newspaper reports to this effect, Erskine said:

"I feel it my duty to inform our stockholders that there is not the slightest foundation for such reports. We know of no interests that are trying to obtain control of the corporation and believe such an undertaking to be extremely unlikely.

"We have not been, nor will we be, interested in acquiring a controlling interest in the stock of the corporation. In fact, such an effort by anyone would, in our judgment, be hostile to the best interests of the corporation, its customers, and its stockholders. We prefer to see the number of our stockholders increase, with the widest possible distribution of our stock, and to this end we shall continue to manage the affairs of the corporation in a manner that we hope will deserve the continued confidence and support of the automobile and security buying public. During the past year the number of stockholders increased from 3000 to 12,000, including 3000 employee stockholders."

Durant Purchases Denied

It has not been denied that Durant has purchased large blocks of Studebaker stock in the open market, but so far as can be learned this has been a purely speculative venture. He bought when the stock was from 20 to 30 points lower than it is now in the firm belief that it was far below its real value, and that there would be a substantial increase in a short time. He also advised his friends to buy for the same reason. It was reiterated by Durant's office to-day that he had no intention of trying to get control of Studebaker or to exert any influence over its affairs. Durant is much gratified, it was stated, at the prosperous condition of Studebaker affairs. The statements of Erskine and Durant seem to dispose effectually of reports which have been current in Wall Street for several weeks. Technical control of the company apparently rests in the hands of the banking house of Goldman, Sachs & Co. where it has been for some time.

Highly significant of the conditions now prevailing in the industry is the statement of Erskine to the stockholders that the company has been able to reduce its bank loans materially and that orders for the second quarter assure the largest three months business in the history of the corporation. In this connection he said:

"It will be gratifying to our stockholders to know that our sales of the first quarter were beyond our anticipation and that our net profits substantially exceeded the dividend requirements of both the preferred and common stock. In March we retired $2,500,000 in bank loans and have now outstanding $7,000,000, with over $5,000,000 bank balances. Our collections are exceeding our disbursements, and outstanding bank loans will probably be liquidated before the summer is over.

"The sales of our cars for delivery in the months of April, May and June are far in excess of any previous year in our history, and consequently we are trying to increase production at all plants with the expectation of producing and selling 20,000 cars in the second quarter which will be our record business for any three months. In June the plants will be operating at capacity of 8500 cars per month, which can thereafter be maintained indefinitely."

Stockholders Propose to Take Over Revere

FORT WAYNE, IND., April 2—An entirely new company will be organized to take over the plant of the Revere Motor Car Corp. of Logansport, Ind., according to the plans of the committee recently appointed to formulate plans for the future of the plant. It is proposed to have the new company purchase the plant at a receiver's sale. This committee consists of Judge R. B. Gentzel, of Chicago; Senator P. S. Armatage, of Owensville, Ind.; H. C. Springer, Garrett, Ind.; L. C. Thompson, Trenton, N. J., and John Miller and H. A. Kraut, of Logansport. Copies of the plans for the future of the company have been mailed to all stockholders of the present company and an invitation has been extended to all to become stockholders in the proposed new corporation.

STINNES BUYS FIAT SHARES

NEW YORK, April 2—A dispatch from Rome says Hugo Stinnes, the German industrial leader, has purchased from the Italian Fiat Corp. 200,000 shares in the electrical works in the Italian Tyrol known as the Alpinen Montan Gesellschaft. Stinnes, therefore, will become a director in the largest Italian electrical works and will exert much influence over the Fiat company.

Truck Sales Heads Plan N.A.D.A. Branch

Will Seek Approval of Organizing Truck Dealers Division of Association

DETROIT, April 2—Plans and policies outlined by the directors of the National Association of Motor Truck Sales Managers, which include active co-operation with the National Automobile Dealers Association, promise a season of activity. The meeting was the first held since the induction of Don Whittaker as secretary, and his recommendations covering future efforts of the association met with unanimous approval.

The subject of co-operating with the N. A. D. A. in the organization of a motor truck division of that organization was recommended by a committee, and the directors instructed Secretary Whittaker to begin negotiations with Harry G. Moock, general manager of the N. A. D. A. In many cities truck dealers now affiliate with the passenger car associations of the city and State, and also are members of the N. A. D. A. The successful efforts of the latter organization in promoting the interests of the automobile dealer are recognized by truck men and are prompting efforts to form a strong division to co-operate. Details of the truck division will be worked out later.

Promotion of motor transport, rural motor express and highway engineering also will be major future efforts, and periodical bulletins will be issued in support of road bond issues for distribution through dealers and distributors, and members of affiliated associations. Educating the public in proper truck operation and in promoting faith in the truck as the proper short haul medium, also will feature the activities.

A research department for the collection of data on sales work, general and territorial requirements, statistics on truck production, registration laws and license fees, road mileage, new loading devices and data on foreign business are proposed, and a legislative department which will co-operate in combating adverse legislation aimed at the motor truck will be maintained.

To Extend Secretarial Work

One of the chief functions of the secretary's office under Whittaker will be the employment clearing house where records of all truck salesmen will be kept. Efforts in that direction will be devoted to elevating the standard of salesmen through searching investigation of their records, results of which will at all times be available to manufacturers seeking salesmen or salesmen seeking positions. Attempts to curb the unscrupulous dealer and eliminate the "trade-in" evil will be made, and a meeting to discuss this matter will be held in New York soon, where a plan for overcoming it will be outlined.

Akron Plants Spurt to Meet New Demand

Goodyear Pushes Schedule to 17,500 Tires Daily—General Production 50 Per Cent

AKRON, April 4—With many automobile factories resuming operations, and with the vast surplus of tires of two months ago almost exhausted, marked improvement is being shown in the tire industry and Akron's many rubber and tire factories have begun to recover encouragingly from the slump which has been in force for the past nine months.

Nearly all Akron factories have begun to increase production and many are re-employing men on a large scale. This week Goodyear will put on 1200 of its former employees, and Firestone will re-employ 1000. Firestone has been adding to its force every day for the past few weeks and for the period extending from March 1 to April 30 will have re-employed at least 2000 men, officials announce.

Goodyear has formally announced a 33 per cent increase in production, effective at once, which will carry production up from 12,000 casings and 13,000 tubes daily, to 16,000 casings and 16,000 tubes a day. Firestone will increase production 50 per cent this month and go to 15,000 tires daily. Both factories are running two eight hour shifts daily, and operating on five-day weeks. Goodyear soon will go to a five and one half day week.

Although Goodyear officially announces a production increase to 16,000 tires a day, unofficially it is stated that the company's production this week will be pushed to 17,500 tires daily, and possibly to 20,000 tires by April 15. This unexpected increase has been brought about by heavy original equipment orders from automobile factories, received since the company announced the increase to 16,000 tires daily on Friday of last week.

Most Companies Report Gains

These two companies unquestionably are leading in the spurt taken by the tire industry. The other large companies of Akron, Goodrich and Miller, have made no formal announcement of production increases or re-employment of former tire builders. Smaller companies however are falling in line and several of them have restored operations to a basis of nearly 100 per cent normal.

In fact everything indicates that the back bone of the tire industry slump in Akron, which threw over 50,000 out of work in this city alone, has at last been broken. It is also significant that unless tire companies plan further production increases, the possibilities of an actual tire shortage this spring will be greatly increased. Vast surplus stocks of tires, stored in Akron and in other cities by Akron companies, have dwindled rapidly, through production being held down though sales have steadily increased. With this surplus exhausted rubber factories are now ready to get back to a basis of conservative production commensurate with demand.

Resumption of operations by automobile factories is perhaps predominantly responsible for the stimulated tire building activity. Goodyear alone reports that original equipment orders for April show an increase of 70 per cent over original equipment business placed in March. Goodyear also is reaping the reward of a very extensive and constructive advertising campaign, for consumer sales are increasing without any added sales effort. Firestone also finds its advertising campaign of the past year being reflected in consumer sales. Goodrich, more conservative in advertising, is not reporting any material increase in production.

Unemployment Dwindling

Through increased activity of rubber plants, Akron's army of unemployed is dwindling, and is now down to under 15,000. With many construction jobs opening up in the city, this number will be less than 10,000 and possibly down to 5000 before May 1. Smaller rubber companies planning material production increases within the next 60 days will help to absorb this remaining number.

All companies in hiring men are showing preference to former employees who are married. At the same time men now in the factories are being weeded out. This is being done to increase efficiency per man in the factory, and also to gain a more stable class of factory operatives, so as to give the city home owners, discourage the transient, floating element of labor from drifting into the city, and hold down labor-turnover when times again are prosperous.

A canvass of rubber factories in Akron shows that all are operating on a general average of 50 per cent normal production. This is a 100 per cent improvement over conditions in January.

The results of this canvass in other plants conducted especially for AUTOMOTIVE INDUSTRIES, show—

Plant Schedules High

General Tire & Rubber, nearly 100 per cent normal with one shift.

India Tire & Rubber, about 65 per cent normal. Orders running ahead of production, which will be increased this month.

Mohawk Tire & Rubber, 35½ per cent normal. Orders double production and 80 per cent higher than in January.

Portage Rubber Co., producing 80 per cent normal. Expects to reach normal operation within 30 days.

Rubber Products Co., operating 75 per cent normal in tire departments, and 65 per cent normal in other departments. This company never dropped below 60 per cent of normal production even at the lowest ebb of the tire industry slump.

Amazon Tire Co., now on basis 80 per cent normal, due to increases in dealer orders.

Star Rubber Co., 65 per cent normal. Plans substantial increases in next 60 days.

Swinehart Rubber Co., 70 per cent normal.

American Tire & Rubber, nearly 100 per cent normal.

Thus it may be seen that with all companies operating in excess of an average of 50 per cent normal production, the tire industry is now being operated on a basis of over $250,000,000 annually or nearly $27,500,000 a month.

Goodyear Enforces New Wage Reduction

Retrenchment Program Calls for Cut of $5 a Tire in Overhead Costs

AKRON, April 4—Although the Goodyear Tire & Rubber Co. has officially announced that it will increase production 33 per cent, going to a basis of 16,000 tires daily by April 15, and will employ 1200 former tire builders, a severe retrenchment program is being continued in the general and factory offices and in many factory departments.

Under the refinancing negotiations for $85,000,000, and under dictation and suggestion of banking interests negotiating the immense loan for Goodyear, the company is attempting to cut actual manufacturing cost nearly $5 per tire, by reducing overhead, by combining jobs and by laying off several hundred office employees, many of whom have held executive and semi-executive positions at commanding salaries. The company will also enforce a 10 per cent cut in wages this week in the factory. Salaries previously were reduced.

The Goodyear "Tire News," said to be the largest corporation magazine in the world, and at times of peak production having a monthly circulation of approximately 100,000, has been discontinued with the April number.

Elimination of this magazine will mean a vast saving to the company it is stated. Whether or not the publication will be revived will depend entirely upon the matters of reorganization of the company and future developments in the tire industry.

In the factory offices, a reduction of 76 per cent has been made. This has compelled the company to dispense with many of its high salaried men in official and semi-official capacity. In the general offices, departments have also been cut to the bone. It is understood the factory and general offices, which have functioned separately and in different office buildings, will be combined.

Wage Based on Living Cost

The matter of contemplated wage cuts, was protested by the Industrial Assembly of Goodyear, composed of employees, and was held in abeyance until the projected reduction was arbitrated. It will become effective this week. According to Vice-President and Factory Manager P. W. Litchfield, the lowering cost of living, and the economic readjustment of prices, makes a wage and salary cut equitable at this time.

Litchfield prepared charts for employees showing that there has been a 25 per cent decline in house rents in Akron, a 50 per cent decline in room rents, and an average general decline of 27 per cent in retail commodity prices. Litchfield assured employees that a 40 hour week would be maintained, and that the factories might go to 45 hours a week.

Syracuse Factories Resume Activities

Whole Colony of Industries Revives As Franklin Production Continues Heavy

SYRACUSE, April 2—With the re-establishment of a 100 per cent operating schedule by the H. H. Franklin Mfg. Co., the entire colony of Syracuse industries interested in automotives has felt a revival during the past few weeks. In addition to the Franklin interests, however, there has been a general, though less active, return to production.

Ever since the middle of February the Franklin company has been operating on what they term a normal schedule of 40 cars per day. Not until very recently, however, have the other plants felt the effects because only now are new stocks being bought for production.

In meeting the 40 car schedule the Franklin company is employing 3000 men, and according to a representative of the company there has not been any reduction in the wage scale, the employees being paid on the same basis used before the shut-down last fall.

There are 2000 men less, on the Franklin roll now, than there were last year, the company operating on a single shift. All equipped operating buildings are in use now, but the million dollar addition built last year is being utilized for storage space. The Franklin company has relinquished leases on seventeen storage locations around the city. Eventually the new building will be equipped for production the company having originally planned on going right into the new area. The operating schedule with 5000 employed on two shifts was 75 cars per day. This figure probably will not be reached very soon, company officials feel.

Present Schedule Oversold

The present schedule of 40 cars per day has been oversold, according to sales department figures. The program for the entire month of March called for 1031 cars delivered. Up to and including March 26, 832 of that number had been shipped. Orders accepted for March delivery totalled 216 in addition. The sales department reported 236 additional March orders which could not be filled until April, and 825 April shipment orders. The normal April production schedule calls for approximately 1050 cars and already more than that have been sold.

The company has installed a conveyor system in the final assembly which will permit of a production of 125 cars per day. Only part of the system is now in use.

Franklin activity is reflected in the business of the Dyneto Electric Co., which is on a 25 per cent basis, about fifty units per day going to the Franklin plant. Several foundries, including the Straight Line Engine Co., S. Cheney & Sons, the M. L. Oberdorfer Brass Co., have felt the effects of the revival. Other Central New York plants which have increased production are the Halcomb Steel Co., the Penn Spring Works, the A. D. Clapp Mfg. Co. of Auburn, and the Brewer Titchener Co. of Cortland.

At the several gear works in town, there is an indication of a generally increased interest. The Brown Lipe Chapin Co. is on a 25 per cent basis, their production going in small quantities to a number of manufacturers. The same situation exists with the Brown Lipe Gear Co., the New Process Gear Co., and the Durston Gear Co.

The Dyneto company is gradually being readjusted as a result of the action of several months ago resulting in the plant being taken over by a friendly committee of creditors.

Senate to Get Bill Changing Fund Plan

(*Continued from page* 775)

in any legislative act because the number of motor vehicles licensed in each State fairly reflects the wealth, population and total road mileage within the State. If this factor is used in apportioning funds, it is easy and inexpensive to ascertain the size of the factor by merely getting a certificate from the official having charge of the motor vehicle department."

The two amendments will be introduced at the next session probably at the same time that the Senate committee on Post-offices and Post Roads report out the bill for a national highway system. These amendments are expected to wipe out opposition to national highways from Western States.

According to the views expressed by the Oregon Senator, "the users of motor vehicles receive direct money benefits from every mile of road improved, in the form of decreased repair bills, extended life of the vehicle, increased mileage on tires and gas, and increased efficiency. Over poor roads this would be purely a waste. The saving of this waste invested in better roads is economy and good business on the part of motor owners, therefore, a tax imposed on the sale of equipment at its source is more than saved in the reduced cost of operation if the tax so collected is devoted to building more and better roads.

"True, lands and property other than motor vehicles receive benefits from highly improved roads, but lands and other property also contribute to the common cause when they pay direct property taxes for the county market roads which far exceed in mileage both State and National highways."

TO CONTINUE PRESENT PLANT

MOLINE, ILL., April 4—Borg & Beck Co., automobile clutch and service parts manufacturers, will extend their Clearing, Ill., plant, but this development does not mean that the central works will be transferred from this city, officials explained. There have been persistent rumors to the effect that such a change was pending.

Container Car Wins Success in Trial

Store Door Deliveries by Railroads Shown Practical in Test by N. Y. Central

NEW YORK, April 4—Preliminary experiments with its new "container cars" for store-door delivery have been a complete success, the New York Central Railroad announces, and the system will be expanded as rapidly as it is possible.

The freight car, with four portable containers which can be filled and sealed by a shipper in his own warehouse and then loaded on the car truck, has just completed successful trips between Chicago and Cleveland, and a second car of this type will be tried this week on the Boston & Albany for the shipment of shoes. A steel express car, with nine portable containers, has finished successful trips between this city and Chicago with the Twentieth Century and other fast trains, and is declared to be successful.

Experts of the New York Central consider their experiment a radical departure in transportation. It is predicted that wide use of the new car will save not only demurrage and truckage, but clerk hire and large losses by theft.

The new system provides "compartment" service for freight and express by means of specially-devised "containers" and "container cars," which in effect gives to shippers the use of individual traveling safe-deposit vaults of various standard, interchangeable sizes which are carried locked and intact from the door of the shipper to the door of the receiver of freight. The "containers" or huge steel boxes, are readily removable from the car body and are packed and locked at the factory of the shipper, carried by motor truck or electric car to the railroad and hoisted aboard the car, and at destination are carried by truck to the store door of the consignee, where they are unlocked and unloaded at convenience.

Unload Direct to Shelves

Goods may be stowed in the "containers" in cardboard or even paper wrappings, without need for costly wooden boxes or crates, and the shipment travels untouched to the door or platform where the packages may be unloaded directly onto shelves.

"The savings effected by the new system in loss and damage of freight prevented, in wages, in boxing and crating of individual small shipments," says the New York Central, "are expected to be exceeded in amount by the greater use of moving equipment—railroad cars, trucks and draws—as well as of freight-terminal facilities, whose limits of capacity in periods of heavy demands for transportation have restricted the size of the 'peak-load' and adversely affected commerce."

G. M. C. Takes Loss on Its Inventories

Liberal Allowance for Depreciation Cuts Heavily Into Earnings for Year

NEW YORK, April 5—Net sales of the General Motors Corp. for the year 1920 were $567,320,603, which was an increase of $57,643,909 over sales for 1919. The net income was $93,150,308, but $47,766,787, which is slightly more than half that amount, was deducted to cover Federal taxes, to write down inventories, for depreciation of plants, and for operations conducted in assisting employees to buy their own homes. In addition to these deductions, reserves previously set up were utilized to provide for all contingencies and write down the value of inventories and other accounts to a conservative level. The net profit for the year was $45,383,521.

The report shows that the demand for the corporation's products, which had been very urgent during the first part of the year, was sharply curtailed in September. Inventories reached their peak about the middle of October, but by Dec. 31, notwithstanding shrinkage in sales, there had been a net reduction in inventories of approximately $25,000,000. Inventories were further reduced by $25,776,112 at the close of the year by the charging off of all obsolete materials as well as adjusting values to cost or market, whichever was the lower.

While all known losses and write-downs of inventories had been taken care of in closing the books as of Dec. 31, it nevertheless has been deemed advisable to set up a special reserve of $7,500,000 to take care of possible losses in respect to outstanding commitments for materials undelivered and for other unforeseen contingencies.

Taxes Make Heavy Inroads

A table showing the progress of the earning power of the corporation shows that the net earnings of 1918 were $35,285,597, of which practically $20,000,000 went for Federal taxes, $13,504,000 for interest and dividends, and $1,667,000 was retained in the business. Net earnings in 1919 were $91,181,222, of which $30,000,000 went for Federal taxes, $22,713,000 for interest and dividends and $38,468,000 was retained in the business. The net earnings for 1920 were $47,248,383, of which $3,894,000 went for Federal taxes, $29,117,000 for interest and dividends, and $14,236,000 was retained in the business.

The report, which was submitted to the directors to-day, says:

"The officers and directors of the corporation have thought it unwise to undertake the production of materials that do not relate largely to the automobile. Thus, a comparatively small portion of the total tires produced are consumed by the automobile manufacturer, the larger percentage being sold directly to users of cars for replacement purposes; the greater part of the production of sheets and other forms of steel is consumed by trades other than the automotive industry; therefore investment in these fields has not been made. By the pursuit of this policy, General Motors Corp. has become firmly entrenched in lines that relate directly to the construction of the car, truck or tractor, but has not invested in general industries of which a comparatively small part of the product is consumed in the manufacture of cars.

"The rapid development of the industry has called for equally rapid changes in the character of manufacturing plants, but by constant reinvestment and rebuilding, the General Motors Corp.

Note—The corporation had a contingent liability of $1,416,333.11 on December 31, 1920, on account of sight drafts discounted.

*Included in this amount is $68,332,415.90, covering paid in surplus growing out of the issuance of stock for cash and for acquisition of properties.

Conditions Brighter in Northwest Zone

Business Shows Decided Improvement in Cities—Credit Situation Reported Improved

MINNEAPOLIS, April 5—That the automobile business is looking up in Minneapolis territory is evident. Dealers are beginning to smile and gloom is being dispelled. Business in the larger cities is the first to look up, such as Duluth, St. Paul and Minneapolis. As for the country, not so much can be said as yet. Possibly one reason for the situation is that the driving season in the country will not begin in earnest until winter's mud has been dispelled. The financial situation is not such yet that country dealers can get the cars they want. The truck men feel pretty well because hundreds of road and other contractors are feeling the return of the building season, after a long lapse. The tractor situation is not so bright.

Manufacture of tractors has been resumed by the Minneapolis Steel & Machinery Co. after a long shut down. This month, 200 additional men will be put on with the reopening of the foundry. Tractors have been shipped already to Venezuela and Czecho-Slovakia. All tractors on hand with this representative concern are sold for delivery or future delivery.

Northwest credit conditions have improved in the last six weeks, but are not at normal. Of the total accommodation by the Federal Reserve Bank in the district March 4, loans were largely agricultural, or $41,000,000. There is more unemployment, and a decline in both wholesale and retail prices of commodities is shown from Feb. 1 to March 18.

Crop Season Brings Confidence

Confidence seems to prevail as the Northwest enters the new crop season. In parts of North Dakota and Montana, farmers cannot repay borrowings until the new crop is harvested. In other parts, say South Dakota and Minnesota, farmers can liquidate heavily when they release their present holdings of grain. The new wheat area is reduced some, but the total grain crop average may go above normal. Farmers are slow about paying, and based on $1,000 average loan, they are said to owe above normal, as follows: Minnesota, $200, or $1,200; South Dakota, $250, or $1,250; North Dakota, $400, or $1,400; Montana, $300, or $1,300. These are owings to country banks.

The Pence Automobile Co., one of the first to receive big shipments of cars, the Buick, has received from the new St. Louis factory three trains of 38, 39 and 55 freight cars each. The load is four automobiles per car. Actual offers for more than half of the total have been received already. The first train made the trip from the factory by daylight, stopping as optimism creator, at many points.

75 BUICK PURCHASERS JOIN IN DRIVEAWAY

DETROIT, April 4—Four special trolley cars will convey 75 new Buick owners and friends to the Buick factory at Flint, Wednesday, where, following a banquet at the Durant Hotel, they will be given their cars for the overland journey to Detroit.

The party represents purchasers of cars from the Starkweather Buick Co. at the Detroit automobile show during which C. C. Starkweather and his force of eight salesmen sold 78 cars. Three of the purchasers are out of the city and will not be able to make the trip returning from Flint. The sheriff of Genesee County and staff will escort the procession to the Oakland County line where the sheriff of that county and staff will bring the party to the Wayne County line.

Colonel Harry Jackson the Detroit traffic chief and his staff will meet them at the city limits and escort them through the city to the Starkweather service station where the cars will be washed and turned over finally to the owners. Starkweather will turn over to the factory official, a check for $158,075.67.

Northwest Business on Scale of Last Year

PORTLAND, ORE., April 1—Spring weather burst upon Portland with the arrival of Easter last Sunday, and Portland dealers have more than been satisfied with the resumption of buying. In fact, many of the dealers are comparing the present period with last spring, which was the finest in business history here.

A resume of business during the month of March disclosed the fact that dealers on the whole had an excellent month, and that business has increased steadily from the first to the last of the month. One dealer reported 90 new and used cars sold, while another reported 60, both figures running close to last year's March records. New cars are beginning to experience a strong demand and some of the dealers are forecasting a shortage later in the spring. Many who have been waiting for a possible reduction of price are realizing that indications do not point to a decrease and are getting into the market.

AUSTIN MACHINERY TO REBUILD

CHICAGO, April 4—The Austin Machinery Corp. will rebuild the plant at Winthrop Harbor, Ill., which was recently destroyed by fire. Pending the erection of the new plant, the manufacturing operations of the company will be continued at Muskegon and Toledo. The company has also recently consolidated into its group the plant of the Fairmont Mining Machinery Co., Fairmont, W. Va.

Business Caution Again in Evidence

Chicago Reserve Bank Finds Continuance of Post-War Conditions Hurts Trade

CHICAGO, April 1—The same caution in business in the Middle West that was apparent several months ago has again appeared, attributable, according to the Federal Reserve Bank of the seventh district, to the following factors:

1—Uncertainty on account of a continuance of high retail prices for many articles that make up the daily living budget.

2—Curtailed building operations due to high cost of construction and the consequent shortage of housing and further increase of rentals.

3—The attitude of greater resistance by wage earners to any lowering of the pay scale.

4—The turning of the attention of farmers from marketing to new crop preparations, thus delaying liquidation of farm holdings.

5—The continued heavy demand for money and the high interest rates.

More favorable conditions are reported from the agricultural districts of which Chicago is the center, weather conditions during the past winter having favored increased production although at the same time some apprehension has been created in regard to the forthcoming crops by the scarcity of snow during the past season.

What the mild weather has done for the farmer which is reflected in the continuance of frozen credit as a factor in the liquidation of loans, has been to turn his attention to spring work rather than to continued marketing. There is a feeling among the farmers that the best way to recoup the losses sustained through the decline in prices is to feed their corn and oats to live stock, a more merchandisable product. Farmers are taking a more hopeful view of the situation though there are indications of a 10 per cent falling off in the prospective wheat acreage.

PACKARD DISCUSSES SALES

DETROIT, April 1—Directors, dealers and branch managers of the Packard Motor Car Co. closed a three-day session with factory officials here this week. Those present represented New York, Philadelphia, Boston, Chicago, Baltimore and other large cities. President Macauley and other executives of the Packard organization spoke to the dealers, all of whom expressed the opinion that the improvement noted in the automobile industry in the last two weeks gave every promise of continuing throughout the spring and summer. Sales resistance, and in fact all of the obstacles encountered by the distributing organization, were discussed and plans evolved for overcoming them. Production is starting up strongly, demand being pronounced for the light six.

"Full Speed Ahead," Factory Order

Production Hitting on All Cylinders

Output for March Doubles February—April Schedules Are Increased Heavily

DETROIT, April 5—With all automobile factories in production and the majority hitting on all cylinders, a rapid return to prewar normal is apparent in the remarkable step-up in production for March when the output in Detroit and Michigan totalled 105,245 cars. This compares with 53,040 in February, an increase of approximately 100 per cent.

The real significance of the figures is best seen in a comparison with March of last year which in many factories established a record for production up to that time. The total manufactured last March was 176,831. The total for the month just ended was 59.5 per cent of the March 1920 output.

Further investigation reveals that last month's output was in reality 66 per cent as great as last March for the reason that the Willys-Knight and Overland production last year was 17,700 cars and there was no production at those plants last month. Overland and Knight production was resumed last Monday and while there is no set schedule for April, output is expected to reach around 5000.

While Ford was responsible for 72,000 of the cars represented in last month's figures, the actual increase exclusive of Ford production in March over February was 15,205 or 84.3 per cent.

Schedules for April production in all factories have been increased from 10 per cent to 35 per cent, though executives of the most successful companies contend that the total output for 1921 will be between 50 per cent and 60 per cent of 1920 which was regarded as an abnormal year and a production record that probably never again will be reached.

Speed Up on Parts Making

Many factories were enlarged during the abnormal period in an effort to speed up production. With a prospect of maintaining output at about 60 per cent of last year's figures, or on a basis of close to prewar normal, proper utilization of spare factory space and equipment is a problem. A majority of the manufacturers are solving it, however, by speeding up in the parts manufacturing end. This is regarded as a logical plan and certain to prove of great advantage to the owner in quicker and better servicing.

When not driven to undue haste in turning out spare parts, as was the case last year, parts will be turned out more nearly perfect as to quality and in quantity sufficient to keep all dealer service stations well stocked. Some manufacturers also are contemplating side lines, allied with automobiles, but no definite step in this direction has been taken.

Dodge swung into production in March and while the factory started on a 10 per cent basis, output was increased rapidly each day until the plant now is on a 60 per cent production basis which will be maintained indefinitely. It is significant with all manufacturers that employee forces have been curtailed to a minimum and while many factories now are operating on a 60 per cent production basis and some close to normal, they are doing this with forces cut to from 40 to 70 per cent.

Efficiency Lowers Overhead

Despite the fact that all factories now are in operation, many on schedules close to normal, former employees may be seen loitering about the factory gates and streets without work and with slight possibility of their securing reemployment. A high degree of efficiency reached and maintained, manufacturing executives declare, has lowered the overhead in a great measure and is permitting operation at a profit in the face of the production curtailment as compared with last year.

Sales Managers Too Busy for Convention

NEW YORK, April 6—The meeting of the Advertising Managers Council of the Motor and Accessory Manufacturers Association, which was to have been held at Washington April 14, 15 and 16 has been postponed until some time in May or June. The general subject will be, "How the Wealth of Government Resources Can Be Utilized by the Automotive Advertising Managers" and the meeting will be held in Washington. The chief reason for the postponement is that advertising and sales executives are too busy to attend at this time because of the general business revival. It also has been deemed advisable to wait until the new administration becomes more definitely settled and in a better position to outline a program of assistance.

Goodrich Meeting, April 20

AKRON, April 5—The B. F. Goodrich Co. has issued to stockholders a call for the annual stockholders' meeting on April 20 at New York and for a special meeting of stockholders the same day to ratify the proposed retirement of 11,880 shares of preferred stock of $100 par value each which the company has acquired. Retirement of these shares will reduce the company's stated capital from $108,412,000 to $107,224,000.

N. A. C. C. Committees Press Legislation

Important Conferences Scheduled with Government Department Heads—Trade Improves

NEW YORK, April 7—Pratically all the directors of the National Automobile Chamber of Commerce will be in Washington to-morrow to attend a series of conferences which will be among the most important for the industry since the armistice. Here is the schedule:

Highways committee, headed by Roy D. Chapin, will confer with President Harding and Secretary Wallace of the Department of Agriculture. The purpose of the calls will be to present arguments in favor of the Townsend Federal highways bill.

A special committee headed by H. H. Rice, vice-president of the General Motors Corp. and comprising J. Walter Drake, Alvan Macauley, R. E. Olds and H. M. Jewett, will confer with Herbert Hoover, Secretary of Commerce. This committee was named at the request of Hoover to co-operate with him in the development of foreign and domestic automotive trade.

The tax committee, headed by C. C. Hanch, will confer with Secretary of the Treasury Mellon and Senators Penrose and Smoot in regard to the taxation program outlined by the N. A. C. C. The committee will urge a program of strict economy and a tax on retail sales if additional revenue is needed.

Directors of the Chamber at their monthly meeting here yesterday went on record as opposed to the adoption of legislation for a soldiers' bonus at this time but declared for proper care of disabled soldiers. Opposition to the bonus was on the grounds of economy.

Business Gains General

Reports received by the directors showed that business is improving in virtually all parts of the country with the exception of the Dakotas and in the south, outside of Georgia and Florida. Passenger car sales are much better even in Iowa and Kansas.

Production reports for March showed an increase of 63 per cent over February and that business for the month was 42 per cent of the total for March, 1920, which was the largest single month in the history of the industry. Business in February was 58 per cent greater than in January. Carload shipments for March were about 16,500 and there were about 10,000 driveaways.

President Clifton of the N. A. C. C. will open the service managers convention at Buffalo, May 17.

G. M. C. Writes Off Inventory Losses

Will Complete Construction Program This Year at Cost of $10,619,521

(*Continued from page 779*)

has kept well in advance and its factories may now be considered in satisfactory condition. The great plant of the Cadillac Division, in Detroit, which will be fully occupied in the summer of 1921, is the last large item of reconstruction to be finished. There still remain several small and somewhat antiquated plants that have been relegated to minor manufacturing or assembly purposes, but these items are of little consequence and may be abandoned at a not distant date.

"Constant change has necessitated careful study of customers' demands and possible improvement in the character of product. In addition to the studies conducted by the individual manufacturing divisions of the corporation, there has been organized and established at Dayton the General Motors Research Corp., with complete organization and facilities for systematic experimentation. The corporation has thereby insured the proper checking of all developments of the several divisions and has made possible independent research and study of the problems of the industry, abstract from the routine of manufacturing.

"Rapid increase in production has also necessitated the building of houses for the accommodation of factory employees, notably at Flint and Pontiac, Mich.; Janesville, Wis., and Walkerville and Oshawa, Canada. These houses are being sold to employees, as the corporation does not intend to carry the investment longer than necessary, and already 76.7 per cent have been sold.

"The construction program, inaugurated in recent years, was about completed during the year 1920 by the expenditure of approximately $79,161,951. There remains for expenditure during the year 1921 the sum of $10,619,521."

Directors to-day declared a dividend of 25 cents a share on the common; $1.50 a share on the 6 per cent preferred; $1.50 a share on the 6 per cent debentures, and $1.75 a share on the 7 per cent preferred.

New Cadillac Plant Replaces 77 Buildings

DETROIT, April 2—General offices of the Cadillac Motor Car Co. now are in the new Cadillac plant on Clark Avenue. The purchasing, accounting, manufacturing, sales and advertising departments will begin to function at the new home Saturday.

Some idea of the size of the plant may be gained when it is known that all factory operations which heretofore have required 77 buildings in Detroit, will be carried on in it. There are 8 large buildings, chief of which is the manufacturing building, 800 by 600 feet, with a floor space of 970,000 feet. Raw materials are received at one end and the Cadillac chassis leaves under its own power from the other end.

Conveniently near the manufacturing building is the heat treatment building, 500 x 80 feet. The assembly building, second largest in the row, is 800 x 300 feet, with a floor space of 620,000 feet. The storage building which adjoins the assembly building is 480 by 140 feet and has storage space for 1000 Cadillacs. The factory service department is housed in this building.

Executive offices are in a handsome administration building, 225 by 50 feet, equipped with all conveniences. The power plant is one of the most modern in the country.

Particular thought has been given to comfort and surroundings of the 6000 Cadillac employees in the installation of locker rooms sufficient to give each worker a steel locker, special bridges, walks, etc., that will permit a great saving in time and a minimum of confusion in entering and leaving the plant. The welfare department and First Aid hospital is so located that it can be reached from any part of the plant in a few minutes.

N. A. D. A. Strongly Opposes Dumping

(*Continued from page 775*)

dustry recently has been threatened by the dumping upon the American market of thousands of vehicles and millions of dollars of automotive merchandise salvaged from the war areas of Europe, and

"WHEREAS, the carrying out of such a plan will result inevitably in the demoralization of the automotive industry, thereby further seriously disrupting employment, will cause the loss of thousands of dollars to manufacturers and dealers in automotive merchandise and will deprive the Government of great sums of revenue, therefore,

"BE IT RESOLVED, that the Congress of the United States be asked to enact legislation which will equalize the differences in the marketing of this salvaged equipment. affording protection to the Government as well as the industry and which will afford a much needed stabilization for all American business.

British to Stop Dumping

WASHINGTON, April 4—The Department of Commerce has been informed that the British government has issued formal proposals for the protection of key industries and the prevention of dumping. The plan contemplates the imposition of a customs duty of 33⅓ per cent ad valorem for five years on articles produced by key industries. The list includes magnetos. The government proposal says a further duty of 33⅓ per cent may be added to any other duties on goods offered below the production cost or at prices which, because of currency depreciation, are below production costs in the United Kingdom.

Wisconsin Proposes New Tractor Tests

Will Limit Sale of Machines to Those Meeting Working Requirements

MILWAUKEE, April 4—Agricultural department officials of Wisconsin have worked out a new plan for regulating the sale of tractors and all other forms of liquid fuel traction engines and machines, for the purpose of preventing further distribution of unreliable and untested tractors, and safeguarding the interests of purchasers, more especially the farmer.

Under a bill covering the plan, just introduced in the Wisconsin legislature, no tractors may be sold in Wisconsin without a permit to the manufacturer or assembler, and permits will not be issued until models have been tested by a board of three competent engineers under the control and supervision of the agricultural engineering department of the University of Wisconsin.

The measure is to go into effect Sept. 1 of this year so that as many models as possible may be tested and permits issued for them individually by Jan. 1, 1922. All models offered for test shall be regular, stock models. A permit is required for every model offered for sale. The tests include endurance, horsepower rating for continuous loads, and consumption of fuel per hour or per acre of farm operation. All test results will be open to public inspection.

Results of tests will be certified to the Wisconsin Railroad Commission which will issue the permits.

The commission shall revoke permits or refuse to issue any, if two or more bona fide customers residing in this State show evidence that the tractor manufacturer has failed to maintain adequate service with a full supply of parts and replacements in the state, and within reasonable shipping distance of the customers.

Temporary permits may be issued if by Jan. 1 all tests are not completed, but failure on the part of manufacturers to supply the models for testing shall not be cause for issuance of temporary permits.

Models not admitted may be re-examined after alterations are made. No company shall use the results of the tests for advertising purposes, except the entire report is published, under penalty of permit suspension.

For violations fines of $100 to $500 for each offense are provided in the bill. Hearings will be held on it in April at Madison, before legislative committees.

STUDEBAKER DIRECTORS CHANGE

JERSEY CITY, April 6—The annual meeting of stockholders of the Studebaker Corp. was held here yesterday. All directors were re-elected with the exception of G. M. Studebaker whose place was taken by H. A. Biggs, vice-president in charge of sales.

24 Dealers Exhibit at Automobile Club

Closed Models Predominate at Special Showing — Minerva and Rolls-Royce Shown

NEW YORK, April 4—Twenty-four New York automobile dealers are holding a passenger car show this week at the Automobile Club of America. The stands occupy the grand ballroom, the restaurant, entrace hall and the office of the Touring Bureau. Many of the leading American makes are represented, as is one foreign car, the Belgian Minerva (the Rolls-Royce, also shown, may be regarded as an American product now). As might be expected, there is very little that is new, most of the cars shown having been exhibited either at the Automobile Salon or at the automobile show last January.

An Essex two-passenger cabriolet is a car that is exhibited for the first time, although literature regarding it was distributed at the automobile show in January. This car impresses one by its low build. The Hudson and Essex companies are now enameling their hoods and radiators in addition to their fenders and splash pans, which is a change made since last January. The Hudson company shows a standard touring limousine.

Space is naturally somewhat limited and where only a single car is shown, it is a closed car in the majority of cases. No exhibitor shows more than two cars, and then generally one open and one closed model Both Packard and Pierce-Arrow, for instance, have one touring model and one limousine on exhibition. The only chassis shown is that of the Belgian Minerva.

A new custom built brougham is shown on the standard Mercer chassis. While built low, it gives ample head room. It is a two-passenger brougham and sells for $8,500. Winton shows the same four-passenger sport roadster as at the Commodore some months ago. Two Rolls-Royce cars are shown, one a Salamanca cabriolet and the other a town car of English design, finished in yellow.

Dodge Brougham on Exhibit

A Dodge car with a brougham body is shown by the Stratton-Bliss Co., the New York Dodge agents. It is a rather attractive car and sells at $3,750, f.o.b. New York. Nickeled wire wheels are fitted and two extra wheels, tires and tire-covers are supplied. The wire wheels are of Hayes make. The equipment includes a dictaphone, dome light, individual cast aluminum steps, sliding steering wheel and special windshield; the latter being of square form, nickeled and rather low.

The only entirely new car at the show is the Ambassador, which is manufactured by the Yellow Cab Mfg. Co. of Chicago. It is an assembled proposition, comprising a Continental Model 8A motor, a Brown-Lipe clutch and transmission, Timken axles and Disteel wheels. Later, however, it is planned to use a special Ambassador design of engine, to be built by Continental. Only custom-built bodies will be supplied. The one exhibited was by Racine Body Co.

Among the special features is a double instrument board. That is, in addition to the regular instrument board on the cowl there is an instrument board at the rear of the front seat, for the benefit of the rear seat passengers.

Durant Reincorporates Under Delaware Charter

NEW YORK, April 6—Durant Motors, Inc., has been chartered in Delaware to succeed Durant Motors, Inc., the New York company formed by W. C. Durant to mark his reentry into the automobile field. The capital of the Delaware corporation is 1,000,000 shares of no par value stock.

The first of the Durant experimental cars have come through and are now being given thorough tests on the road. It will be August at the earliest, however, before the factories are put into production. Dealer territory will not be allotted for several months yet.

It has been announced that one of the Durant Motors assembling plants will be located at Jackson, Mich.

Briscoe Motors to Add $2,000,000 to Capital

TOLEDO, April 5—Clarence Earl, elected president of the Briscoe Motor Corp., Jackson, Mich., has told friends here that a new syndicate is to provide $2,000,000 additional capital for his company through a stock issue.

His plant is now employing 400 men and working on a nine-hour basis.

K. R. Jacoby, vice-president in charge of purchases at the Willys-Overland Co. until recently will also go to Briscoe.

Increases Capitalization

DOVER, DEL., April 4—The capital of the Briscoe Motor Corp. has been increased from $16,500,000 to $21,000,000.

LAUSON CUTS TRACTOR PRICES

NEW HOLSTEIN, WIS., April 2—Prices on Lauson tractors have undergone reductions ranging from $100 to $300. The $300 cut applies on models 15-30 and 15-25 farm and road building tractors, and the $100 cut is on the 12-25 high powered farm tractor. The latter model was placed on the market this spring, the sales price, $1,595, being now reduced to $1,495. The company announces that reductions are made possible by the increased quantity of business which is promised.

TO MAKE TRACTOR STEERER

DES MOINES, April 2—A new device, which it is claimed, will eliminate the need for an extra man on tractor drawn farm machinery has recently been placed in production by the Selia Mfg. Co. of this city

Premier Motor Files New Incorporation

Capital Stock Is Reduced from $5,000,000 to $1,000,000—New Directorate Formed

INDIANAPOLIS, April 1—"Closer welding together of all interests of the old corporation and putting affairs of the Premier company in condition to carry out expansions contemplated" is the announced reason for the filing to-day of new incorporation papers of the Premier Motor Car Corp. Reorganization of the company has been going forward for the last two months, since the death of Dr. L. S. Skelton, president. Announcement to-day said the Skelton estate would continue the principal financial group in the corporation.

Statement issued by the company said that the capital stock had been decreased from $5,000,000 to $1,000,000, of which $500,000 is in preferred stock. The directors of the new corporation are B. L. Craig, B. H. Miller, C. B. Reynolds, J. A. Price, A. C. Perrill, J. F. Pancoast, N. P. Hutchinson, James Callans, I. F. Schaeffer, A. S. Beckett, M. A. Whipple. Whipple, Price and Pancoast, are attorney, administrator and representative of the Skelton estate, respectively. The statement adds that "representatives of the merchandise creditors, gold note holders, and minority stock holders have met with the Skelton interests at various times and the formation of this corporation is the outcome of their conferences."

The directors meet to-day and Friday for conferences with other financial interests. Officers will be elected to-morrow. A meeting of Premier distributors Thursday and Friday is expected to bring out some new factory policy announcements.

The new directorate represents varied interests as follows:

B. L. Craig represents creditors. He is owner of R. N. Collins Vehicle Wood-Working Co., St. Louis. B. H. Miller represents creditors. He is associated with the American Foundry Co., Indianapolis, and also represents Fletcher American Bank. C. B. Reynolds, representing creditors, is with B. F. Goodrich company.

A. C. Perrill, representing minority stockholders, is a stock broker, Chicago; James Callans, represents the Philadelphia Finance Co., financer of Premier dealers and owners; N. P. Hutchinson represents gold note holders; I. F. Schaeffer is secretary-treasurer of Premier; A. S. Beckett is assistant treasurer of the company. Schaeffer is the only remaining former director.

ERIE TIRE INDICTED

ERIE, PA., April 2—The Federal grand jury for the Western District of Pennsylvania has returned a true bill against the Erie Tire & Rubber Co. The company is charged with using the mails in a scheme to defraud.

Elections Benefit South African Trade

General Feeling of Business Confidence Follows Vote Favoring Constitution

JOHANNESBURG, SOUTH AFRICA, Feb. 28 (*By Mail*)—The General Election for the South Africa House of Assembly has turned the tide in favor of the existing constitution and the trade can, therefore, look forward with a greater degree of confidence than has been the case during the past few months, to the revival in full of the automobile industry in this country. Despite the fact that the vital issue at stake was decided little more than three weeks ago, signs are being seen of the renewed confidence.

This is especially so in country districts, and salesmen coming in from all parts confirm the fact that dealers are more inclined to buy than has hitherto been the case this year. Car sales do not show any marked tendency to increase, but the general feeling of satisfaction that exists throughout the trade places a very optimistic face on matters.

The Durban municipality has purchased nine Orwell electric trucks for various municipal services and one of these will shortly be operating in this city as a tower wagon. These vehicles are of British manufacture and are from 2 to 3½ tons capacity. They are very fast for electrics and are capable of 20 m.p.h. The year 1921 is going to be a bumper year for truck sales and traders are out to secure good business in this direction.

The commercial vehicle has come to stay. The S. A. Railways are using numbers of Clydesdale trucks in the Cape Province and trials have recently been carried out to test their capability under Transvaal conditions. Overloads were carried, but the trucks negotiated some extremely difficult roads without any concern. Some of the worst conditions possible out here were imposed during the tests which were eminently satisfactory.

The G. P. O. at Johannesburg are using Chevrolet, Ford and various electric models for collection purposes, and the same branch of the Government service at Pretoria has taken over a new Spacke model for similar purposes. It is anticipated that more of these cars will be put to the same purpose.

Consignments of the 1921 model Maibohm and Saxon have arrived. The former, as was expected, does not differ very materially from its predecessors, but the Saxon is very much liked in its new guise.

WASHINGTON TO BUILD ROADS

SEATTLE, April 4—Appropriations for highway work aggregating $12,490,000 were authorized by the Washington State Legislature which recently closed its sessions. This sum, with the $14,000,000 which the state is to receive from the Federal government for road work, gives Washington a healthy amount.

Of the amount appropriated by the legislature, $2,800,000 is for the maintenance of State highways outside the incorporated cities and towns and of streets in cities and towns through which primary highways pass.

The remaining $9,690,000 is to be spent mainly on new work, including grading and paving. While the actual details of how the $9,690,000 is to be spent will be left to the highway board, the bill which appropriated the money set forth the highways to be improved.

Ceylon Motor Exhibit Shows Light Car Trend

NEW YORK, April 5—A report that the Ceylon Motor Show, held in Ceylon from Jan. 22 to Feb. 2 this year was a complete success, has been received from Consul Keiser to the Bureau of Foreign and Domestic Commerce. A fair amount of business was done, although financial conditions prevented a normal sale, the consul states, and the attendance was so great that it was necessary to continue four days extra.

Sixty-nine cars and trucks were exhibited; 27 cars and 5 trucks were American, 22 cars and 8 trucks British, 2 cars French, 1 car and 1 truck Italian, and 2 cars and 1 truck German. American made tractors were the only ones demonstrated during the exhibition. The result of the sales made during the exhibition proves conclusively that the largest market in Ceylon is for a light weight touring model of 4 cylinders, these exhibits having attracted more attention than those of higher power and more expensive cars, the report adds.

Willys-Crossley Works Shows $562,000 Earnings

LONDON, March 11—(*Special Correspondence*)—Because of the acute situation in the British motor and other industries and the fact that many motor balance sheets are on the wrong side, it is noteworthy that the past year's report of the Willys-Overland Crossley works at Heaton Chapel, Manchester, shows a profit of £112,210 (about $562,000) which will enable 5 per cent dividend on the 10 per cent preference stock to be paid and a substantial sum placed to reserve.

TO SPEAK ON FOREIGN TRADE

CLEVELAND, April 1—In the present listing of speakers for the National Foreign Trade Council which meets here May 4 to 7 are these men who are connected with the automotive industries:

J. Walter Drake of the Hupp Motor Co., who will speak on "Government Service to Foreign Trade."

Col. Fred Cardway of the Packard Motor Co., on "Psychology of International Merchandise."

Frederick Dickinson of the Hupp Motor Co., on "Foreign Advertising."

Prices Undergo Cuts On British Market

General Movement Is Seen to Reduce Surplus Stocks—Guarantees Unpopular

LONDON, March 18 (*By Mail*)—The spring season here is being ushered in with some notable cuts in car prices. The American contingent, especially the larger sixes and fours, shows the most decided cuts, in most cases the cause being obviously to clear up the large accumulations of cars left over from the previous season. Many British firms are in the same position and are sacrificing stock to take advantage of expected cuts in material prices.

Price guarantees offered by some manufacturers through the dealers are proving unpopular. Many persons seem to be unsatisfied with this sort of proposition and are holding off buying. There is a good bit of business stirring, however, the real spring season being advanced almost a month by the fine weather obtaining.

The controversy between Harper-Bean Co. receivers and the British Motor Trading Corp., which had the distribution rights of the car, has been adjudicated in the courts, the distributers to sell cars at list prices and refund to the Bean company all but their agreed commission. It is believed in trade circles that the affairs of the Harper-Bean Co. will be straightened out, and it is reported that Sir George Bean has offered a substantial sum on his own account to help stabilize the company.

Business in automobile stocks has been better of late owing to the increased demand for vehicles. Another sign of improvement is the return of activity at Coventry, the Detroit of Great Britain. Among the leading motor stocks are Standard, Calthorpes, Rover, Humber, Singer, Swift. Austin and Star stocks are unchanged. Dunlop stock is steady and the new issue of debentures is selling at the price issued.

OCEAN FREIGHT RATES HIGHER

NEW YORK, April 4—Increases in freight rates on merchandise consigned to several European countries, amounting in some cases to 300 per cent, have gone into effect as the result of the settlement of an ocean rate war. The increases will apply to goods shipped to French Atlantic ports and to ports in Belgium, Holland and Germany. The rate on agricultural implements is increased from $2 a ton to $8.

FEDERAL TO BUILD NEW TRUCK

DETROIT, April 2—Federal Motor Truck Co. is coming through with a new 5-ton which is somewhat different from the present Model XE. The chassis price is $5350 and the engine is a Continental 4-cylinder 4¾ x 6 in. The gear ratio has been made such that the higher speeds are possible.

Arkansas Business Hit by Crop Prices

Little Rock and Hot Springs Report Buyers But Rural Districts Suffer

LITTLE ROCK, ARK., April 1—"Sixty days ago we had no prospects but we have plenty to-day. We sold two new and one used car last week." In these words L. E. Whitmore, local manager of the Cadillac agency, summed up the recent improvement in motor business in this city. Generally speaking the State of Arkansas is 60 per cent normal, if by normal is meant business the dealers and distributors had been counting upon.

Ford business is always a good barometer of the motor trade in a territory, and H. Bale of the Shoemaker-Bale Co., one of the two Ford dealers, says business has picked up unexpectedly in the last few weeks. This company sold 60 cars in March, which was double the sales for either January or February. The company is out of touring cars, and has not had sedans or runabouts for 15 days. Ninety per cent of these sales are in the city, and 10 per cent in the country territory.

The Ford truck business, which has been poor, is picking up, and sales are at the rate of 10 trucks per month. During 1920, Ford truck sales averaged 9 per month. Five have been sold in the last 30 days. The dealers of Little Rock generally agree that in all lines of motor cars business has improved in the last 30 days. Nearly all dealers other than Ford are stocked with cars, but such lines as Marmon, Nash, Paige and Packard have made recent sales.

The country dealer in Arkansas has very largely disappeared during the last five or six months. One distributor of a leading car had five agents a year ago of whom but two remain. Other distributors have but two to four dealers at present in the entire State. There is literally no business in the State outside of Little Rock, Hot Springs, where business has been particularly good during the present season, and a few other towns, notably in the northwest, which is the fruit section of the State.

Must Rebuild Organizations

The Arkansas distributors now face the problem of building up an organization of country dealers, but there is no hurry as the country and small town buyer is out of the market for most of the year, unless Europe should suddenly come into the market and furnish an outlet for cotton and rice. If this does not happen, the country buyer will not be back until the cotton and rice crops are well under way, and then the market price will be a considerable factor.

There is no question but that the oil fields of Arkansas are a certainty. Since the discovery of petroleum on Jan. 10 last, when the first gusher was brought in, 26 good wells have been brought in, and only two failures recorded. This is a record without parallel in petroleum history. The operations are largely in the hands of large oil companies and all Arkansas is agog to see where the next oil wells will be brought in. Drilling is becoming general in many parts of the State.

The highway building movement, which started in Arkansas three years ago, and which has proven a stimulant to the motor industry in the past, has practically ceased due to the shortage of money, caused by the inability to sell highway bonds. The State overstepped itself in this regard. The State Constitution will not permit of issuing State Bonds, neither can county bonds be issued. It has been necessary to create districts in which the farmers along the highways to be improved have issued bonds.

Country Dealers Quit in Southern Districts

TEXARKANA, April 2—One of the results of cotton selling at eight cents per pound, and the lumber business getting to prices approaching the pre-war level, is that this city with 25,000 population has only seven active motor car dealers, five having gone out of business since the boom of a year ago. Practically all of the seven now in business constitute the backbone of the industry here, some of them having been in business 10 to 12 years, in contrast with most of the five firms that have been eliminated that were in business scarcely a year, and some of them not more than four or five months.

This elimination of the small dealer in Texarkana has been greater in the surrounding territory, which largely depends on the cotton farmer. One local distributer, representing one of the best medium priced cars in the country, and who had eighteen dealers a year ago in his territory of 26 counties, has only three left.

As a result, motor car sales in the territory are practically nil, and in the city they have improved slightly within the last month. There is a tendency for the wealthy buyer in the city to hold back hoping for price reductions, and the man with a few hundred dollars is entirely out of the market. Several of the dealers have enough cars on hand to run sixty days, and in some cases ninety days, at the present rate of sales. The Ford dealer is out of runabouts, and expects to be out of touring cars in a few weeks. Too many of the dealers were heavily overstocked last fall. One dealer claims he sold more used cars in one month two years ago than he has sold during the last ten months.

LIFT GASOLINE RESTRICTIONS

NEW YORK, April 2—All restrictions upon the sale of gasoline in Italy have been removed by the Government. Service stations are being re-established in all the important centers on the Riviera, which will make motoring in Italy as popular as ever. Roads are in good condition, especially north of Rome.

METAL MARKETS

STEADY increase in the steel tonnages going forward to automotive plants is noted. The bulk of this material is still on account of releases of orders previously suspended. Interest in the market, however, has quickened considerably in the last few days and, while fresh orders are being placed cautiously and tonnages involved are light, the indifference that was characteristic of the attitude of most automotive purchasing agents a few weeks ago has completely vanished. In fact, with most of the steel producers a law unto themselves, when it comes to prices, the opportunity for securing advantages due to skilled search of the markets is greatly enhanced and astute buyers delight in such a condition where individual ability counts most. Mahoning Valley sheet markets, who a few weeks ago were reported to have withdrawn quotations in expectation of an upward revision, have quoted prices within the last few days that show their eagerness for business even though it be necessary to trim prices to the extent of 10 per cent. Aside from the automotive demand, there is virtually no activity in the steel market and it appears to be generally recognized that a marked increase in demand cannot be expected much before the third quarter of the year. The sheet rolling mills furnish perhaps the best indication to the manner in which the steel industry plans to meet this condition. Some of these mills have shut down entirely while others have reduced operations to approximately one-third of capacity. There are, however, enough mills left which are determined to "carry on" during the present quarter. They will be more than able to take care of the automotive demand and there promises to be a continuance of spirited competition for automotive business among these factors. The market for steel bars although still largely a single-car affair, is growing more active. Wall Street reports that the U. S. Steel Corp. will shortly announce a reduction in prices simultaneously with a reduction in wages, are nothing more than plausible conjecture.

Pig Iron.—Automotive foundries are ordering forward iron more freely. There is considerable talk of extraordinarily low prices in the Cleveland market but it is doubtful if No. 2 foundry has been sold at below $25 and malleable at below $25.50.

Steel.—New inquiries for small tonnages of cold-finished steel bars and cold-rolled strip steel are reported from automotive interests aside from liberal releases of old orders. Cold-rolled strip steel is offered at as low as 5.65c., Pittsburgh. Cold-finished steel bars are quoted at 3.00c.. Pittsburgh. Several large sheet inquiries from Detroit passenger car builders are reported from Pittsburgh. Nothing definite can be learned regarding reported negotiations for the acquisition by the Ford Motor Co. of an Ohio alloy steel rolling mill.

Copper.—In spite of the shut-down of most of the large producers, a certain amount of output continues.

Aluminum.—The market continues quiet and unchanged in tone.

Tin.—The market seesaws fractionally at around 30c.

Lead.—Representatives of Spanish interests owning the Penarroya mines, are offering metal at 4.25c., New York. In the "outside" market 4.50c. is asked for spot dead. New York, which is $5 a ton above the chief interest's quotation.

Zinc.—The market continues dormant with metal obtainable at below 4.65c., East St. Louis, the price nominally quoted.

FINANCIAL NOTES

Kelly-Springfield Tire Co., directors have declared the usual quarterly stock dividend of 3 per cent on the common stock, but decided to omit the quarterly cash payment. The stock payment will be made May 2. The regular quarterly dividend of $2 a share on the 8 per cent preferred stock was also declared and will be paid May 16. Cash disbursements of $1 a share have been made on the common stock in addition to the stock dividend in each quarter for some time past.

International Harvester Co. has no intention of embarking upon a plan of refinancing, according to a statement by President Harold F. McCormick, who branded such reports as deliberate misrepresentations. The financial requirements for the year have been fully provided for, he said, and the maximum 1921 borrowings will not exceed two-thirds of the amount borrowed in previous years. All the foreign plants are being operated and export demand is heavier than usual.

Fisk Rubber Co. balance sheet for Dec. 31 shows total assets of $57,205,725.55, of which $20,888,163.40 is represented in inventories and $2,419,277.12 cash. The surplus of $7,789,085.45 represents a falling off from the surplus of $8,295,821.49 for the year previous. Dividends paid in 1920 totaled $2,561,739 and $235,700 was set aside for Federal taxes. Net sales for the year were $42,345,871.05. Net profits totaled $4,952,681. Inventory and contract losses written off totaled $2,669,117.38.

Perfection Tire & Rubber Co. stockholders will vote on April 13 on the proposition to create $5,000,000 8 per cent participating cumulative preferred stock and on changing the $1,500,000 common stock, par $10, to 150,000 shares of no par to be exchanged for old stock pro rata. Present production of the company is said to be 80 per cent of normal. The company is operating on a basis of $50,000 a month profit.

Timken-Detroit Axle Co. announces a total surplus of $17,820,062.16 and net profits for 1920 of $712,508.87 in its report as of Dec. 31. Total assets were $21,494,863.39, including $671,150.38 in cash and inventories of $10,932,521.39. Land, building and equipment account is given as $8,257,232.52. Current liabilities were $3,574,801.23, including $3,000,000 due in bank notes and $387,480.15 in accounts payable.

Hart-Parr Co., in a balance sheet as of Dec. 31, 1920, show total assets as $3,102,519.13, of which $215,189.76 is cash and $1,144,216.02 merchandise inventories. Loss on contract and purchase commitments will approximate $34,635 for which no provision has been made. A deficit of $131,923.90 is shown. The ratio of current assets to current liabilities is 5.5 to 1.

National Motor Car & Vehicle Corp., is offering through Ford Lambert & Co., New York, an issue of $1,200,000 8 per cent. five-year sinking fund gold notes, due April 1, 1926, at a price of 97½.

Spicer Mfg. Co. reports surplus after interest charges, depreciation, inventory adjustment and Federal taxes of $646,022, equivalent after preferred dividends of $1.29 a share earned on the 313,750 shares of no par value common stock outstanding.

Stutz Motor Car Co. shows total assets for 1920 as $8,052,522, of which $3,049,238 is inventory and $217,043 cash. Dividends payable are placed at $250,000 and reserves for all purposes at $618,238. The surplus shown is $5,404,414.

Moline Plow Co. creditors in charge of the plant have chosen F. O. Wetmore as chairman of their committee. The company has passed its preferred dividend because of the falling off in sales and slow collections.

American Bosch Magneto Corp., at the annual meeting returned all members of its board of directors and the directors reelected all officers.

Goodyear Tire & Rubber Co. of Canada has passed its dividend for the current quarter on its preferred stock.

Liberty Airless Tire Corp. has purchased the Carey Tire & Rubber Co.'s tire plant at Carey, Ohio.

INDUSTRIAL NOTES

Atlas Crucible Steel Co. has moved its general offices, including general sales, to the Hanna Building, Cleveland, effective April 15. The company has extended its facilities and is now furnishing alloy steels as well as tool steels. Frank P. Case will be in charge of tool steels and Harry J. West in charge of alloy steels.

Wheel Trueing Tool Co., importers of industrial diamonds and manufacturers of diamond pointed tools, has moved its western office from Milwaukee to the branch office in Chicago. William J. Sansome will be in charge at the new location.

Gardner Motor Car Co., St. Louis, is now operating on a five-day week basis, turning out between 65 and 70 cars daily and employing 750 men. A total production of 2000 cars was made for the first quarter of 1921.

Kahler Co., New Albany, Ky., manufacturers of bodies for Ford cars, resumed operations this week after being closed down for fourteen weeks. The plant is on a daily production basis of 280 bodies.

Eco Co. has been formed in Boston for the manufacture of piston rings. The new corporation assumes all obligations of the Eco Mfg. Co. and the personnel and management will continue the same.

Miles Piston Ring Co., Chicago, has recently moved into its new factory. The company is adding additional equipment which will enable it to increase output.

Creditors to Decide Standard Parts Plans

CLEVELAND, April 6—Something of a definite nature regarding the future of the Standard Parts Co. is expected to develop at a meeting of the creditors of the company which will be held at the Hollenden hotel in this city April 12. The meeting has been called by F. H. Goff, president of the Cleveland Trust Co., who is chairman of the creditors' committee.

"This meeting has been called for a conference of the creditors of the Standard Parts Co.," Goff said to-day. "Reports will be submitted by Frank A. Scott and J. O. Eaton, the receivers as well as by the creditors' committee. The whole situation will be thrown open for discussion and creditors will be given an opportunity to express themselves as to the proper course to pursue."

It is understood that a plan will be submitted by the creditors' committee for the lifting of the receivership.

BANK CREDITS

Written exclusively for AUTOMOTIVE INDUSTRIES *by the Guaranty Trust Co., second largest bank in America.*

NEW YORK, April 7—The outstanding feature of the financial week was the continued marked improvement in the reserve position of both the New York Federal Reserve Bank and the Federal Reserve System as a whole. The shifting of credits in the central gold fund at Washington and the continuous stream of gold imports have favorably affected the New York bank in particular.

Last week the New York Federal Reserve Bank increased its gold reserves by $93,941,000, bringing the total up to $682,233,988, the largest total since June, 1919, and $238,000,000 above the figure of four weeks ago. Cash reserves increased $93,524,000; total bills on hand declined $68,967,000; total earning assets $70,542,000, and total deposits $3,362,000. While Federal Reserve notes in circulation increased $2,721,000, the ratio of total reserves to deposit and Federal Reserve note liabilities combined increased from 50.3 per cent to 56.7 per cent, the highest ratio attained since 1918.

The week-end statement of the New York Associated Banks reflected somewhat the results of the end-of-the-month settlements. The excess reserves over legal requirements at $14,285,300 marked an increase of $6,624,260, and loans declined $11,804,000, and net demand deposits increased $93,235,000.

A large increase in gold reserves was largely responsible for the improvement in the position of the Federal Reserve banks as a whole, but a substantial reduction in note circulation and in deposits was also an important factor. Gold reserves increased $35,674,000 and cash reserves $39,254,000, while total bills on hand declined $72,608,000, total earning assets $79,252,000, and total deposits $51,654,000. Federal Reserve notes in circulation declined $22,576,000 to $2,908,153,000, or $496,800,000 below the high of Dec. 22, 1920. Federal Reserve Bank notes also declined $5,768,000. As a result of these changes, the ratio of gold reserves to Federal Reserve notes in circulation, after setting aside 35 per cent against net deposits, increased from 60.7 per cent to 63.1 per cent. The ratio of total reserves to deposit and Federal Reserve note liabilities combined increased from 50.8 per cent to 52.4 per cent, the highest since the beginning of 1919.

The improved banking situation had no outward influence toward lowering interest rates. Call money was unchanged, with a range of 6 to 7 per cent and a ruling rate of 6½ per cent, with outside money said to be still available at lower rates than those quoted on the "board." A firm undertone, however, was evident near the end of the week—the result, probably, of the end-of-the-month settlement. The time money market was dull with few important transactions.

MEN OF THE INDUSTRY

W. L. Shaffner, for the last nine years connected with the B. F. Goodrich Rubber Co., has resigned to join the Acme Motor Truck Co., at Cadillac, Mich. Shaffner will be in charge of the national account division under the direction of Sales Manager C. J. Helm. Shaffner enjoys a wide acquaintance in the trade. For the last five years he has represented Goodrich in the manufacturers' division of the Detroit district. L. E. De Groat, formerly of Timken-Detroit Axle Co., is now with Acme in charge of dealer promotion work.

Charles S. Crawford has resigned as vice-president in charge of engineering at the Premier Motor Corp., Indianapolis, and has opened a consulting engineering office at 337 North Irvington Avenue, that city. He will consult on all Premier engineering work for the balance of the year. Crawford has been connected with the automotive industry since 1909 when he joined the Cole Motor Car Co. as chief engineer and assistant to J. J. Cole. He had been associated with Premier since 1916.

L. E. Warford, Seattle, well known in Pacific and Western States good roads and touring activities, has become associated with the American Automobile Association touring bureau at its New York headquarters. With his thorough knowledge of Western and Pacific Coast routes, obtained by actual touring contact, Warford will be able to supply first-hand information of especial value to interstate road travelers.

George T. Briggs, formerly in advertising and sales capacities with the Wheeler-Schebler Carbureter Corp. and the Sinclair Consolidated Oil Corp., has been made general manager of the Motorcycle & Allied Trades Association with headquarters at 326 West Madison Street, Chicago. The association has under way a "Do It With a Motorcycle Campaign" which includes national publicity in a number of mediums.

B. F. Jones has resigned as president of the Republic Rubber Co. because of ill health. He has been with the company only about a year and has given such close attention to its affairs during a period which has been critical for tire companies that his physical condition has been impaired in consequence.

W. J. Jamison, who has been superintendent of the Delco Light Co. plant at Dayton for the past five years, has been appointed factory manager of the Kelly-Springfield Motor Truck Co., succeeding L. P. Kalb, who resigned recently.

E. H. Roddy has joined the Barco Battery Company, Inc., manufacturers of the Bearcat storage battery, as general superintendent. Roddy formerly was with the Electric Storage Battery Co. and also the Philadelphia Storage Battery Co.

J. C. Kearns has been appointed acting sales manager of the Republic Rubber Corp., following the resignation of H. J. Woodard as vice-president in charge of sales. L. M. Barton has been appointed manager of pneumatic tire sales.

J. J. Moriarity has been appointed factory manager of the Victor Rubber Co., filling the vacancy caused by the resignation of Frank R. Talbott. Moriarity was formerly connected with Republic Rubber Co. and with Firestone.

Willis T. Behoteguy has been named manager of all tires sales with the Goodyear Tire & Rubber Co., succeeding H. G. Palmer, who retires because of ill health. F. L. Morgan is made manager of automobile tire sales

E. S. Beggs at Long Beach, Cal., has been made sales manager of the Planet Mfg. Co. of Detroit, manufacturers of a carburetor attachment.

F. H. Hearsch has resigned as San Francisco district manager of the Kelly-Springfield Tire Co. His plans for the future are not announced.

J. Harold Kraus, Jr., formerly of San Francisco, has joined the sales department of Bantam Ball Bearing Co., Bantam, Conn.

Nine Manufacturers Affiliate with A.E.A.

CHICAGO, April 6—At the mid-convention meeting of the Automotive Equipment Association a committee was formed to handle the show at the Coliseum in November, which consists of: N. H. Oliver, chairman, Illinois; William Von Elm, vice-chairman, New York; Charles C. Gates, Colorado; W. E. Wissler, Iowa; W. H. Parkin, Michigan.

The following new members were admitted: Jobber—Sheridan Auto Supply Co., Chicago. Manufacturers—Adams & Elting Co., Chicago; Bowen Products Corp., Auburn, N. Y.; Graton & Knight Mfg. Co., Worcester, Mass.; S. C. Johnson & Son, Racine, Wis.; Las-Stik-Patch Mfg. Co., Hamilton, Ohio; Standley Skid Chain Co., Boone, Iowa; Vogt Mfg. Corp., Rochester, N. Y.; F. W. Wakefield Brass Co., Vermilion, Ohio; Western Vulcanizer Mfg. Co., Chicago.

President Robert A. Stranahan was made chairman of a committee to promote trade relations.

A steamship will leave Chicago, June 18 to carry members from tributary sections to Mackinac Island. William Von Elm is handling arrangements for a boat to leave Buffalo, Cleveland or Detroit to carry members from the east.

The question of manufacturers or jobbers entering local shows was covered by a resolution requiring the sanction of the advisory committee or local jobbers.

Franklin Net Profit for 1920, $2,235,625

SYRACUSE, April 4—In the annual report by the H. H. Franklin Mfg. Co. of Syracuse, net profit from sales for the past year is shown as $2,235,625.20. From this total was deducted depreciation of inventory to market value at the close of the year, write-off of development expenses and obsolete stock, and miscellaneous adjustments, which leave the net income of the business at $831,514.99, before Federal taxes. After deducting these taxes, the addition to surplus for the year totals $696,514.99.

Total sales for 1920 aggregate $28,585,398 including cars, spare parts and die castings. This figure compares with $22,811,889 the previous year.

During March, 1005 cars were shipped from the Franklin plant, this being the full output of the factory. Since Feb. 10, the factory has operated at 100 per cent normal (or at the rate of 40 cars per day) and from that date up to April 1 has shipped a total of 1765 cars.

Orders for 843 cars for April delivery were already on hand on April 1.

Edge Would Speed Aid to Export Business

WASHINGTON, April 6—Of the utmost significance to the automotive industry is the proposal of Senator Edge of New Jersey to amend the so-called Edge Act in order that the $100,000,000 Foreign Trade Financing Corp. may operate immediately. The original legislation which the Senator sponsored required that 25 per cent of the capital should be paid in before activities could start.

The Senator proposes an amendment, it is said, which will allow the foreign trade financing organization to function with the requirement to call up their total capital stock at certain specific periods. The proposed amendment would liberalize this proviso yet provide essential safeguards. With the slump in the volume of American export business in automotive products, all efforts to assist market development will have an important bearing on production.

New Tariff Effective When Sent to Congress

WASHINGTON, April 6—While the tariff is not as important to the automotive industry as internal revenue revision, it is interesting to note, in view of increased imports of foreign cars, that it is proposed to introduce a joint resolution making the permanent tariff schedules effective from the day the drafts are reported to the House. This resolution, if passed, would automatically increase the price of foreign cars provided of course, higher rates are enacted.

It is understood that this resolution will be reported from the House Committee on Ways and Means soon as a form of interim legislation. The resolution would be in accordance with recommendations of the Tariff Commission under which duties would attach themselves to imports though the actual rates had not been approved by the Congress. As Chairman Fordney plans to introduce the permanent tariff by May the new schedules would become effective as of that date.

MEETING AGAIN POSTPONED

AKRON, April 4—The meeting of Goodyear stockholders scheduled for Wednesday to definitely ratify the company's reorganization plans and refinancing negotiations for $85,000,000, has been adjourned again until April 11.

Calendar

FOREIGN SHOWS

April 16 - May 8—Bosquet, Algiers; Algerian Agricultural Fair, Motor Cars, Machinery and Tractors.

Apr. 20 - May 5 — Mexico City, Mexican Automobile Show, National Theatre Bldg.

April, 1921—Sofia, Bulgaria, Tractor Trials, under the Bulgarian Ministry of Agriculture.

May 28, 1921 — Czecho-Slovak International Automobile Exposition of Cars, Trucks, Tractors, Motorcycles and Equipment. Prague.

May 28-June 8—International Automobile Exhibition, Basle, Switzerland.

June, 1921—Reykjavik, Iceland, Agricultural Exhibition—Agricultural Machinery—Icelander Agricultural Society, Reykjavik, Iceland.

September—Buenos Aires, Argentina. Passenger Cars and Equipment. La Pabellon de las Rosas. Automovil Club Argentino.

September — Buenos Aires, Argentina, Cars, Trucks, Tractors, Farm Lighting Plants and Power Farming Machinery. Palermo Park; Sociedad Rural Argentina.

September—Luxemburg, Luxemburg Agricultural Sample Exhibition.

Oct. 5-16—Paris, France, Paris Motor Show, Grand Palais, Administration de l'Exposition Internationale de l'Automobile, 51, Rue Pergolèse, Paris.

Nov. 4-12 — London, British Motor Show, Society Motor Mfrs. and Traders.

CONVENTIONS

May 4-7 — Cleveland, National Foreign Trade Council.

May 17-19—Buffalo, Convention of Factory Service Managers, Auspices of Service Committee, N. A. C. C.

May 24-28 — West Baden, Ind., Summer Meeting Society of Automotive Engineers, West Baden Springs Hotel.

July 4-9 — Mackinac Island, Mich., Summer Meeting Automobile Equipment Association.

Oct. 12-14, 1921—Chicago Twenty-eighth Annual Convention National Implement & Vehicle Ass'n.

RACES

June 18—Uniontown, Pa., Speedway Events.

July 25—Grand Prix, Le Mans.

Labor Day—Uniontown, Pa., Autumn Classic.

N. A. C. C. Questions Paris Show Ruling

NEW YORK, April 4—According to the application blanks just received, certain restrictions have been placed upon prospective exhibitors of American motor cars at the Paris Automobile show next fall which the American manufacturers believe is hardly in line with the co-operative spirit that has been shown on this side of the water, especially following the request of the National Automobile Chamber of Commerce for a reduction in the tariff on foreign cars coming into this country.

The restriction which is felt to aim particularly at American manufacturers reads as follows:

"Manufacturers belonging to allied nations are admitted on the same terms as French firms, provided they have taken part in three previous Paris shows and on condition that their pre-war import duties were not more than 15 per cent ad valorem."

Under such a rule American firms do not have the same choice for space as British, Belgium, and Italian manufacturers.

Not Proper Show Condition

At the N. A. C. C. offices it was said that little objection could be raised to a rule which required all exhibitors to have taken part in at least three previous shows although no such rule is enforced at the American exhibitions to which foreign cars have always been welcomed, the question has been raised whether the question of duty properly comes under the show conditions, especially when such limitation may prevent a fair presentation of American products, many of which have been sold abroad for years.

It was pointed out that at present the tariff on motor cars coming into this country is 30 per cent on cars valued at $2000 or less and 45 per cent on cars selling at more than $2000. The manufacturers of cars and trucks in the N. A. C. C. voted unanimously to request Congress to reduce the tariff to 30 per cent so that all cars may come in on the same basis.

In this connection it was requested of the authorities at Washington to offer this reduced rate in all cases where our products going into a foreign country are treated the same as the cars imported from all other countries.

Sunbeam Builds Special for Indianapolis Race

LONDON, March 12, (By Mail)—The eight-cylinder-in-line 3-litre Sunbeam to run at Indianapolis has commenced its tests at Brooklands. Although no details of the design are yet available, the following general particulars can be given. It has a bore and stroke of 65 x 112 m.m. and is said to develop something like 130 b.h.p. There are four overhead valves per cylinder, and four Claudel carbureters are fitted with their intake pipes projecting through the right side of the hood, matching the exhaust outlets on the left.

No flywheel is used, this item being considered unnecessary in view of the heavy balanced crankshaft. Delco ignition is depended upon, and while only rear wheel brakes are fitted to this particular car, the three sister cars for the French Grand Prix have front wheel brakes in addition. In another respect, also, the Indianapolis and Grand Prix cars differ, for in the former the chassis as a whole is not set centrally on the axles, being appreciably nearer to the left hand wheels than to those on the right, this arrangement having been adopted to assist cornering towards one side at high speeds.

The frame is very considerably upswept over both axles and thus gives the car an extremely low appearance.

FOX OUT AS GUN MAKER

PHILADELPHIA, March 28—Ansley H. Fox, president of the Fox Motor Car Co. has not been connected with the A. H. Fox Gun Co. for several years, although he invented the Fox shot gun.

Argentine Expositions to Be Repeated in 1921

NEW YORK, April 5—The announcement of two important automotive exhibitions to be held in Argentina was made to-day by EL AUTOMOVIL AMERICANO, the Spanish automotive publication of the Class Journal Co. These exhibitions, the first of which will take place the first two weeks in September, will be the annual cattle and agricultural show of the Sociedad Rural Argentina and the second, which will be held later, will be the annual automobile show of the Automovil Club Argentino.

These snowings are perhaps of more importance to automotive manufacturers than any others held in Latin-America. They are both well established, well managed and draw large attendance from all parts of Argentina, Uruguay and some of the other countries adjacent to Argentina. The agricultural exhibition of the Sociedad Rural Argentina takes place in the grounds of the association in Palermo, at Buenos Aires, and the best products of the Argentine ranches are brought there for show. Immense crowds attend, and while not exclusively automotive, it is an excellent opportunity to display passenger cars, motor trucks, tractors, farm lighting plants and other equipment.

Will Be Fourth Car Show

The show of the automobile club was held for the third time in November of last year in a fine building known as the "Pabellon de las Rosas" and the announcement that it will be repeated during 1921 should be of wide interest to the trade. Passenger cars and accessories are shown and the Chamber of Commerce of the United States in the Argentine Republic is authority for the declaration that practically every American and European car represented in Buenos Aires is on exhibition.

The plan of holding automotive shows throughout Latin-America is increasing rapidly, according to EL AUTOMOVIL AMERICANO.

AUTOMOTIVE INDUSTRIES
THE AUTOMOBILE

VOL. XLIV. NEW YORK—THURSDAY, APRIL 14, 1921 No. 15

Importance of Taxes to Automotive Vehicle Sales

The sales resistance must increase as the cost of maintenance increases. The taxes proposed in pending legislative suggestions will mean a levy of $63 per vehicle. Steady increase of taxation is indicated.

By Clyde Jennings

IT IS, of course, repeating a truism to say that the marketing of automotive vehicles has been grossly neglected, as compared with the designing and production of the vehicles. The same statement might be made about any other new industry, at least in the period before it had reached a stage of positive development.

There has been practically no sales research or analysis as regards the automotive vehicles. Many manufacturers have seriously discussed the saturation point, when a few hours of organized study of the possibilities of the vehicle they were making would have convinced them that the saturation point of transportation would come when civilization became fixed.

Even a casual interest in the points of resistance to the sales of motor vehicles would long ago have convinced any one interested that one of the chief points of resistance was

The continual threat of higher taxes upon the vehicle.

Had this point been appreciated years ago the present acute situation would not have arisen. The industry would have been forewarned and prepared for the situation that exists, and it would have been more of a passing incident than an acute situation.

The writer well remembers talking with a member of a Southern State legislature a few years ago when he spoke of a bill that had come quite near passing which would have taxed automotive vehicles out of that State. He was asked who opposed the bill. The answer was:

> **"Chiefly a few members of the legislature who owned cars or trucks and who saw the possibilities of these vehicles. A few private motor car owners came to our aid. A dealer or two showed some interest, BUT NO MANUFACTURERS."**

This was the situation until a few years ago. Beginning with the war period the legislative and tax problem has been given more consideration. When America finally went into the war, the question of luxury or necessity became acute and it was quite seriously debated. On the face of the returns the automotive industry was the victor in that argument. At least trucks gained the right of way, but the passenger car went into the discard—as the cards were written for the next year's program.

The situation was never entirely worked out, thanks to our army in Europe. Then the manufacturers went home and to a considerable extent forgot about that battle over the necessity of the automotive vehicle except on those occasions when reminiscences were the order of the evening. This is not in any way a criticism of those who worked so valiantly and well for the industry in the crisis of that period.

The next move was a logical one—the organization of the Motor Conference Committee.

The idea behind the Motor Conference Committee is a good one and it is working out very well. The only criticism here is that the organizations behind the committee have not seemed to appreciate the need of this work, nor the need of support to be given by personal efforts of work that the Committee might do. The industry has never appeared to appreciate the power of the individual in legislation.

The greatest single step toward a remedy for the situation as it has existed was the writing of the Proposed Uniform Vehicle Law and the concentration upon that law for proposed legislation. Granted that the law is not exactly what any one of the persons interested would write, it is the best that can be agreed upon by the various elements interested in this legislation. A concentration upon a measure of this sort is a constructive effort to regulate taxes from the state, and these have been by far the most important item of taxes.

But now comes the question of Federal taxes, and, because the industry has not been in training in matters of constructive legislation work, it is not prepared to meet the situation. Then, too, even within the industry, the proposed Federal taxation figures take entirely too alarming an aspect.

It is the truth that the bulk of the increases of taxes, fees, etc., made possible in legislation in the several states promises to equal the proposed taxation by the Federal government, yet there has not been centered upon the legislation in the states anything like the activity that is being brought to bear in the Federal situation.

The suggestion is this:

Legislation in Federal, State and municipal governments is working constantly and should be under constant observation. There should be a steady pressure exerted for fair and intelligent legislation. It should not always be mere fighting of legislation. Automotive vehicles are property, and there should be taxes on them, but it should be a fair and consistent taxation, in keeping with the necessity and value of the article taxed.

All states collect fees and licenses on automotive vehicles and many states levy an additional fee upon any person who holds a driver's license. The total of these fees and licenses amount to more than $100,000,000. The tabulation of the registration figures showed in excess of $91,000,000 and in many cases the reports there were not for the full year. Also this tabulation does not include municipal fees, which are collected in many large cities.

In addition there is a very large personal property tax on automotive vehicles in those states where a personal tax is levied. C. A. Vane, general counsel for the National Automobile Dealers' Association, has estimated the personal taxes collected on automotive vehicles at $80,000,000. Vane's estimate is that the state taxes and fees for the last year were about $200,000,000. They will be greater this year. How much greater cannot now be accurately estimated because the legislatures are not yet through with their job of increasing fees.

An increase of taxes means increased sales resistance. This, certainly, will not be disputed.

A man may be perfectly willing to pay $3,000 cash for something and be absolutely **opposed to the idea of assuming an obligation to pay a tax of $75 a year for the privilege of spending that $3,000.**

The present situation is rather acute because many states have been deprived of their revenue from liquor licenses without preparation (such as usually takes place when a state goes dry by its own vote) and the lawmakers are looking for the easiest (not best) method of raising money to replace this loss. As is stated elsewhere in this magazine, in an article by Alvan Macauley, it looks on the surface as though the man who drives a motor could easily pay for this privilege.

Naturally the suggestion of former Secretary of the Treasury Houston that almost $300,000,000 of additional taxes be levied annually upon the motor equipment of this country looked too startling to those within the industry to be true. There was a good deal of astonishment that the new administration showed signs of approving of this tax as outlined by the retiring Democrat.

But the fact remains that these suggestions by Secretary Houston are still being considered seriously. AUTOMOTIVE INDUSTRIES printed the following statement of Secretary Houston's annual report in the issue of December 2, 1920:

IN his annual report, Secretary of the Treasury Houston has made specific recommendations for raising the $5,000,000,000 which the present administration considers necessary for running the Government next year. The part of the tax recommendations which are of especial interest to the automotive industry are:

1. Increase of the sales tax from 5 per cent to 10 per cent, which it is estimated will make an increase of....	**$100,000,000**
2. A Federal license of cars based on 50 cents per hp..................	**100,000,000**
3. A consumption tax on gasoline at 2 cents per gallon..................	**90,000,000**
4. The truck sales tax will be continued at 3 per cent, despite efforts to have it eliminated.	
New taxes from industry.............	**$290,000,000**

The 10 per cent sales tax is applied, as now, to passenger cars, motorcycles, parts and accessories for these vehicles and will include tires.

These recommendations by Secretary Houston are about what those of the industry who are familiar with the tax tendencies expected from his report. They are practically the same as those recommended in the preliminary report of the National Industrial Conference Board. When this report was brought up for hearing recently at a New York meeting of the Board, the National Automobile Chamber of Commerce appeared before the Board and asked that these tax recommendations be revised. It was then shown that the automotive industry in 1919 paid almost $150,000,000 in excise taxes to the national government, as follows:

1. Excise taxes on motor car sales.....	**$77,000,000**
2. Excise taxes on truck sales.........	**14,000,000**
3. Excise taxes on parts and accessories	**52,000,000**
1919 taxes........................	**$143,000,000**
In addition the automotive equipment pays:	
State and municipal registration fees...	**$64,000,000**
State and local taxes on the valuation for personal taxes.................	**50,000,000**
	$114,000,000

When this showing was made to the Industrial Conference Board that body immediately agreed that the industry was paying its share of taxes and they decided to make no recommendations for increased automotive taxes. During the hearing a member of the Industrial Conference Board asked if the industry did not want

Apr

national registration of cars. The answer was that while this might be very desirable, the industry did not want to pay $100,000,000 for such registration.

Taxes in 1920 were much higher than in 1919. Let us assume that they amounted to $200,000,000.

The attempt to show just how a total tax levy of probably $800,000,000 on the automotive industry would increase the sales resistance would be a waste of time. The person who cannot see in a measure the result of this taxation on sales is hopeless. The estimate is arrived at in this way:

State fees and taxes for 1920	**$200,000,000**
Proposed and existing Federal taxes and fees	**500,000,000**
Probable increase in state fees and taxes	**100,000,000**
Total	**$800,000,000**

Let us assume that the registration during the year will be increased 500,000, making a total of cars and trucks registered at the end of 1921 of about 9,500,000. This would make an average of taxes and fees for each vehicle registered in the United States of almost $85 a vehicle.

And we might add here that the N. A. C. C. had said that the average wholesale price of cars sold in 1920 was $897.

At this rate America would soon have taxes and sales problems similar to those of several European countries, and likely a similar decreasing registration of automotive vehicles.

In this connection it must be remembered, always, that every automotive factory, salesroom, garage, and this also includes parts factories and hundreds of machine shops, pays local taxes and fees in large amounts. These taxes are, of course, the same as are levied on other industries.

A Brief Analysis of the Annual Appropriation Bills

IT is of little use to criticise any movement, whether public or private, without a constructive suggestion. It is particularly foolish to make a demand of a government, which is "for the people, of the people and by the people," that it economize without pointing out wherein the people are willing that economy should be exercised.

For many years the people have been going to the Government and demanding economy in one breath and advocating expenditure for their favored enterprise in the next. The board of trade of any particular community is very likely to pass a strong resolution demanding greater economy in government so that taxes may be lowered, or even go to the extent of demanding the removal of a certain tax, and then the next day pass a resolution that their city should be favored with a new public building or that some local improvement should be included in the River and Harbor Bill.

This sort of criticism and demands are certainly not constructive. It is fortunate that the National Automobile Chamber of Commerce this year has adopted a different policy as to their tax communications with the Government. Briefly, the attitude adopted by the Chamber is:

> **That the people are stockholders in the Government; the legislative and executive departments of the Government are merely directors of this business body owned by the people; the Chamber and other business and civic organizations propose to advise the Government.**
>
> **FIRST, to economize, and,**
>
> **SECOND, wherein economy may be practised.**
>
> **It is not the policy of the Chamber to attempt to dictate what sort of taxes shall be levied. The actual levy and collection of taxes is to be left to the judgment of tax experts.**

As preliminary to this rather unusual tax program and as the first step in carrying forward this argument, the Chamber has obtained a graphic presentation of the Annual Appropriation Bill for 1922. This presentation indicates the amount of money asked in each of the bills. This graph is reproduced as a part of this article and as an insert in this number of AUTOMOTIVE INDUSTRIES. A glance at the graph will convince the most casual reader that he has probably had a very inaccurate idea as to the actual expenses of the Government. An analysis of this graph is perhaps necessary:

Post Office Bill. This bill is at the top of the graph. It is really not an appropriation bill in the sense that they are to be considered here. The Post Office is practically self-sustaining and the appropriation by Congress is merely permission to spend its own money. The fact that this bill is considered as other bills is a part of the archaic practice of the Government that has been maintained.

Sundry Civil. This bill is the second in the graphic presentation and the line indicating the amount of the estimate is the longest of all the lines in the presentation. It indicates to what extent the governmental experts and others concerned have desired money for the various enterprises concealed under this meaningless title. The line indicating the current appropriations is just a trifle longer than that for the Navy; the appropriations, as passed, being slightly more than $2,000,000 greater. The Sundry Civil Bill is probably open for attack more than any other of the bills. It includes much that is worthy and perhaps indispensable to the Government. Part of the bureau's expenses which are included in this bill are the Interstate Commerce Commission, the War Risk and Soldiers' Rehabilitation. These are quite heavy items in this bill. There are numerous other commissions, the expense of which is carried in this bill from year to year that are not so indispensable. It is seldom that a Congress adjourns without creating several commissions, the object of which seems to be to provide for the "lame ducks" of Congress. The current Sundry Civil Bill has also been "loaded" with numerous civilian army and navy employees. These are commissions and employees left over from war practice which it is hoped to maintain in office. The Army and Navy estimates were so large that it was necessary to place them elsewhere and they were put into this bill. A discussion of the worthiness of these cases would become a discussion of each individual commission. This bill is one that will bear inspection very closely.

Navy. The next highest appropriation bill is that for the Navy. The Navy Bill was passed only by the House.

Army. The Army ranks third in the amount of money asked and fourth in the amount of money appropriated. It was not signed by the President.

A discussion of these two bills will not be entered upon here. Primarily the amount of money to be appropriated for the Army and Navy in the minds of each individual is merely indicative of his attitude toward the question of national armament. Those who are inclined toward a pacifist attitude advocate much reduced appropriations.

Pension. The Pension Bill represents an obligation that the Government has assumed and should not be a part of this discussion.

The five bills already referred to constitute 90.4 per cent of the Annual Appropriation Bill. Below these come the **Legislative,** which is really a very important bill; its real title is Legislative, Administrative and Executive bill and it includes the expenses of Congress, the judiciary, executive departments and from which appropriation practically all civilian employees in Washington are paid; the **Agriculture,** which includes the wide and profitable activities of this great department; **Fortifications** Bill is camouflage for a part of the Army Bill; **District of Columbia** Bill, about half of which is raised by local taxes and the other half is assumed by the Government because of the great demands made by the Government upon this District.

River and Harbor Bill, commonly known as the "pork barrel" bill, is perhaps more widely discussed in newspapers and other publications than any of these bills. This bill has long been one which carried many appropriations for local improvements. Because it hits in so many states, it is much discussed and, of course, every community criticises every appropriation in it except that for their own local purposes. It is really of minor importance.

It has been necessary on the graph, as presented here, to exaggerate somewhat the lines showing the amounts in the next three bills, the **Indian, Diplomatic and Consular,** and the **Military Academy.** These are such small factors in the expense of the Government that if they were wiped out the decrease in taxes would be so slight as to be unappreciable.

It is usually the case that the amount of the various appropriations and the purpose for which they are intended are entirely lost sight of in a discussion of the kinds of taxes to be levied. During the present tax discussion the sales tax has been the topic of a great deal of discussion. In the question as to whether the sales tax should or should not be levied there have been brought out so many opinions and some rather earnest controversies that the persons engaged have not had time to really discuss the purposes of taxation.

There is no dispute on the part of the automotive industry that the Government needs large amounts of money to recover from the effects of the war and that the automotive industry and automotive vehicle owners must pay a proportion of these taxes. It is only a question of what a fair proportion of these taxes shall be.

It is entirely appropriate that in this discussion the industry should be considered as to whether it is a utility industry or a luxury industry. But that question is one very difficult to discuss, because what is a necessity to one person is not to another. There is no question that in the taxes as levied through the bills of a few years ago much injustice took place. There were also many gross inaccuracies. Due to the fact that many articles escaped taxation by technicalities, there is becoming a serious sentiment among serious persons for a general tax on all articles of manufacture or commerce except the few absolutely necessary staples which enter into every person's life. The sentiment expressed in the N. A. C. C. resolution that the technicalities of taxes be left to the experts is also gaining ground.

Of course, there are other expenses of the Government besides these Annual Appropriation Bills. These include the interest on public debt, sinking funds, expenses of loans and already incurred obligations such as year to year road policy and things of that kind. These appropriations should not be the subject of a discussion of this sort. The obligation has already been incurred.

The entire appropriation program is here presented as printed in the *Congressional Record* of March 4, 1921. This information supplements the figures shown in the graph.

From Congressional Record of March 4, 1921

Table comparing, by bills, estimates of regular, supplemental, deficiency, and permanent annual appropriations for the fiscal year 1922 with the appropriations made for the fiscal year 1922.

A Sane Statement of the Necessity of the Automobile

It probably is not necessary to argue the necessity of the automobile with an audience of men who create motor cars but Mr. Macauley has made such a straightforward argument that we suggest it as a model for your conversations. He discusses unwise taxes and methods of meeting them.

By Alvan Macauley*

"WE have in the United States more than eight million passenger - carrying automobiles. Practically every one is a luxury," said Chairman James W. Good of the Committee on Appropriations of the House of Representatives recently. He then proceeded to outline plans to impose a special tax of $500,000,000 a year on the automobile.

Secretary Houston of the Treasury, in his annual report for 1920, recommended special taxes on the automobile to run close to $400,000,000.

"Any man who can afford to run an automobile can afford to pay a stiff tax," is the slogan that went around the Capitol when the new Congress began hunting new sources of revenue.

So, from all sides in Washington, comes the demand that the automobile owner be marked down for special mulcting. He has money, is the claim; the fact that he is an automobile owner proves that he is spending it for luxury.

There is no question that the automobile owner should pay his full share of the cost of running the nation, according to his wealth. He has to do that, anyway. He, like all of us, pays income taxes, excess profits taxes, excise taxes, stamp taxes, property taxes, road taxes and all the other taxes. But this demand is to make him pay a special and distinct tax beyond that which is paid by other people of his own financial class.

It would be fruitless to raise the question whether this is fair. Taxes have to be raised, and since they must be collected from people who can pay them it is not always possible to assess them with complete abstract justice. Any tax system that has ever been devised, or probably that ever can be devised, will have serious weaknesses, and it is possible to offer a good argument against almost any of them.

Unwise Taxes

But it is usually possible and always desirable to settle the question whether a given tax is economically wise. Unwise taxes have an amazing and terrifying power to destroy progress and prosperity. The welfare of a nation is often as much dependent upon its tax system as upon any other one thing. Taxes which place a burden upon production, upon progressiveness, upon decent living, upon thrift—all these taxes have long since been proved unwise.

There was a time when England imposed a tax for every window in a house. It was a luxury, if you please, to have a window. But England has long since learned better. We have recently had vigorous and successful agitation against the excess profits tax, on the ground that it hindered and limited business. In general, the rule by which wise tax leviers guide their conduct is not to impose any burden, more than is absolutely necessary, upon activities or equipment which are in themselves beneficial to the country as a whole. In other words, the rule is that there shall be no tax burden laid on prosperity or progress.

It is obvious, from the remarks quoted, that more than a few men in Congress do not feel that in taxing the passenger automobile we will be making a levy on either progress or prosperity. They feel that they would be taxing a luxury—a very different thing. If these quotations are not enough, the attitude is very definitely shown in the list of articles offered by Secretary Houston for special taxation. This list included, along with the automobiles, such things as tobacco, musical instruments, chewing gum, toilet soap, perfumes, cosmetics. These, in Mr. Houston's mind and apparently in the minds of many members of Congress, have the same general value to the community as the automobile. So, if it can be shown that the automobile is not a luxury, then the plan for special taxation is self-condemned.

What Is a Luxury?

A luxury is something extravagant, something rather exclusive, something lacking in permanent usefulness and good only for the pleasure or ease that it gives. Undoubtedly there was a time when the automobile came under this definition of a luxury. That may, perhaps, have been true even up to five years ago. Certainly at that time automobiles were comparatively exclusive, for in 1914 there were in America only 1,700,000 cars as against the eight million which are running to-day. In those days the automobile was more or less a "rich man's toy."

No one who stops to see what is going on around him can seriously claim that the same situation has lasted until to-day. The very fact that there are eight million automobiles running shows that luxury has become a very every-day affair, or else that the automobile has achieved some place outside the luxury class.

During the last year, certain investigations have been made which for the first time have presented a clear picture of the actual status of the automobile in American life. These investigations were conducted by the National Automobile Chamber of Commerce, which sent to many thousands of automobile owners scattered throughout the country a questionnaire asking for their own statement of the place the automobile fills in their lives. These replies were carefully tabulated, and showed:

*President of Packard Motor Car Co.

That 90% of all automobiles are used chiefly for business purposes.

That 64% of all mileage run by passenger cars is for business purposes.

That the average automobile, including those cars which are used purely for pleasure purposes, has increased the earning capacity of its owner 56.7%.

Let us translate these figures into what they mean in actual life. If we assume that the car which is not used for business purposes is a luxury, then we have in America to-day 800,000 automobiles which can be considered luxuries—a large figure; but there are 7,200,000 which are not luxuries. To tax the "luxury" cars it will be necessary also to tax nine times as many cars which are not luxuries.

If we consider that all automobile mileage which is not for business purposes is a luxury, then there were run in the United States in 1920, on a conservative estimate, 25,920,000,000 passenger miles that were for luxury. But there were 46,080,000,000 passenger miles that were for business purposes.

Earning Capacity

Most startling of all are the figures in regard to the increased earning capacity of men who used automobiles. These mean that the eight million cars have added to the productive force of America the equivalent of four and a half million men. This is an increase of 10 per cent in the working power of the country.

Take the same figures from another point of view. In 1920 there were approximately two million passenger automobiles manufactured. These give the country, as long as they last, an increased productive force amounting to more than 1,000,000 men. Since they will last an average of five or six years, and some of them three times that long, the country benefits from their production by something over five and a half million years' work. There were at no time engaged in the automobile industry in all its branches, including the manufacturers of cars, of parts, of accessories and tires, in selling or in service, more than one million persons. So that the automobiles manufactured last year will give back to the country between five and six times the labor that it cost to make and maintain them.

It must be confessed that these facts surprised many men in the automobile industry who had believed that they realized the essential part that the passenger car was playing in modern life. But further analysis of the situation only increases the evidence of the situation.

For example, surveys that have been made by several different agencies agree that about one-half of all passenger cars are owned to-day by farmers. Even more important from the point of view of taxation is the fact that about two-thirds of all cars manufactured went to the farmers. So the bulk of the sales tax is being paid from the farms, by men who are seldom accused of indulging in luxuries.

Another class that has found the car invaluable is salesmen. There are no figures to show how many salesmen own or use automobiles, but if anyone will stop to think how many of the cars within his own knowledge are used by such men, he will realize how important a part of our selling organization the passenger automobile is.

Multiplies Doctors

Then, there are the doctors. More than one hundred thousand physicians in the United States are using automobiles. Their cars not only increase greatly the number of patients that they can reach, but they make it possible for the doctor to get to the bedside in times of crisis far more promptly than of old. This saves both life and suffering, but perhaps should hardly be counted as an economic factor. But the increased number of calls each doctor can make is a saving that can be figured in dollars and cents.

There is, also, the direct use of the car in public services. An example of this may be seen in the big telephone companies. The New York system keeps on hand more than 700 passenger cars for the use of its line men and "trouble shooters." Philadelphia has about 500, and so it is throughout the continent. National, State and City governments also are using thousands of passenger cars for various purposes.

Something of the way in which the car is making money by saving time for its owners may be seen from the following list, compiled from the questionnaire mentioned, which shows by classes the increase in capacity as a result of using automobiles.

Real Estate and Insurance	113%
Doctors	104%
Salesmen	103%
Clergymen	98%
County Superintendents	72%
Farmers	68%
Contractors	51%
Manufacturers	33%
Bankers (including rural)	33%
Merchants	25%
Lawyers	23%

These facts give us the first true picture that has been drawn of the place of the automobile in American life. In drawing this picture, everything except the dollars and cents value has been carefully excluded. This picture proves that the automobile to-day is no longer a luxury but a tool, that it is an essential part of modern industrial life. It shows what those who have watched it closely have known, that the glory of the automobile in the last five years is that it has ceased to be a "rich man's toy" and has become the common servant and companion of people of all classes.

It is clear, then, that the plan now before Congress is to tax not a luxury, but a tool. There is no question whatever that such a tax would decidedly limit the use of this tool and hamper the economic progress that we could otherwise expect from its aid. What will this mean?

Civilization can fairly be said to have begun when some savage discovered that by sharpening a crooked stick for a hoe he could increase his crop of corn without increased labor. From then until to-day civilization has progressed through making machinery that increases the productive power of the individual man without increasing the effort that he has to exert. Particularly, we have learned that the things which pay us most are those which save our time; and in our complex modern society the greatest of the time savers is transportation.

No one would think of putting a punitive tax upon railroad travel, although it is often for pleasure. Yet the automobile to-day is carrying a heavier passenger mileage than is the railroad. It is as a transportation agent, as a time saver, that the automobile is performing its great services and paying its immense profits to the people of America to-day.

These savings and profits are matters shown by statistics and are beyond dispute. But there are other economic services, giving high value, on which it is impossible to compile figures but which are just as definite and just as important.

The Greatest Service

The greatest of these, perhaps, is the service that the automobile is giving in making farm life more tolerable. It has long been known that one of the things that has

been driving young people from the farms, and that has now turned America into a country where the majority of its population is in the cities, has been the isolation and the dreariness of most American farm houses. The farmer's car is, first of all, a time-saving productive instrument, but in addition it has destroyed the distances and the isolation of the rural communities, and brought neighbors closer together so that with a car the farmer and his family can enjoy a neighborhood social life and the benefits of community life in a way that was never before possible.

In the second place, the automobile is definitely acting as an offset to the congestion of the cities. Scores of thousands of people of all classes have found in their automobiles, during the recent crisis, the answer to their housing problem. A glance at the map showing settlement around New York City indicates this. There have been almost no new traction lines built in the suburban area within the last ten years. A map of ten years ago shows a narrow strip of settlement, seldom more than a quarter of a mile on each side of the tracks, along these traction systems.

Workers' Cars

To-day the spaces between the systems have been filled or are filling rapidly. Men would not walk more than a quarter or, at the most, a half mile to the stations; their cars carry them four or five miles in the same length of time and in far greater comfort. The tremendous increase in New York's suburban population, with all that it means of relief in the congestion that would have occurred had these hundreds of thousands of families been poured into the actual limits of the city, and all that they now have in comfort, fresh air, sunlight and quiet, is distinctly due to the automobile.

Nor is this a benefit that is monopolized by the rich or even the middle classes; it is one that is shared and shared largely by the manual workers in all of our industrial centers. It was noted last fall, when the depression struck Akron, for example, that the great exodus of rubber workers from that city took place almost entirely in automobiles, in these cars they scattered to city and town and country within a radius of several hundred miles and found work in places where the depression was not yet felt.

Around Detroit we have seen the same thing in another impressive way. All through the country, within fifteen miles of the city, there have sprung up in the last few years literally hundreds of little groups of cheap houses. Many of them are mere two-room shacks. Some are more pretentious and a few are extremely comfortable six or eight-room cottages. Most of them have one feature in common—a garage.

Commutation

These are the homes of workers. Many of them they have built with their own hands, and during pleasant weather it is no uncommon thing to find on Saturdays and Sundays an entire family—father, mother and children—busily at work putting up their homes. Around the houses spring up little gardens and the men who have adopted the "flivver commutation" pour into the city in the morning along a dozen highways and pour out again at night. They have found fresh air, quiet, sunshine, cleanliness and health for themselves and for their children. And these are distinctly men to whom the payment of an extra tax will be nothing less than a calamity.

With many of the "rubber tire commuters," too, there is a saving in rent and in general living expenses. People who have put their housing problem on wheels, so to speak, and moved it out of town, certainly have far greater comfort and far more healthful surroundings than can be purchased in the city for the same money. Special taxation on the automobile will have a definite effect in limiting this movement, which is one of the most healthful and promising of modern times.

There is no need to dwell upon the social services that the automobile gives, of the kind that cannot be reckoned in cash; the fact that it provides healthful, inexpensive recreation for millions, that it puts the outdoors within reach of the city dweller and the city within reach of the country man, that it is a successful competitor of the dance hall and the pool room—these latter two being without doubt luxuries and, therefore, may be held to be justly taxable.

Who Will Pay

One of the questions to be considered in planning intelligent taxation has to do with what class of people will pay. Those who are urging heavy taxes on the automobile haye assumed an answer to this question. They believe that it will be paid by those who can most easily afford it, that is, by the rich.

Of course, rich people have cars, but it is no longer true that the majority of cars in the United States are the property of wealthy people. The average retail price of passenger cars manufactured in 1919 was under $1000 each. It is obvious, therefore, that a great majority of motor vehicles in this country are not of the class of luxurious products which customarily go into the hands of rich folks.

There are, of course, high priced cars and there are considerable numbers of them. The total output last year of the various automobiles that fall into this class was between 3 and 4 per cent of the total output for the year. At first glance, it would seem reasonable to say that the owners of these are people who could very easily pay the heavy taxes proposed, but it should be remembered that these are the people who are already carrying the great bulk of the taxation of this country. At any rate, the other 96 per cent of the cars are in the hands of people who cannot possibly be considered rich or even well-to-do.

Tax on Production

So we find that in imposing the heavy discriminatory tax on the automobile, beyond the 5 per cent it already carries, our legislators are advocating exactly the kind of tax which economists agree has everything against it and very little to recommend it. They are advocating a tax upon production, a tax that puts a penalty upon thrift and business efficiency. It is a tax, too, on good health, on comfort and on sane recreation. It is distinctly not a luxury tax.

Moreover, it is a tax on progress. No one who's memory goes back twenty years needs any proof of what the automobile has done in bettering living conditions for the great body of the American people. No one with any foresight can doubt that this improvement is only beginning, and that if unhampered the automobile in the next few years will provide more comfortable homes and better living conditions for millions, in addition to continuing to serve as a powerful productive agent.

In the coming years the automobile will be the greatest factor in breaking up the fetid congestion of our great cities and toward destroying the isolation of the farm. It will be of the greatest possible help in bringing to people of all parts of the country in all walks of life an equality of enjoyment and opportunity in many of the most essential of those things that go to make up our American democracy.

It will do these things in proportion as it is not hindered. The proposed tax will definitely check all these beneficial tendencies and will set progress back just so much. Of course the tax cannot stop it. But it can do incalculable harm.

The Two Programs

Let us look for a moment at the two principal programs which have been offered for taxing automobiles. The first came from former Secretary of the Treasury Houston in his annual report for 1920, when he recommended that the following taxes should be levied:

	Million Dollars
A Federal License Tax (50c. per hp.)	100
A Tax on Gasoline (2c. per gallon)	90
A Sales Tax (10%)	200
A total of	390

Chairman Good of the Committee of Appropriations of the House of Representatives, who will have a powerful influence in framing the tax bills under the present Congress, has a much heavier program. He would levy:

	Million Dollars
A Horsepower Tax of	200
A Wheel Tax of another	200
And retain at least the present tax of	100
Or a total of	500

He has not yet stated whether he would tax gasoline according to Secretary Houston's proposal.

What this tax may amount to will be seen if we consider one of the cheaper cars costing, say, $500, having 24 horsepower and running 8000 miles a year on 15 miles to the gallon of gasoline. This would give the following:

Sales Tax	$50.00
Horsepower Tax (Mr. Good's plan)	24.00
Gasoline Tax	10.66
Wheel Tax (Mr. Good's plan)	24.00

This would make a total for the first year of $108.66, or more than 20 per cent of the purchase price of the car. It would make a yearly total thereafter of $56.66.

It is almost unthinkable that such a burden should be laid on a man whose only offense is that he owns a flivver, yet that is the proposal.

A 1-Ton Bevel Gear Rear Axle

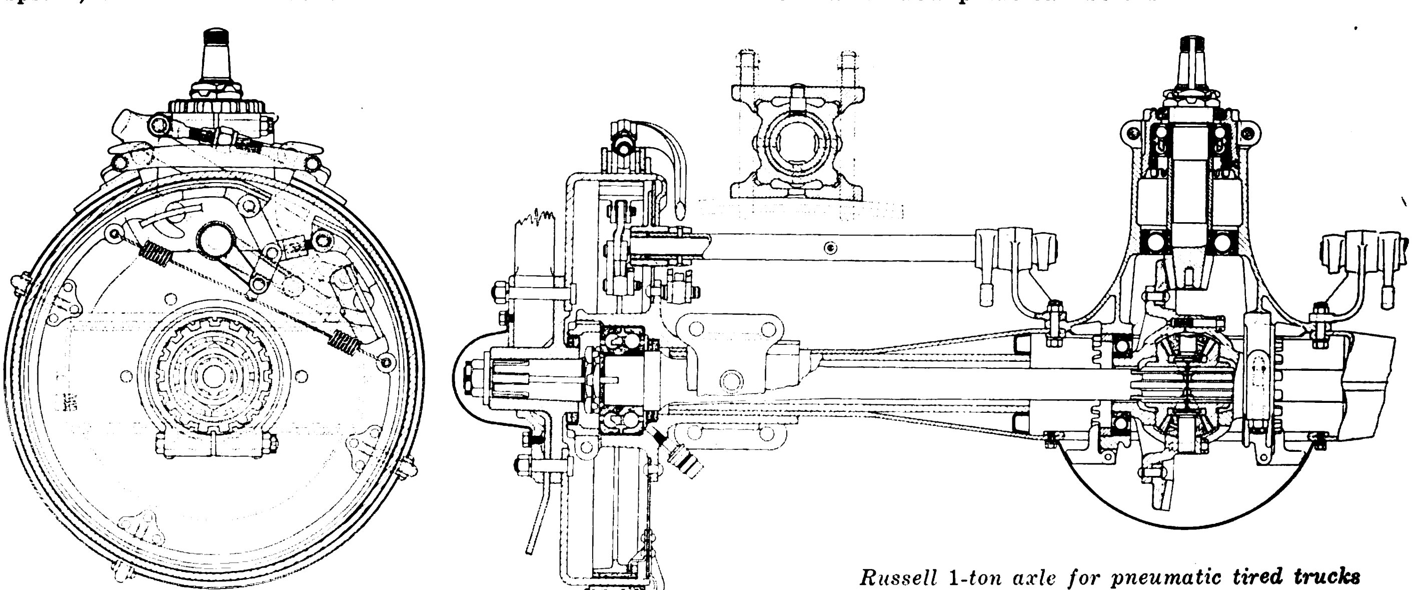
A BEVEL gear driven rear axle designed for use on pneumatic tired speed trucks of 1-ton capacity is manufactured by the Russell Motor Axle Co. The maximum load on the spring pads is limited to 4200 lb. The brake drums for both the inside and outside brakes are of 18-in. diameter, the brakes being of the full wrapping type. The inside brakes are actuated by a toggle linkage and the brake levers are conveniently arranged for inside hookup.

The axle housing is of 3/16 in. material, reinforced by a chrome nickel steel tube of 5/16 in. wall thickness. At the present time this axle is available with a gear ratio of 6 1/3:1, but other ratios can be furnished. Ball bearings of ample size are used.

The driving pinion, which is of the spiral bevel type, has six teeth of coarse pitch, insuring more than one pair of teeth in contact at all times, to enable quiet operation. The differential is of the four pinion type. Its gears and pinions are mounted upon the differential spider, which carries all of the load. The differential cases are free from any bending action caused by shaft deflection.

This axle has been designed strictly for truck use. The maximum torque input permissible is 9000 lb.-in.; that is, the axle can be used with a 4 x 5¼-in. motor developing 2100 lb.-in. torque, with a transmission reduction of 4:1. All parts are so designed as to be able to withstand the stresses created when the tires are slipped. These stresses are greatly in excess of those set up under driving conditions, even when the clutch is "dropped" in. Provision has been made for mounting either wood or disc type steel wheels on the axle.

THE two motor car routes which are being constructed from the Kilo goldfields, Northeastern Congo, to the Nile at Redjaf, and to Lake Albert at Kaseny, are said to be nearing completion. The latter road will facilitate the transport of heavy machinery to the mines, the output of which will, it is expected, be greatly increased when new plant can be installed.



Russell 1-ton axle for pneumatic tired trucks

Cause of Cracking of Rubber Insulation on Ignition Cables

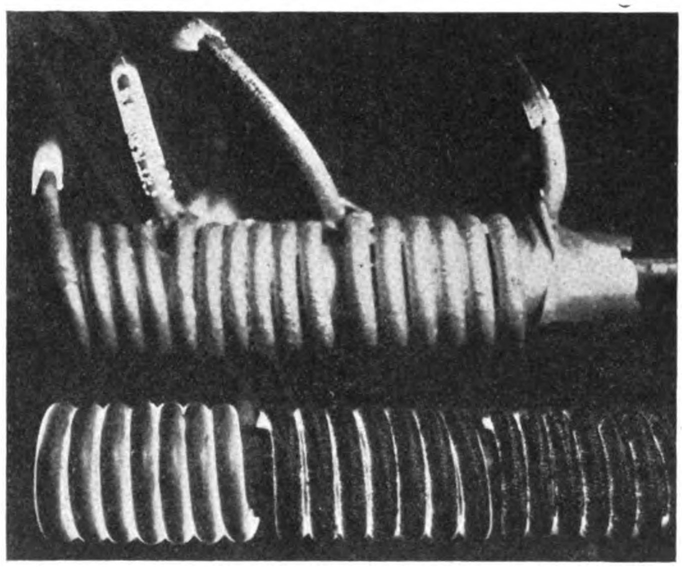
Tests at Bureau of Standards show that cracks are due to chemical attack on rubber by ozone formed as a result of electric discharge. Can be materially reduced by using braided cable and avoiding sharp bends.

EXPERIMENTS conducted at the Bureau of Standards by F. B. Silsbee and J. B. Dempsey show that the cracking at sharp bends, observed in the insulation of high tension ignition wires after service, is due to a chemical attack upon the rubber by the ozone of the electric discharge which takes place at the surface of the cable. This cracking does not occur if the insulating material is not under tension, or if the cable is surrounded by some medium other than air; but does occur even if the insulation is not subjected to electric stress, provided the atmosphere near the cable contains ozone. The extent of this cracking varies greatly with the insulating material used; and can be materially reduced by using braided cable and by avoiding sharp bends.

It appears from the experiments that cracking is produced in substantially the same manner, but somewhat more rapidly, when the samples are tested on 10,000 volts alternating current, than when tested on a magneto. The amount of the cracking is very materially reduced by the presence of a braid and is much less in material with Kerite insulator than in that with rubber. The cracking is entirely absent if the sample is left straight, or if no electrical stress is applied, or if surrounded by water or paraffin. The cracking is evidently a progressive phenomenon, requiring a combination of several factors, i.e., mechanical stress, electrification and the presence of air.

The theory of this action, which successfully explains nearly all of the phenomena, was originally suggested by Mr. Harris of the Kerite Company as follows: The electrification produces a brush discharge at the surface of the cable, which in turn produces ozone and oxides of nitrogen. This is shown by the noticeable odor after the endurance test has been run for some time and the visible glow surrounding the wires when in the dark. This glow is more prominent on the alternating current test. The accompanying photograph is taken with about 15 minutes' exposure at 13,000 volts. The electrical stress in the air at the surface of the cable, as computed from the dimensions of the wire and the dielectric constant comes out much in excess of the breakdown strength of air, and indicated that corona is to be expected.

It is well known that ozone actively attacks rubber; and when the rubber is under mechanical stress the products of the reaction are pulled apart, thus exposing at each incipient crack a fresh surface of rubber, which is in turn attacked. This effect doubtless is responsible for the fact that the action is localized in definite cracks when the material is under tension, but does not penetrate the material when the rubber is unstressed.



Corona on ignition cables on 1-inch arbor. Exposure to corona only fifteen minutes at 13,200 volts A. C. and to artificial light 5 seconds to show location of discharge
Upper mandrel from left to right: Kerite bare, mineral rubber, kerite uncovered
Lower mandrel from left to right: Kerite bare, kerite covered, mineral rubber

A possible remedy for this trouble would be to cover the cable with a closely adhering coating of conducting material, such as conducting paint or water soaked braid. This will prevent the tendency to form corona, as is shown in the photographs. It is, however, objectionable on account of the increase in the electrostatic capacity of the leads which results in a reduction of the maximum voltage produced by the ignition system and also because most forms of conducting paint are liable to crack and produce at the cracks an excessive amount of corona. The use of an insulator having as small a value as possible for the dielectric constant is advisable, as the voltage gradient in the air outside the cable is thereby reduced. There seems to be considerable difference in the rapidity with which different insulations are attacked chemically by the ozone. The ordinary impregnated braids help very materially in preventing cracking, probably because they are nearly air tight and prevent the ozone from reaching the rubber. After much bending, however, they will probably lose their efficacy. The importance of carefully avoiding sharp bends in the wiring is very obvious.

The experiments referred to in the foregoing are fully described in Technical Note No. 32 of the National Advisory Committee for Aeronautics.

A New Four-Cylinder Engine of Conventional Design

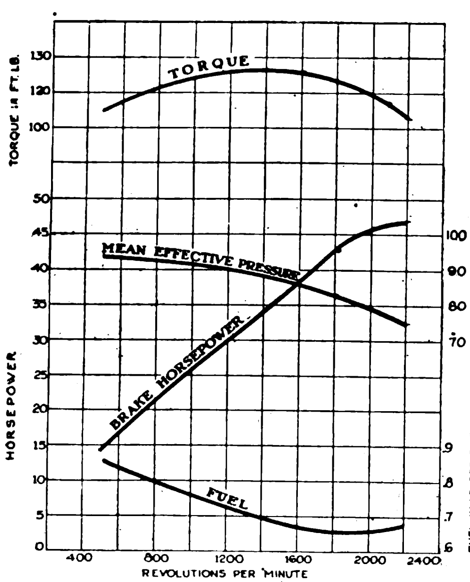
Is intended for passenger car or light truck applications. Four 3¾ by 5 in. cylinders develop a maximum of 47 hp. at 2200 r.p.m. Full pressure feed lubrication and ample water jacket space are provided.

By J. Edward Schipper

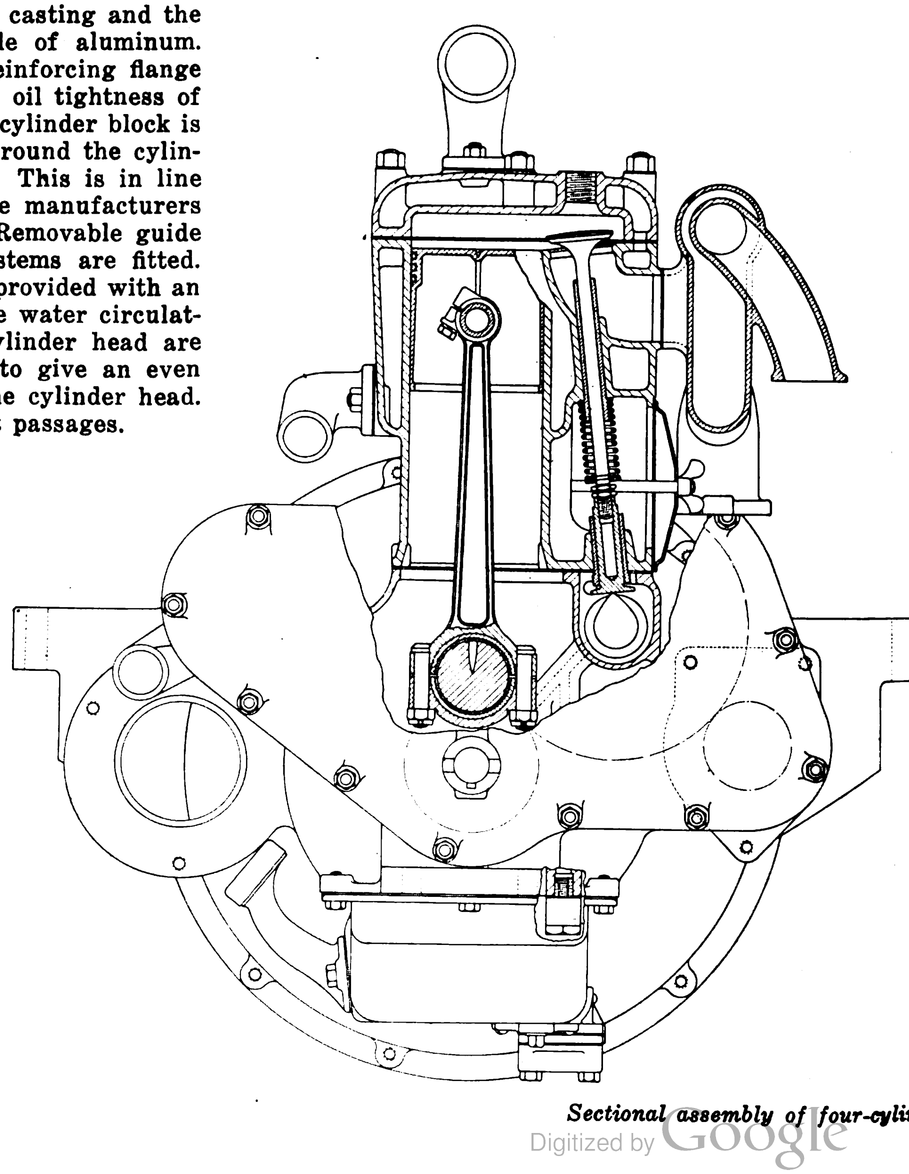
AMONG the engines recently placed on the market is one known as the Turmo. It is of the four-cylinder L-head type and is adapted for either light truck or passenger car work. It develops its maximum horsepower (47) at 2200 r.p.m., according to tests made at the laboratory of the Zenith Carburetor Co. The maximum torque is reached at about 1400 r.p.m. This new powerplant does not depart from established L-head practice, but differs from most of the stock engines of that type in that it has a full pressure feed oil system without splash.

The 3¾ by 5-in. cylinders are cast in a block of semi-steel. The cylinder head is a separate casting and the crankcase is also separate, being made of aluminum. The oil pan is pressed steel, with a reinforcing flange around the top for ease in maintaining oil tightness of the gasket. One of the features of the cylinder block is the extra large water space provided around the cylinder walls and around the valve seats. This is in line with a growing tendency among engine manufacturers to provide more liberal water space. Removable guide bushings for both tappets and valve stems are fitted. The demountable cylinder head is also provided with an unusual amount of water space and the water circulating holes between the cylinder and cylinder head are drilled instead of cored, which tends to give an even distribution of water to all parts of the cylinder head. The cylinder head has two water outlet passages.

Semi-steel pistons of the full skirt type are provided. The pistons are 4 in. in length and provided with three rings, all above the piston pin. Just below the bottom ring there is an oil-collecting groove and from this groove there are drilled oil holes to the top side of the piston pin. This insures oiling of the piston pin on the up-stroke. The pistons are finished by grinding. The piston pins are tubular steel, carbonized, hardened and ground. They are held stationary in the rods by clamping with alloy steel, heat treated bolts. To prevent the piston pins from working against the inside of the cyl-



Characteristic curves of new Turmo model H engine



Sectional assembly of four-cylinder

inder walls, a slot is cut in them through which the clamp bolt passes.

Drop-forged, .40 carbon steel, I-beam connecting rods are employed. These are 10 in. in length, center to center. The caps on these rods are held in position by nickel steel bolts with slotted nuts and cotter pins. The crankshaft is a three-bearing type, also of .40 carbon steel, heat treated and ground at the bearing surface. The crankshaft is 1⅞ in. in diameter. The bearing lengths are given in the table of specifications herewith. The crankshafts are all given a static as well as running balance and the end thrust on the crankshaft is taken care of by flanges provided at the center bearing.

The integral camshaft is 1¼ in. in diameter, and is supported in three bearings. The camshaft and tappets are carried in a tunnel in the crankcase and are always submerged in oil. The three camshaft bearings are of cast iron, the shaft being hardened and ground. Camshaft lubrication is by the pressure system, which is claimed to result in particularly long life. The other bearings of the engine are of nickel babbitt. In order to obtain a good fit, the engine is placed on a special burnishing machine which removes all high spots in the bearings and gives a high percentage of bearing surface. Laminated shims are provided on all of the crank and connecting rod bearings.

Pressure lubrication is utilized for all of the engine bearings. The gear oil pump is attached to the bottom of the oil pan at the rear. The oil pump together with the oil screen can be removed for cleaning and inspection by the removal of four nuts. The pump is operated by a vertical shaft which is driven by gears from the rear end of the camshaft and the top end of this shaft also drives the distributor when one is used. From the pump the oil is carried through the three main crankshaft bearings and from the crankshaft bearings to the connecting rods through the drilled crankshaft. Leads are drilled in the crankcase from the main crankshaft bearings to the camshaft bearings. An oil relief valve

Table of Specifications Turmo Model H Engine

(All dimensions in inches.)

	Diameter	Length
Bore, 3¾ in.		
Stroke, 5 in.		
Number crankshaft bearings, 3.

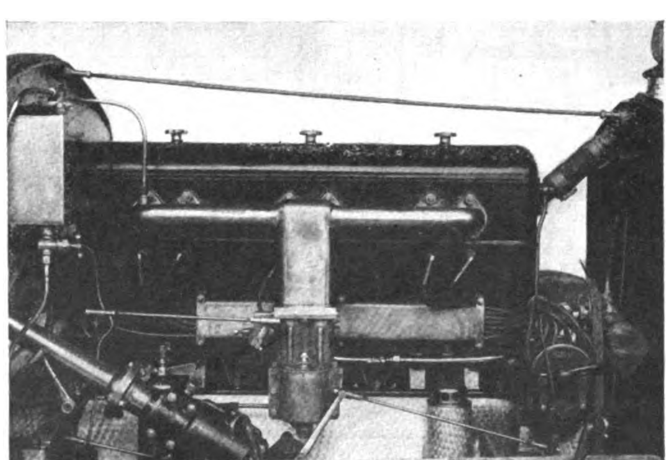
for regulating the oil pressure is located at the front on the top side of the crankcase. The overflow from the relief valve lubricates the timing gears. The cylinder walls are lubricated by oil mist from the main and connecting rod bearings. The piston pins are lubricated by special oil grooves in the pistons, as noted above. An oil level gage is located on the right side of the oil pan.

Practically all of the fittings used are S. A. E. standard. For instance, the generator mounting is the No. 1 S. A. E. flange type; the starting motor mounting, the No. 2 S. A. E. flange type, and the starter is fitted with an 11-tooth inboard Bendix gear. The distributor mounting is S. A. E. type B and the bell housing the No. 3 S. A. E. Any standard magneto can be fitted, the rotation being clockwise, looked at from the driving end. The fan is left hand and is driven from the camshaft. Either pump or thermo-syphon cooling can be provided. The engine is manufactured by the Turner & Moore Mfg. Co.

Racing Practice Employed in New Sporting Type Delage

By W. F. Bradley

A GUARANTEED speed of 80 miles an hour, with sporting body and full touring equipment, is given with the new sports type Delage just placed on the market. This car is not an entirely new job, for the standard touring car chassis is employed except that a new overhead valve engine is fitted. In order to keep the cost of production down and to simplify supplies, the old crankcase, crankshaft, connecting rods and pistons are used. The cylinder block is special, comprising six cylinders of 80 by 150 mm. (3.1 by 5.9 in.) bore and stroke, in one casting. For the first time use is made of a detachable head, in which are mounted two vertical valves per cylinder. These have a diameter of 42 mm. and a lift of 11 mm. The valves are mounted directly in the head without the use of cages, and unlike the touring model the intake manifold is external. Valve operation is by means of a camshaft mounted in the base chamber, pushrods carried through the cylinder casting and overhead rockers. The whole of the overhead mechanism is inclosed by an aluminum housing, and the compression cocks are carried inside this. Lubrication is on the same lines as the touring model, with the addition of a special lead to each of the overhead rockers. These latter are fitted with wicks which, after feeding the pins, carry the lubricant to the pushrod end of the rocker and then by the guides back to the base chamber. As on the touring model, a cross shaft drives the water pump and the magneto from its two extremities. A double magneto is used, however, and this fires twelve plugs mounted horizontally immediately below the intake valves, on opposite sides of the cylinder.



Carbureter side of new Delage overhead valve sporting type engine

On the touring type Delage two independent carbureters are used. The sporting model has one Zenith dual carbureter connected up to the intake ports by a six-branch copper manifold, the vertical passage of which is heated by means of a by-pass from the water circulating system. Bench tests show 88 hp. at 2380 revolutions, and as a road speed of 80 miles an hour is easily obtainable with this number of revolutions, it is not intended to carry the power curve any higher. The Delage engineers believe that most purchasers of a sporting type car are satisfied with a maximum of 80 to 84 miles an hour, providing it is coupled with a wide range of power at low and moderate engine speeds. With the standard gear ratio of 3.1 to 1 the car will pull away easily on top with very rapid acceleration.

Improvements in a Line-Driven Tractor

AT the recent Columbus tractor show two models of the Automotive one-man, line-controlled tractor were exhibited, one being a cut away model. Several improvements have been made in this tractor since last year, which are briefly described in the following.

The tractor is now provided with two sets of brakes instead of one, and the actuation of the brakes is somewhat different. The new brake is a belt pulley brake, and serves three purposes: First, to stop the tractor transmission immediately after the clutch is released; second, to stop the tractor when the transmission is in gear; third, to stop belt-driven machinery. The third object is accomplished by an extension from the two clutch operating lines to the driven machine and this feature is said to appeal very much to the user, as he can stop his belt-driven machine instantly without going to the tractor.

The belt pulley is connected with the engine clutch throw-out cam, so that the brake action follows the clutch action, and it is stated that gearshifting is accomplished with absolutely no clashing of gears. Fig. 1 shows clutch throwout cam A and brake shoe B. The brake rod and the pulley are not shown in this photograph, but the simplicity of the arrangement is apparent.

The second brake is now actuated by hand instead of by the gear shift lever as formerly, and is used to hold the tractor stationary when the transmission is in neu-

Views of the Automotive line-driven tractor, showing improvements made the past year

The Influence of Various Fuels on Engine Performance

This is the first of a series of articles describing what is believed to be one of the most thorough and important investigations of engine fuels ever conducted. It has been definitely proved that the tendency of a fuel to detonate is by far the most important factor in determining its value for use in engines. Power and efficiency not increased by use of "dopes." Proportions of aromatics, naphthenes and paraffins important.

By H. R. Ricardo*

IN the latter part of 1919 the author started extensive research work on hydrocarbon fuels, including a thorough investigation into the behavior of the working fluid in an internal combustion engine cylinder and the influence of the composition of the fuel upon its behavior.

Before any actual experimental work was started a careful analysis was made of the existing information with a view to indicating in what direction research was likely to prove most fruitful, and at the same time a preliminary investigation was made both as to the requirements which an ideal fuel should fulfill and as to the possible variations which might be expected as between fuels of different chemical composition.

The analysis of existing information proved, for the most part, somewhat disappointing; although much valuable data relating to the theoretical side were found, particularly in the publications of the Journal of the Chemical Society, and in various other scientific publications, the actual experimental data available proved to be of very little value. It was found, on close scrutiny, that the results would not agree among themselves; such data had to be set aside as unreliable. The outcome of this analysis was that, so far as engine test results were concerned, there appeared to be no information sufficiently accurate or reliable to be of much practical value.

After much thought it was decided:

(1.) To make a thorough investigation into the factors controlling detonation, since the tendency to detonate determines the degree of compression which can be employed, and therefore both the power and efficiency of an engine.

(2.) To determine accurately the total internal energy of each fuel when mixed with the quantity of air required for complete combustion, for when burnt with equal efficiency it is clear that the power output obtainable with each fuel is directly proportional to the total internal energy. It is well to emphasize that the internal energy has little or no connection with the heat value of the fuel, in terms of its weight.

(3.) To determine the losses due to change in specific heat and dissociation at high temperatures, and to ascertain how far these losses vary with different fuels.

(4.) To investigate the available range of burning of different fuels.

(5.) To investigate the factors controlling distribution and ease of starting.

(6.) To determine accurately the calorific value of different fuels.

(7.) To determine accurately both the self-ignition temperature and the process of combustion, when different fuels are ignited by adiabatic compression in a large cylinder.

Of these factors, it was already realized that the first was likely to prove by far the most important. It was known in a very general way that certain fuels, such as benzole and other members of the aromatic group, also alcohol, will not detonate readily even under very high compression pressures, and that detonation can be kept in check by the addition of benzole to ordinary gasoline. A fair amount of data was available also as to the phenomena of detonation. Very little information of a quantitative nature was, however, available, nor was anything known as to the influence of other fuels upon detonation.

With regard to (2), (3) and (4), very little information was available, at all events in a form readily applicable by engineers. Sir Dugald Clerk, Professor Hopkinson and other members of the Gaseous Explosions Committee of the British Association, had, before the war, made a very extensive investigation of these factors in relation to coal gas, but it has long been realized by many investigators that the conditions are widely different when applied to the volatile hydrocarbon fuels which contain no inert constituents. It is, of course, evident that any variation either in the total internal energy, in the losses due to dissociation and change of specific heat, or in the range of burning available, will influence very powerfully both the power output and efficiency obtainable, even with the same compression ratio.

With regard to (5), it is clear that the distribution and ease of starting must necessarily be dependent to some extent at least on the chemical and physical characteristics of the fuel, and it was clearly of importance to determine how far it was so dependent, and to ascertain what are the practical limits as to range of boiling point, vapor tension and other such considerations.

With regard to (6), the published data as to the heat value of different fuels were found in many cases to be contradictory and unreliable.

*Condensed from a preliminary report concerning extensive research work conducted by the author for the Asiatic Petroleum Co., Ltd., and published in *The Automobile Engineer*.

As regards (7), a somewhat elaborate piece of apparatus has been designed and constructed for research in this direction, but little data are as yet available.

Before proceeding to details either of the apparatus employed or of the experimental or theoretical results obtained, it will perhaps be well to outline very briefly the definite practical conclusions which have already been arrived at, and to deal later and in more detail with the reasoning and the experimental results by which they have been deduced and confirmed.

The general conclusions, expressed as briefly as possible, are subject, as such conclusions always must be, to minor qualifying conditions which will be dealt with later. With the exception of alcohol and certain other fuels, these conclusions can be taken as applying to all volatile liquid hydrocarbons practically available and all combinations thereof. Alcohol and other fuels containing oxygen atoms in the molecule differ in certain important characteristics, and therefore cannot be included without some reservations.

General Conclusions

(1.) It has been proved that the tendency of a fuel to detonate is the one outstanding factor in determining its value for use in an internal combustion engine. Compared with this, all other considerations are of secondary importance.

(2.) There appears to be little doubt as to the correctness of the view, now generally accepted, that detonation is less the lower the rate of burning of the fuel.

(3.) In all cases it seems that a low rate of burning is advantageous. No fuel has yet been found whose rate of burning is too low to permit of maximum efficiency being obtained in the highest speed engine yet tested.

(4.) Fuels capable of standing a very high compression will operate in a low compression engine as efficiently as those whose normal rate of burning is high—provided that there is a reasonable degree of turbulence in the combustion chamber.

(5.) Apart from the limitations introduced by detonation, the power output obtainable from all volatile liquid fuels, with the exception of the alcohol group, is the same at the same compression to within less than 2 per cent. Such variations as occur within this range are due rather to variations in the latent heat of evaporation than to any other circumstance.

(6.) Owing to the high latent heat and low boiling point of alcohol and certain other fuels, the weight of charge per cycle is greater and a higher power output is obtained in consequence.

(7.) The efficiency with which all volatile fuels, other than alcohol and the others previously referred to, are burnt is the same, at the same compression ratio, irrespective of rate of burning, provided the compression is low enough to avoid detonation under any circumstances. In the case of alcohol, the efficiency is very slightly higher, for reasons which will be considered later.

(8.) The useful range of burning is to all intents and purposes the same for all volatile liquid fuels.

(9.) The unavoidable losses due to dissociation and change of specific heat at high temperatures are substantially the same in all cases.

(10.) All the experimental results indicate that, with certain trifling exceptions which will be considered later, the performances of any combination of hydrocarbons as regards detonation, and therefore the power output and efficiency obtainable, is the mean performance of each of the components. The performance of any complex fuel such as gasoline can therefore be predicted, once the nature and proportion of its constituents are determined, or conversely, a fuel can be prepared to give any required performance, within the limits available.

(11.) No increase in power or efficiency has been found or need be expected from the use of "dopes." A large number of these were investigated and tested, but, as might be expected, the improvements in all cases proved to be practically negligible.

(12.) The highest useful compression ratio for, and therefore the power output obtainable from, any gasoline is governed by the relative proportions of aromatics, naphthenes and paraffins it contains—the smaller the proportion of the latter the better from almost every point of view. The influence of olefines has not yet been investigated.

(13.) To judge the quality of a fuel by its specific gravity is entirely misleading. If naphthene and aromatic fractions are present in any large proportion (as is sometimes the case), then a high specific gravity is a substantial advantage.

(14.) Owing to the very rich mixture delivered normally by pilot jets, and the still further enrichment effected by flooding, only a relatively small proportion of highly volatile constituents appears to be required for starting.

(15.) There is considerable evidence to indicate that in the case of most "natural" gasolines the more valuable constituents are those whose boiling points lie between the range 80 deg. C. (176 deg. Fahr.) to 180 deg. C. (356 deg. Fahr.). It is therefore often quite as undesirable to restrict the final boiling point of a fuel to 150 deg. C. as it is to permit it to exceed 200 deg. C. So much, however, depends on the actual composition of the fuel, and so great are the variations in this respect that this conclusion must be regarded only as a broad generalization.

The apparatus constructed or requisitioned for these experiments included:

(1.) A special variable compression research engine. This engine has been described in a paper presented by the writer at the British Association meeting at Cardiff and reported in full in Engineering of Sept. 3 and 10, 1920.

(2.) A research engine provided with means for supercharging the cylinder.

(3.) A special machine for determining the self-ignition temperature and pressure of fuels under adiabatic compression.

(4.) A single-cylinder experimental engine with crosshead piston, used chiefly for experiments on fuels of high boiling point.

(5.) Engines of various commercial types, mostly four-cylinder, used for tests on starting, check tests, etc.

(6.) Several motor cars of different types for road testing.

(7.) A miscellaneous collection of auxiliary apparatus.

It will be shown later that the standard of accuracy obtainable with both the research engines, and more particularly the variable compression engine, is exceptionally high; extreme variations extending over a year's running have been found to be less than 1 per cent, while the mean results obtained during any one group of tests can be taken as accurate in most respects to within one-quarter of 1 per cent.

The absolute accuracy of all the figures given later as test results can safely be accepted as being within one-half of 1 per cent, while the relative accuracy is about twice as high.

The accuracy of tests on the various commercial engines is not of a very high order. While the accuracy of observation is comparable with that obtained on the research engines, the mechanical and thermal efficiency of such engines is, for the most part, so low that varia-

tions in the efficiency or power output obtainable with different fuels are frequently completely obscured by much larger variations in the friction losses, distribution, carburation, etc.

Little was hoped for from road tests on cars, and indeed they proved to be practically valueless for indicating small differences. It was found impossible to assess and allow for the variations due to road surface, wind, tire inflation and many other variables, all of so large a magnitude as completely to mask any but well-marked differences.

It soon became apparent that the only conclusions of any value from road tests would be those drawn from the mean results of a large accumulation of data obtained from the behavior of many vehicles operating over a long period on each sample of fuel. Such a test was not practically possible.

One of the most serious difficulties which had to be contended with was that in many cases it was altogether impracticable to obtain chemically pure samples in sufficient bulk. It would, of course, have been desirable to use a pure light fraction—preferably of the paraffin series—as a standard basis of comparison, but to obtain a pure fraction, such as hexane, in the quantity required for calibration and check testing, was altogether out of the question. After much consideration it was decided to employ as a standard basis of comparison a comparatively light gasoline containing a fairly high proportion of paraffin fractions, and from which all, or almost all, of the aromatic members of the series had been removed by sulphonation. For this purpose the Asiatic Petroleum Co., Ltd., set aside some 5 tons of suitable gasoline and treated it by sulphonation until the aromatic content was reduced to less than 2 per cent. This fuel, which was used throughout the whole series of experiments, both for calibrating the engines and for comparative purposes, will be referred to in future as standard aromatic free gasoline. Its general characteristics are given in Table I, from which it will be seen that it consists almost entirely of members of the paraffin and naphthene series. Since the whole quantity was drawn from one tank and treated by sulphonation at one operation, it follows that its uniformity does not vary—a very important consideration in view of the fact that the research was expected to occupy not less than two years, and any change in the composition of the standard fuel would have involved endless complications and the possibility of serious errors.

It was found that the minimum quantity of fuel required for any individual test was about two gallons, and this, of course, left no margin for retests or for checking discrepancies, such as are inevitable when working to within such fine limits. While every effort was made to obtain chemically pure samples of the various members of different series, it was by no means always possible to do this, and in several instances serious errors were introduced due to the presence of impurities in what purported to be chemically pure samples. Of the paraffin series, reasonably pure hexane was obtained in sufficient bulk to permit of extensive tests. Of the naphthene series, samples of cyclohexane, hexahydrotoluene and hexahydroxylene were obtained in sufficient bulk, but, although the first of these purported to be chemically pure, subsequent analysis indicated that it contained so considerable a percentage of paraffins and aromatics as appreciably to modify the conclusions drawn from the earlier experimental results. Of the aromatic series, samples of benzol and toluene of great purity were relatively easily obtained. The greatest difficulty was experienced in obtaining ethyl alcohol.

Considerations of the chemical and physical properties of ethyl alcohol made it clear, not only that it would prove highly interesting in itself, but also that its behavior might be expected to throw a good deal of light on several questions relating to other fuels, such as the very important one of the influence of the latent heat of evaporation. Fairly early in the course of the research the necessity for running tests on alcohol became evident, and means had therefore to be found for obtaining sufficient quantities of this most interesting fuel. The samples ultimately obtained proved to be of a very high degree of purity.

Of the olefine series no really pure samples have yet been obtained in quantities sufficient to run engine tests.

Of the sulphur compounds, both carbon bisulphide and methyl mercaptan were obtained in sufficient quantities, but the influence of thiophine has not yet been investigated.

With the other miscellaneous samples, such as ether, acetylene, acetone, etc., no difficulty was encountered in obtaining sufficient supplies of reasonable purity.

For the most part the impurity of the samples has not had any very important influence on the deductions to be drawn from the test results, but their presence has rendered the tests far more arduous, since it was necessary in each instance to determine the nature and proportion of the impurities present and to arrive by independent tests at their influence. Once these factors had been determined the influence of their presence on the behavior of the fuel as a whole could be allowed for.

The close agreement between the theoretical deductions arrived at by Messrs. Tizard* and Pye* and the actual experimental data has been throughout a very striking feature. The influence of sulphur compounds of low ignition temperature upon the tendency to detonate, and the somewhat eccentric behavior of heptane, have been the real surprises, while the very important influence of the latent heat of evaporation upon the power output obtainable was not appreciated at first, nor does it appear to have been realized by any other investigators.

Table I. General Characteristics of the Standard Aromatic Free Gasoline

Net calorific value (minus latent heat of the evaporation of the fuel)				19,080 B.t.u. per lb.
Latent heat of evaporation				133 B.t.u. per lb.
Specific gravity at 15° C				0.718
Chemical composition	Paraffin series			63% by weight
	Naphthene series			35% by weight
	Aromatic series			1.7% by weight
		Deg. C.	Deg. F.	
Engler distillation	Boiling below	60	130	1%
	Boiling below	80	176	16%
	Boiling below	100	212	49%
	Boiling below	120	248	72%
	Boiling below	140	284	85%
	Boiling below	160	320	93%

The series of tests may be divided broadly into two sections:

Section 1.—A series of comparative tests carried out on a large number of different samples of gasoline with an immediate view to determining the best mixtures for blending, and indirectly with a view to exploring and determining the most fruitful avenues for further research. This series was carried out during the earlier stages of the research, while the more accurate

*Who conducted the theoretical portion of the investigation.

and intricate apparatus was in the process of design and construction, and while the theoretical investigations were in progress.

Section 2.—A much more accurate and analytical series of tests carried out with apparatus designed specifically for the purpose, using pure, or relatively pure, samples of all the different ingredients of the various volatile liquid fuels, conducted with a view to

(1.) Checking and proving the accuracy of the theoretical determinations.

(2.) Ascertaining the individual characteristics of samples of each of the various leading groups and the influence of the presence of such samples on the performance of a composite fuel.

(3.) Determining accurately the influence of compression ratio, temperatures and pressure, upon the power output and efficiency of an engine.

(4.) Determining the influence of the addition of gases, both active, such as acetylene, and inert, such as nitrogen, CO_2, etc.

The tests, which are still in progress, have involved to date about 1600 hours running on the three engines set aside purely for this research and several hundred hours running in other engines on the test bed and on the road. So far over 8000 readings of fuel consumptions have been taken with various fuels or mixtures of fuels under various conditions as to temperature, compression, etc., etc.

In view of the large number of readings taken it is impossible to give actual individual results, except in the cases of certain more or less isolated experiments. For the most part, the curves and tables which will be given represent the mean results of many hundreds of readings.

Table II gives a list and the leading characteristics of the various samples obtained in sufficient bulk to permit of fairly extensive tests. Besides those given in this list, a large number of other samples of gasoline and a number also of relatively pure substances were tested, but these have been omitted here.

With regard to the various samples of gasoline, these are selected either because they are fairly representative or in some cases because they afford extreme instances either as regards their specific gravity, aromatic content, naphthene content, etc. The different gasolines include samples of well-known commercial gasolines of all grades, ranging from the lightest aviation spirit to the heaviest mechanical transport gasoline.

Of the so-called pure substances, the degree of purity is denoted by the figures in brackets.

(To be continued)

(2) Where two values are given bracketed, the one underneath is the more recent, and is probably the more accurate determination.
(3) Final boiling point of gasoline is always a somewhat uncertain quantity.

How Current Practice in Body Design Differs from Earlier Practice

Changes are less rapid and less radical as industry becomes more stabilized. Great majority of purchasers are unable or unwilling to pay the large difference in price between open and closed body. Wider use of all-season top predicted. Many new models use cast aluminum step.

By George J. Mercer

BODY design is not, as in the early days, changing by leaps and bounds. Changes are slowly evolved in much the same way as chassis changes are evolved. Now any forward movement is consistent with the normal movement of a stabilized industry.

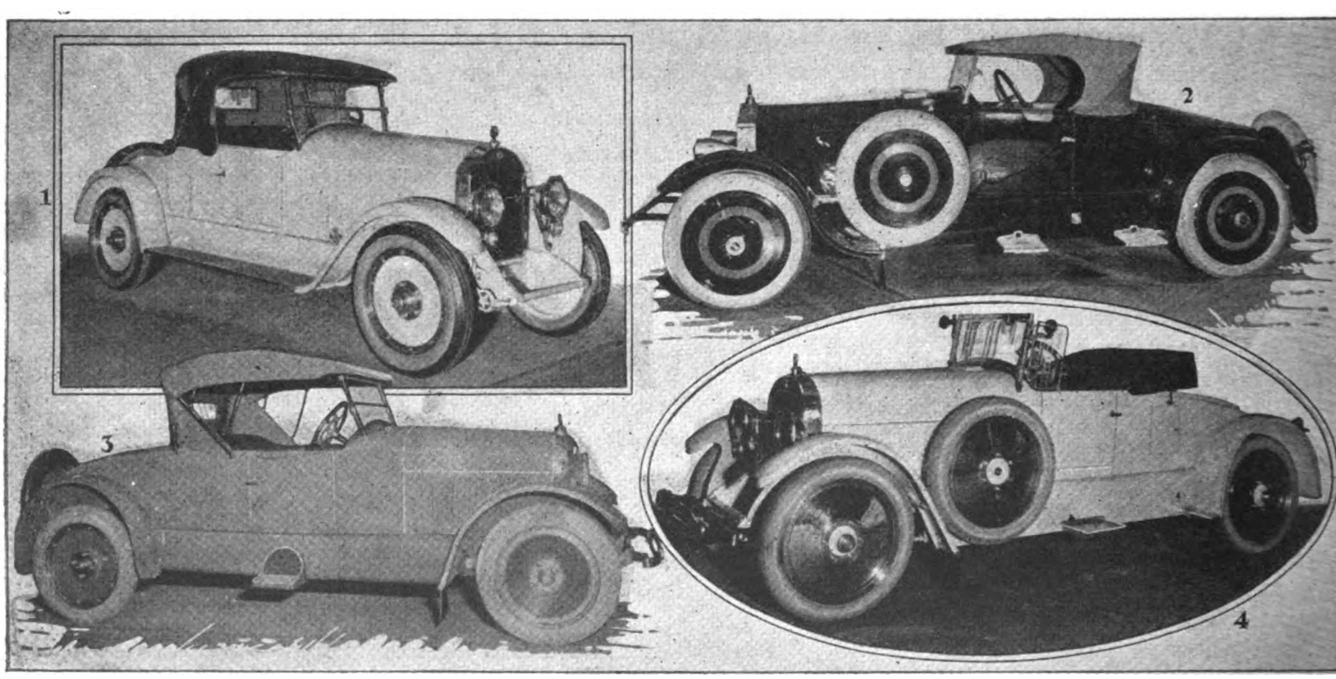
When changes are made they are generally confined to some one body model. The period that has just passed was based on the belief that the public wanted a closed car and were willing to pay for it. However great may have been the need for closed cars, the great majority of actual buyers are either not able or not willing to pay the difference and decide to purchase the open car. Hence prominence is given to the open models.

A general effort to make open cars more attractive is apparent. The runabout has been an uncertain factor for several years and has been made in sizes that ranged from the two bucket seats on a platform to a four-passenger that was virtually a touring car. This year's designs are neither extremely large nor small. In the new models the trick side, the folding seats and all combinations for carrying more than two passengers are eliminated. The body sides average as high as those on the touring models. The rear carrying compartment has been enlarged and covers all the space between the rear mudguards. The seats are low and seat-backs have plenty of slope, and as the body sides are high in relation to the cushion, the seats are, on the average, more comfortable for the driver than in any other body model.

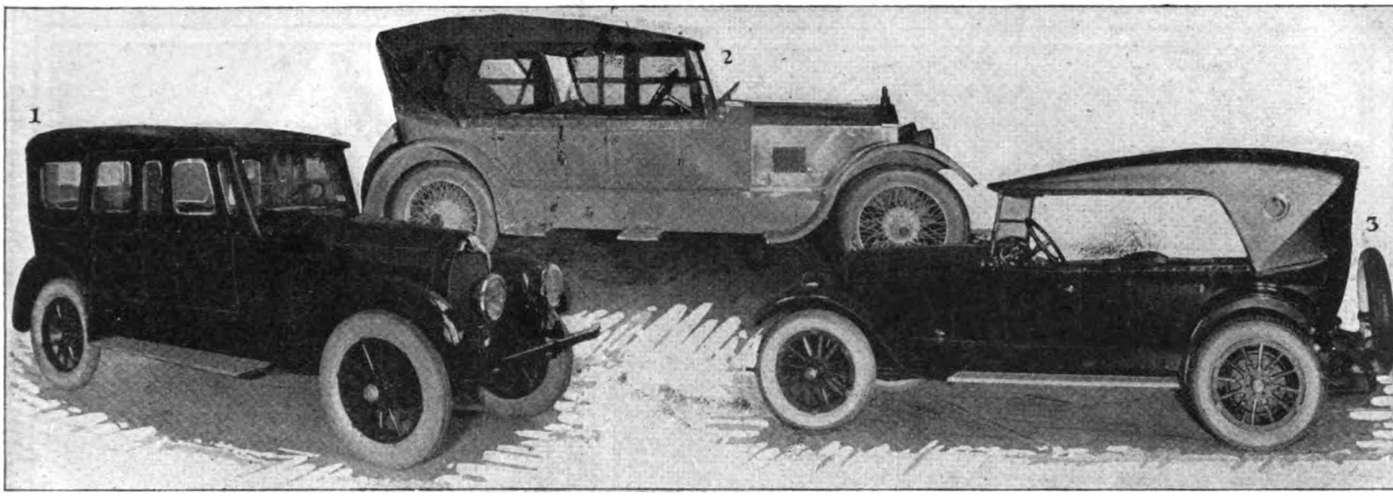
There is a tendency to show and use these cars with the tops up. This is in line with the current practice on other open cars. Many tops are snug-looking. The Cole, Roamer, R. & V. Knight and Haynes runabouts here illustrated are good examples of present practice. Windshield wings are desirable when the top is up, as they help to deflect air currents which otherwise pocket under the roof.

A rather radical change is in evidence on a number of open cars which have dispensed with the runboard and have, instead, cycle mudguards and steps. Disk and wire wheels are also quite popular. More makers are using disk wheels, and of these a number have the wooden disk type for the first time.

The touring bodies share equally with the runabouts in the addition of attractive features, but do not show



Four examples of up-to-date design in runabout bodies. (1) Cole, with well designed top. (2) Roamer, with low good appearing top, striped disk wheels, etc. (3) R. and V. Knight, showing cycle type mudguard and cast step. (4) Haynes, showing windshield wings, side wheel mounting, disk wheels, etc.



Three types of touring car tops. (1) Holmes, fitted with Artcraft all-season top. (2) Roamer, with novel back curtain, and body with leather covered top edge. (3) Stephens, with semi-Victoria top.

the same amount of redesigning. Most touring bodies are of conventional design, but brighter color combinations and an increased use of nickel parts is in evidence. The use of nickel on radiators is becoming quite general. Windshield standards also have the same finish in many cases and, where steps replace runboards, they are often cast in metal that permits the edges to be finished bright. Outside and inside door handles are the rule. Small cowl lamps are generally fastened to the base of the windshield post and these lamps, as well as the headlights, are often nickel-plated.

In some new models the bevel surface and the extreme straight line all the way through is being abandoned. The rounded radiator, hood and body shroud are of such height as to make these parts look large and substantial. When so made, they harmonize with the straight line on the top of the body, providing the body is of the flat-top type with slightly rounded outer edge. The tendency is toward this design, and it seems likely to become popular because the effect is pleasing and the manufacturing costs are not high.

The sport touring model, which has come in as a division of the touring type, has become well established. It is not required to be so comfortable as the larger touring body, hence the straight lines and angular surfaces will, on account of their advertising value, be continued longer on this type.

Much attention has been given the question of tops. The regulation touring top with emergency side curtains has reached a sensible state of development, but the need to converting the open body into a comfortable car for all-season use has necessitated the development of a top differing from the folding type.

The Artcraft all-season top, applied to the Holmes car shown in the accompanying cut, is a step in this direction. Other tops similar in appearance and apparently effective in securing the results desired are also being marketed. These tops are much superior in appearance to those designed heretofore for the same purpose. It is fair to predict, now that the time of inflated prices has passed, that competition will force the car manufacturers to incorporate this or a similar type of top as regulation equipment on one touring model.

Most of this year's touring bodies are of the five-passenger size. This, in fact, seems to be the size best suited for the majority of users. Seven-passenger models are, of coure, available, but they are not in the majority, as in previous years. In time the conventional type will probably be regularly equipped with some form of all-weather top, while the sport model will no doubt retain the lighter folding top.

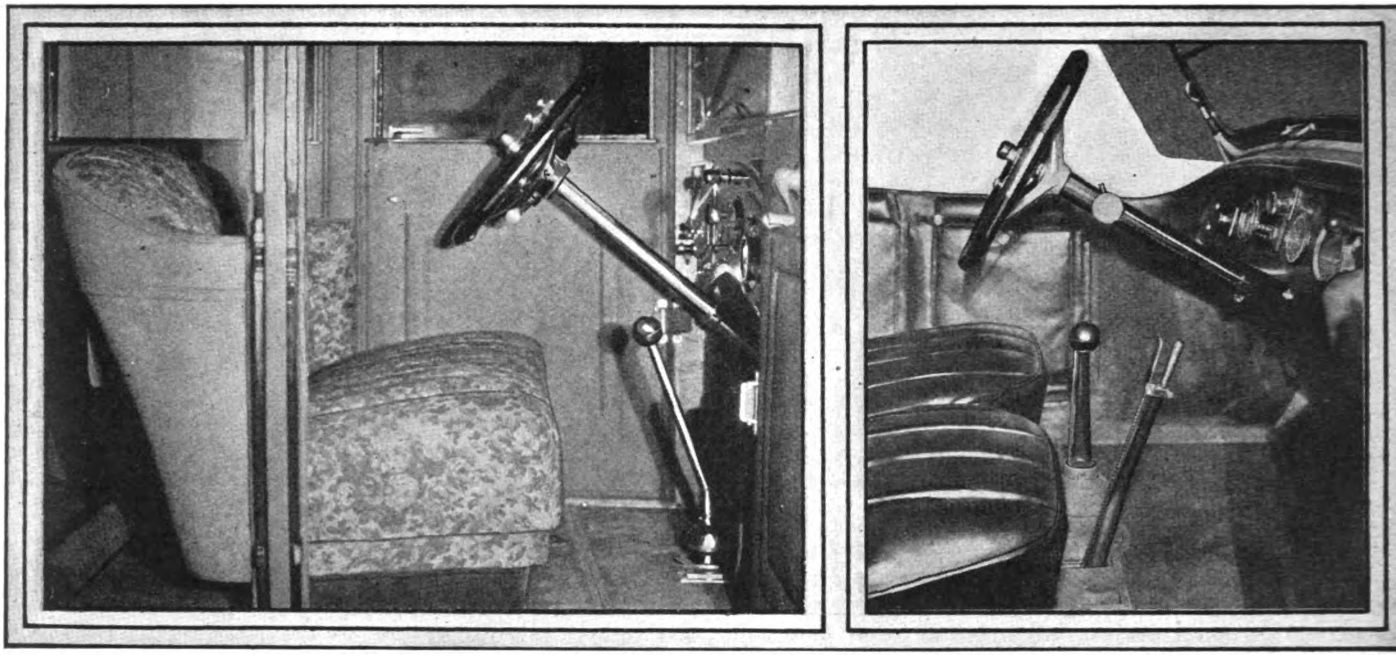
The top on the Stephens car, shown in the cut herewith, is an example incorporating the semi-victoria curtain with the back curtain, while that on the Roamer, shaped to come slightly around the corner, eliminates the gypsy quarter curtain.

The writer feels confident that the gypsy quarter will be superseded by the semi-victoria type. The objection to this type has been the cumbersome bulk that it forms when folded down, and the necessity of using a small triangular curtain to square the front up with the door curtain when the door opens from the rear. This latter objection can be satisfactorily provided for by making the triangle a part of the large curtain and simply folding it inward, buttoning it onto the bow when not needed. This eliminates a curtain that is irregular in shape, is not convenient to attach and adds weight in the curtain pocket.

The gypsy curtain has been used because it provides additional comfort by covering the quarter formerly left open. It leaves the impression that something is wanting, that part of the top is naked. The better appearance that the all-weather top presents when the side panels are removed, because the space above the seat is filled in, will, I believe, ultimately necessitate the use of a similar curtain on all tops.

The Roamer sport model has the unusual feature of a leather border about 5 inches wide entirely around the top edge of body. This matches the Spanish-finished trimming leather. This border extended across the shroud as far forward as the windshield and a flap buttoned tight at the base of tonneau windshield. In practice this may have the same objectionable feature as, at times, the flaps on doors have—that is, moisture collecting under the edges and running down in streaks. If fastened on with cement, this can be overcome and the effect made very attractive. Occasionally an entire car is covered with imitation Spanish leather, which, when well put on, is said to be durable.

In the touring, more than other body models, the rear must balance with the forward end of the car. This body is virtually a continuation of the hood and radiator, and, while a good low top with slanting windshield helps greatly on the side appearance, the real test of a well-proportioned design is the three-quarter front view, as this is the one that emphasizes comparative proportions. We have had in the past such an extremely rounded side that it gave the impression of a barrel ready to roll over,



Two methods of locating brake and gear levers in such a way as to facilitate access to driver's seat from the right door. Left, Jackson, right Mercer

and then again there has been the bevel edge that is not parallel with the top edge of the body, making the car look as if it is nosing down. There is less chance of making inharmonious effects with moderately rounded surfaces, and, for that reason, when experimenting with new proportions the results are apt to be more satisfactory where such surfaces are used.

A bird's-eye view of the car should always show an unbroken, rounded taper from the dashline back to the center of the rear wheel. The straight line of the hood to radiator should be tangent to this curve. If the dash width is narrow, so that a reverse curve must be used, the front has a "starved" look and shows something wanting. On the new runabouts the bottle-neck appearance which the extreme reverse curve gives is eliminated, for back of the seat these new bodies are now continuous with the body side, and fill the space between the mudguards, as well as being high enough to carry the body top line.

One real criticism of many of the touring models is that the seat does not look as comfortable as the old bodies, with higher sides and thick trimming rolls around the rear top edge. On the seven-passenger bodies, when the side heights were reduced, the extra seats prevented spreading out, and the height of cushions from the floor and slope of same was not proportioned to conform with the drop in the panel height. Now that the five-passenger body is the rule, there is no reason why the front seat-back cannot be set further toward the rear, the steering column be made a little longer, both cushions made with at least three inches slope and the seat-backs made to conform to the back of the passenger. The runabouts, as noted above, show a better average in this respect than most of the touring bodies.

The location of the front door on both open and closed bodies, to facilitate getting to the driver's side from the right, is important, as is also the position of the change gear and brake levers with respect to the front of the seat.

Two views, one on a Mercer and one on the Jackson, show how this has been provided for in different ways. On the Mercer both levers are short and work within a depression in the front of the seat and are sufficiently low to enable a man to slide over them. On the Jackson the levers are so well forward as to permit going behind them.

Trimming designs show little changes over last year. The French pleat is the style used, and the cushions are without facings. Black leather is used on seats and backs and imitation leather on the doors, back of front seats and other flat places of the touring and runabout models.

The commercial welt makes a neater finish on the doors and edges than was formerly the case with the home-made article. The usual number of bodies use fancy colored leather. These are always soft tones and in keeping with the color scheme.

The robe-rails are the strap kind. Very few use tonneau light or natural wood finish at the rear of front seat. Foot-rests are not considered as necessary as formerly. In fact, when the form of rear cushion is right, the need for foot-rests decreases. Instrument boards, even when of metal, are generally finished to imitate natural wood, but some few are dull black.

Mudguards show changes only when used with steps. At times these cycle guards come lower down at the front end than usual. The steps used are nearly always large and substantial looking and are generally cast of white metal so as to wear and finish bright. More lamp brackets than ever are fastened to the front guard with a tie-rod between.

The value of a high radiator was never more emphasized than this year. Changes in this respect made over last year are toward more expanse. The Pierce-Arrow is an illustration of this.

All the color combinations are sensible and, except in rare cases, the striping adds to the harmony. The disk wheel is an exacting unit in the color scheme. Striping on the disk must necessarily be a circle, and if this is overdone it gives the appearance of a target. Those that look best are of plain color, and, except in the white or yellow cars, the disk color is a lighter shade than the body. Aluminum painted rims better the appearance of the wheel.

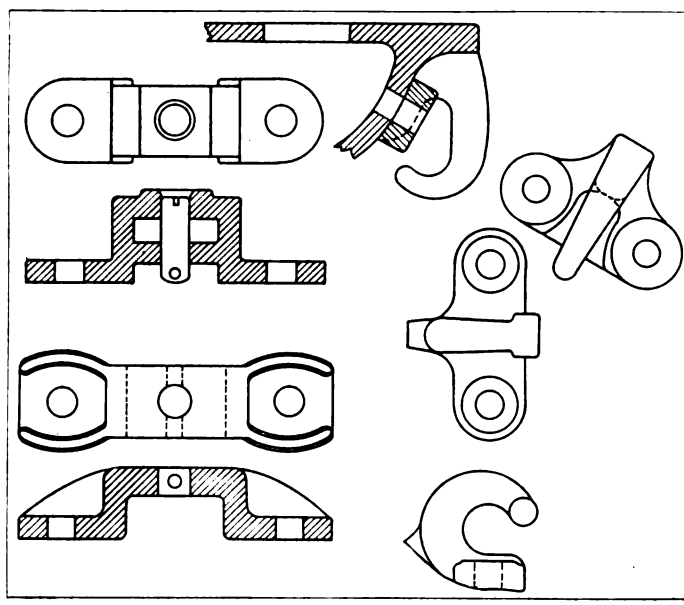
Color combinations are similar to those used in former years, but there are more cars using the bright colors.

The blues, as usual, are most used, at times with white striping. The stripe just below the top edge of the body and parallel thereto is used less than a year ago. In a few cases this line is continuous from the body and on the hood to the front. When the hood is rounded, a continuous line from the body does not look right. One of the best jobs of striping that has come to our notice is a blue touring car with white stripes in each door panel about 1 inch from the door edge all round. The colors most used on closed cars are lake and black, maroon and black and bronze green and black.

Wool fabrics are used more than last year for trimming of the closed bodies. Many of these fabrics have a smooth finish and some of them a pin stripe. Fewer two-compartment bodies are used. Vanity cases are usually the small visible type and these are used on a minority of cars only. Cowl lamps are not used on the closed cars as much as the open types.

Skid-Chain Fastening for Cast Steel Disk Wheels

IN connection with an editorial printed in AUTOMOTIVE INDUSTRIES of Jan. 6 relating to lack of means for applying anti-skid chains to cast steel disk wheels, our attention has been called to the fact that the Clark Equipment Co., who manufacture wheels of this type, have long been providing such means. The first steel disk wheels manufactured by the concern were for the Nash Quad. This was a single disk wheel, and 1-in. holes were drilled through the web of the wheel through which fastening means for the chain could be passed. There are several methods of fastening the chains when the wheel webs are thus drilled. The simplest method consists in the use of a bolt and nut. One end of the chain is then threaded over the bolt, the bolt is passed through the hole and the other end of the chain, and the nut put on. Nash and other manufacturers, however, use a special fastening. The bolt and nut method of fastening the non-skid chains is probably the quickest in operation.

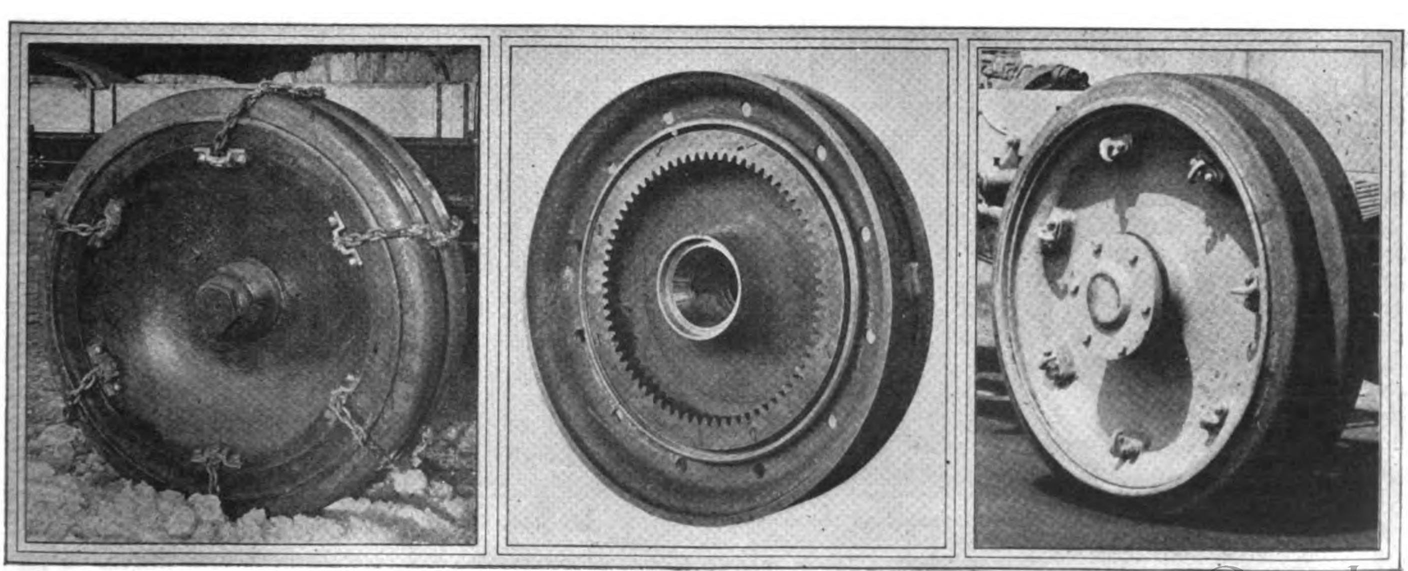


Methods of attaching anti-skid chains to cast steel disk wheels

On the larger double disk wheels of the Clark Equipment Co. with old style box section rim, the rims were drilled from the end. Several types of clamp have been designed by the Clark company and hooks are also used in connection with these wheels, the Titan Motor Truck Co., for instance, having designed a hook bolted to the rim of the wheel which it uses on its trucks. On a White truck used by the Clark company the clamps are bolted to the under side of the rim.

This box-rim type of wheel is now obsolete, however, having been superseded by the French type of rim. All wheels of this type made by the Clark company are cast with bosses on both sides of the web, through which holes are drilled. This permits of the application of any type of hook the manufacturer may desire. Some designs of wheels made by the Clark Equipment Co. and the hooks used are herewith illustrated.

The Engineering Subcommittee of the Empire Motor Fuels Committee, under the chairmanship of Dr. W. R. Ormandy, is conducting tests and experiments on the design and operation of internal combustion engines running on alcohol fuel and on alcohol-benzol-ether mixtures.



Cast steel disk wheels with provisions for fastening non-skid chains

Future Development of the Motorcycle in England

Two articles recently published in AUTOMOTIVE INDUSTRIES discussed the future development of the American motorcycle. It is interesting, in the light of those articles, to read this analysis of the English situation, written by a man who has closely observed the industry over there.

By M. W. Bourdon

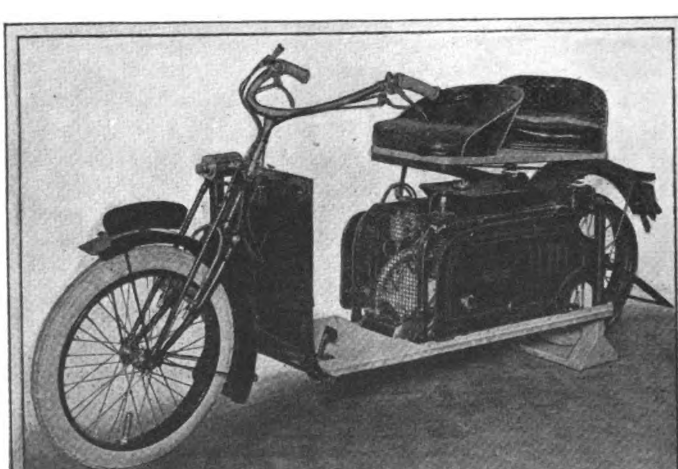
IT has been suggested that the present type of motorcycle in England has reached a stage of gross overdevelopment, and that it will be necessary, in order to tap the wider market which awaits it, to strike out on new lines of general design.

Speaking broadly, the 1920 type of motorcycle in its elaborately equipped and highly powered forms has not been designed at all; it has been merely evolved from the stiffened-up pedal cycle of 1900 with a 1 to 1½ hp. engine attached to a cumbersome and unsightly projectile still exhibiting some of the most obvious failings of its forerunners. The whole efforts and ingenuity—one hesitates to say engineering ability—of its makers have during the past 20 years been directed mainly toward making it faster and a better hill climber by piling on more power, causing it to become a more and more unsightly entity from both the esthetic and engineering points of view. Subsidiary endeavors have been concerned with making it more reliable and, in some cases, more comfortable for the rider.

But in the way of protection for the rider and his clothing, ease of upkeep, certainty of lubrication, cleanliness of outline, simplicity of control, quietness of running, fuel efficiency and other features there is evident little if any improvement over the machines of the early years of the century—in fact, in some of these points it does not equal the earlier models.

There is an engineering saying, the truth of which is admittedly open to argument at times, that "when a thing is right, it looks right." But no man with engineering instinct will suggest that the present day English motorcycle satisfies him visually.

Take the average frame as an example. There is a great deal to be said in favor of the tubular construction with its rigidity combined with low weight; but as usually applied to motorcycles it is a mere conglomeration of tubes of various sizes and shapes, adapted or arranged mainly to fall in with the whims of the moment as to engine size and type, with additions or variations made apparently as afterthoughts to accommodate other components and accessories.



A development of the scooter; the Reynolds Runabout. Has a 2½-hp. two-stroke engine, seat platform on quarter elliptic springs, 24 in. x 2¼ in. wheels, two-speed gearset, and chain and belt transmission

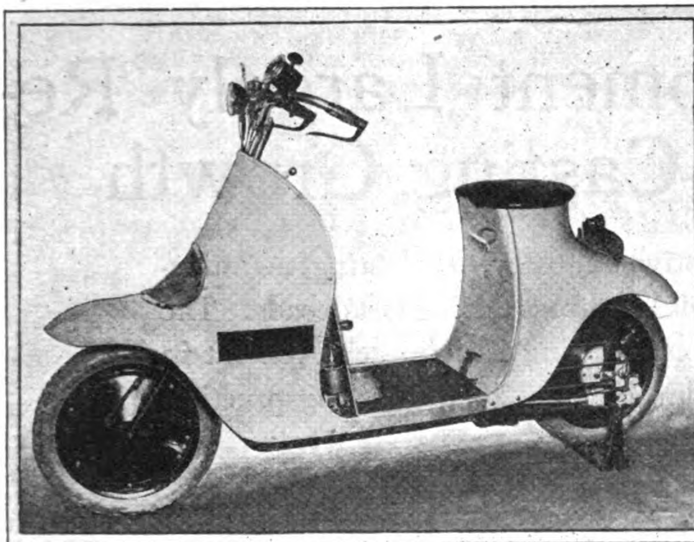
It has a tank of some nondescript shape clipped on here, a battery box with an outline that clashes with every other item strapped on there, a gearset bolted somewhere else and a multitude of control levers, wires and rods, oil pipes and fuel pipes, and the connections for other fittings running in every direction and at all angles with no particular shape or curvature.

"A mass of bits" goes a long way in describing a modern motorcycle, but to this should be added "exposed to mud, rain and the effects of vibration, and encouraging formation of rust and failure in operation."

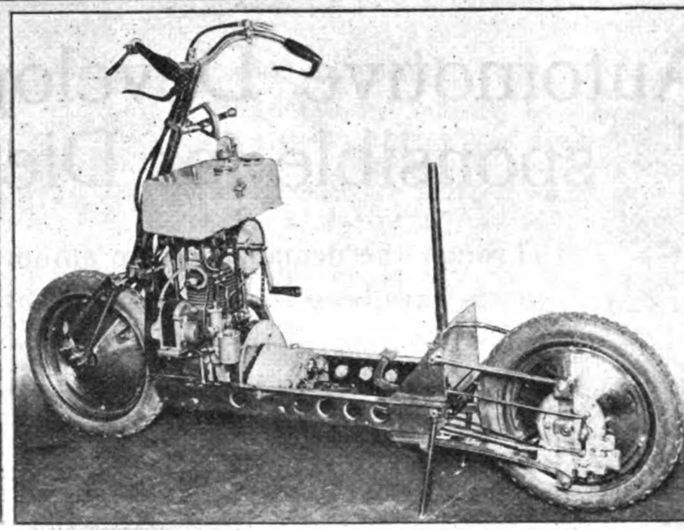
No wonder is it that the best engineering and automobile firms and the brains they could apply with advantage to the industry have, most of them, refrained from associating themselves or allowing their names to be associated with motorcycle production in the past. There are signs, however, that such firms are now inclined to allow their resources to move in this direction. Among British firms, Beardmores have since the war taken interest financially and otherwise in the industry, and now we have Vickers undertaking the production of engines for an existing firm; whether the latter implies a Wolseley motorcycle in the near future remains to be seen.

British car manufacturing firms who have long been motorcycle makers as well, were nearly all originally pedal cycle makers (e.g. Rover, Humber and Sunbeam). Their motorcycle departments are run by men still connected with the pedal cycles and the atmosphere of the latter still prevails.

There are, nevertheless, clear signs that in the motorcycle industry there are brains in plenty; but they appear to be misapplied or at all events limited in their application. No maker of renown has yet seen fit, or has had courage, to get out of the rut into which motorcycle design has fallen. Post-war productions do not



The Unibus with its engine, mud shields and seat fitted. The addition of side panels suggests itself to afford greater protection for the rider



Unibus chassis has a pressed steel frame, 2½-hp. single-cylinder two-stroke engine, two-speed gearset, open propeller shaft and worm drive

depart from pre-war practice to any marked extent and then only in detail.

The piling up of "refinements" on the existing structure is leading nowhere and development where it occurs—as in the lightweight section—is mainly a matter of recommencing the circle.

All this leads to a consideration of possible developments, and in the writer's opinion—confirmed by that of men known for their breadth of view and associated with motorcycle production, though held in check by the interests they serve—the fundamental requirement is a fresh design of frame.

It cannot be denied that the existing type of machine appeals almost entirely to men below 40 years of age, the majority being enthusiasts below 30 who desire speed above all else. The sidecar combination certainly attracts men of small means, but they have to take a machine of the type produced for the speedman.

They would much prefer one which afforded them more protection and greater comfort, and did not necessitate the use of special overall clothing to keep them warm and clean. They really need an ultra-lightweight car on two wheels for solo work, and two seats for passenger work, either tandem fashion or with the second seat in a side attachment, and in their desires they have with them innumerable potential purchasers who will not at any price buy or use either a solo or sidecar on existing lines.

Such a new type of machine clearly necessitates a fresh design of frame, roughly a looped pattern with a low platform in front of the seat allowing the use of normal warm overcoats for cold weather riding.

The next requirement is more protection for rider, engine, transmission and controls from rain, mud and dust. This implies better mudguarding, a panel in front of the rider, partially enclosed engine, and a completely enclosed transmission.

Two machines at the Olympia Show contain the germ of the type in mind, so far as their general arrangement goes. These are the Unibus and the Reynolds Runabout, illustrated herewith. It is not suggested for a moment that these two machines as they stand are practical general purpose or touring mounts, but they appealed to many far-seeing men at Olympia as having very distinct possibilities for development.

The Unibus, in particular, is of interest in this connection. While it now has wheels far too small (16 in. diameter) and an engine also on the small side (2½ hp.), it has all the elements of a successful type. A general description of it is as follows: Pressed steel frame supporting the engine under a detachable hood in front with the clutch and gearset arranged car fashion in the frame; open propeller shaft drive to worm gearing alongside the back wheel, the latter connected to the frame by a pair of quarter elliptic laminated springs and a pair of parallel radius rods; two sets of expanding brake shoes within the worm wheel; articulated front forks with quarter elliptic springs almost parallel with the tubular members; a pedestal seat having below it a detachable hood forming the rear mudguard; a hinged panel in front of the rider gives immediate access to the engine. Through this panel projects the starting crank with chain connection to the clutch on the crankshaft. Both wheels are readily detachable and could easily be made interchangeable.

In the Reynolds runabout a simple frame of tubular construction, with duplicated and parallel side members, has two side arches between which the engine and transmission are located and on the top of which is a platform on quarter elliptic springs for one or two bucket seats. Engine and transmission are screened by detachable side panels and by a wire front to admit air, each side panel having a scoop to direct more air onto the cylinder. In this case a chain and a belt form the transmission. These could with advantage in some respects be superseded by a shaft and worm or helical bevels. Again, the wheels are easily detachable for tire repair and both engine and gearset can be removed from the frame without difficulty.

Both these machines sell at approximately £100 (say $500) at present. The first is being made by an airplane plant established during the war and the other by a quite small concern. Neither has yet attained any considerable output. Both machines could be made little or no heavier than a present-day motorcycle of similar power.

The rider's seat would have to be such as to afford him more "grip" of the machine for steering on rough surfaces and at speed. But there are the fundamentals for a new type, with the economy, reliability and most of the speed of the present day machine.

Automotive Development Largely Responsible for Die-Casting Growth

Through the demands of the automotive industry, die-casting manufacturers have been forced to do "impossible" things during last decade. The commercial perfecting of the aluminum casting is main achievement in this period. Here is a story of the development of die-casting practice.

DIE-CASTING owes its technical and commercial development to its contact with the automotive industry more than does any other type of casting or forging. The thirtieth birthday of the first die-casting plant has not yet been passed, but the manufacture of die-castings now reaches an annual production of about three million pounds a year. More than fifty firms are producing die-castings at the present time, although a large percentage of the total tonnage of the industry is produced by some five or six firms.

Though the die-casting industry is almost thirty years old, its growth was not uniform throughout this period. Die-casting manufacture was begun by H. H. Franklin in 1892, but the growth of the industry during the first twenty years of its existence was not nearly so rapid as during the last decade. During this last ten years die-castings came to be used extensively for automobiles and trucks, so that the die-casting industry was enabled to partake to the fullest extent of the benefits incident to the rapid growth of the automotive industry.

During the first decade of its existence, the die-casting industry was concerned with the production of castings for phonograph, telephone, cash register and similar parts, and it was not until 1904 that die-castings were used in automobile construction. H. C. Skinner, general manager of the Franklin Die-Casting Corporation, states that:

"As far as the writer knows, the die-castings were first used in the automotive industry on the Franklin automobile. The first die-cast part was a connecting rod bushing for the 1904 engine. This took the place of bronze, and the results were so satisfactory that bronze bushings were eliminated except in the case of the small end of the connecting rod."

The Doehler process came into commercial being about 1906 and since that time other firms have been organized, some dying after a short life, others still in successful operation. The progress of the industry as a whole, however, has closely paralleled that of automotive development.

Technical Phases

The general principles underlying die-casting manufacture are familiar to automotive engineers. The process may be defined as "metal castings made by forcing molten metal, under pressure, into a metallic mold, known as a die."

The types of die-castings manufactured readily divide into these classes:

1. Aluminum base alloys.
2. Zinc base alloys.
3. Tin base alloys.
4. Lead base alloys.
5. Brass and bronze.

The lead base alloys find a very limited use in the automobile industry, since the castings produced from these materials do not have the qualities necessary to make them suitable for extensive automotive use. The tin base alloys are used in making babbitt bearings, but their use is practically limited to such castings so far as automobile work is concerned. There is a very large tonnage absorbed by the automobile industry, however, for this purpose.

Before 1914, probably 90 per cent of the die-castings produced were of zinc base alloys. Since that time, however, the development of aluminum die-casting has made the zinc base castings of less importance. At the present time aluminum base castings constitute probably 30 per cent of the total die-castings production, zinc base castings about 22 per cent.

The zinc base castings are considered adaptable to such parts as magneto housings, switch locks, switch handles, self-starting devices, oil pump parts, speed indicators and windshield nuts. The tensile strength of zinc base castings often runs as high as 20,000 pounds, but at least one authority states that they cannot be depended upon for more than 10,000 lb. when used in any vital part.

The die-casting of aluminum became commercially possible about 1914. Experimental work had been going on for many years before this, but it was not until the beginning of the war that the process was perfected so that its use would be profitable in a commercial way. Since that time, however, the aluminum die-casting has become very widely used and now constitutes a large percentage of the total production of the industry.

The chief properties of the aluminum casting which give it popularity as opposed to the zinc base castings are:

1. Freedom from the crystalline, a structure which characterizes zinc base castings. This property makes the aluminum casting more permanent and more reliable.
2. Greater strength.
3. Lower specific gravity.
4. Higher melting point and greater resistance to varying temperatures.
5. Greater ductility.
6. Lighter weight for any given strength.

The disadvantage of the aluminum casting, of course, is its high price due to the greater difficulty in casting this metal as well as to the higher original cost of the metal itself.

Brass and Bronze Die-Castings

There has recently been some discussion between various die-casting experts concerning the possibility of die-casting brass and bronze in such a way as to make the product commercially practicable. Thousands

of dollars have been spent during recent years in attempts to produce dies capable of standing up under the relatively high temperature necessary to melt and cast brass and bronze. Charles Pack, production manager of the Doehler Die-Casting Co., states that it has been technically possible to produce brass and bronze die-castings for ten years, but that up to the present time no die material has been discovered which would withstand the casting process for a sufficient length of time to render production on a commercial basis economically possible.

In making this statement, Pack calls attention to the definition of die-casting as being "the production of metal castings by forcing molten metal, under pressure, into a metallic mold." Several of the well known die-casting companies are producing bronze castings at the present time, but by a pouring, rather than a pressure, process.

Aluminum bronze die-castings, however, are being produced by the Buffalo Bronze Die-Casting Co. by a pressure process, conformable to the definition of die-casting given above. This company claims to have found by long experiments a die material capable of standing up under the necessities of aluminum bronze die-casting production. Castings are being produced by this method for some of the best known automobile companies.

There are certain limitations to aluminum-bronze die-casting, however, according to T. W. Jeacock, president of the Buffalo concern, which are not experienced in connection with the aluminum casting. Certain intricate shapes can be cast in aluminum which are not yet possible in bronze. On the other hand, the bronze casting is specially adapted to parts requiring more strength than the aluminum casting can give. Moreover, this concern does not claim to be able to die cast all bronze and brass alloys, but simply an aluminum-bronze alloy.

The following list covers the aluminum-bronze castings which are being made at the present time by the Buffalo concern:

- Windshield Parts: Sash Pivots, Upper and Lower.
  - Glass Retaining Clips.
  - Sash Pivot Clamps.
  - Sash Pivot Clamp Thumb Screws.
  - Sash Corner and Connecting Brackets.
- Steering Arm Ball Sockets.
- Shaft Lever Ball Sockets.
- Gasoline Control Gears.
- Spark Control Gears.
- Spark Control Levers.
- Gasoline Control Levers.
- Instrument Board Brackets and Fixtures.
- Door Handles.
- Door Locking Bolts.
- Door Hinges.
- Door Strap Holder Plates.
- Door Window Adjusting Levers or Cranks.
- Door Strikers.
- Hub Cap Latches.
- Carburetor Body Plug.
- Carburetor Float Balance Weight.
- Carburetor Air Valve Cam.
- Gas Tank Shut-off Handle.
- Elbow Gas Tank Outlet Cock.
- Elbow Oil Pressure Gage.
- Chamber Plugs.
- Cap Oil Pump Driving Shaft.
- Battery Box Cover Dowel.
- Worm Driving Gear: Teeth cast in Truck Driving Gear.

It has not been our purpose to enter into the technical details of this discussion, but merely to present to engineers the discussion itself, in giving a brief statement of the claims made by the various parties interested.

Influence of Automotive Industry

Not only has the automotive industry been largely instrumental in the commercial growth of die-casting, but it has influenced strongly the technical development as well. As the demands of the automotive industry became more varied, the die-casting manufacturers were spurred on to greater technical and research efforts and many times within recent years it has been found possible to die-cast certain pieces which had previously been considered impossible of manufacture by this method.

Rapid progress has been made during the last five years, yet it is the universal opinion among die-casting experts that the art of die-casting is still in its infancy. The die-casters have been able to do so many things recently that at one time they thought impossible that they hesitate to predict any limits for future possibilities.

There are certain rather definite limits, however, to the commercial possibilities of the die-casting art at present. These should be considered by the engineer in making up his designs and he should bear in mind that there is a real difference between technical limitations and commercial limitations. In other words, the die-casting manufacturers may be able, by the exercise of considerable ingenuity and some extra work, to die-cast a specially difficult part, but the cost will be in proportion. On the other hand, it might be possible, through a recognition of the limitations of die-casting practice, to simplify the design of that part in such a manner that its production would be cheaper and its fundamental characteristics preserved without essential changes.

Benefits of Consultation

The best results can usually be obtained if the die-casting manufacturer is consulted regarding production possibilities before the design is so far along that change of a specific part will necessitate major changes elsewhere. Practically all the leading die-casting producers are glad to render such service to customers or prospective customers, and regard it as an essential part of their merchandising policy. If they can make suggestions leading to a reduction in cost of the product, it is to their advantage since their percentage of profit is the same in any case, and the reduced cost means a satisfied customer.

The die-casting manufacturers can undoubtedly be of great assistance to the automobile designer if they are consulted in the early stages of design concerning parts which the designer would like to have die-cast. The die-casting manufacturers seem to understand fully and to admit frankly the limitations of their practice and for this reason are worth while consulting. One prominent executive of the die-casting industry said recently that "the die-casting industry has suffered from over-enthusiasm." Engineers have sometimes tried to get die-castings for parts not suited to this form of manufacture and the result has been unfortunate for all parties concerned. This sane view of their own industry is rather characteristic of die-casting manufacturers.

The advantage of the die-casting, of course, lies in the small amount of machining necessary, the rapidity of production and the adaptability to the manufacture of parts in large quantities. Die-casting limits vary from plus or minus .0005 in. to .0025 in. per inch of diameter or length. Bronze castings, made by the regular die-casting method, can be made in most cases to limits of plus or minus .002 in. per inch of length or diameter;

in many cases to closer limits, according to the Buffalo Bronze Die-Casting Co.

Die-Casting Output

General statistics concerning the die-casting industry are difficult to obtain, since there is no association of die-casting manufacturers. It would not be surprising to note the formation of such an association in the near future, although there is not an undivided sentiment in favor of an association among the various manufacturers. Approximate figures, however, based upon the "educated guess" of some man connected with the industry for many years give some indication of its size and growth.

If business had continued normal throughout the year the production of the entire die-casting industry for 1920 would have amounted to nearly 3,000,000 lbs. Of this total the percentage of each of the chief types may be roughly estimated as follows:

1.	Aluminum base	35%
2.	Zinc base	25%
3.	Tin base	27%
4.	Lead base	8%
5.	Brass and bronze	5%

This total of nearly 3,000,000 lb. for the 1920 output would indicate that the die-casting industry has multiplied about 10 times since 1913, before the war boom, followed by the increased demand of the automotive industry, enabled it to grow to its present proportions. In 1913 practically no aluminum die-castings were produced commercially, while to-day aluminum castings lead the field. The improvement of the process of aluminum die-casting to the point where it was commercially practicable accounts to a large extent for this enormous growth.

Making estimates on the basis of the approximate figures already used, it is possible to estimate the percentage of this output which is now absorbed by the automotive industry. Of the estimated output for 1920, approximately the following percentages went to the automotive industry. Of the output of

1.	Aluminum base die-castings	75%
2.	Tin base die-castings	90%
3.	Zinc base castings	50%
4.	Lead base castings	1%
5.	Brass and bronze castings	90%

Utilizing a weighted average on the basis of the figures presented, then, it may be said in a general way that the automotive industry absorbs about 67 per cent of the total output of the die-casting plants in this country.

To a very large extent die-casting may be said to occupy a special field. It comes into competition with the forging and the malleable and steel casting only in a few instances, since, with the exception of the bronze alloys, the very material from which it is made confines its use to parts where great strength is unnecessary.

Suggestions for Designers

As the die-casting industry has been so closely bound up with the automotive industry, in the past, so future developments bid fair to make closer that relationship as time goes on. Through the co-operative activities of the two, distinct advantages apparently lie ahead for both parties concerned. Some practical suggestions in regard to such co-operation are contained in a booklet issued recently by one of the prominent die-casting concerns. Under the heading, "Suggestions for the Designer," appear the following:

"In designing for die-castings, there are certain points which, if borne in mind, will aid in their successful use.

1. In dealing with steel cores, as is necessary in a process producing finished parts, undercuts or recesses in the castings should be avoided. In many cases it is, of course, possible to use collapsible cores, but this increases the cost of both dies and castings.
2. To give added strength, pins, rings, and other bushings made from brass, bronze or steel may be inserted in casting.
3. No allowance for shrinkage or machining should be included in making drawings except where the limits are such that a special operation is desired, when it should be clearly noted.
4. Parts which require little or no machining after being sand cast or which can be economically produced by stamping or screw machine methods are not usually adaptable to die-casting.
5. It is cheaper to cast raised than depressed letters or figures, but both are practical.
6. Small fillets added at sharp corners greatly strengthen the casting and increase the rate of production.
7. The cost of die work can sometimes be reduced by our knowing the important dimensions, both where accuracy is required and where it is not essential.
8. The following limits should be borne in mind in designing for die-casting:

(A) Limits—Maximum Weights for Casings.
Aluminum—3 pounds.
Tin Base—8 pounds.
Lead Base—10 pounds.
(B) Limits—Minimum Wall Thickness.
Lead—1-32 inch.
Tin—1-32 inch.
Zinc—1-8 (on small castings 1-16 inch).

List of Automotive Parts That Are Being Made by the Die-Casting Process

Air shutters
Ball bearing retainers
Bearing bushings (crankshaft, camshaft, connecting rod, starter, generator, gear shift lever, clutch pilot, oil pump, shifter fork guide, speedometer drive shaft)
Bracket support (accelerator)
Brush holders
Body trimmings
Brush holder covers
Butterfly valves
Camshaft bearing cap
Carburetor float valve parts
Carburetor needle valve pointer
Carburetor float chamber cap
Circuit breaker parts
Foot button guide (accelerator)
Front axle yoke cap
Generator end plates
Gears for control mechanism
Gear cases (small)
Governor weights
Hub caps
Ignition distributor head
Instrument parts

Aluminum—1-8 inch (for small castings 1-16 inch).

(C) Possible Variations from Drawing Dimensions Per Inch of Diameter or Length.

Lead	plus or minus .001
Tin	plus or minus .0005
Zinc	plus or minus .001
Aluminum	plus or minus .0025

Where the distance involved is several inches these may sometimes be reduced.

(D) Maximum Number of Threads.

Lead, external	24 per inch
Zinc, external	30 per inch
Tin, external	34 per inch
Aluminum, external	20 per inch

In the case of aluminum, where close fit is required, thread should be cast oversize and chased.

Where economical, internal threads can be cast in parts made from zinc, tin or lead base alloys, but this is not possible in parts made of aluminum.

(E) Holes.

Lead, Tin, Zinc—1.32 inch minimum.

Regulated by depth of hole and thickness of casting.

Aluminum—3.32 inch minimum.

Size of hole is dependent on its length and the general design of castings. Holes not cast can usually be spotted to facilitate drilling.

(F) Draft.

Lead and Tin—Cores, .0005 per inch of length and diameter. Side walls .001 per inch.

Zinc—Cores .001 per inch of length and diameter. Side walls .001 per inch.

Aluminum—Cores .015 per inch of diameter and length. Cores less than ¼ inch diameter to have .005 per inch of length and diameter. Side walls .005 per inch.

While the above draft is desirable, it is sometimes possible to modify these limits where they would interfere with the service required.

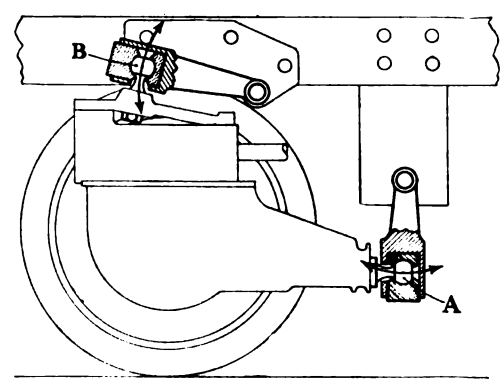
The accompanying chart comprises a composite list, made up from the suggestions of several leading firms, covering those parts which the die-casting manufacturers believe can profitably be made for automotive use by means of die-casting.

A Helical Spring Suspension for Motor Vehicles

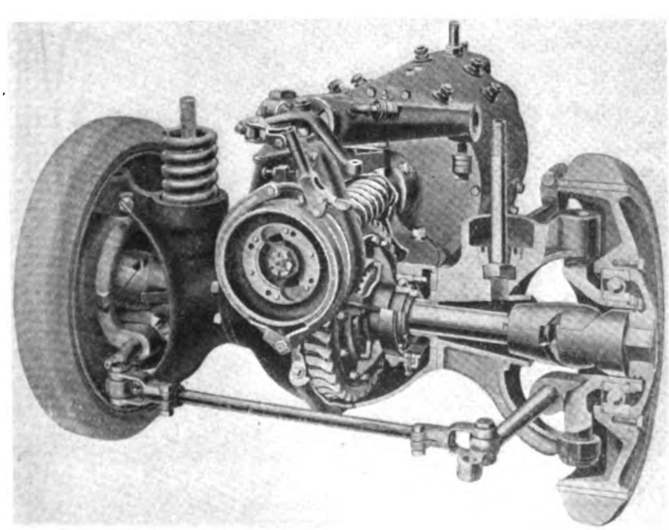
A NEW construction for taking up driving and braking strains is found in the Duplex compensating suspension for motor vehicles incorporated in the new series C Baker electric industrial tractors and trucks. The frame of these trucks and tractors is supported on double concentric helical springs providing the necessary cushioning effect, but the principle involved is adaptable also to other forms of motor vehicles with more conventional springing.

The helical springs referred to above are loosely mounted in pockets cast in the chassis and axle members respectively and support the chassis load only. Swivel studs, free to oscillate in their retaining sockets, hold the springs under proper compression when the vehicle is light, and resist the tendency of the chassis to rebound off the springs when traveling over a rough surface. These spring studs, thus tying together the chassis and the axle, are free in their seats within limits fixed by the torque resisting devices.

Referring to the drawing, the forward torque member, supported in trunnions from the chassis frame, takes all driving strains through a large ball and socket A attached to the motor supporting cradle which forms an extension of the axle housing. A second similar construction B, mounted in a horizontal plane above the power unit, holds the axle in alignment and resists all axle thrusts resulting from forward or backward motion.



Baker R. & L. duplex compensating suspension



Baker R. & L. industrial truck axle

Improvements in a Line Drive Tractor

(*Continued from page* 803)

tral, as for belt work, and stopping on grades. The operating lever A, Fig. 2, is held by spring clips on its quadrant B in both the on and the off position. The brake drum C is still mounted on the universal joint just behind the front drive axle.

As an aid to the operator the tractor is now furnished with a steering indicator A, Fig. 3, and notches B, C and D to indicate the extreme steering range and the straight ahead position. This enables the operator, who always drives the tractor from the implement seat, to steer rapidly and accurately.

The steering clutches A, Fig. 4, are now plain cones, metal to metal, instead of the expanding ring type, in order to eliminate the need for adjustment for wear during the life of the clutches.

The photographs show clearly the essential parts of the mechanism, namely, the steel steering worm with its bronze gear (at S, Fig. 3), the cam arrangement for gear shifting (at A, Fig. 1), the steering clutch assembly (at A, Fig. 4), the transmission, the Torbensen tractor axle, and the five bearing crankshaft in the Hercules engine.

Machining Cylinder Blocks on Drum-Type Continuous Miller

HERETOFORE the top and bottom faces of cylinder blocks have generally been faced off in horizontal milling machines with long tables to which a considerable number of the castings could be strapped at the same time. The illustrations herewith show a machine of the drum type specially designed for handling cylinder castings. This machine is quite compact, and it is also continuous in operation, loading of the drum going on while the machine is in operation.

One of the illustrations shows the milling operation on the top and bottom faces of the cylinder block and the other the same operation on the end surfaces of the block. By performing milling operations on opposite sides of a casting at the same time, one handling is obviated and the surfaces are bound to be parallel.

In milling the top and bottom of the block, two small cutters are used for roughing and one large cutter for finishing. The two small cutters are not operating on the same section simultaneously. Moreover, the roughing and finishing cuts do not occur upon the same casting simultaneously.

All spindles have individual adjustment and are driven by worms and worm wheels, the cutting speed of the finishing cutters being 20 per cent less than that of the roughing cutters. Different cutter speeds can be obtained by means of pick-off gears. The drum is rotated by herring-bone gears and worm and worm wheel, and its speed can also be changed by means of pick-off gears. The drum spindle is of the double taper bearing type, with very fine adjustment to prevent end motion. The other bearing of the drum spindle is provided with a take-up bushing of the split taper type.

All gearing, splined shafts and revolving parts are inclosed and run in a bath of oil. There are oil reservoirs on both sides of the machine and oil is constantly circulated by means of pumps. All slow running bearings, such as the spindles, are provided with special means of lubrication, so they will not become flooded.

In chucking the cylinder block, use is made of a clamp with double bearing, which simplifies the handling. Machining the top and bottom of the four-cylinder block, as shown in the illustration, is accomplished at the rate of 25 per hour, in regular operation, we are assured. The rate of production in milling the end surfaces of the cylinder block, as shown in the other cut, is 35 per hour.

The advantages claimed for the method of cylinder machining here illustrated are that much floor space and much labor cost are saved. The machines are manufactured by the Newton Machine Tool Co.

THE announcement is made by the Secretary of the (British) Department of Scientific and Industrial Research that the Research Association for the Cast Iron and Allied Industries has been approved by the Department as complying with the conditions laid down in the Government scheme for the encouragement of industrial research.

Foreign Trade Financing Plan Makes Material Progress

Nine States have altered the banking laws to permit the banks within the State to invest in export trade funds. Credit to be apportioned in proportion to support in the financing plan. Other foreign trade information.

MATERIAL progress is being made by the Foreign Trade Financing Corp., the bank promoted institution, which proposes to establish a $1,100,000,000 long term credit for American manufacturers in foreign trade fields. An evidence of the advance made in this promotion is that nine states have changed their banking laws sufficiently to permit banks in those states to invest in this corporation.

The plan being worked out is that after $100,000,000 of stock has been subscribed, debentures will be issued for the additional billion dollars. These debentures will be sold to investors. The time of this credit will be sufficient to permit the foreign buyer to turn his goods into money. Also it will give time for the recovery of exchange values.

There is one very interesting point about the present plan of placing these securities which appears to be eminently fair to all concerned. The men who originated the plan of this corporation make no secret of the fact that the money made available to any industry will be in proportion to the financial support given by this industry. In other words, if the automotive industry wishes to avail itself heavily of the advantages of the long term credit arrangement provided by this corporation, it must support the organization of the corporation. The address of the Organization Committee of the Foreign Trade Financing Corporation is 66 Broadway, New York.

RECENTLY in an account of the spark plug sales in Argentina, AUTOMOTIVE INDUSTRIES referred to the Hauquaire plug. This name was taken from the Consular Report. The plug referred to was the Macquaire, a French plug.

Automotive Vehicles in Finland

THE fact that the car population of Finland had reached 1500 at the end of 1920 is related in a Commerce Bureau report by Consul Leslie A. Davis of Helsingfors, who states that two-thirds of these are in Helsingfors and that no other city has more than fifteen or twenty cars. The trucks in operation are given as 300 to 400, a larger proportion of which are used in the country and smaller towns.

During the first nine months of the year the imports of cars and trucks was 631, of which 100 came from the United States and the remainder from Germany, which, because of exchange conditions, is in a favorable position. American cars, because of their higher power, are said to be popular, the preference being for light seven passenger cars with six-cylinder engines, standard tread and wheelbase of from 118 to 124 inches. A high-tension magneto was said to be necessary equipment and the left-hand drive is desirable, although the German cars are being sold with right drive. A good truck market for both industrial and agricultural use exists in Finland, the Consul states, the demand being for a four-cylinder job from 1 to 2½ tons, equipped with pneumatics and the 1 and 1½-ton sizes.

Consul Davis added that there was a difficulty in obtaining import licenses, but that these were given freely, however, on parts of cars to be assembled within the country.

The exports of passenger cars from the United States to Finland in 1920 was 82, valued at $123,859, while 104 trucks, valued at $202,719, were shipped from this country.

Arabs Study Tractors

BAGDAD, in Mesopotamia, held its first agricultural tractor competition for fifteen days during January, with Austin, Fiat, Fordson and Saunderson machines as the principal performers. The trials were followed with great interest by the Arab farmers, who were very quickly converted to the advantages of mechanical traction and who placed orders for these machines without waiting for the final and technical results of the competition. The sight of these modern agricultural machines being driven and cared for by the natives was picturesque in the extreme.

The competition was carried through very successfully, all the machines doing good work. The trials were attended by the High Commissioner, Sir Percy Cox, by various ministers, and other officials, all of whom expressed their satisfaction at the results obtained.

TRACTOR trials will be held in Bulgaria this month under the direction of the Bulgarian Ministry of Agriculture. According to a British trade report, "a small, strong tractor, capable of dealing with rough ground and able to operate within confined spaces, is the type likely to meet with success."

Trucks in England

THE steady growth of motor truck traffic on British roads is shown by two facts of recent date.

First—The large and old firm of jam and food condiment purveyors, Crosse & Blackwell of London, are removing to a disused new five million dollar Government factory near Burton-on-Trent, whence they intend to deliver the goods by motor truck, of which they have made a preliminary purchase of over 150 vehicles.

Second—The big housefurnishing company of Maple's of London are starting a motor truck collecting and distributing service as a cheaper alternative to railway carriage of goods. More than 100 trucks are being employed as a start.

A development of this sort finds response in the railroad interests' seeking to attach to themselves control of the proposed road motor traffic services. Consequently, as there is legislation on the matter pending, feeling runs

high and automotive dealers are being asked to oppose the reported intention of the Government to entrust highway motor truck enterprise to the railways under the auspices of the Ministry of Transport. The latest reports are that the Ministry itself may be scrapped as being too costly for the present financial state of the country and probably as much, if not more, because of the drastic opposition to certain of its program by the rail and transport services at large.

British Automotive Trade

FIGURES for the foreign automotive trade of Great Britain in 1920, recently announced by the Bureau of Foreign and Domestic Commerce, show that 5325 motor cars and commercial vehicles, with a value of £3,929,455, and 3121 chassis, with a value of £2,474,877, were exported during the year. The comparison with previous years, as well as the totals for other automotive equipment, is given as:

	1913	1919	1920
	7,595	1,514	5,325
Touring cars and commercial vehicles	£2,396,369	£1,056,720	£3,929,455
	1,234	678	3,124
Chassis for motor cars...	£465,283	£471,585	£2,474,877
Motor cars, other parts...	£788,239	£1,068,627	£1,986,410
	16,850	8,368	21,304
Motorcycles and tricars..	£733,269	£577,343	£1,672,903
Motorcycles and tricars, parts	£217,330	£321,834	£667,654
Airplanes, airships, balloons and parts	£46,756	£712,784	£1,918,740

Service Competition In Britain

THERE is evidence of an increasing, not to say an accelerated, interest by British auto firms in service facilities. Among the factors responsible for this new zest are fear of the effects of American firms by contrast with British service methods, restricted number of paid drivers, and the increasing use of cars by business men for business ends. All this makes for recognition of the fact that the car—irrespectively of first cost—having the minimum of idle working hours is really the most useful and economical. Just now and for some time a section of the motor press has been discussing standard charges for overhauls, with the result only to expose the chaotic state of the issue and to concentrate attention on the absolute need for standard parts and good stocks of them available at short call.

As an instance of individual service enterprise may be noted the scheme just announced by the Hillman Company of Coventry, one of the smaller British producers of cars. This company is issuing with each car a specific guarantee against mechanical breakdown for one year and seven days from the date it leaves the works. Should a breakdown occur, the repairs may be executed by any competent firm selected by the owner, the bill being paid by the company. Further, the company will pay the owner $5 a day for the hire of another vehicle while his own is out of use up to 30 days. In addition every car sold will carry with it a full insurance policy against all ordinary risks.

These attractions are good in themselves, but they take no account of the cost of such repairs, and although it matters less to the user than it does to the makers what the cost may be during the first year of its use, the scheme makes no stated provision for the cost of repairs when they are usually first needed, namely, after (not during) the first year's use.

Another firm—the Austin Company of Birmingham—has thrown a bomb into the repairing trade by stating in its monthly house organ that its car can be "overhauled" by four men in one day (i.e. eight hours) at a cost of $30. To realize on British garage labor at present pay rates one must charge not less than $1 an hour all round, so that the above sum is quite inadequate, not to mention the ambiguity of the term "overhaul" as used in a connection which is probably meant to imply nothing more than internal cleaning, adjusting screw-adjustable parts, de-carbonizing the cylinders and a generally rapid survey of conditions diagnosed rather by the ear than by the vision.

N. A. C. C. Foreign Trade Policy

THE National Automobile Chamber of Commerce has recently published a booklet, printed in four languages, which is regarded as an international statement for the purpose and aims of the Chamber. The following excerpts from this booklet pertain to foreign trade activities of the Chamber:

"Realizing the growing importance of the automobile as an essential to international progress, the Chamber recently organized a Foreign Trade Department which functions under the directions of a Committee composed solely of manufacturers who are thoroughly conversant with export matters. Among the policies already advocated by this Committee may be mentioned the application to the United States Congress, for a lowering of the duty on automobiles imported into the United States from abroad. At present the United States duty is 45 per cent for automobiles costing at place of origin more than $2,000, whereas those of a lower value are assessed 30 per cent ad valorem. The enactment of a uniform tariff law of 30 per cent on all automobiles, regardless of value, was urged by the American manufacturers despite the fact that foreign manufacturers already enjoy special concessions because of exchange rates in their favor, the manner of determining the dutiable value of imports into the United States at the current rate of exchange rather than at the normal as was done prior to 1919, and the savings in customs charges resulting from the American practice of using the F. O. B. value of the imported product as dutiable basis rather than the C. I. F. value, which abroad mostly serves for such purpose.

"Appreciating that many foreign countries do not benefit in trade by a duty reduction on automobiles imported into the United States, especially if the exports therefrom consist of entirely different commodities, the National Automobile Chamber of Commerce has also urged the negotiation of reciprocity treaties which, by affording better marketing facilities for the products of the nations concerned, also offer assurance of mutual prosperity.

"A further aim of the National Automobile Chamber of Commerce is to promote the construction of highways. A special department is maintained to compile and disseminate gratuitously data on the most modern and economical methods of building roads not only in the United States but in foreign countries also. Because of this provision, governments or individuals abroad may be assured of a spirit of co-operation equally as spontaneous as that extended to those concerned with the solution of road problems in the United States."

Swiss Automobile Exhibit

THE date for the International Automobile Exhibition at Basle, Switzerland, has been fixed for May 28 to June 6. The showing will be made under nine classifications, which are: touring cars and chassis; lorries, tractors and other industrial automobile vehicles; automobile vehicles; agricultural machines and engines, industrial, aviation and motor boat engines; motor cycles and bicycles; parts for automobiles, engines, motor cycles and bicycles; wheels, rims and tires; tools and machines for manufacturing automotive equipment, and sports articles.

Constructive Possibilities of the Open Shop Movement

Intense bitterness has been engineered among many workers by the open shop movement. This has come about because they believe it to be an attempt to take away the power collective action has given them. The movement must be accompanied by fairness and patient understanding.

By Harry Tipper

TWO men were talking in the waiting room at the railroad station the other day. Evidently they had just finished their shift at work and were on the way home. Part of their conversation reached me and it was sufficiently interesting to get me to listen in without respect to the propriety of the matter.

The first man, the taller and quieter of the two, was talking about the new developments in the shop and wound up with a remark, which was the occasion of my attempt to hear the rest of the conversation. The remarks have been censored a little for obvious reasons.

"Yes, that's a fine proposition; they think they can put it all over us now because work is scarce. They talk about the American plan and all that bunk, but what they are trying to do is simply to throw us union fellows out. That's what they mean by the open shop."

"Sure," said the other fellow, who was more aggressive in his attitude. "Remember what Bill said about spies at the last meeting. Remember what happened to Bill a week later, when he was laid off. They said he was laid off because he was not a good worker. He was just reported and laid off on account of what he said at the meeting. Besides, didn't they lay off three men out of the tool room last week; and it's funny that all those three men were on union committees."

The conversation went on; it was pretty bitter and it was too emphatic to be censored readily, so that it could be included in any report of the circumstance. The remarks which have been mentioned were indicative of the attitude of these men and the point of view which they had on the open shop as far as their particular place was concerned.

I have stated a number of times in these articles that the open shop under proper conditions is the ideal arrangement for co-operation, but we are not dealing with the ideal in industry, and in most of the establishments the suspicion, the prejudice and the opinions on both sides are far from ideal.

The leaders of the unions are pointing out continually that the employers did not give up their own co-operative organizations, and in trades where the employers' organizations have been very active in fighting the labor organizations, a careful propaganda of information has been given to the workers concerning these activities. As a consequence, a great many of the union workers believe, like the two men who were talking, that the open shop movement is intended first of all to destroy the union and to fasten upon the worker the old control against which the unions have been fighting.

They believe that this is an attempt to take away the power which collective action has given to them, and a good many of them cannot speak about the open shop movement without displaying a bitterness which is not any less than that displayed by a good many employers.

Warfare is a poor way to secure co-operation and increased suspicion does not lend itself to the establishment of any unity. As the advantage is secured by one side or the other, that advantage is used only to press their control and their demands with the consequence that these demands become more and more incompatible and result in a greater division and a larger measure of disagreement.

Out in the Middle West one of the biggest plants in an industry which is very closely organized has been running a non-union shop for years, for more than the lifetime of the original workers. In that time this plant has not had a strike which assumed any serious proportions and no attempts to unionize the shop have succeeded, although some of the most skillful workers in the business are a part of the personnel of that organization. The owners of this establishment are known far and wide in the business as being on the square, as taking care of their working people and as thoroughly honorable in their dealings with workers. As a consequence, they have secured a family spirit and a unity within the organization which has not deteriorated in the growth of the establishment.

It is possible to make the open shop a valuable advance in American industrial organization, provided that it is accompanied by a spirit of patient understanding and of fairness which does not countenance any spy systems of information, any discrediting of union members because they are union members, or any unscrupulous advantage of the workers in rewards or conditions, because they are not organized into powerful co-operative bodies.

Wherever open shops have been established on this basis, they have succeeded in retaining the allegiance of their workers in the midst of strikes and through all kinds of adversity. This is not only true in this country, but there are some notable examples of this in Great Britain, where the organization condition is far more serious. If the open shop, however, is seized upon as a means of retaining the control of the worker and fighting the union without any desire or patient development of the ideals of fair play, the results will embitter the worker and in the course of time increase the strength of the various types of workers' organizations.

There is no other possibility. The manufacturer must be ahead of the union in his understanding of human nature, and what is involved in co-operative unity and har-

mony, or his objection to organization as it is at present constituted, will have no other effect than to increase its value in the eyes of his employees. There is very little discipline in employers' groups. Employers who have a sane knowledge of the fundamentals of human relations are harmed in their work by the aggressive and belligerent attitude of the man who sees in the present movement only the opportunity to recover control of his employees.

The short sighted manufacturer is the man who leans back complacently with the statement that he has licked the unions because he has secured the advantage for the moment, and believes he can go back to making them do what he thinks, instead of agreeing with them on what should be done.

The average worker is interested in his employment, his local conditions and his own living, far more deeply than he is in the progress of union organization. He will respond to the sincere effort of the manufacturer to establish methods of discussion and agreement if these are effected by a persistent effort which arises out of a desire for fair dealing.

The job cannot be done without patience and a considerable measure of understanding on the part of the manufacturer, because there is a large amount of suspicion to remove, and a new attitude of co-operation to institute. It needs a strong leader to establish an open shop which will be admittedly in advance of the present method of organization, and needs a measure of study which very few executives have given to the human side of the question.

The open shop can be made the best basis for agreement and unity. It will not serve its purpose, however, if the worker, because of ignorance, or because of the character of the attempt, reacts to it as did the two men mentioned at the head of this article.

Personnel Work Necessary in Dull Times

THE relatively great decrease in personnel departments and their functions since jobs became scarcer than workmen naturally brings up the question as to whether or not such abnormal decrease is justified. Manufacturers have given a number of reasons for cutting out such activities.

To find out what there is to say from the other side, a successful and intelligent personnel manager was asked this question the other day, "What is the use of a personnel department or industrial relations activity at this time anyhow? What is your excuse for living?" A brief digest of his remarks is of interest as presenting the other side of the case. His statement was something like this:

In the first place, safety work must be continued, whether the force is large or small. The records of our company show an actual saving of many thousand dollars a year since the institution of safety work, simply in compensation money and similar expenditures. Primarily for that reason our safety work is being continued during the present depression.

Health supervision also comes under our personnel activities. Even with a curtailed working force, the company wants the lowest possible unit cost of production, which, turned around, means the greatest quantity and quality output per man. This can be maintained only through a continuance of health supervision, both as regards accident and medical cases for the men left on the job.

In almost every plant there is considerable job analysis work to be done, which the personnel or employment department has been too busy to complete during the high tension period through which we have recently passed. This work must be completed before the hiring and placing of men can be done on an intelligent basis. The present inactivity in hiring gives the employment manager sufficient time to take up work of this nature, make further research into the various jobs, the conditions surrounding them and the human factors involved in the various production activities.

The task of laying off men properly calls for nearly as much intelligent effort as that of hiring them. When business picks up again every firm will want to rebuild its working force. The firm which has sent its men away with a friendly feeling toward the company will be in the best position to re-employ its former workmen. Where this can be done, thousands of dollars will be saved that otherwise would have gone toward breaking in new men to an unfamiliar plant. In the meantime the employment manager can keep in touch with the best of these men in one way and another, and thus insure their return when they are needed.

Assuming, of course, that the personnel department is pared down to a minimum along with the other administrative divisions of the organization, there appears to be a very definite field for its activities even during times of depression such as the present.

Stimulating Individual Effort

THE ultimate success of the open shop movement will rest fundamentally upon the fairness and patience exhibited by employers. The fact that an open shop is established and the power of the union eliminated or even diminished is in itself only an incident in the solving of the labor problem. The maintenance of a belligerent attitude on the part of employer or employees can have even a greater deleterious effect on production than union domination.

The ultimate futility of the fighting attitude was voiced recently by Herbert Hoover when he said: "We cannot attain equality of opportunity or maintain initiative through crystallization of economic classes or groups arraigned against each other, exerting their interest by economic and political conflicts. We cannot attain it by transferring to governmental bureaucracies the distribution of material and intellectual products.

"We can attain it by . . . the stimulation of individual effort in the whole mass."

Methods of stimulating individual effort over long periods of time have not yet been well worked out. Study and analysis of the factors involved and a determination of possible methods are the chief activities which lie ahead of those seeking a solution to the complex problem of human relationships in industry.

Thoroughgoing Fuel Research

IN England where the automotive fuel problem is more pressing if not more serious than in this country, one of the prominent petroleum companies has undertaken what promises to be the most exhaustive and thorough research into the inherent characteristics of liquid fuel and their effect upon engine operation ever undertaken. This research is being conducted not by a petroleum chemist or even by the engineering staff of a company in the oil business, but by a group of engineers, physicists and chemists including several of the foremost investigators in these lines which England has produced. The work is in charge of Mr. Ricardo, one of the most progressive automotive engineers in Great Britain, but a man whose training and experience is not primarily in fuel matters, but in engine design and the relations existing between design and performance as affected by the character of the fuel.

This is significant as indicating that the investigation will not be primarily of a theoretical nature—though the theory involved will quite properly be fully investigated and developed and the results checked from this standpoint—but rather that practical conclusions will be drawn. In short, it appears that the underlying purpose is to learn, first what fuels are best suited for efficient use in internal combustion engines, and second what inherent qualities render them superior to other fuels.

With such information in hand, and only then, will it be possible for fuel producers to intelligently proceed in making the fuel supply go furthest and be used with greatest convenience and satisfaction.

Thanks very largely to one or two progressive American investigators allied with the automotive industry we have come to learn in recent years some few facts—or at least some reasonably plausible theories—regarding the advantages and disadvantages of certain classes and grades of domestic fuel; something about the important effect of detonation upon the utility of fuel; and something about means for preventing or mitigating detonations by the use of "dope" and otherwise. Most of the information is vague and incomplete. Some of it appears to be of doubtful value if not actually misleading as judged by the results of the British investigation announced to date. All of which points to the need in this country of just such thorough and comprehensive research as our British contemporaries are undertaking.

There has been much talk about and there is great need of co-operative research in which the automotive and fuel industries should join, but little has yet been accomplished in this direction. When will those whose interests are so vitally concerned awaken to a full realization of the importance of getting to the bottom of the matter?

Fortunately the results of the British investigation referred to are to be made public. Some of them are given on another page of this issue. Is it too much to hope that some American fuel producer will see the light and take action similar to that taken by the Asiatic Petroleum Co.? Or will the matter be allowed to drift until a national emergency forces governmental action?

Thus far the initiative in fuel research in this country has been mostly from the automotive side, but even this has been limited to a small percentage of those who should be interested. There is a great opportunity for those willing and able to grasp it. It should be seized and turned to good account. Patriotic motives should rule, if self interest of the industries concerned is not sufficient.

A New Phase of Service

SERVICE of the vehicles now in the owner's hands is the most important problem before the automotive industry. Service means a lessened sales resistance; it means a greater respect for the products of the industry, and a much wider use of these products. It is an axiom that a chain can be no stronger than its weakest link. Certainly the automotive industry can never be stronger than is the acceptance of its service by the owners of the vehicles.

Just at present the interest in service is centered in a new plan for the distribution of service parts. Some parts manufacturers have already established stations in various sections of the country where dealers, independent service shops, and business organizations which are on the factory list as national buyers can obtain parts. This plan is favored by some manufacturers and opposed by others. It is looked upon as a solution of some existing problems by some parts manufacturers and by others it is utterly condemned. Indeed, this division of opinion exists within the executive staffs of some of the organizations chiefly interested. One sales manager openly favors this plan of distribution of parts, but says that other factory executives have overruled him and propose to let the vehicle manufacturer distribute the parts.

AUTOMOTIVE INDUSTRIES holds no brief for either plan. Both are subject to all of the human weaknesses that will appear in the organization that must be maintained for the carrying out of the project. The present plan of the vehicle manufacturer distributing parts to his dealers has developed certain defects which must be cured. These defects are too well known to need discussion here. What may be the defects of the new plan cannot now be discussed.

AUTOMOTIVE INDUSTRIES does, however, hold a brief for the best possible service. This proposition permits of no discussion. The attainment of better service is vital to the industry and to each factor in the industry. The service responsibility is growing faster than any individual manufacturer's business. At the beginning of 1920 the registration shows that in 1919 there were 7,596,503 vehicles in use and thus needing service. In 1920 there were 8,932,458 vehicles, an increase of 15.65 per cent in the service end of the industry. There is no adequate measure of the service facilities during that period.

With a business growing at the rate the need for service is growing, and will continue to grow as the number of vehicles increases, some wise steps must be taken. As the industry has grown there has been a constantly increasing number of orphan vehicles, and the lack of service facilities for these vehicles is a blow at the industry as a whole. Not every buyer is discriminating enough to realize that it was a mistake in his own judgment that caused him to listen to false promises. He is very likely to judge the industry by the experience he has had with the individual manufacturer.

There should be a distinct effort on the part of someone to see that the owners of orphan vehicles get service.

There is one point on which we believe that a distinct improvement could be made in the present service system. There is no disputing the fact that some manufacturers regard their sale of parts and service too selfishly. Sales have been spread over a very large territory, and it is physically impossible in some instances to maintain adequate service stations at certain points. It has sometimes happened where the vehicle was not properly represented in a service way, that independent service firms, fully competent to give this service, have been refused permission to buy the required parts at a trade price. Such narrowness in a service plan is almost unbelievable, yet it exists.

It is entirely safe to assume that the proper service has not yet been worked out, but the business is becoming of such volume and importance that it will, in time, assert itself and will override those who place selfish interests before the natural objective of service. We do not believe it is within the realm of business prophecy at present to say what form this service will take.

There will be experiments, there will be disappointments, but justice to the vehicle user and a reasonable business policy within the industry will prevail. Service is too big and too important for any individual or organization to much longer delay an equitable solution.

Conflicts and Co-operation

ANY close analyst of our industrial situation must recognize that, for the present at least, there are definite conflicts of interest between employer and employee. But at the same time there are numerous ways in which their interests lie along the same path. The progress of human relationships in industry depends largely upon which of these bases are taken as the starting point for industrial relations.

Better advancement can be made if both sides can come together for consultation upon the basis of those factors in which they really have a community of interest. From that point constructive progress can be made. When they come together on the basis of their differences, the probability of the growth of co-operation is not great.

Harding Endorses Highway Reforms

President Greets N. A. C. C. Committee

Likely to Support Townsend Bill —Conferences Held With Cabinet Officers

WASHINGTON, April 9—The Harding administration will maintain a sympathetic attitude towards the principles of highway transportation enunciated by the National Automobile Chamber of Commerce.

This was made clear in an announcement by President Harding after a conference yesterday with the highways committee of the N. A. C. C. While the President did not commit himself directly to the proposed Townsend bill providing for a commission to supervise a system of interstate highways, he declared he would advocate expenditure of Federal funds for highway building when adequate provision had been made by the States for maintenance.

The conference was the most important of a day devoted to meetings with Cabinet officers and Congressional leaders. Practically the entire directorate of the N. A. C. C. was in Washington for the conferences, probably the most important since the armistice, and they were accompanied by representatives of the Motor and Accessory Manufacturers Association, the Rubber Association of America and the National Automobile Dealers Association. As a consequence, virtually the entire industry was represented. The spokesmen of the industry were cordially received and the results of the day's work were considered fairly satisfactory.

President Harding openly denounced the present system of Federal aid, and statements he made to Senator Townsend as well as the highways committee indicated strongly that his support of their program was highly probable.

Must Study Permanent Effect

The President stressed the fact that hereafter Federal road money would not be expended with a view to the immediate and temporary effect, but always by its permanent and ultimate effect. The declaration that the present system was nothing short of criminal because no thought was given to permanency in construction could be interpreted in no other way than as warning to Congress to change its plan of distribution of highway funds. Though sectional interests will undoubtedly attempt to force the Federal aid bill through, the attitude of the President shows that it will fail through a veto, provided Congress ignores the desires of the Chief Executive.

The effect of the highways committee's conference was aptly illustrated when the President, in regular conference with Washington correspondents, expressed himself very clearly on the road-building program. His statements, in general, were in harmony with the utterances of George N. Graham, vice-president of Pierce-Arrow Motor Car Co., and Roy D. Chapin, president Hudson Motor Car Co., who had spoken on behalf of the industry. The President declared it was monumental folly to permit local communities to build roads which benefited a few and would deteriorate before the bonds issued for the construction matured. He pointed out that no Federal aid could be expected in the future unless States guaranteed maintenance.

In addressing the President, Graham said in part:

Graham Discusses Industry

"As representatives of the second largest industry in the United States, with sales of cars, trucks, tires and accessories in 1920 to a wholesale value of $3,578,000,000, we value the chance to direct your attention to the commanding place our industry has assumed in the nation's transportation.

"Our possibilities extend beyond National boundaries, for we now export cars and trucks to 114 countries, including 56 motor vehicles to Iceland in 1920.

"Less than a decade ago the European car was the standard of the world outside of the United States. To-day American cars are preferred to all others. American manufacturers must now meet the aggressiveness of the French, British and Italian governments who are striving to win back their automotive export trade by liberal credit extensions. The complications of exchange further handicap the American manufacturer. We welcome the efforts of the State, Treasury and Commerce departments to overcome these obstacles and will co-operate in every way possible.

"All transportation demands a proper measure of credit. Makers of motor vehicles and their distributors are entitled to just and liberal treatment both on part of the Federal Reserve banks and financial institutions in the various States.

"Happily our situation is much improved by the fact that we are one of the first industries to experience symptoms of returning prosperity, a result we attribute to the fact that business and individuals must have cars and trucks or be handicapped in efficiency.

Federal Consideration Needed

"At the present time our industry is so much exposed to the application of State rights that it peculiarly needs federal consideration. Every State, through control of its highways, can force motorists and truck operators to pay whatever proportion of its total taxes may be desired, regardless of equity.

"We concede the necessity of revenue, State and national, but urge that our burden should not be out of proportion to that of other forms of transportation.

Iowans Storm Good with Tax Opposition

Express Hope He Was Misquoted in Proposal of New Federal Wheel Tax

CEDAR RAPIDS, IOWA, April 9—Declaring that the automobile industry is "already overburdened with tax," automotive men of Cedar Rapids, the home town of Representative James W. Good, have risen in protest against the wheel tax measure proposed by their congressman. The action against the bill has been taken both under the banner of the Linn County Motor Trades Bureau and individually by automobile men. The trades bureau has written Good taking exception to the wheel tax and asking for further information from him concerning the proposed legislation. In addition, every garage owner, automobile or truck dealer, and other motor-interested men in Cedar Rapids and Linn county has written the local congressman a letter of protest against the proposed measure.

As soon as Good's plan to levy a wheel tax that would yield $200,000,000 a year revenue was brought to light here, a meeting of the Linn County Motor Trades Bureau was held and E. K. MaKibben, president, was instructed to communicate to Good the fact that his plan met with united disapproval of local men in the automobile field. To augment this, the motor dealers pledged themselves to write individual letters to Good in protest against the measure.

Contest "Luxury" Assertion

"We wish to take exception to a statemen attributed to you in the New York *Times*, issue of March 25," declared MaKibben in his letter as president of the Linn County Motor Trades Bureau. "This quotes you as saying that we have, in the United States, more than 8,000,000 passenger carrying automobiles, and practically every one is a luxury. This also quotes you as stating that you are in favor of a wheel tax that would yield $200,000,000 a year."

The remainder of the letter reads as follows:

"We do not think it possible that anyone at the present time would consider the automobile a luxury.

"We are very much opposed to a tax of this nature, as the automobile industry is already overburdened with tax.

"You, being an Iowan, must realize what a value automobiles are to Iowa farmers, and what a wonderful blessing they have been to Iowa farmers' families.

"We sincerely trust that you were mis-

Motor Cars Essential, Harding Says

Takes Up Highways in First Message

Declares Automobiles Indispensable—Demands Reforms in Present Road Work System

"The motor car has become an indispensable instrument in our political, social and industrial life."—PRESIDENT HARDING.

WASHINGTON, April 12—Essentiality of the motor vehicle has been recognized by the President of the United States.

President Harding, in his first address to Congress, proclaimed that the motor car is indispensable in every phase of American life. After discussing the problems of the railroads and the need for reduced rates to increase traffic, he took up the question of highway transportation, expressing complete accord with the arguments presented to him at a conference Friday with representatives of the National Automobile Chamber of Commerce. On this subject he said:

"Transportation over the highways is little less important, but the problems relate to construction and development, and deserve your most earnest attention, because we are laying a foundation for a long time to come, and the creation is very difficult to visualize in its great possibilities.

"The highways are not only feeders to the railroads and afford relief from their local burdens, they are actually lines of motor traffic in inter-state commerce. They are the smaller arteries of the larger portion of our commerce, and the motor car has become an indispensable instrument in our political, social, and industrial life.

"There is begun a new era in highway construction, the outlay for which runs far into hundreds of millions of dollars. Bond issues by road districts, counties, and States mount to enormous figures, and the country is facing such an outlay that it is vital that every effort shall be directed against wasted effort and unjustifiable expenditure.

Can Influence State Policy

"The Federal Government can place no inhibition on the expenditure in the several States; but, since Congress has embarked upon a policy of assisting the States in highway improvement, wisely, I believe, it can assert a wholly becoming influence in shaping policy.

"With the principle of Federal participation acceptably established, probably never to be abandoned, it is important to exert Federal influence in developing comprehensive plans looking to the promotion of commerce, and apply our expenditures in the surest way to guarantee a public return for money expended.

"Large Federal outlay demands a Federal voice in the program of expenditure. Congress can not justify a mere gift from the Federal purse to the several States, to be prorated among counties for road betterment. Such a course will invite abuses which it were better to guard against in the beginning.

"The laws governing Federal aid should be amended and strengthened. The Federal agency of administration should be elevated to the importance and vested with authority comparable to the work before it. And Congress ought to prescribe conditions to Federal appropriations which will necessitate a consistent program of uniformity which will justify the Federal outlay.

"I know of nothing more shocking than the millions of public funds wasted in improved highways, wasted because there is no policy of maintenance. The neglect is not universal, but is very near it. There is nothing the Congress can do more effectively to end this shocking waste than condition all Federal Aid on provisions for maintenance. Highways, no matter how generous the outlay for construction, can not be maintained without patrol and constant repair. Such conditions insisted upon in the grant of Federal aid will safeguard the public which pays and guard the Federal Government against political abuses, which tend to defeat the very purposes for which we authorize Federal expenditure."

Elwood Haynes Appointed Education Commissioner

INDIANAPOLIS, April 9—Governor Warren T. McCray of Indiana announced to-day the appointment of Elwood Haynes, president of the Haynes Automobile Co. of Kokomo, Ind., as a member of the State Board of Education for a period of four years. Haynes will succeed A. M. Hall of Indianapolis as the manufacturers' representative.

C. G. COMPANY STOCK SELLS

KALAMAZOO, MICH., April 12—Former stockholders of the old Kalamazoo Spring & Axle Co. have subscribed for $120,000 of the 8 per cent preferred stock and 1200 shares of common stock of the C. G. Spring Co. The stock is to be issued to them in a period extending over some 18 months. The newly acquired automobile bumper industry is now being moved to Kalamazoo and will be installed in the local plant. The head bumper sales office will also be located here.

U. S. Rubber Sales, $256,150,130 in 1920

Inventory Write-Off of $11,151,444 and Reserve of $6,000,000, Cuts Income

NEW YORK, April 11—A new high record for net sales was established by the United States Rubber Co. in 1920 when the total turnover was $256,150,130, compared with $225,589,465 for the preceding year. Net profits for 1920 after interest charges were $21,220,983, as compared with $17,730,237 in 1919. The balance for the common stock was $16,002,265, which was equivalent to $19.75 a share, compared with $24.18 in 1919.

Samuel P. Colt, chairman of the board of directors, in his remarks to the stockholders said, in part:

"To meet the heavy decline in prices of certain materials, notably cotton fabrics, inventories have been written down $11,151,444 below cost, thus bringing the inventory valuations down to a conservative basis. This reduction was charged against reserves previously created in anticipation of such a decline in prices. In addition to this write-off of $11,151,444, there was appropriated out of the income for the year 1920 and set up as a reserve, the sum of $6,000,000 to take care of any contingencies that might arise hereafter.

"There has been expended upon the plants and fixed properties of the company during the year 1920, $28,316,616, notably in the enlargement of our tire plants at Detroit, Hartford, Providence and Indianapolis. The work is practically completed and paid for.

The general balance sheet as of Dec. 31, 1920, showed net current assets of $187,128,205 as compared with $161,875,058 at the close of 1919. Cash on hand at the end of last year was $14,534,846, against $20,037,646, and inventory was valued at $123,403,029, against $87,633,699. Accounts receivable were $46,329,738, as compared with $40,770,428 the year before. Net current liabilities were $67,373,547, against $26,971,737.

NEW JERSEY INCREASES FEES

TRENTON, N. J., April 11—Increases in motor vehicle fees to bring the State additional revenue of about $1,200,000 a year have been authorized by the legislature.

It was provided that the minimum fee shall be $4 for a car of 10 h.p. or less. From 10 to 30 h.p. the fee will be at the rate of 40 cents a horsepower, and above that, 50 cents a horsepower. The fees for trucks will be based upon capacity, the smallest fee to be $10.

Maxwell President to Sell Off Plants

Action Part of Preliminaries to Consolidation with Chalmers —Working Capital Ready

NEW YORK, April 11—Reorganization and consolidation of the Maxwell Motor Co., Inc., and the Chalmers Motor Car Co. entered upon its final stage when simultaneous decrees were handed down Saturday in United States District Courts in Detroit, Dayton and Indianapolis, appointing W. Ledyard Mitchell, president of the Maxwell company, receiver for that corporation.

This action followed the filing by creditors of petitions in bankruptcy and means a temporary and friendly receivership. The step was decided upon some six weeks ago by the reorganization committee headed by Walter P. Chrysler. It is preliminary to the sale of the assets to a new company to be known as the Maxwell-Chalmers Corp. of Detroit. It will forestall action by disgruntled creditors and minority stockholders which might have embarrassed the reorganization committee.

All the property of the Maxwell company in Michigan, Ohio and Indiana is ordered sold. According to the Indianapolis decree the minimum bid to be considered is $10,915,000. It is expected that the sale and reorganization will be completed within 40 days.

The decree handed down by Judge Tuttle in Detroit contains the provision that the sale shall take place when such a step would appear to be advantageous. Judge Tuttle finds that the debts of the Maxwell company amount to $16,000,000. He appointed William S. Sayres, Jr., a special master to conduct the sale. The special master will receive bids for the property as a whole and for each nine parcels of it. It will be sold in blocks or in parcels, whichever is more advantageous to the creditors.

The reorganization of the two companies will be the largest in the automotive field since the war. Ninety-nine per cent of the bank creditors and 98 per cent of the merchandise creditors have approved the proposed consolidation. The proportion of stock of the two companies deposited with the reorganization committee is virtually the same.

To Take Over All Properties

All properties of the two companies will be taken over by the new corporation. This includes the Maxwell and Chalmers factories at Detroit, the Maxwell plant at Newcastle and the Maxwell body plant at Dayton. The Maxwell and Chalmers cars will be manufactured and sold as heretofore, except that there will be a largely increased production of an advanced type of motor vehicle. The other plants will be operated as they have been in the past.

The only surprise in the court proceedings to those who have followed the situation closely was the appointment of Mitchell as receiver. It had been understood that a new executive was to be appointed for the company but Chrysler, who has been directing the reorganization, is said to have been much pleased with the way in which the present president has conducted the business since affairs reached a critical stage many months ago. There is now a strong possibility that he may remain at the head of the company, although numerous changes in the executive personnel are expected when the reorganization is completed.

Will Have $15,000,000 Cash

When the reorganization is completed the new corporation will have available $15,000,000 in cash which has been underwritten by a syndicate of banks headed by the Chase National. The bank debts of the Maxwell company aggregate $12,000,000, and the merchandise debts about $4,000,000. The obligations of the Chalmers company are placed at approximately $5,000,000.

This statement in regard to the court proceedings was issued by the reorganization committee:

"The reorganization of the Maxwell Motor Co., Inc., to-day entered upon the final stages leading toward successful completion.

"This is the meaning of the initiation of a temporary and friendly receivership in the United States District Court. The primary purpose of the receivership, which was agreed to by all the interests concerned, is to establish title to the properties under the reorganization.

"The court appointed as received W. Ledyard Mitchell, president of the company, who, with Arthur E. Barker, general sales manager, has been in active direction of the Maxwell business during the period of the reorganization.

"Members of the committee said that this appointment is evidence of the continuance of the policies which have had so much to do with the recent upbuilding of the properties.

"They said further that the receivership clears the way for carrying out the larger plans which has already been put into operation on a limited basis. Strengthening and expansion of the factory and dealer organizations will proceed along the lines recently followed.

"The sale of the properties in accordance with the order of the court will no doubt be advertised almost at once, which will clear the road for the discharge of the receivers and the consummation of the reorganization plan, thus rendering available the new $15,000,000 of cash which has been held ready for months for the use of the company."

F.W.D. PRICE DOWN $700

CLINTONVILLE, WIS., April 11—The Four Wheel Drive Automobile Co. announces that effective April 4 the price of F.W.D. trucks was reduced from $4,900 to $4,200. The cut was made after a thorough survey of existing conditions, meetings with dealers all over the country and conferences with many fleet owners.

Efficiency of Labor Reaches High Point

High Production in Detroit Now Reached With Minimum Number of Men

DETROIT, April 9—With all factories at work in Detroit, many of them nearing the 100 per cent production stage figures on the labor situation give some idea of conditions as they will exist for some time in the future. Of 75 factories reporting to the Employers' Association, the total number of employees listed at work now is 132,858, or 57 per cent of the number employed the same time in 1920.

This, taken in connection with the fact that factories are maintaining a production ratio of from 50 to 100 per cent, indicates that there will be many left overs among the labor element when all factories have filled their quota.

Labor to-day in Detroit is as near 100 per cent efficient as is believed possible, and the turnover is giving employers little concern. Many idle men are hanging around the gates of the different factories and on the streets. This is particularly true at the plant of the Ford Motor Co. When the Highland Park plant went down in December more than 50,000 men were employed and the factory was turning out around 4000 cars a day. While there is no authoritative information on the number of men on the Ford Highland Park payroll now it is believed to be approximately 31,000. This in face of the fact that the plant is turning out an average of more than 3000 cars daily indicates that the factory can reach maximum or peak production with the addition of but a few thousand more men.

It is apparent, therefore, that thousands of former employees, who still are waiting patiently for the postal cards summoning them to work, will be disappointed. In fact, hundreds of men who have appeared at the Ford gates each morning have come to the conclusion that there is no chance of their resuming their old jobs and are looking elsewhere or leaving the city.

Clerks Not Replaced

The big force of clerks which was let off early in January has not been replaced and will not be. Many of those clerks were given opportunity to accept jobs in the factory and some did so. Others have refused to go into the factory, and were compelled to seek employment in clerical lines elsewhere.

Another feature at the Ford plant is that all foremen now are working—that is, foremen instead of walking around the different departments looking after the men, are assigned themselves to a task and keep busy at it, at the same time keeping an eye out for the men under them.

Practically the same situation exists in all other plants where production is being maintained with forces of from 50 to 75 per cent of the normal quota.

Wisconsin Factories Increase Production

Nash, Mitchell, Kissel, Ogren Report Gains—Parts and Truck Plants Active

MILWAUKEE, April 11—A marked revival of passenger car as well as motor truck sales in all sections of the country is being reflected into the automotive parts and equipment industries of Milwaukee to the extent that these industries are now in the lead in percentage of operations among all manufacturing groups. Especially since April 1 has it been necessary to extend operating schedules and re-employ men to meet the growing demand for parts and equipment. It is now confidently predicted that normal will be reached before midsummer.

B. W. Twyman, general manager of the 4-cylinder car division of the Nash Motors Co. at Milwaukee, said this operation is now on a 100 per cent production basis, and shipping 20 cars daily. Additions now under construction and contemplated for the summer will bring the capacity to 50 cars a day. The main Nash plant at Kenosha, Wis., increased its force by nearly 300 men in the last week and is operating at 66 2/3 per cent of capacity. Production will be on a 75 per cent basis by the end of the month. Normal production is 160 cars a day.

John Tainsh, general sales manager of Mitchell at Racine, says that the plant is operating at between 50 and 60 per cent of capacity, and with the demand picking up in all sections, save some parts of the South and Northwest, production is gradually being enlarged.

Kissel at Hartford, Wis., is producing on a basis of 60 per cent of normal, and is adding men every day as the spring demand for cars becomes more and more pronounced.

Fred L. Good, factory sales manager of the Ogren Motor Car Co., Milwaukee, said the plant is sold up to June 1 and new business is being received at a rate guaranteeing capacity production beyond that date.

Forge Plant on Three Shifts

The Interstate Drop Forge Co., Milwaukee, specializing in automotive forgings, is the high light among local manufacturers, as it is operating 24 hours a day in three shifts and employing the full capacity, with eight hammers. It is filling orders from Ford, Hudson, Scripps-Booth and other factories, reflecting renewed activity in motor car plants at Detroit and other centers.

Herbert A. Githens, sales manager of the Federal Rubber Co., Cudahy, suburb of Milwaukee, says the tire business has entered a new period of prosperity, and that within five or six weeks it probably will require full capacity. The Cudahy works extended operations from three days a week to five days during the past week. The early spring and mild weather are responsible for an unusual demand for tires for replacement as well as for equipment of new cars at the factories.

J. L. Sinyard, general production manager of the Parker Motor Truck Co., Milwaukee, said that early summer will find the plant working at full capacity, judging from the present development of demand. The Parker company specializes in trucks for highway construction and a healthy demand is now beginning to appear.

Truck Plants Feel Activity

J. C. Millmann, general manager of the Titan Truck Co., Milwaukee, said that within 30 days the plant will be operating at 100 per cent. Orders at present amount to about 80 per cent of new business a year ago.

It is regarded as significant that in their public expressions retail merchants generally are pointing to the automotive industries as taking the lead in a new era of activity and that with motor car trade once more getting into a healthy swing other business will follow. Predictions of general trade revival almost invariably lay stress on this point. It is frequently said that the passenger car business was the first to feel the depression and is the first to overcome its effect.

Retail sales by Milwaukee dealers during the first 10 days of April were the largest of any similar period of time within the last six months, and it is apparent that only a beginning has been made in the penetration of the resistance which buyers have been offering since last summer.

HASSLER FACTORIES ON OVERTIME WORK

INDIANAPOLIS, April 8—Officials of Robert H. Hassler, Inc., announced to-day that business had improved to such an extent during the past month that the factory had gone to working overtime. The first overtime worked was on April 4 and the company now is averaging about three hours a day overtime. Officials say there has not been a time in the last six months when prospects were as bright as now. Shock absorbers are manufactured at the plant. According to present plans the company will continue to work overtime until production catches up with orders.

PILOT AND DAVIS BUSY

RICHMOND, IND., April 8—Plants of the Pilot Motor Car Co. and the George W. Davis Carriage Co., are operating on about 80 per cent capacity, according to information obtainable from both factories. The Davis company expects to have full capacity operations underway soon to accommodate a good increase in business recorded in the last ten days. Many sales have been developed in territory adjacent to the plant.

Spring Starts Sales Humming on Coast

Dealers Report 60 and 90 Car Businesses in March—April Better

PORTLAND, ORE., April 9—The final advent of spring, which was ushered in on Easter Sunday with the sky radiant with sunshine, was the signal for the arrival along automobile row in Portland of the real spring buying. For months the dealers have been marking time, a little more than holding their own against a current of business depression, waiting for the weather to break so that the call to the open road would be strong enough to bring prospective motorists to a definite decision with regard to buying.

Warm weather and sunshine did just these things, for the dealers along the row report that their business Sunday far exceeded any previous day this year, and the following days of the week have lived up to the precedent set by Easter Sunday.

The numerous inquiries and the actual business done shows that there are any number of buyers who are simply awaiting their time to get the cars they want, dealers say. Some have been waiting for prices to fall, but with spring motoring fast coming on and every indication pointing to no further decreases in price they are giving up their waiting and are becoming actual buyers.

Business for many of the Portland dealers was excellent in March, judging from a cursory investigation among the dealers. In fact, every dealer reported that business has been rapidly improving for the last four or five weeks. One dealer reported the sale of 90 new and second-hand cars, while another reported 60. In both cases business had been nearly as good as in March last year, when Portland experienced phenomenal buying activity.

Another dealer reported five sales of new cars one day this week, and stated that he had orders for more of the same model far in excess of those on hand. Reports such as the above were heard on every hand along automobile row, indicating a decided improvement of business, and an approach, in fact, to the conditions of last spring.

DETROIT ADDS 6649 MORE MEN

DETROIT, April 9—Report of C. M. Culver, general manager of the Employers Association of Detroit, shows 6649 more men employed this week than last. The 79 firms affiliated with the Association reported yesterday a combined working force of 95,221. While this is far short of the number employed a year ago, factories reporting to the Association rapidly are nearing normal, both as to men employed and production. More men are being taken on daily, but the total when all factories are at 100 per cent will be considerably less than a year ago.

Harding Endorses Highway Reforms

President Greets N. A. C. C. Committees—Likely to Support Townsend Bill

(*Continued from page* 826)

"At present we are the most taxed of industries. We now have five main levies as follows:

"1. National and State income tax, common to all industries.

"2. Sales taxes, limited to ourselves and a few other industries.

"3. Taxes on repair parts, a permanent charge on the life of all vehicles, a tax specific to our industry.

"4. State license and registration fees, a virtual monopoly to us.

"5. Scattering municipal and personal property taxes.

"There are no federal sales tax on other units of transportation, as for example, steamships, locomotives, trolley cars and horse-drawn vehicles.

"The theory that the tax on motor vehicles is a tax on wealth is disproved by the fact that two-thirds of the nine million motor vehicles now in use in this country are owned in homes whose total income is $4,000 per year or less.

"It is right to reach the profits of the automobile manufacturer through the same taxes that apply to other kinds of business.

"We now accept without complaint State automobile taxes sufficient to keep all roads in repair. Thus we pay not only for the damage we inflict, but for that of all vehicles. Further we should not be called upon to go.

"More than one billion dollars are now available for road construction. Fifty-nine per cent of the national public works budget is devoted to highways. No single domestic activity of the United States Government and its civil sub-divisions predicates such large expenditures. Obviously the direction of such an effort should not be left as a subordinate detail in a department all of whose bureaus combined expend but one-third as much money annually as does the Bureau of Public Roads.

"Fundamentally the highway problem is not one of engineering but of economics. The first question is the determination of the economic reason for its location. Engineering is the detail of construction and maintenance. After that remains the paramount question of transport over the highway. For this reason road construction should be lodged under the direction of a body which has a broader vision than that of construction alone. For this reason, too, the lodgment of highways under a Department of Public Works would be to subordinate the end to the means.

Logical to Plead for Commission

"If it is logical to plead for a highway commission in the State, is it not logical that the National Government should follow the same policy? Most of the States adopted the commission plan at the suggestion of the Government when State highway departments were created.

"What is needed is a National Highway Commission—empowered to administer the Government's highway activities—to lay out and have constructed the inter-county roads of national importance, and to be responsible for the sound development of transport over the highways."

Later the highways committee conferred with Secretary of Agriculture Wallace and explained the problems relating to highways and pending legislation. As the Bureau of Roads is under Wallace at present and would be absorbed by the proposed commission, it is apparent that the President will ask for his views on the subject. The secretary stated that he had an open mind on the question and would consider it carefully.

Discuss Foreign Trade

The Foreign Trade Committee, with J. Walter Drake as chairman, talked over current problems of trade promotion with Secretary of Commerce Hoover. The conference was brief but satisfactory to the representatives of the industry for they obtained an insight into the plans of the new secretary and in turn showed him how the Department of Commerce could aid the automotive industry through extension of co-operative effort.

The conferees agreed that better results could be obtained through direct contact with the department here. As a result, it was decided to have President Clifton of the N. A. C. C. select a small committee for this work. Other industries will have similar representation, but the automotive leads the way. In addition to Chairman Drake, the industry was represented at the Hoover meeting by H. H. Rice, vice-president of the General Motors Corp.; H. M. Jewett, president Paige-Detroit Motor Car Co.; C. C. Hanch, vice-president N. A. C. C. and chairman taxation committee; Alfred Reeves, general manager N. A. C. C., and George F. Bauer, secretary foreign trade committee N. A. C. C.

Hanch and members of the taxation committee conferred with Senator Penrose, chairman of the Senate Finance Committee. The Senator advised them that it was impossible to advocate removal of excise and consumption taxes at this time or to take a stand on the sales tax plan. It was indicated, however, that he would accept the sales tax if Congress passed the soldiers' bonus bill. Senator Penrose stated that enactment of a soldier bonus would require heavy levy as disbursements would amount to $5,000,000,000 or more.

Mellon Not Committed on Tax

The committee discussed the same taxation principles with Secretary of Treasury Mellon to-day. The secretray would not commit himself to any specific plan other than join in the universal suggestion that excess profits taxes be removed.

In addition to representatives already mentioned, the other participants in the conferences were A. J. Brousseau, president International Motor Car Co.; E. S. Jordan, president Jordan Motor Car Co.; E. H. Broadwell, president Motor and Accessory Manufacturers Association and vice-president Fisk Rubber Co.; C. A. Vane, representing National Automobile Dealers Association; W. O. Rutherford, Rubber Association of America and vice-president B. F. Goodrich Co., and Pyke Johnson, manager Washington bureau of the N. A. C. C.

Motorcycles Bulk of Camp Jesup Sale

Only 400 Trucks and Cars in Lot—Buyers Come from Distant Points

ATLANTA, April 11—Twelve hundred motor vehicles were sold in seven hours Thursday, April 7, at Camp Jesup, Ga., near Atlanta, by a corps of auctioneers representing the United States Government, who are making a tour of various army camps throughout the country disposing in this way of motor vehicles used by the Government during the war. Most of the automobiles sold at Camp Jesup were in rather poor condition, prices paid ranging from less than $100 in a few cases to as high as $1100.

The sale included about 300 motor trucks, all of well-known makes, ranging in capacity from ¾-ton to 5-ton. There were about 100 touring cars and roadsters, 800 motorcycles and 500 sidecars.

Buyers were present at the Camp Jesup sales from some of the Northern and Eastern states, and from all over the South. They represented in some cases persons in quest of individual bargains for their own use, but there were also several speculators present and a number of dealers.

Dealers in the Atlanta territory do not believe that the sale will affect their business to any material extent, for many of the purchases were by men outside this section, only a comparatively few of the sales being to local dealers and buyers. The only effect on business that the sale would be likely to have will doubtless be of used cars, and it is not believed that its effect in this regard will be of serious consequence for so many of the cars sold at Jesup were in a very poor condition.

Iowans Storm Good With Tax Opposition

(*Continued from page* 826)

quoted and that you do not believe in a tax of this sort. We would appreciate very much hearing from you concerning this."

Of a similar nature are scores of other communications sent out by the automobile men of Cedar Rapids and Linn county. An example of the sentiment expressed may be found in the letter, which went to Good from the MaKibben Motor Co., Inc., as its protest against the passage of the wheel tax measure:

"We are vigorously opposed to this measure and consider that the automobile industry, at the present time, is overtaxed. We sincerely hope that you will give this question further careful consideration."

Local automobile men say that they feel the next steps in this matter should be taken by Representative Good and that they will wait further word from him in reply to their communications before taking any other action.

Find Concrete Roads No Longer Economic

Wisconsin State Highway Commission Seeks Right to Use Gravel Construction

THE comparative and final saving of a concrete road has entirely disappeared in many locations, with the increased costs of all types of roads.

Total abandonment of concrete surfaces is not urged. Many roads must be built of concrete or equally durable material, regardless of differentials.

The main motto in any road building project must be "to furnish transportation service to present day traffic." Neglect at times of primary rules of road building is defensible, with concentration on maintenance.

The day labor or force account plan in state road building enterprise has been found superior over contract building at least to the extent of getting actual costs and experiences.

MILWAUKEE, April 11—These are features which will be emphasized in the next annual review of the Wisconsin State Highway Commission, which is building a 7500 state trunk highway system in the Badger State, in connection with a number of pieces of legislation desired to further advance the work. For one thing, remedial legislation will be asked to permit counties which bonded themselves to build concrete roads, to use their funds for other types of construction.

The records of the commission show that in 1914 an 18-foot surface of concrete could be built for $12,000 a mile. In 1921, the cost will be about $25,000 per mile. In 1918, an 18-foot surface of gravel could be built for $3500 a mile; in 1921, $6,000. These figures do not include grading, culverting and bridging. Accepting it as a fact that a concrete highway is worth one-half of its cost at the end of fifteen years, and a gravel road one-half at the end of five years, the probable annual cost of concrete in 1914 was:

Figures Show Saving

Interest on investment, $600; depreciation, $400; maintenance, $100; total $1,100 per mile. For gravel, according to the commission's figures the costs are: Interest, $175; depreciation, $350; maintenance, $175; total, $700. The 1921 costs are estimated as follows: Concrete: Interest, $1,250; depreciation, $833; maintenance, $175, and total $2,258. Gravel: Interest, $300; depreciation, $600; maintenance, $250; total, $1,150.

Gravel in 1914 was cheaper than concrete by $400 a mile per year; in 1921, gravel will be cheaper by $1,108 a mile per year.

"These figures do not pretend to be exact for all roads and will change with locations, available materials and traffic to be served," said A. R. Hirst, state highway engineer, "and they only emphasize that the comparative and final saving of a concrete road in many locations has entirely disappeared since 1914." The economic positions of concrete and gravel are untenable to-day on many stretches, said commission members, where economy was undoubted six or even two years ago. Therefore the commission urges counties be given permission to use bond money provided specifically for concrete roads, under the state aid plan, for other and economically available materials. It is recognized that many miles of highway in Wisconsin must be built of concrete.

Try Out Construction Costs

The commission having found certain irreconcilable differences of opinion between contractors and the members as to fair prices for road building, the commission prosecuted a small part of Federal aid construction with day labor forces. It is the hope of the commission that each year a minor fraction of its work will be done under this system to keep in touch with actual cost situations, "and thus be able to deal fairly with contractors and the taxpayers."

The state law which limits county bonds to paying 5 per cent, is to be amended to permit 6 per cent rates.

A more intensive system of maintenance is demanded. The report will say, in substance: "It may be expected, despite the temporary depression in the sale of motor vehicles, that their use will constantly tend to increase, thus magnifying the difficulties of maintenance." The present patrol system is to be reinforced and more power is asked for state commission regulation of the county patrols. The commission also believes it must have complete control and direction over the highway marking system, now up to the counties.

Receiver Is Appointed for Lockwood Company

KANSAS CITY, April 11—The Lockwood Mfg. Co., making automobile tops, seat, tire and radiator covers, filed a voluntary petition in bankruptcy, April 8, in the Federal Court here. Schedules showed about $342,759 in unsecured obligations and $269,207 of assets, represented in stock and equipment in the Kansas City factory and warehouses, and the Buffalo factory. The Lockwood company has now no connection with the Baker & Lockwood Mfg. Co.

Albert Newman of the National Bank of Commerce was appointed receiver for the Lockwood Mfg. Co. He will continue operation of the plants, and it is expected that a sale will enable operation to proceed uninterruptedly.

GILLETTE RUBBER ADDS MEN

EAU CLAIRE, WIS., April 11—The Gillette Rubber Co., Eau Claire, Wis., has added more workmen in order to cope with increased orders and expects to reach a daily output of 500 casings by the end of the month. It has more than $1,000,000 worth of orders on its books and prospects for a 1921 business of at least $5,500,000. The daily capacity is 1000 tires and 2000 tubes besides mechanical rubber goods and specialties. L. A. Fosse is general manager.

Exporting Methods Are Found Improved

Mexican Dealers Gain More Favorable Impression of American Merchandise

WASHINGTON, April 9—American firms, including automotive interests trading with Mexico, are extending more credit and longer than during the war period, are shipping better merchandise with a greater assortment, and most of them have learned how to pack and ship for export. Consul J. B. Stewart at Chihuahua reports that these important facts have been obtained by inquiry from a number of Chihuahua merchants of all nationalities engaged in various lines of business.

During the war probably 90 per cent of the goods shipped from the United States were sold on a cash with order or cash against document basis. To-day reliable firms which do not wish to take advantage of the 30 days' cash discount (10 days is not attractive to merchants in Mexico) are being granted 60 to 90 days and some old customers are receiving as much as 120 days. And, as it always takes European goods from six weeks to two months longer to arrive than American goods, the 120 days' credit is as good as the six months' European credit about which so much has been said and written.

The war made it impossible in many cases for the American manufacturer and jobber to send out the quality and assortment of goods which he desired, any many foreign merchants, who up to that time had made most of their purchases in Europe, obtained a wrong impression of the standard of American-made goods. That impression is now giving way to one much more favorable to American merchandise which many in Mexico admit is as good as, and in many cases better, than European-made goods.

But notwithstanding, the statement adds, it cannot be denied that there is a quiet, persistent propaganda on foot which has for its base the theory that once European firms are again seriously competing for the Mexican market, merchants then will be able to buy goods on very long credit terms, that the merchandise from Europe will be of a higher quality than they now are receiving, and that it will be packed in a highly satisfactory manner.

OAKES BUYS MATHER PATENT

INDIANAPOLIS, April 11—The Oakes Co., manufacturers of radiator cooling fans and other automobile parts, has acquired the sole license to manufacture and market automobile tire carriers under the Mather patent, No. 1324461. The Mather patent covers the demountable feature of the tire carrier on a standard type of support bracket. The chief advantage is the interchangeable feature of the bracket.

Earl Reorganizes Briscoe Personnel

New Division Sales Managers Are Named as Preliminary to Sales Campaign

DETROIT, April 11—With the company on a sound financial basis, C. A. Earl, newly elected president of Briscoe Motors Corp., has perfected the reorganization of the company's personnel and formulated plans for speeding up production in the factory at Jackson. The Tilden and Swift interests of Chicago, which control Briscoe, have issued 100,000 shares of stock at $20 a share for the use of the company as working capital. Rules of the stock exchange and other technicalities necessitate waiting a certain number of days during which time present stockholders are given preference in subscribing to the issue before the money actually can be turned in and the stock taken over by the financial interests in control.

A representative of the Chicago financiers said Saturday the interests behind Briscoe had full confidence in the company's, product, and with Earl in control had every assurance of a bright future ahead. Ample financial backing is assured the company, he said, to carry out policies and plans formulated by Earl.

As the first step in putting the plant on a quantity production basis, and at the same time perfecting a sales organization that will put the car in the forefront, Earl announced the selection of K. R. Jacoby, former director of purchases for Willys-Overland, as the new director of sales. J. R. Findlater, a veteran at Briscoe, continues as vice-president in charge of Pacific Coast distribution. H. F. Wardwell, who was succeeded as president by Earl, remains as vice-president.

Other officers are: John Fletcher, treasurer; L. C. Allen, assistant treasurer; L. E. Latta, secretary; E. R. Cowham, assistant general sales manager; D. M. Shaw, advertising manager; Victor Jantsch, chief engineer; J. C. Cunningham, general superintendent; T. W. Tinkham, assistant general superintendent; J. L. Blyth, director of service; W. M. Zerby, traffic manager.

Look for Extensive Business

New division managers also have been named by Earl as follows: J. A. Garrity in the Western Division; F. A. Bixby, Northwestern Division; H. G. L. Campbell, Eastern Central Division; C. E. Rollins, Western Central Division; J. C. Baggott, Eastern Division, and A. H. Jones, assistant to J. R. Findlater, on the Coast. R. M. Chapman, who has been associated with Earl for several years, is made assistant to the president.

The factory has started on a production of 20 cars a day, which will be increased gradually, according to Earl, until it is hoped to reach a daily output of 75. This, of course, is contingent upon market conditions and sales requirements. Earl, however, feels assured the present rapid improvement in sales will continue, and with confidence in the Briscoe, as a leader in its line, he is certain there will be a ready market for as many cars as can be produced under present factory conditions.

"When I accepted the presidency," said Earl, "I did so because I was convinced Briscoe had no superior in its field. It is not nearly so well known as it should be owing to the fact that the company has been content with moderate production nearly always oversold. The car itself has met competition succesfully wherever it has been introduced. The financial resources of the company are ample for any expansion that may be desired, and I took the presidency with the stipulation that we would go out after business on the scale which the car and the standing of the company justified. Readjustment of the executive organization by the addition of several strong men is the first step."

Texas Motor Creditors Would Operate Plant

CHICAGO, April 11—L. S. Maremont, president of the Maremont Mfg. Co., one of the principal creditors of the Texas Motor Car Assn., has sent a letter to creditors of the Texas company, which is now in receivership, urging concerted action which will permit continued operation of the plant in such a way that creditors will realize a substantial sum on their claims. In his letter he asserts that unless operations can be continued there will be no equity in the plant for the creditors. The only assets are the plant, equipment and inventory. The investment in the factory aggregates more than $1,000,000, but there are mortgages against it amounting to $250,000. The liabilities are something over $500,000.

Maremont says in his letter that a tentative plan for continued operation of the plant has been submitted to the receivers, the court at Fort Worth and the bank which is by far the largest creditor. All of them have approved it as the only means of realizing anything for general creditors. Financial interest familiar with reorganizing and operating automobile plants are said to be willing to advance sufficient funds to continue work at the factory in order to use up the large stock of parts, units and accessories, a considerable part of which are of special design and which can be made of value only by assembling them into finished cars. Creditors are asked to give Maremont their approval of his proposal.

SALES MANAGER SUES COMET

DECATUR, ILL., April 11—G. Vernon Beck, former sales manager for the Comet Automobile Co. of this city, is suing the company for $40.000 for alleged breach of contract. Beck claimed that under his contract he was to receive a number of shares of stock in the Comet in addition to his salary. He said he had been unable to secure fulfillment of this contract and his resignation followed.

Harvester Notifies of Work Suspension

Lack of Foreign and Domestic Demand Cause—Lower Costs Must Develop

CHICAGO, April 11—The International Harvester Co. has sent a circular to the employees in its tractor works informing them that on May 1 the company will have on hand all the tractors it can reasonably expect to sell this season and that it will be necessary to curtail production to such an extent that it will amount virtually to closing the plant.

After explaining the reasons for the lack of foreign and domestic demand for tractors, the company says it already has reduced prices on large lines of its output at a heavy loss under present prices for labor and material. Lower costs of material and labor must develop, it is asserted, before industry can hope to get back to normal production.

The circular says that according to the best judgment of the company it is improbable operations will increase for several months, although it is hoped they may be somewhat better in the early fall. Announcement of the proposed shutdown is made now to give employees every opportunity to obtain employment elsewhere.

"Operations have already been continued in spite of heavy cancellations of orders and at serious risk of overproduction so that the maximum employment might be afforded during the winter months," says the circular. "It is hoped that employees will realize that the conditions which make suspension necessary are beyond the company's control. Cancellations of orders for domestic trade are due to the severe drop in the price of farm products, which took place last fall after work had already begun on the schedules of manufacture at this works. As a result, farmers generally have been compelled to sell their products at prices far below what they had hoped to receive and frequently below the cost of production. Therefore they have been and are in no position to buy farm machinery in any such quantity as in normal times.

"The foreign trade, which before the war furnished nearly half the company's volume of business, has been heavily reduced on account of the difficulty of many of the nations and the fall in exchange value in the moneys of other countries."

OHIO GASOLINE DOWN TO 27c.

TOLEDO, April 11—Joyful news to motorists this morning was announcement of a drop in price of one cent a gallon for gasoline, naphtha and varnolene by the Standard Oil Co., making a retail price of 27 cents for gasoline. One cent price declines have been coming every three or four weeks since the first of the year.

Car Finance System Approved by Banker

Vice-President of Irving Finds Development Logical Sequence of Industry's Growth

NEW YORK, April 11—The system used by automobile financing companies was approved by Charles Elliott Warren, vice-president of the Irving National Bank, in an address at the Automobile Club of America. In a discussion of the automotive industry he said:

"The dealers who relied upon local banks before the peak of restriction in credits, turned with a rush to the automobile finance corporations, acceptance corporations and others. There are now more than 110 of these corporations operating in the United States—some local, some state wide and some national. Between 45 and 50 per cent of all cars being sold to-day are marketed on some form of a deferred payment system. Without doubt the methods or system used by these companies in financing both the wholesaler and the retailer are a logical financial sequence and eventually place automobile paper in the same class with any other commercial paper—but back of it must be analyzed the integrity of the company and the dealer.

"Briefly speaking the meaning of the automotive industry is first *Transportation*, involving the use of the truck for the short haul and for the long haul and the saving to the railroads. Second—*The Family Automobile* for the saving of time and the carrying of supplies and the pleasure vehicle. Third—*The Development of the Farm*, the tractor, haulage of supplies and product—the economic value to agriculture.

"Now as to the future of the industry, the war opened the eyes of the world to quick transportation in which the motor played an important and prominent part. It developed transportation in out of the way places and brought about the application of American export of machinery units for the automobile and it must necessarily follow that the manufacturer, dealer and retailer will place the automobile as an American product in foreign countries as was done with the sewing machine. These ends, if brought about, will develop the market.

Must Enforce Economy

"May I say the health of this great automobile business depends upon the stabilizing of the industry by a better production, by economy in manufacturing and selling and by more capable salesmanship, and by dependability and integrity of those interested in the business.

"To sum up, let us say then the outlook is encouraging and while the world is not yet well again, and care and prudence must be exercised in all matters, business men realize that forced action based on artificial optimism may lead to unwise action and produce further embarrassment."

SALES RUN TO $750,000 AT INDIANAPOLIS SHOW

INDIANAPOLIS, April 11—John Orman, manager of the Indianapolis Automobile Trade Association, has compiled a report for the board of directors on sales made by dealers and distributors at the recent spring automobile show at the State fair grounds. The report was submitted at the regular meeting of the board and shows that $660,840 was the total of sales, but conditional sales run the figure far above $750,000. Orman would not count verbal reports of about fifteen exhibitors. Twenty-three firms reported their retail sales numbering 219 jobs as amounting to $553,349.88 and wholesale orders for sixty-three jobs reported by the same dealers amounted to $107,490.

Southern Indiana Sales Show Steady Increase

INDIANAPOLIS, April 9—Every evidence of a sharp increase in motor vehicle sales throughout Indiana in the last week bears out the many predictions of the first quarter of the year. Weather of the last week has been ideal and the increased business is generally credited to the sunshine.

In the southern half of the state sales have been picking up steadily for the last three weeks but took a sudden jump with the first of April and distributors here say that stocks will be heavily depleted if buying continues through another ten days in the ratio of the last half of March.

The automobile show in Terre Haute, this week, was graced by a fair opening attendance, which increased heavily the second and third days and by mid-week buying was generally reported, although sales were not recorded in the first two days of the show. The Vigo county tradesmen believe that the show would have started a renewal of buying without the good weather.

FORT WAYNE INDUSTRIES BOOM

FORT WAYNE, IND., April 11—From all reports the unemployment in Fort Wayne is rapidly vanishing. With the labor situation taking such a decided turn for the better, local business men are feeling more optimistic than they have for some time. There are only one or two factories running full time, full pay, but some of the factories which have run but a week or two since the first of the year are announcing a resumption of business and the building operations are increasing rapidly. Dealers report business is on the increase and the majority of them are quite optimistic over the outlook, although it is expected that business will be slow during the summer.

British Makers Try Trade Experiments

Wolseley Reduces Refinements to Cut Price—Humbers Introduces Larger Car

LONDON, March 24 (*By Mail*)—Two announcements made by prominent British motor manufacturers this week are of interest as showing entirely diverse policies in respect of light cars. Wolseley has put forward a popular rendering of the 10 hp. two-seater, stripping the standard model of non-essential refinements, such as electric light and engine starter, leather upholstery and superfine exterior finish, and is selling this "utility" type at $400 less than the standard.

Humbers, on the other hand, has introduced an enlarged edition of its 10 hp. chassis, fitting an engine with 3 mm. larger bore (68 x 120 mm. in place of 65 x 120), far better and roomier bodies, longer wheelbase, many important detail chassis improvements and a more complete equipment. This new model—for so it may be viewed—displaces two hitherto standard chassis, for until now the chassis of the two-seater has differed widely from that of the four-seater; in future the same will serve for both.

Wolseley, therefore, is appealing to the market with a "short purse" by offering an abbreviated equipment. Humbers, also, with a light car is putting forward something better for the same price as hitherto for the four-seater ($3,500) and at $300 more for the two-seater. The Wolseley Ten has a smaller engine (1260 c.c.) and chassis than the Humber (1783 c.c.), and the former is not fitted with four-seated bodies; but both represent the really high-grade British light car.

Developments of prime importance are anticipated in other directions before the end of the year; one firm hitherto making only "super-grade" cars of over 30 hp. has half a dozen experimental cars running, these consisting of two-cylinder, air-cooled engined runabouts with friction drive, while another high-grade car maker is designing a popular type on entirely different lines. The "economy wave" is undoubtedly making itself felt in many directions and will have an important effect upon the industry.

The British trade has livened up very appreciably during the last two or three weeks and most plants are on full time again with, admittedly, a more or less abbreviated staff.

TO RESELL REYNOLDS' ASSETS

MT. CLEMONS, MICH., April 11—Resale of the assets of the Reynolds Motor Truck Co. has been ordered by Circuit Judge Tucker for April 26. The original sale by Charles J. Reimold, the receiver, for $26,000, was not acceptable to the court.

Parts Service Decision Hangs Fire

Committees to Try to Reach Settlement

Truck Makers and Parts Men Adhere to Positions—Prices Discussed

DETROIT, April 12—Following several hours' discussion here to-day of the national parts servicing plan proposed by unit makers, it was apparent the contending factions were as far apart as ever. A joint committee of ten men representing truck assemblers and parts manufacturers was named to conduct further negotiations looking to a compromise plan.

General Sales Manager A. J. Whipple of the Republic Truck Co. brought the discussion to an end with a motion for appointment of the committee "to discuss ways and means for co-operation and to formulate plans looking to our mutual benefit." An amendment authorizes the committee to invite representatives of the National Automobile Dealers Association or others interested, to participate if they see fit. The committee will report back to a joint meeting of the Motor Truck Manufacturers Association and the parts manufacturers, to be called upon notification of the committee that its report is ready.

The committee is composed of M. L. Pulcher, general manager of the Federal Motor Truck Co., chairman; M. Cook, general manager of the Service Motor Truck Co., J. W. Stephenson, vice-president of the Indiana Truck Corp., Col. F. F. Smith, vice-president of the Republic Truck Co., E. A. Williams, representing the Truck Association, and L. M. Viles, vice-president of the Buda Co., William Mack, sales manager of Borg & Beck; Fred Glover, vice-president of Timken-Detroit Axle Co., H. L. Horning, general manager of the Waukesha Motor Co., and G. W. Yeoman, vice-president of the Continental Motors Corp., representing the parts manufacturers.

"Harmony Didn't Mean Anything"

It became apparent at the outset that both sides were determined in their stand and while there was an evident inclination to get together the point of contact could not be reached. Despite the surface harmony there was always apparent an undercurrent of determination to stand pat and the result of the meeting is best summed up in the statement of a prominent parts manufacturing executive, that, "there was lots of discussion and lots of harmony but it doesn't mean anything."

The outstanding feature is that everyone interested is determined to give full consideration to the problem of proper service which means satisfied customers and increased truck sales. The matter of price standardization also was a theme for much discussion indicative of growing conviction that a uniform price list must be made effective.

The strength of the "wild-cat" manufacturer was stressed by Estel Scott, general manager of the General Automobile Parts Co. of Kansas City, who declared the present conditions were responsible for his success.

Service Requires Capital

Emphasizing his point, Scott said he carried a $62,000 stock of parts and contended every dealer must be equipped similarly to properly service his line. Service, he said, was the vital problem to-day and if it is not adequately furnished the business will be killed. Scott made a plea for a systematic campaign of investigation among individual users to get their idea of best methods and insisted they would be a unit in demanding the plan that assures service, no matter by what name designated or by whom maintained.

Whipple, opposing the plan, said the real question is who is going to conduct the parts servicing business. He asked if it was presumed the men who built up the business were going to turn it over to the parts makers, virtually admitting they were incompetent to conduct it. "We want to conduct the business along proper servicing lines and we are asking only co-operation," he said.

Harry G. Moock, general manager of the N. A. D. A., made a strong plea for the dealer who, he declared, was struggling in desperation to keep his head above water. In the final analysis, he declared the dealer is the one to be considered as the point of contact between the truck manufacturer, the parts maker and the consumer. "Educate the dealer and show him wherein his duty to his manufacturer and his customer lies but don't take away his profit and force him out of business," said Moock. He cautioned his audience to take the dealer into its confidence lest it run against a wall of opposition when the time for settlement comes.

Service Man Gives Views

R. C. Rognan, president of the Automotive Service Association of New York, said the truck manufacturer had not given consideration to proper servicing. If he had he would now be servicing his product and the present conditions would not have arisen, he said. Rognan cited cases of many fleet owners now servicing themselves and said many others were contemplating similar efforts because of the inadequacy of servicing by dealers. He said if central stations were maintained fleet owners could buy more

Price Fixing Bill Offered in Senate

Labor Organizations Included in Provisions—Owen Would Regulate Bank Interest

WASHINGTON, April 12 — An amendment offered by Senator King of Utah would tighten the Sherman anti-trust law. The amendment would include labor organizations under the act. Section one of the King amendment practically covers open price plans and other forms of information relating to prices. The section reads:

"Every contract, combination in the form of corporation, trust or other form of association, agreement, arrangement, meeting, conference, understanding or conspiracy for purpose of monopolizing, dominating or controlling the trade or commerce in any commodity between two or more states, or for the purpose of fixing or determining the price or prices, charge or charges, at which any commodity may or shall be sold for transportation in trade or commerce between two or more States, or for the purpose of including, or preventing, or impeding any person from buying or selling, procuring or disposing of, dealing in, producing, manufacturing or fabricating any commodity for transportation and commerce between two or more States is hereby declared to be illegal."

The penalty ranges from a fine of $5000 to one year in prison.

Senator Edge of New Jersey, author of the so-called Edge Act, which was designed to stimulate foreign trade, has offered an amendment to the act intended to expedite the operation of the law. The amendment liberalizes certain sections so that operations may begin when corporations organized with capital stock of not less than $2,000,000 have paid in 25 per cent of the stock. The remainder of the capital stock may be paid in installments of 10 per cent of the whole amount at intervals of two months.

Alleges Banks Profiteered

Senator Owen, of Oklahoma, introduced a bill to-day amending the Federal Reserve Act in order to prohibit excessive rates of interest charged by bankers to industry. The bill would prohibit a rate of interest in excess of 6 per cent on loans secured by stocks or bonds as collateral. The Senator insisted that the Federal Reserve Banks have profiteerea shamefully while legitimate industry suffered during the depression.

Congressman McArthur, of Oregon, to-day introduced in the House a bill providing for the appropriation of $75,000,000 for highway construction.

Congress Will Bar Truck Dumping

Reimportation Evil to End, Smoot Says

Will Insist on Specific Provision in Any Anti-Dumping Bill Passed

WASHINGTON, APRIL 13—No anti-dumping bill will be allowed to pass in the Senate without a specific provision covering reimportation of army trucks and other surplus war supplies sold abroad.

This statement was made to-day by Senator Smoot in an interview given the correspondent of AUTOMOTIVE INDUSTRIES. The anti-dumping measure which Representative Young of North Dakota introduced in the House Monday did not carry this proviso.

Senator Smoot feels that the anti-dumping measure is for the protection of domestic markets from foreign competition and that it must embrace all phases of the problem. He is prepared to draft an amendment to the Young bill if it passes the House without the provision essential to the protection of American manufacturers and dealers.

Representative Young told AUTOMOTIVE INDUSTRIES that his bill was designed to cover every form of dumping but admitted that the question of reimportation had not been considered specifically. When it was pointed out to him that a heavy burden was placed on the American automotive industry by the reimportation of American made vehicles, duty free, and their sale here at prices below production costs, he indicated that this condition could be corrected by amendments offered from the floor when the bill is before the House.

It is expected that dealers in California and other states who have felt the effects of the sale here of surplus war supplies by foreign agencies will appeal to their congressmen for action.

STAGE TRUCK DRIVEAWAYS

DETROIT, April 9—Truck manufacturers throughout Michigan have been taking advantage of the open roads for truck driveaways in the last week. Acme Motor Truck Co. of Cadillac has staged driveaways to Grand Rapids, Detroit and many other points in the southern part of the state. Last week a fleet of four trucks consisting of three 2-ton gravel dump jobs and a 1½-ton chassis were driven to Grand Rapids.

CONGRESS GETS TRACTOR BILL

WASHINGTON, April 13—Senator Ball, of Delaware has introduced a bill providing for the transfer of 1000 five-ton caterpillar tractors, complete with spare parts; 500 ten-ton tractors, and 200 Mobile machine shop units, from the War Department to the Bureau of Roads for use in highway construction.

Senator Pittman has introduced a bill providing for a national license system for automobiles. This measure has the support of automobile organizations and is designed to force reciprocity on states which have special requirements for automobile owners.

Goodyear Refinancing Definitely Completed

AKRON, April 14—The special meeting of stockholders of the Goodyear Tire & Rubber Co. to ratify the reorganization plan is being postponed from day to day pending the completion of preliminary details. Negotiations for the refinancing have been definitely consummated, however. It is understood that Goldman, Sachs & Co. of New York will head a syndicate which will offer $25,000,000 in 20 year 8 per cent first mortgage bonds while Blair & Co. will head a syndicate to offer $25,000,000 in 10-year 8 per cent debentures.

The company has filed with the secretary of State of Ohio articles reducing its common capital stock from $100,000,000 to $1,000,000. This is said to be merely one of the steps preliminary to refinancing.

Interest Law Revision Asked

COLUMBUS, April 11—Legislation by the state of Ohio is necessary to enable the completion of the refinancing of the Goodyear Tire & Rubber Co. of Akron, the General Assembly of Ohio was told to-day after the introduction of a bill by Senator W. H Chatfield to permit any corporation to borrow money without regard to the rate of interest. Ohio at present limits corporations to 8 per cent.

Exclusive Sale Move Is Denied by Dodge

DETROIT, April 13—Denial is made by the Dodge Bros. Motor Car Co. that it has informed all dealers that they must handle the Dodge line exclusively or forfeit their contracts. Recent changes in representation in two or three large cities are responsible for the report. When new dealers are appointed, the company asserts, it is simply because of local conditions and not the result of a general policy.

ERSKINE N. A. C. C. DIRECTOR

NEW YORK, April 14—A. R. Erskine, president of the Studebaker Corp., has been elected a director of the National Automobile Chamber of Commerce to succeed C. W. Churchill of the Winton Co. who has engaged in other business.

Endorse New Plan for Standard Parts

Creditors Accept Reorganization Proposal—Would Retain Control of Company

CLEVELAND, April 12—An assemblage of creditors representing $7,500,000 of the $9,500,000 outstanding obligations by unanimous vote to-day accepted a reorganization plan for the Standard Parts Co. The vote was taken after an all-day session during which representatives of the largest creditors of the company spoke in favor of the proposed plan.

Frank Scott, one of the receivers, who withheld approval of the proposal when it was first broached to him, said he did so because some of the creditors had expressed to him their discontent with it. Scott said that he felt these objectors had been appeased to an extent and he said he was now ready to present the plan to Federal Judge Westenhaver should it be ratified.

In brief the reorganization plan provides for the sale of the Standard Parts Co. property to an individual representing the creditors. This purchaser is to resell the plant to a new corporation to be formed in consideration of $6,500,000 of mortgage notes bearing 8 per cent interest, all of the management stock and 110,000 shares of the common stock The management stock consists of $1000 of preferred stock, consisting of ten shares of $100 each, and it is to elect a majority of the new company's directors. This stock is to be under the control of a managing committee, the members of which are to be made up of the Creditors' Committee. Through this plan the creditors would retain their hold on the corporation and if the stockholders did not carry out their part of the plan, the creditors could go through with some other proposal.

Stock Worth $35 a Share

It is estimated that the common stock will be worth $35 a share. It is to be sold to old stockholders of the corporation and the proceeds of this sale, together with the income from the $6,500,000 of mortgage notes, will take care of the total indebtedness of the corporation.

The plan has the approval of the preferred stockholders and the reorganization committee in addition to the creditors. Efforts are to be made to obtain the consent of creditors who were not represented at to-day's meeting and speakers voiced the hope that petition for sale of the property would be filed within 30 days. It was estimated that from $1,200,000 to $3,000,000 would be

Unemployment Light in French Factories

Situation Far Less Serious Than in United States or England, Report Says

WASHINGTON, April 9—According to Monsieur Laurent, secretary of the Confédération Générale du Travail (General Confederation of Labor), there is a great deal less unemployment in France, proportionately, than there is in the United States or in England, and it is of a much less serious character. A report on the labor situation received by the Bureau of Foreign and Domestic Commerce from Eugene A. Masuret, clerk to the American trade commissioner in Paris, says that Mr. Laurent estimates the number of unemployed workers in the various trades throughout France at between 120,000 and 150,000.

Unemployment in the metallurgical trades affects mostly the laborers and the semi-skilled workers. Many men were taken on in this industry during the war from other trades, and, although not efficient, did not return to their former trades. The skilled worker is generally retained, unless, of course, the plant is completely shut down.

In Paris the total number of unemployed is between 50,000 and 60,000, principally in the metallurgical and furniture trades. The proportion of unemployed in the latter trade is 50 per cent, due mainly, it is stated, to American competition in this line. Unemployment on a large scale is anticipated within the next month in the textile trade at Lille, Troyes and Rouen, because of overproduction. In the shoe industry at Millau (Aveyron) there are now 2000 unemployed, 1200 men and 800 women.

M. Laurent explained that there are two kinds of unemployment in France—unemployment caused by a real lack of work, and preventable unemployment—the latter being temporary in nature and for the purpose of forcing a reduction in salaries. For instance, some employers, it is stated, close down their plants for a period of a week or so, and then re-engage their employees at, say, 20 francs per day instead of 25 francs per day which they formerly paid them.

M. Laurent further stated that there is little probability that unemployment in France will reach a critical stage. The number of unemployed is constantly varying; while some workers are being laid off, others are being taken on. At no time, M. Laurent said, is there a complete cessation of work in any one line of industry throughout the whole country.

JAPANESE LIKE LIGHT CARS

WASHINGTON, April 8 — Consul Hawley has advised that 98 per cent of the passenger automobiles in the Nagoya (Japan) Consular district are of American manufacture. The prices asked for such cars range from $1,000 to $3,000, while half-ton motor trucks are from $3,500 to $4,000. Trucks of 1 and 1½-ton capacity seem most suited to local requirements. There are about 100 trucks and 700 passenger cars in the district. The better class of trade prefers the 6-cylinder car as being the most efficient. There is no specific requirement as to location of steering wheel; a minimum of two headlights is required.

German Exports to England Total £31,126,088 in 1920; December Quarter with £10,494,000 Largest Since War

WASHINGTON, April 9—The total value of imports from Germany into the United Kingdom in 1920 aggregated £31,126,088, of which £8,743,000 was received in the September quarter, and £10,473,881 in the last quarter, according to official monthly returns of the trade, but in Parliament, on Feb. 21, 1921, the value in the December quarter was stated to have reached £10,494,000. Figures showing items imported have been received by the Bureau of Foreign and Domestic Commerce from Alfred Nutting, clerk in the American consulate in London. Copper, iron and steel, dry goods, motor car parts, machinery and other items imported in the fourth and third quarters are as follows:

	Quarter Ended Sept. 30, 1920		Quarter Ended Dec. 31, 1920	
	Quantities	Values	Quantities	Values
Copper, in bars, etc., electrolytic, tons	203	£22,023	1,416	£143,386
Cotton gloves and mfrs.' small wares, doz. pairs	22,024	373,445	37,168	50,065
Dyes and dyestuffs from coal tars, cwt	23,732	1,010,546	59,366	3,041,798
Iron or steel tubes, pipes and fittings, tons	599	29,546	1,066	47,012
Jute piece goods, cwt	4,439	27,788	6,727	33,698
Pig lead, tons	1,762	66,873	3,884	136,251
Dressed leather, cwt	104	17,727	164	27,461
Machinery for printing, bookbinding, etc., tons	125	24,556	206	33,615
Motor car parts and accessories, except chassis	...	48,793	...	74,180
Steel bars, rods, angles, etc., tons	162	6,866	1,276	43,786
Woolen and worsted tissues, cwt	534	40,755	891	56,624
Zinc, crude, tons	1,664	67,356	7,671	314,612

In the above the total in the December quarter is about 140 per cent greater in quantity and 157 per cent in value contrasted with the earlier period and inasmuch as the gross increase in value was only £1,751,000 or 20 per cent, there obviously must have been certain classes of imports which decreased, but there is no information available as yet to denote which they were.

The statement was officially made that 1627 German bicycles were imported from Germany during 1920 valued at £7,081, and that "there is no doubt whatever they can be imported at considerably less than the price at which they can be manufactured" in the United Kingdom. A further official comment was that "Imports from Germany have doubtless contributed to some extent to the depression of the labor market in this country."

French Tariff Bars German-Austrian Cars

PARIS, April 11—(*By cable to* AUTOMOTIVE INDUSTRIES)—A special import tariff applying only to Germany and Austria has been adopted by the French government. It stipulates a duty of 180 per cent ad valorem on imports of passenger cars and 200 per cent on trucks.

Jean Chassagne has entered a Peugeot in the Indianapolis sweepstakes.

Ralph DePalma has drawn No. 1 position in the French Grand Prix.

TO BUILD PLANES IN JAPAN

WASHINGTON, April 9—A group of British airplane construction experts has arrived in Nagoya, Japan, reports Consul Hawley, under a three-year contract with the Mitsubishi Co. to supervise the construction of airplanes in all details. It is expected that a complete airplane manufacturing plant will be organized, capable of turning out airplanes of the most approved type for all purposes.

Fiat Plant Again Faces Serious Labor Troubles

NEW YORK, April 11—Dispatches from Turin, Italy, say that the situation resulting from the dismissal of workmen in the Fiat works is becoming increasingly serious. The Prefect of Turin has made a futile attempt to mediate. The tension has been increased by the fear that the men may again occupy the works.

The problem of the Fiat company is similar to that of other establishments in disposing of superfluous labor since war orders ceased. The Fiat motor car plant carriage works and cylinder foundries have been closed, making idle 12,000 employees. The directors posted a notice stating that their position was a result of the "systematic opposition of workmen's organizations to a practical understanding." The clerical and expert staffs have been retained on holiday leave. The factories are occupied by troops.

Michelin Closes Down Plant

The Michelin Tire factory in Turin also is closed as a result of an attempt to reduce the number of workers to 1200. The employees protested against this decision and declared that instead of reducing the number of employees the factory should be worked only three days a week. The directors refused to agree and the factory was closed.

INDUSTRIAL NOTES

Handley-Knight Co., Kalamazoo, Mich., will soon install in its plant a complete finishing department and in the future all bodies will be bought in the rough and painted, varnished and upholstered in Kalamazoo. The new departments will give employment to about 50 additional hands.

Code Mfg. Co., Chicago, has been incorporated under the laws of Illinois to manufacture ratchet wrenches, visors and oilers. The company has been in production for the last six months. J. R. Oyott is president; William E. Code, vice-president, and A. L. Rousseau general manager.

Auto Specialties Mfg. Co., St. Joseph, Mich., in addition to its line of Bair top holders, automobile jacks and malleable iron castings, has acquired all patents and manufacturing rights on the shock absorbers for Ford cars, formerly known under the name "Burgess."

Sandusky Tractor Co., Sandusky, Ohio, has been chartered with an authorized capital of $100,000, to manufacture and sell tractors of all kinds. At first the tractors will be designed for agricultural purposes, and it is proposed to go into other lines.

Edward Valve & Mfg. Co., in order to centralize control of its industry, promote economy and better serve its customers, has moved its general offices from Chicago to its factory located at East Chicago, Ind.

Hughson & Merton, Inc., San Francisco and Los Angeles has been appointed sales representative for the Lane Bros. Co., Poughkeepsie, N. Y., manufacturers of sliding door hangers and H-C jacks.

Thomart Motor Co., Kent, Ohio, has been endorsed by the Kent Chamber of Commerce after an investigation into the management and financial standing of the company.

Victor Rubber Co. will establish general offices in the downtown section of Springfield, Ohio, instead of maintaining the offices at the factory as formerly.

TERMAAT-MONAHAN SOLD

OSHKOSH, WIS., April 11—The International Cultivator Corp., New York, has bid in the property of the Termaat-Monahan Mfg. Co., this city, at receiver's auction and intends to reopen the plant for the manufacture of gas engines, farm power units, lighting systems, etc. The purchase involves about $90,000. The International corporation has filed articles and been granted a charter to do business in Wisconsin.

RECEIVERS OPERATE PHELPS

COLUMBUS, April 11—The Phelps Mfg. Co. of Columbus, makers of the Phelps wire wheels for automobiles, which has been in the hands of J. H. Weisenback and Thomas W. Pickard as receivers for several months, is resuming operations. For a time the plant was shut down but now with a revival in the demand for wheels production is starting up under the receivers. Some of the machinery is being disposed of.

WITHDRAW OFFER FOR PLANT

LOUISVILLE, April 11—Withdrawal by the Collapsible Wheel Co. of its $172,500 offer for the property of the bankrupt Kentucky Steel & Iron Co. marked proceedings Saturday in the court of Referee George Du Relle. The case was passed to Tuesday. The offer of the Collapsible Wheel Co., a Delaware corporation, was made by L. Culbreath, Asheville, N. C. The bid was withdrawn, it is understood, because representatives of the wheel company feared possible litigation on the part of creditors who had objected to the sale. The wheel company is capitalized, it is said, at $2,000,000.

Labor Statistics Show Car Increases Steady

WASHINGTON, April 9—Increased activity in the automotive industry is reflected in the report of the United States Employment Service showing a gain of 28.1 per cent in the number employed during March. The amount of increase listed from reports under "Vehicles for Land Transportation" was 31,342. Of the total reported employed in 14 groups on March 31, the relative weight of the vehicle industry was 8.9 per cent. Though slight increases were reported in the employment situation in 4 other industries, the gain was not comparable to that registered in the automobile industry.

Reports from 1424 firms, usually employing 501 or more, showed that 1,587,786 workers were employed on March 31 as against 1,612,611 on Feb. 28, a net decrease of 24,825, or 1.5 per cent. The net decrease in employment since Jan. 31 has been 40,348, or 2.5 per cent.

While agents of the Labor Department in Detroit reported that automobile manufacturers were proceeding with caution, it was pointed out that the situation indicated permanent movement and steady increase in the working forces.

Throughout the States of Ohio, Illinois, Indiana, Michigan and Wisconsin the automobile and textile groups are in increasingly better condition but no other group shows appreciable improvement.

EQUIPMENT SELLS IN TEXAS

FORT WORTH, April 11—The recent business depression in the automobile business in the Southwest is over. So the guests of the Equipment Co. of Texas were told by President H. R. Shedd. As evidence, he declared the March business had been the best in the firm's history and April was starting off equally well. The guests were salesmen of the company in the Texas territory, and the meeting an annual affair. Plans for extending the 1921 business were mapped out.

KANSAS CITY CONTINUES GAINS

KANSAS CITY, April 11—March was for several distributors of standard makes of passenger cars, a better month than March 1920 in Kansas City and territory. The chief gain was in retail sales. All cars, both standard and less well known makes, moved better at retail in March than in several months past.

METAL MARKETS

As for its effect on the steel market, Tuesday evening's long expected announcement by the United States Steel Corp. of a reduction in its prices which practically brings them to the independents' level, one need but recall the fact that the news was given out after the close of the stock market and this circumstance is more noteworthy than any of the price adjustment details.

Attention has been previously directed in these reports that the most significant feature of any price changes by the Corporation lies in the generally accepted theory that when the Corporation promulgates price changes they are almost invariably predicated upon fairly precise knowledge of orders for representative tonnages that have been hanging fire and that can be booked immediately following the price change. If there be any such latent business overhanging the market, they are from the structural, railroad and other lines of steel consumption. Whatever the future may bring forth, however, the fact remains that the automotive industries so far furnish the staff on which iron and steel producers lean for support. Compared with war days, the tonnages involved in new business emanating from passenger car builders and automotive parts makers may be light, but the impressive feature is the steadily growing number of orders and, perhaps still more so, the broadening of this demand over departments of the market heretofore entirely neglected. Builders of low-priced passenger cars are figuring prominently in the market for tubular goods, and about the only worth while sale of ferromanganese that has been made of late was one in which a Detroit passenger car and tractor interest figured as buyer. It is gratifying to note that Mahoning valley sheet makers are setting up a vociferous plaint, because nothing but absolutely perfect sheets pass muster in automotive plants these days and that rejections for defects have never been so numerous as at the present. The sheet mills themselves will in the end be the greatest gainers from this exacting method.

Pig Iron—With two-thirds of the stacks blown out and production cut to the lowest level in many years, a steadying tendency is in evidence; at $25, valley, both malleable and foundry may even be called firm.

Steel—While one of the Corporation's regular automotive customers is said to have recently placed an order for 5,000 tons of steel bars at 2.35c., Pittsburgh, other interests have booked business in the last few days at 2.10c. Cold-finished steel bars are offered at as low as 3c. Detroit passenger car builders continue to release suspended tonnages for specialties. Strip steel is also moving in carload lots to the automotive trade. Orders for several hundred tons of sheets are reported to have been placed in the Pittsburgh and Chicago markets.

Aluminum—Most of the resellers and importers are now asking 24c. for virgin ingots, 98@39 per cent pure. German metal is still being offered at bargain prices, but purchases involve undesirable terms of payment.

Copper—The shutdown of 75 per cent of the mines will not be felt in refinery output until June.

Tin—Speculative ups and downs continue with consuming demand light.

Lead—Quiet and of a routine character.

Zinc—Slightly more demand from galvanizers; brass mills still apathetic.

FINANCIAL NOTES

Wright Aeronautical Corp., for the year ended Dec. 31, reports net profits, after charges and Federal taxes, of $411,349, which is equivalent to $1.83 a share on the 224,890 shares of capital stock of no par value outstanding. Total sales for the year were $1,486,124, while the costs of sales were $1,124,058, leaving a profit of $362,066.

Mullins Body Co. directors voted to pass the dividend payment due on common stock. Heretofore the company has been paying at the rate of $1 quarterly on common. The regular quarterly dividend of $2 a share on preferred stock will be paid May 1. The passing of the dividend is said to be due to the lockout which has closed the company's plants for more than a month.

Packard Motor Car Co. is issuing $10,000,000 in coupon bonds in interchangeable denomination of $1000 and $500, registerable as to principal only. The bonds are to be redeemable at the option of the company on any interest date, on 60 days notice as a whole but not in part, at 107½ per cent on or before April 15, 1926, and at 105 per cent thereafter. The company covenants to set aside quarterly sums equal annually to one-tenth of the largest amount of these bonds which has ever been outstanding, such sums to be used as far as possible, for the purchase of bonds in the open market at not exceeding 105 per cent and interest.

French Battery & Carbon Co., Madison, Wis., is being reorganized on a larger and broader scale to take over the manufacture of a battery under patents owned by the Federal Battery Co., Cleveland. The French company will start work shortly on a large factory addition. Its new capitalization consists of $300,000 of common stock, $700,000 of first preferred and $1,000,000 of second preferred, both 8 per cent stock. It is understood that the Federal Battery Co. becomes owner of a large block of the first preferred.

Spicer Mfg. Corp. reports for 1920 sales amounting to $17,862,929.94. Net profits after depreciation and deduction of interest were $1,448,752.79, with reduction of inventory to present prices and provision for Federal taxes, net profit was $646,022.08, equivalent to $21.33 on the preferred stock. Despite unfavorable conditions, the company has paid the regular preferred dividends, a 50 per cent dividend on the common and retired the first series of five year 5 per cent notes amounting to $600,000.

Independent Pneumatic Tool Co., Chicago, earned $1,308,457 in 1920 before dividends and charges, compared with $1,439,376 the previous year. Dividends and charges required $418,874 from the surplus in 1920, where in 1919 the surplus was increased by $727,694. Total assets of the company are shown as $5,618,546, cash totaling $655,041 and inventories $623,435.

Federal Rubber Co. in a balance sheet as of Dec. 31, 1920, shows total assets of $19,618,321.21 and a surplus of $1,245,826.25. The assets include inventories totaling $7,836,123.58, of which $5,061,625.06 represented finished product at factory and warehouses. Cash in banks and on hand is shown as $432,605.08. Net sales for the year were $13,911,993.22.

Ohio Body & Blower Co. for the year ended Dec. 31, 1920, reports net sales of $2,737,250. Expenses, depreciation and inventory adjustment amounted to $2,967,153, leaving an operating loss of $229,903. After payment of interest and dividends there was a net deficit of $596,629 for the year. The surplus was reduced to $1,576,100.

Stutz Motor Car Co., in a comparative balance sheet as of Dec. 31, shows assets of $8,032,522, in which is included cash of $217,043 and an inventory of $3,049,238. The surplus of $5,404,414 is $368,544 less than the 1919 surplus. On Dec. 31, it is declared, the net tangible assets applicable to the capital stock, amounted to $6,404,414, or $32.02 a share.

Keystone Tire & Rubber Co. reports net loss after expenses, interest and taxes in 1920 of $317,704. Profit and loss deficit on Dec. 31 was $384,623. The company reported total assets of $4,650,135, which included cash of $105,032 and inventory $860,921. Accounts receivable totaled $2,243,912.

Stewart Warner Speedometer Corp. directors, after their meeting in Chicago this week, declared that the quarterly dividend would be cut from $1 to 50 cents a share April 20. The company reports retail trade back to normal.

Sewell Cushion Wheel Co., Detroit, has paid the regular quarterly dividend of 2 per cent on preferred stock and 8 per cent on common. At the annual meeting of directors April 5 all of the old officers, headed by H. J. Sewell, president, were re-elected.

Service Motor Truck Co., Wabash, Ind., has changed the par value of its common stock from $100 a share to $10 a share, and the number of its shares from 35,000 to 350,000.

United States Rubber Co. has declared regular quarterly dividends of $2 a share on common stock and $2 a share on preferred, both payable April 30.

Kelsey Wheel Co. has declared the regular quarterly dividend of 1¾ per cent on the preferred stock payable May 2 to stock of record April 23.

United States Motor Truck Co. paid the regular 1¾ per cent dividend of preferred stock on April 10.

Wisconsin Truck Merger Awaits Stock Action

KENOSHA, WIS., APRIL 13.—Consolidation of the Winther Motor Truck Co., the Kenosha Wheel & Axle Co. and the Marwin Truck Corp. will be announced April 29 if the stockholders ratify the action proposed by the directors and they are expected to give their assent.

There is a strong probability that this combination will be expanded later by the addition of a half-dozen representative truck manufacturing companies. Under the plan proposed each factory would manufacture a truck of one capacity.

The chief obstacle thus far to the larger combination has been the question of financing. The bankers approached on the subject are understood to have given it their approval but have advised waiting a few months until conditions improve in the money market.

CREDITORS ASK NEW RECEIVER

INDIANAPOLIS, April 9—Three Indianapolis firms, creditors of the Van Briggle Motor Device Co., filed papers in Federal court April 7 against William R. Hirst, receiver of the company, asking that a receiver in bankruptcy be appointed in Federal court.

BANK CREDITS

Written exclusively for AUTOMOTIVE INDUSTRIES *by the Guaranty Trust Co., second largest bank in America.*

NEW YORK, April 14—The attention of the financial community last week was directed, in the main, toward prospects for easier money. Continued liquidation in the industrial and commercial fields, the steady improvement in the reserve position of the Federal Reserve System, the continued stream of gold imports, and rumors of possible lowering of official rates abroad lead many to think that a permanent lowering of money rates was at hand. While the industrial situation in England practically prohibited the expected lowering of the Bank of England's official discount rate, the National Bank of Switzerland was the one bank on the continent which did lower its discount rate, which had been in effect since August, 1919. The rate now is 4½ per cent as against an old rate of 5 per cent; and the Bank's rate for advances against security was lowered to 5½ per cent.

While money was easier in New York there was no assurance of a lasting change. Call money ruled from 5 per cent cent to 7 per cent as against 6 per cent to 7 per cent the previous week. The renewal rate on Monday of last week was 6½ per cent and thereafter did not get above 6 per cent until Monday of this week, when 7 per cent was quoted.

The Federal Reserve Banks as a whole last week gained $17,571,000 in gold reserves, making an increase of $204,677,000 since Dec. 30, 1920. Total gold reserves at $2,264,010,000 were at the highest point in the history of the Federal Reserve System. Rediscounts were $213,698,000 less than they were four weeks ago and are at the lowest point since Jan. 23, 1920. Federal Reserve notes in circulation at $2,893,964,000 are at the lowest point since Feb. 9, 1920, and are $14,189,000 less than a week ago.

Total earning assets declined $75,580,000 and total deposits $43,917,000. Total bills on hand were also less by $78,727,000.

Bank clearings for 193 cities in March were $31,600,363,064 as against $41,338,259,6991 in March, 1920, making a decline of 25 per cent. For the three months ended March 31, clearings were $91,245,362,890 or 21.6 per cent less than for the corresponding period of 1920. Bank clearings for New York showed the same tendency. March clearings were 25.3 per cent less than for March a year ago, and clearings for the three months were 21.8 per cent less than for the first three months of 1920.

PLAN QUICK SALE OF IMMEL

COLUMBUS, April 11—The reorganization plans of the creditor's committee of the Immel Co. are working out satisfactorily, according to A. G. Gilmour chairman of the committee and it is likely that the receiver, Robert H. Schryver will offer the plant and assets for sale within 30 days.

Men of the Industry

Joseph L. Bardig, advertising manager of the motor bearings division of the Hyatt Roller Bearing Co., has joined the staff of the Campbell-Ewald Co. to assist in sales promotion work. Previous to his appointment as advertising manager of the motor bearings division of the Hyatt Roller Bearing Co. he was assistant advertising manager of the motor equipment division of the General Motors Corp. In this capacity he directed advertising of the Remy Electric Co., the Klaxon Co., the Harrison Radiator Co. and the Jaxon Steel Products Co.

John E. Tracy, who served four years as general sales manager of the Sterling Motor Truck Co., Milwaukee, has resigned, to accept the position of vice-president and director of sales of the Hicks-Parrett Tractor Co., Chicago, a new $3,500,000 concern which is manufacturing heavy duty truck units and fire apparatus. Tracy was the first president of the National Association of Motor Truck Sales Managers, in the organization of which he took a leading part. He assumed his new duties April 4.

S. M. Williams, chairman of the Federal Highway Council, announces the election of four new members to the executive committe of the Council: W. J. L. Banham, general traffic manager, Otis Elevator Co.; David Beecroft, president, Society of Automotive Engineers, and directing editor, Class Journal Co.; H. W. Alden, vice-president, Timken-Detroit Axle Co., and S. P. Leeds, president, Atlantic City Chamber of Commerce.

R. C. Hawley has rejoined the sales staff of the Remy Electric Co. About a year ago Hawley resigned from the Remy sales department to take up an electrical engineering project of his own. Prior to that time he was a member of the Remy organization since 1918, coming from the Mitchell Motor Car Co., where he was engineer in charge of electrical installation.

Stanley E. Knause, who has been closely connected with the sale of commercial aircraft since the war and who for the last two years has been sales and advertising manager for Continental Aircraft, Inc., has been made sales manager of the Stout Engineering Laboratories, Inc., Detroit, and will assume his new duties immediately.

George D. Wilcox, director of sales and advertising for Commerce Motor Car Co., Detroit, has been promoted to general manager. Wilcox has been in charge of sales for the last seven years both in America and the export field. O. D. Coppock, who has been assistant to Wilcox, becomes sales manager.

C. M. Bunnell, for the past ten years in charge of sales of automobile lamps for the Edison lamp works of General Electric Co., has accepted the position of director of branches with the Splitdorf Electrical Co., with headquarters at the general offices of the company, Newark, N. J.

Worth Colwell, who with Edward F. Korbel has handled publicity for most of the automobile exhibits in New York in recent years, will sail for Europe the last week in April to study exhibits abroad. Colwell is also president of the Rowland Advertising Co., Inc.

W. E. Baker has been appointed assistant general sales manager of the I. J. Cooper Rubber Co., Cincinnati. He was formerly sales manager of the Cincinnati Time Recorder Co. and prior to that was sales manager of the E. A. Myers Co., Pittsburgh.

C. N. Eason, vice-president of the Hyatt Roller Bearing Co., has become associated with the Samson Tractor Co., Janesville, Wis., division of General Motors, as assistant to President J. A. Craig and supervisor of the engineering department.

Elwood Haynes, president of the Haynes Automobile Co., Kokomo, Ind., together with three brothers, has donated to the city of Portland, Ind., a large tract in the northwestern part of that city to be used as a public park.

Harry Doty, formerly branch manager at Chicago for the Haynes Automobile Co., has been appointed sales manager for the Premier Car Corp., with headquarters at the factory in Indianapolis.

L. E. DeGroat, formerly of Timken-Detroit Axle Co., has joined the Acme Motor Truck Co., Cadillac, in charge of dealer promotion work.

Herbert Y. McMullen, formerly connected with the Trackless Transportation Corp., New York, has resigned his position.

H. D. Minchin, formerly sales manager of Lewis Searing & Co., is now general sales manager of the Field Body Corp.

Robert I. Erlichman resigned as president of the General Utility Co. and was succeeded by A. H. P. Leuf.

H. W. Scholl has resigned as sales manager of the Splitdorf Electrical Co., Newark, N. J.

N.A.C.C. Names Committee to Confer with N.A.D.A.

NEW YORK, April 12—Arrangements were completed to-day by the National Automobile Chamber of Commerce, for the first of a series of conferences with the National Automobile Dealers Association, at which problems of the industry affecting both manufacturer and dealer are to be discussed. The initial session will be held at the Detroit Athletic Club, Detroit, May 9.

The following committee was appointed by President Clifton to represent the N. A. C. C. at the conference:

W. C. Sills, sales manager, Chevrolet; C. B. Voorhis, sales manager, Nash; C. W. Matheson, sales manager, Dodge; Hal B. Boulden, sales manager, Selden Motor Truck Co., and F. E. Connor, sales manager of Chandler.

Southern Money Easier, Farmers Pay Off Loans

ATLANTA, April 12—Business conditions over the South continue on the upward trend with the result that there is a much better feeling as regards the outlook for the future in industrial and commercial circles than the section has known for months.

The Federal Reserve Bank of Atlanta reports that the farmers in the sixth district, which comprises most of the states of the Southeastern area, are still holding between 50 and 60 per cent of last year's cotton crop, and that approximately half of this is pledged as collateral for loans. Just how long this cotton will continue to be held depends to a arge extent on what Southern producers do this year in the way of acreage reduction. A drastic reduction would serve to increase cotton prices and result in the sale of considerable of the staple now being held. This, naturally, would still further improve the financial condition of the section. There is every indication that the acreage will be reduced from 30 to 50 per cent.

Governor M. B. Wellborn, of the Federal Reserve Bank of Atlanta, said that "if liquidation of borrowings in the Atlanta district continues as it has the past three months, the directors of the bank will consider lowering the discount rate."

Ford Orders, 102,000; Look for Million Year

NEW YORK, April 13—The average production at the Ford plant is now about 3300 cars a day and the plan is to increase production until it reaches approximately 4000 daily. No definite schedule has been fixed for the year but the total is expected to approximate 1,000,000. Actual sales in the domestic market for March were 87,221 cars and 4708 tractors. Orders on hand for cars total 102,000. The number of men employed is about 32,000.

Henry Ford is entirely satisfied with the present outlook. Bank notes to the amount of $24,000,000 will be due April 18 and it is understood he expects to pay at least 25 per cent of them and is confident he will encounter no difficulty in paying the remainder.

Theft Protective Bureau to Issue Radiator Disks

NEW YORK, April 12—The Automobile Protective and Information Bureau of Chicago, representing a large number of insurance companies handling automobile lines in the Middle West, plans to distribute to policy holders brilliant metal disks to be placed on radiators reading "This Car is Protected by the Automobile Protective and Information Bureau of Chicago." The William J. Burns Detective Agency, Inc., in conjunction with the Rent Renton Auto Recovery service in this city, has been planning a similar device. Detectives assert that such placards on automobiles are found to be worth while deterrents to thieves.

PAIGE STAGES NATIONAL WEEK

DETROIT, April 9—Paige Motor Car Co. dealers throughout the United States are participating in a national demonstration week which began Monday. With all of the larger shows past factory executives decided that the time was most opportune for a spring salon and a real Paige show in each city at the Paige salesrooms.

The Paige factory is working practically full time at close to 100 per cent production in anticipation of demand resulting from the week's efforts.

Calendar

FOREIGN SHOWS

April 16 - May 8—Bosquet, Algiers; Algerian Agricultural Fair, Motor Cars, Machinery and Tractors.

Apr. 20 - May 5 — Mexico City, Mexican Automobile Show, National Theatre Bldg.

April, 1921—Sofia, Bulgaria, Tractor Trials, under the Bulgarian Ministry of Agriculture.

May 28, 1921 — Czecho-Slovak International Automobile Exposition of Cars. Trucks, Tractors, Motorcycles and Equipment. Prague.

May 28-June 8—International Automobile Exhibition, Basle, Switzerland.

June, 1921—Reykjavik, Iceland. Agricultural Exhibition—Agricultural Machinery—Icelander Agricultural Society, Reykjavik, Iceland.

September—Buenos Aires, Argentina. Passenger Cars and Equipment. La Pabellon de las Rosas. Automovil Club Argentino.

September — Buenos Aires, Argentina. Cars, Trucks, Tractors, Farm Lighting Plants and Power Farming Machinery. Palermo Park; Sociedad Rural Argentina.

September—Luxemburg, Luxemburg Agricultural Sample Exhibition.

Oct. 5-16—Paris, France, Paris Motor Show, Grand Palais. Administration de l'Exposition Internationale de l'Automobile, 51, Rue Pergolèse, Paris.

Nov. 4-12 — London, British Motor Show, Society Motor Mfrs. and Traders.

CONVENTIONS

May 4-7 — Cleveland, National Foreign Trade Council

May 17-19—Buffalo, Convention of Factory Service Managers, Auspices of Service Committee, N. A. C. C.

May 24-28 — West Baden, Ind., Summer Meeting Society of Automotive Engineers, West Baden Springs Hotel.

July 4-9 — Mackinac Island, Mich., Summer Meeting Automobile Equipment Association.

Oct. 12-14, 1921—Chicago Twenty-eighth Annual Convention National Implement & Vehicle Ass'n.

RACES

June 18—Uniontown, Pa., Speedway Events.

July 25—Grand Prix, Le Mans.

Labor Day—Uniontown, Pa., Autumn Classic.

S. A. E. MEETINGS

Buffalo section—April 19—Paper on "Carbureter Performance," by F. C. Mock.

Dayton section—May 3.

Parts Service Problem Referred to Committees

(*Continued from page* 834)

cheaply and would naturally be heartily in favor of the plan. Service must be put on a commercial basis if the industry is to live, Rognan asserted.

Otto Armleder, president of the O Armleder Co., took the parts makers to task for not fulfilling their obligation to the manufacturer and his customer in their attitude on replacements.

"We stand behind every unit of our product," said he, "and when you send out an improper product it is your duty to replace it and assume all expense. It is the great evil of the business. You parts makers must start right. We owe our customers an obligation and you owe the same to us."

In support of the plan of the parts makers, Yeoman recited the history of it dating from the first station established five years ago which he said was brought about by continued complaint from customers that they could not get service. With reference to the plea for the dealers, Yeoman said the dealer profit on parts was so small as to be of virtually no consideration and he cited numerous figures to sustain his contention. He insisted the only reason Continental was operating the service station plan was to insure service to users of Continental engines.

Underselling Market

Independents, Yeoman said, were selling to the dealers as cheaply as the parts makers can sell to the truck assembler. He said the parts makers felt that the plan was a big asset to the assembler and declared it was the earnest desire of the parts makers to co-operate with the assembler in convincing the consumer of the advantage of the assembled truck, thereby increasing the demand. The parts stocks in the stations now operating, Yeoman added, varied in values from $20,000 to $90,000, and he contended that many men had heavy building investments in addition.

He said it was the unanimous opinion of the parts makers that the truck manufacturers were unable to find dealers who could assure proper service, the inference being that there would be no inclination to recede from the present position.

Pulcher, who opened the discussion opposing the service station plan, said he had a grip full of communications from dealers opposing it. He declared the parts makers had done nothing for the dealers, whereas the truck manufacturer had taken care of them. The serious problem from the manufacturing standpoint, Pulcher said, was in keeping the dealer organizations intact and he declared the dealer's only profit in the last six months was from service. He asserted the manufacturer lost contact with his customer when that customer was able to go to a parts station for new parts rather than to the dealer.

Prices Vary as High as $40

Pulcher said prices varied as much as $40 in some instances and urged the need of standardization and printed price lists. He told of the trouble in getting dealers and in holding them and in citing concrete instances where his company had helped a dealer financially, demanded to know if the parts maker would have done that. If an inferior part goes out in a truck, Pulcher said, unless it comes back to the dealer the manufacturer knows nothing about it and the truck gets the blame. He said his company was ready to help the small assembler who was unable to maintain a large dealer organization, by giving him discounts and in every way. Pulcher declared his company was unalterably opposed to the stations operated by the parts maker.

The meeting, which had been transferred from the Detroit Athletic Club to the Wolverine Hotel for convenience of the large crowd expected, was called to order by President B. A. Gramm. Armleder read the resolution adopted by the truck association committee two weeks ago expressing unalterable opposition to the service station plan as detrimental to the interests of all concerned. On motion of Pulcher committees of six parts makers and six assemblers were named to formulate separate statements for presentation at the afternoon meeting and the morning session adjourned.

Endorse New Plan for Standard Parts

(*Continued from page* 835)

paid in for the benefit of creditors within 90 days. Dismissal of the receivers would follow success of the proposal.

Scott made it plain that the present status of the Standard Parts was brought about by an internal fight. J. O. Eaton, general manager of Standard Parts, and one of the receivers, is in California, and he was unable to attend the gathering.

It was pointed out that while debts aggregate $9,500,000, the assets are more than $20,000,000. Cash and accounts receivable aggregate $2,200,000; inventory $4,000,000; stock in the Bock Ball Bearing Co., $2,000,000; plants were appraised at $11,700,000; holdings in the Eaton Axle Co., $1,200,000.

It was brought out in the discussion that while earnings of the company had at times dropped to $250,000 a month, the figure for April will approximate $800,000. Under normal conditions the company can earn $3,000,000 a year, and $6,000,000 under more favorable conditions.

Big Dirigible to Fly 8000 Miles to Coast

NEW YORK, April 12—The ZR-2 formerly the R-38, which the United States Navy is having constructed in England and which is the largest airship ever built, will be flown to the United States in May or June. It is planned, if possible, to fly the great dirigible direct to the Pacific Coast, thus making in its maiden flight a non-stop record of approximately 8000 miles.

The ZR-2 is almost one-third larger, far more powerful and with twice the cruising radius of the R-34, which in 1919 made the round trip of the Atlantic Ocean after laying over several days on Long Island. It is being rushed to completion at the Royal Airship Works, Cardington, Bedford. Its engines are being built by Sunbeam. Dimensions of the craft are 700 ft. long and 85 ft. diameter.

AUTOMOTIVE INDUSTRIES
THE AUTOMOBILE

VOL. XLIV. NEW YORK—THURSDAY, APRIL 21, 1921 NO. 16

Balancing Factory Equipment for Efficient Manufacture

Team work is as necessary in a factory as in a ball team. Only by cooperation of all units can production costs be properly adjusted. In the production scramble many stars were bought. Now comes the era of specially equipped all-star factories.

By J. Edward Schipper

NOW that automobile manufacture has reached a production basis again, with factory output ranging from 25 to 100 per cent of capacity, machine problems are coming to the front. In many plants the production manager finds his machine tool equipment out of balance. This is due to the accumulation of new machinery during the past year or two in some departments, while in other departments, in the same plant, older machinery is relied upon. The result is that the shop is not producing uniformly, or up to profitable efficiency.

To put the situation in a nutshell:

The next year in the automobile industry must be one of intensive retooling if automobile manufacturing costs are to be adjusted to the general business trend. From the present outlook, there is not much to be hoped for in any material reduction in labor costs. Wages are apt to remain indefinitely about where they are, and if manufacturing costs are to be cut it must be on a production side, or, in other words, by the use of better machinery adapted to manufacturing at higher speeds.

It may astonish some manufacturers to know that, from the machinery standpoint, their plans are practically obsolete. It would be perfectly possible with up-to-date tool equipment to manufacture a greater number of automobiles in the same space and time by the use of new machinery. **Naturally, a manufacturer equipped with this machinery would be in a position to undersell the concern with the older tool equipment.**

This is clearly brought out by a visit to factories which have been partially re-equipped with machinery.

> **There is one particular engine which the writer has in mind in which it is necessary to run one machine only two hours in order to keep production up with the rest of the shop. This either means that the manufacturer had no right to buy the improved machine, or he is losing money by not re-equipping his factory to the production schedule of his most advanced machine. A machine cannot pay its carrying cost by two hours' work.**

There is another, and a very important, advantage in the purchase of improved machinery to replace older models. **This is in the greater accuracy of the new machine and the consequent saving, not only in the matter of rejections of partially machined parts, but also in the inspection department.**

The problem in retooling a plant is broadly economic in the many angles it presents for consideration. Between the time a piece of raw material enters the plant and the time it leaves the factory, as a finished product, this piece of material is costing the manufacturer money. Naturally, the shorter he makes this period, the less his cost of production will be. He will have saved money by shortening the labor charges; by increasing the rapidity of turnover and by reducing the amount of money tied up in parts in process.

The efficiency of the machinery in the plant has a direct bearing on the ratio of output to process parts. Consequently it is a direct factor, not only in the cost of the finished article, but in the amount of working capital required to run the manufacturing business.

When these factors are taken into consideration and when it is considered that a great many of the automobile plants in successful operation are using the machinery purchased from 5 to 10, and in some cases 15 years ago, this question of retooling becomes one of the biggest problems within the industry.

Now that the cost of machine tools is back on a basis where purchase is readily justified when the economic consideration of the plant demands it, the time has come when every manufacturer should ask himself if his machine tool equipment is such that he is getting as large a return for the money invested in manufacture as his new competitor, who is tooled up along more modern lines.

If it is true that a new manufacturer could enter the field with a new plant and make the same or a better product at less cost, there is something wrong with the tool equipment of the older concern.

It has been stated before in these columns that there are certain automobile manufacturers who are admittedly giving a greater value to the public on a dollar per dollar basis than other manufacturers. A study of the reason entering into this shows that it is largely a question of manufacturing equipment. Manufacturers whose plants have been developed and maintained at a modern standpoint can turn out a greater quantity of cars at a less price and with a smaller amount of floor space than plants using older equipment.

Drill presses are a good example of this. It would not be far wrong to state that the drill press equipment of the automotive industry is about 30 per cent behind times.

In other words, if the entire mass of drilling operations for the entire industry were considered in bulk, it would be possible to drill the same number of holes in the same length of time with only 60 per cent of the number of machines now utilized and in 60 per cent of the space. This is an arbitrary figure, but well within what machine tool men know to be a fact.

The advance in the machine manufacturers' art during the past three years has been far greater than the advance in engineering in the automobile field. From a performance standpoint, the automobile of to-day is fairly satisfactory from the viewpoint of the consumer. To-day an automobile is discarded, not because it ceases to respond to the demand for transportation, but because it becomes noisy, somewhat more expensive to operate and chiefly because of the pride of the owner. This being the case, we must not look to the designer for the big improvements in the automobile industry during the next few years. These improvements will be rather in the manufacture of the product and in the material chosen than in design engineering.

It is hardly likely that any revolutionary engineering discoveries will be made within the next few years that will entirely shake the foundation of the art, so far as performance is concerned. **On the other hand, it is entirely possible to look for revolutionary improvements in the matter of manufacture and, as a matter of fact, these revolutionary improvements have largely taken place during the last three years.**

New machines available to the automobile manufacturer, if he studies the machine tool market, are further ahead of the tools which he has had in his plant for the past 5 or 10 years, than the cars of to-day are ahead of those of 10 or 15 years ago.

The long pauses between cutting operations have been eliminated and on many of the tools now on the market, particularly for milling and grinding operations, there is hardly an instant during the working day when the tool is not cutting. A tool reaches its maximum earning capacity **when it is cutting at the highest possible cutting speed during the entire working day.** This ideal, of course, has not often been attained, but is so nearly accomplished on some of the newer machines that the advance in manufacturing efficiency is surprising.

It is not difficult to look through the cost figures of the automobile manufacturer and find where such machinery will save money. **Furthermore,** unless new tool steels are invented which make it possible to cut at a faster rate than is now possible, the manufacturer is assured that just as long as he has machine tools which are continually cutting at that rate, he will be in a position to manufacture that particular piece with the greatest efficiency.

Accuracy of manufacture has come with the new machinery for a variety of reasons.

One example is in the simplification of locating points which has been rendered possible by the ability of machines to operate at several points on the piece at the same time. With the older equipment, it was necessary to twist and turn the piece so many times during the process of machining that location from secondary locating points was often required. The impossibility of maintaining accuracy under such conditions is readily recognized by all manufacturers.

Furthermore, the machinery which is capable of the greater number and the greater rapidity of cuts has been made far more rigid than the older machinery, which is another factor in the increase in accuracy.

As a third factor in promoting accuracy, the machinery is very often adapted to much simpler and better forms of jigs, and furthermore, particularly in the case of the drilling operations, the same jig can often advantageously be passed from one machine to the next, so that not only is time saved in eliminating the necessity for removing the piece from one jig and placing it in the next for succeeding operations, but also absolute accuracy is assured in the spacing of drilled holes and in their location.

There is no intention here to go into the detail of improvements which have been made in the various classes of machinery, but it is desired to point out the fact that manufacturers who are not keeping themselves fully posted on improvements in machine tools (which can improve the speed and accuracy of manufacture of their products) are leaving an opening for their competitors.

Buying a machine tool is very much the same sort of problem as that of buying a truck to solve a transportation problem. The purchaser must not consider that he is buying a mere piece of machinery. He must take the view that he is buying the service which it renders. As a man buys a truck to trans-

port goods from one place to another, he naturally overlooks the first cost of the vehicle and figures it in the transportation costs over the period during which the truck is in action. This, of course, is the only logical basis upon which the truck should be bought.

In the same way, the manufacturer must not forget that in buying machinery he is buying manufacturing ability, with the cost of the machinery spread over period during which the machine will serve him.

Now that engineering and design have reached a basis where the fundamentals of a design are unlikely to be radically changed for several years, the matter of tool equipment can be approached in an entirely different attitude than it could have been during the period when the manufacturer was forced to bring out practically a new model every year in order to keep pace with the engineering. In those days the manufacturer looked askance at a single purpose piece of machinery. He knew that such a machine would have to be discarded, or at least converted at a high cost at end of the year.

To-day the proposition is entirely different. When a model has been designed and approved after exhaustive laboratory and road tests, and the manufacturer is sure that what he has is the best that modern engineering brains and skill can produce, he knows that he has to equip his factory to manufacture that particular model over a period of years.

For this reason he can afford, in these days, to purchase machinery which will enable him to get the utmost in production for any given period. Where a special machine will do better than a stock product, he is justified in purchasing such a special machine because of its better ability to handle a particular part efficiently.

Any student of the industry knows that we are entering a period of sharp competition. Sharp competition naturally means that price will be a deciding factor. The manufacturer with the best machine tool equipment is in a position where he can furnish the best possible article at the lowest possible price. All other things being equal, this means that he is going to get the business.

An American Floatless Carbureter

FLOATLESS carbureters seem to be the object of some interest in Europe, to judge by the recent article on German carbureters in AUTOMOTIVE INDUSTRIES. The accompanying illustrations show the LaFehr floatless carbureter, which is now being manufactured in Detroit, where tests of it are now going on in various laboratories. This carbureter depends almost entirely upon velocity head for its operation. It does not use hot air, but tests already made are said to indicate unusual starting ability in cold weather with ordinary present day fuel.

Referring to the sectional drawing, it will be seen that the fuel enters the passage *A* from the tank through the usual type of connection. A needle valve with milled head *B* controls the flow into the passage *C* below the jet. Cranking the engine relieves the ball check *D* which is part of the metering pin *G*. Gasoline flows past the ball check valve, now lifted off its seat, into the chamber *E* and also into the passage *F*. If the engine is running at high speed and the suction is sufficient, the fuel in chamber *E* is exhausted and all of the fuel passes up through the chamber *F* at very high velocity. On shutting off the motor, the chamber *E* is again filled, the function of this chamber being to prevent pumping of the gasoline, due to the rising and falling of the metering pin *G* and to furnish a starting and acceleration supply.

In normal operation, the fuel makes right angle turns at *C*, at the point of leaving the ball check, at the point of entering the passage *F*, at the top of the passage *F*, and again after entering openings in the metering pin *G*. There are a number of these openings which register with the passage *K*. As the suction of the engine increases, the cone *H* at the top of the metering pin is lifted higher, allowing the graduated jets to register successively with the port *K*. This increases the fuel supply in proportion to the demands of the engine. Air enters through the passage *J* and passes the cone *H*, which gives it a whirling or vortex effect. The metering pin *G* is grooved at each of the openings so that if it turns on its seat there is no interference with the flow from the port *K* into the proper opening in the metering pin *G*. The fuel issues from the center of the metering pin and the mixture occurs immediately above the cone *H*, where the fuel is picked up by the air stream.

The atomizing effect, due to the extreme velocity of the fuel and the right angle turns in the direction of flow; together with the sudden change in pressure on leaving the jet is claimed to be very considerable.

The LaFehr Floatless Carbureter Sales Co. is to handle the retail sales. The manufacturers' equipment business will be taken care of by the Detroit Carbureter Corp.

Non-detachable Head Used in New Stock Engine

Has four cylinders, 3¾ by 5 in., and develops a maximum of 48 hp. Both halves of crankcase and water jacket cover are aluminum castings. Valve caps are screwed into cylinder head. Full pressure lubrication employed.

By J. Edward Schipper

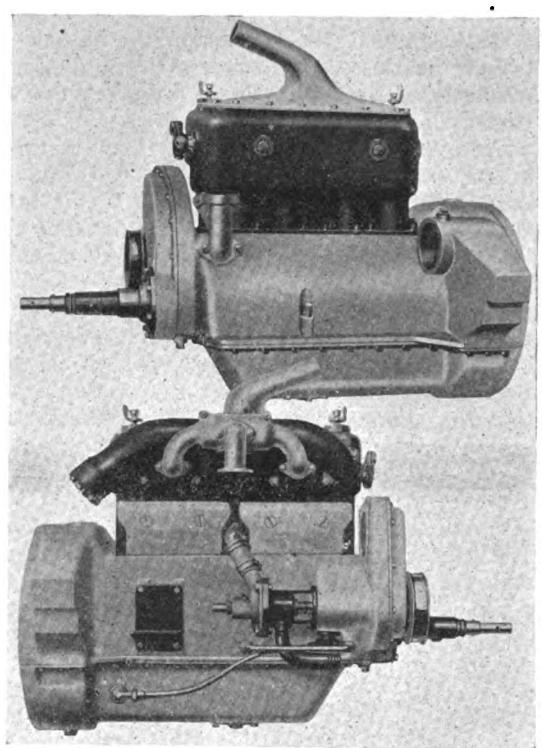
THE engine here described and illustrated is of the four-cylinder L-head type suitable for light truck or passenger car work. It has a bore and stroke of 3¾ by 5 in., giving an S. A. E. rating of 22.5, but develops a maximum of 48 hp., or about 1 hp. for every 4.6 cu. in. displacement, the total being 221 cu. in.

The engine is a universal type in that it will take any standard equipment. For ignition any standard make of magneto or distributor can be fitted, the carbureter flange is a 1 in. S. A. E. standard vertical type, the generator mounting a No. 1 S. A. E. flange, the starter mounting an S. A. E. standard barrel type for Bendix drive.

In construction, the engine follows along straight L-head lines with the four cylinders cast in a single block of semi-steel. The upper and lower halves of the crankcase are cast separately, both parts being of aluminum. The cylinder head is non-detachable, but the jacket cover is detachable and is of aluminum. The extensive use of aluminum in this engine gives a fairly light weight design, the total weight of the entire powerplant being 425 lb.

The pistons are of the three-ring type, all three of the rings being above the piston pin. They are grey iron castings 3¾ in. in length. The rings are 3/16 in. in width. The piston pin is 1 3/32 in. in diameter, of seamless steel tubing, locked in the piston pin boss by a special set screw. This set screw is locked in such a way that there is no possibility of the piston pin becoming loose and coming in contact with the cylinder bore. The piston pin bearing in the connecting rod is bronze bushed and is 1½ in. in length.

The connecting rods are I-section drop-forgings, 10½ in. long, center to center. The lower rod bearings are 1⅞ in. in diameter by 2 3/16 in. in length. As a means of securing compactness, the center line of the big end connecting rod bearing is offset from the center line of the rod, thus compensating for the increased length due to water jacket space between the cylinders. The engine is 35 3/16 in. in length from the end of the front support to the rear face of the bell housing.

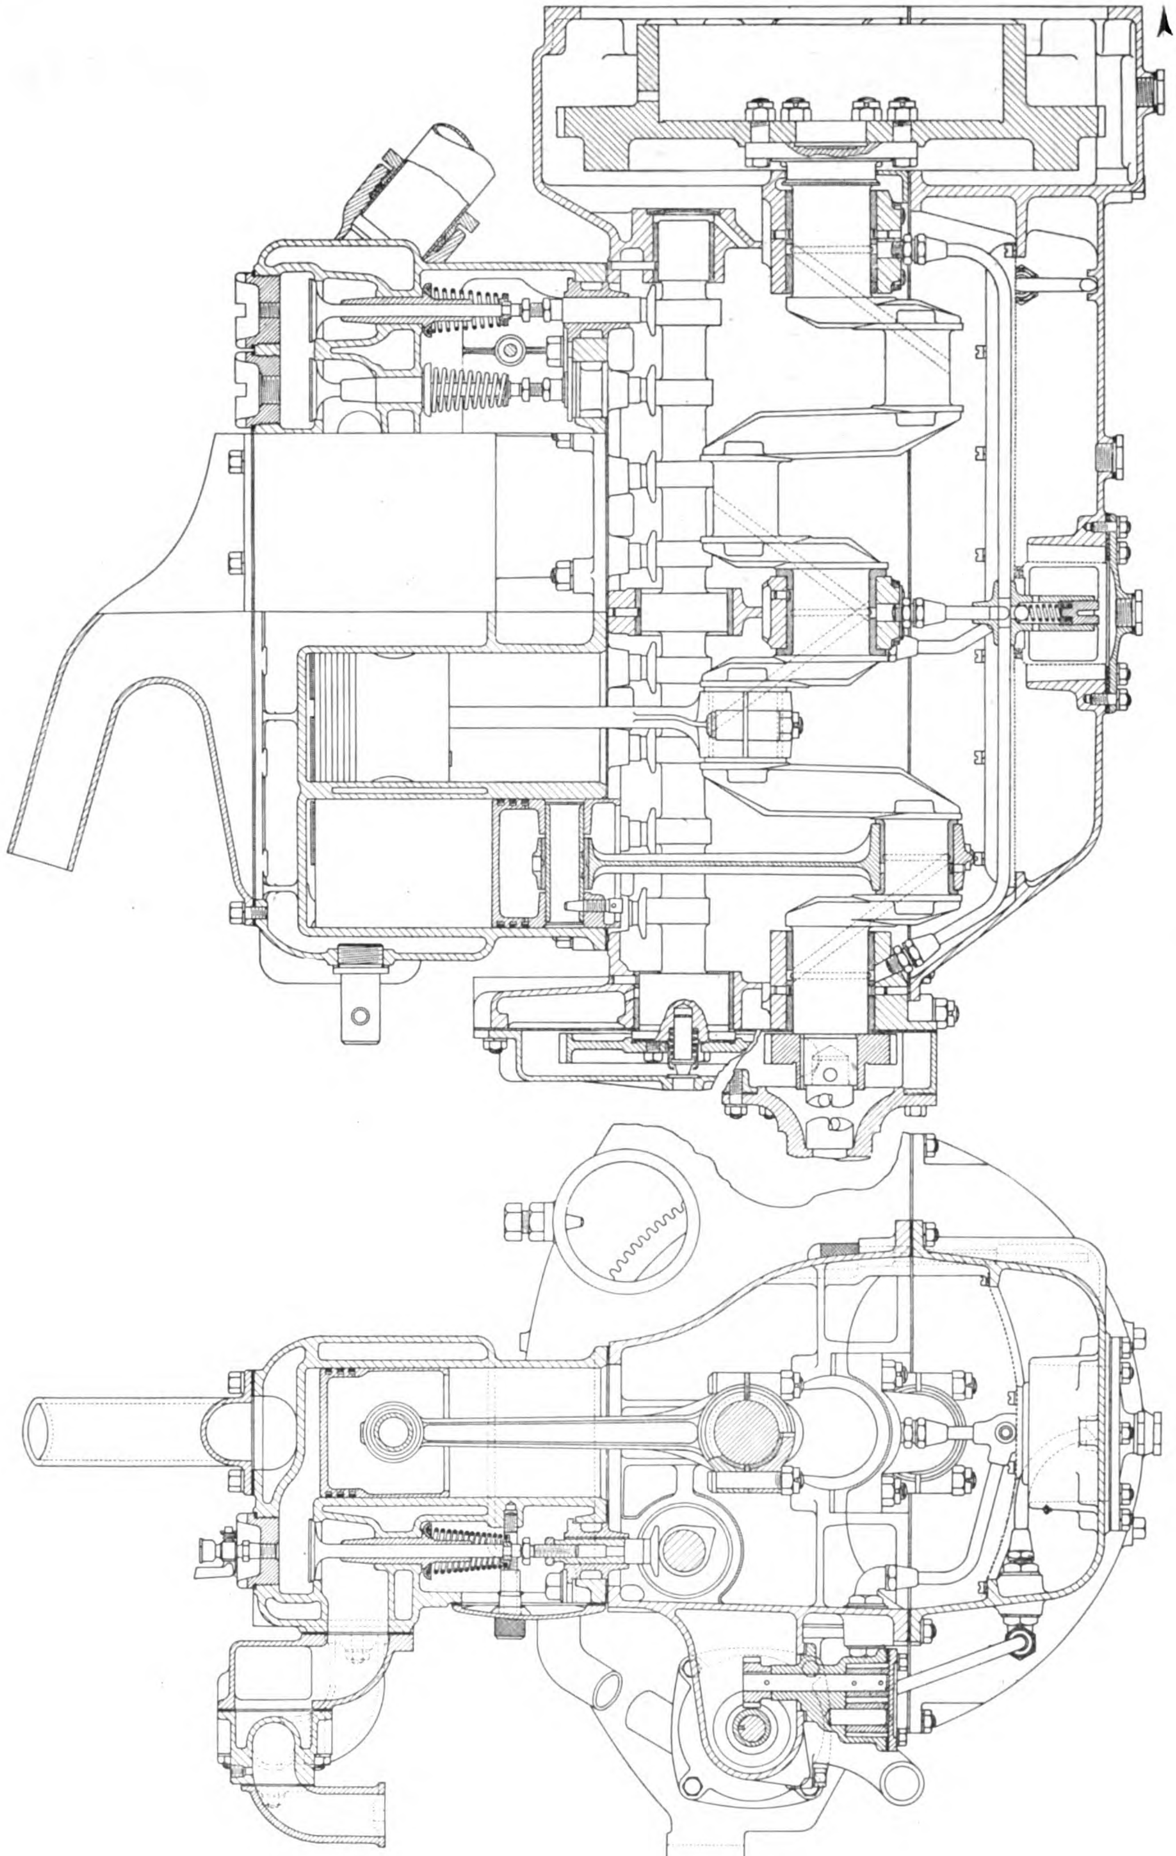


Right and left sides of Highway engine, showing the pump drive, manifolds, standard S. A. E. starting motor mounting and large diameter water outlet

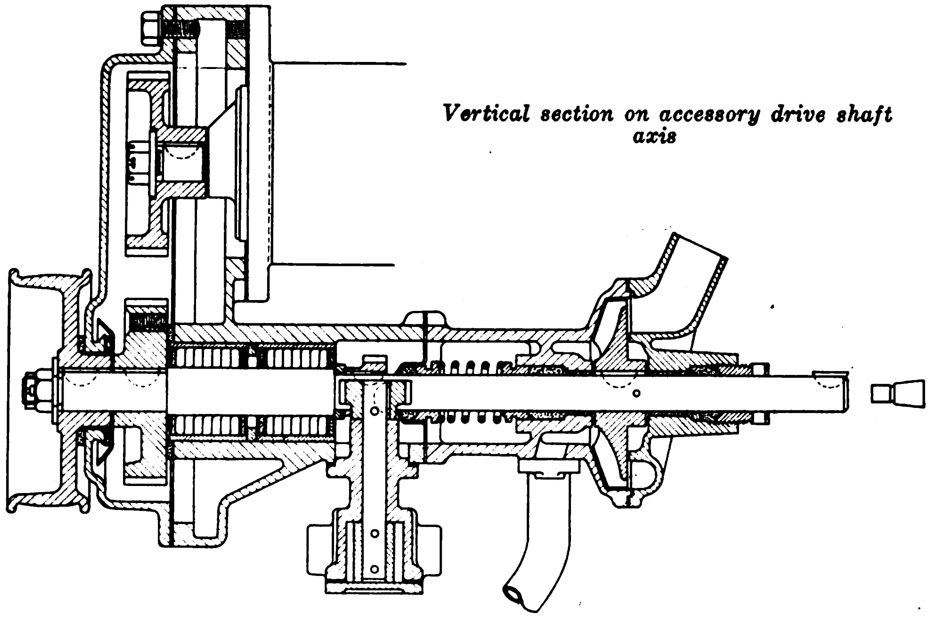
The crankshaft is carried on three main bearings which are supported in the upper half of the crankcase. The crankshaft bearing dimensions are (front to rear): 2 3/16 in. diameter by 3 in. length; 2 7/32 in. by 2½ in., and 2¼ in. by 3 in. This is an exceptionally large shaft diameter for the size of the engine and the shaft has sufficient rigidity to practically eliminate noticeable periodic vibration. The end thrust on the crankshaft is taken by flanges on the center bearing. The main bearings are bronze backed with babbitt lining, the white metal being doweled into the bronze. There is an oil thrower ring on the rear main bearing, working in a recess in the bronze bushing and an aperture in the crankcase, allowing the oil to drain back to the pan.

The timing gears are of the helical type, with ⅞ in. face. The camshaft is an integral forging mounted on three bearings. The dimensions of the camshaft bearings (front to rear) are as follows: 2 19/32 in. by 1⅝ in.; 2 9/16 in. by 1⅛ in., and 1½ in. by 1¾ in. This tapering in the size of the camshaft bearings permits of withdrawal of the camshaft endwise by removing the aluminum timing gear case at the front end of the engine. The camshaft end thrust is taken up by a spring and button attachment in the front end of the shaft. The valves are operated by flat, mushroom type tappets, the push rod guides being pressed in from the top. The valves have exceptionally long guides, which extend a considerable distance below the valve pocket. The clear valve diameter is 1⅞ in. They can be removed through valve caps screwed into the cylinder head.

The oiling is by full pressure to all of the crankshaft and rod bearings by a gear driven oil pump. The oil pump is in direct communication with the main bearings and thence by drilled leads with all of the lower rod bearings. The balance of the lubrication is taken care of by spray. There is no splash to any of the bearings. Cooling is by centrifugal water pump, the pump shaft being driven from the timing gears. The water spaces are exceptionally large, the inlet diameter being 1¼ in. and the outlet 2 in.



Transverse and longitudinal sections through new Highway 3¾ by 5 in. four-cylinder engine



Vertical section on accessory drive shaft axis

The intake and exhaust manifolds are bolted together to form a hot-spot construction and are mounted on the right side of the engine. The exhaust manifold bore is for a 2¼ in. outside diameter pipe. A ring gear is fitted on the flywheel.

The engine here described is shortly to be manufactured by the Highway Engine Co. in its own plant. Heretofore it has been manufactured in another plant.

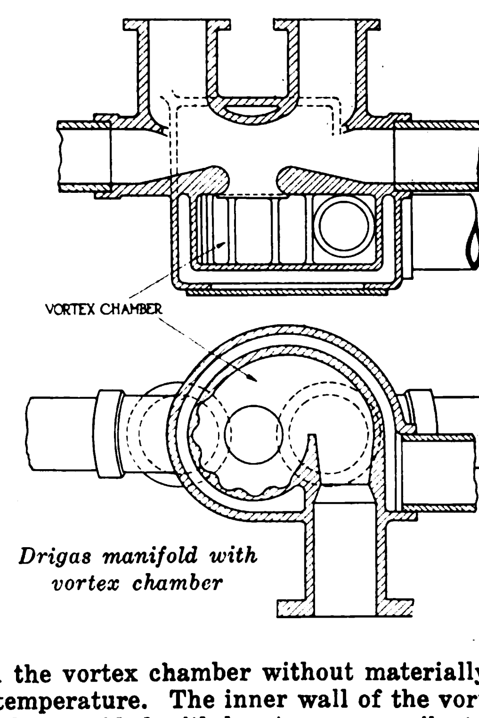
EXPORT figures for 1920 show an increase of 29 per cent in the number of American motorcycles sent to Spanish speaking countries. In 1919, there were 2780 motorcycles exported to these countries, while the 1920 total went to 3579. Spain was the largest consumer in both years, its 1920 consumption being 1416. Argentina ranked second with 597.

Exhaust-Heated Manifold Patents

ROBERT W. A. BREWER, an English engineer, has developed an induction system for internal combustion engines making use of relatively heavy fuel. Patents have been issued to him on this system, and the trade name of Drigas has been registered in Washington.

Brewer's first British patent was applied for on Dec. 1, 1913, and accepted Aug. 27, 1914. The specification shows a four-cylinder inlet manifold substantially of T form, in which the volume near the joint of the branches is increased with a view to damping out the fluctuations in charge speed due to the suction. Another feature is that there are no sharp edges at the junctions of the several parts, the inlet passage being relatively high at the center and sloping down toward the ends, but in order that any unvaporized fuel may drain back to the carburetor, there are provided two narrow channels having a slope toward the vertical part of the manifold. The upper side of the inlet manifold is in metallic contact with the wall of the exhaust manifold and therefore forms a sort of hot spot. As an alternative the upper side of the inlet manifold may be formed integral with the wall of the exhaust manifold.

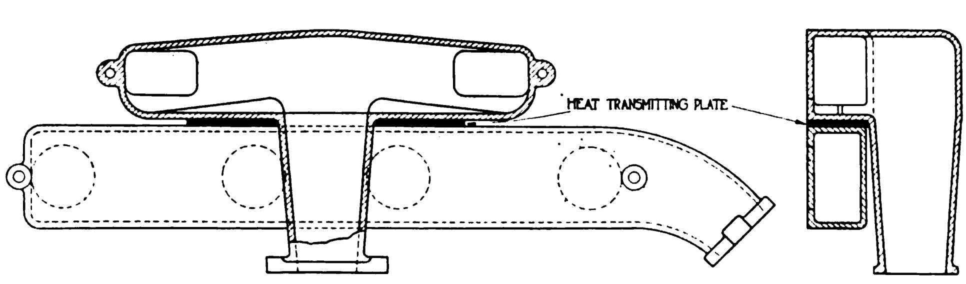
The other patent referred to was applied for on Jan. 27, 1920, and issued on Dec. 23, 1920. The object of this invention is to provide a comparatively large heating area for the charge from the carburetor in a limited space. The charge enters a so-called vortex chamber, that is, a short cylindrical chamber with tangential inlet, which is completely surrounded by an exhaust jacket. The tangential inlet gives the gases a whirling motion in the vortex chamber, throwing any unvaporized particles against the cylindrical, exhaust-heated surface. The outlet from the vortex chamber is either at one end or both ends. The intention is to pass the gaseous mixture



Drigas manifold with vortex chamber

through the vortex chamber without materially increasing its temperature. The inner wall of the vortex chamber may be provided with low transverse ribs to increase the heating surface and break up the layer of unvaporized fuel. The outlet or outlets from the vortex chamber and the inlets to the branches of the manifold are restricted in area.

The invention also refers to means for introducing an inert gas, such as exhaust gas, into the fuel stream entering the manifold during a period of low power development, to increase economy.



One form of Brewer's 1914 manifold

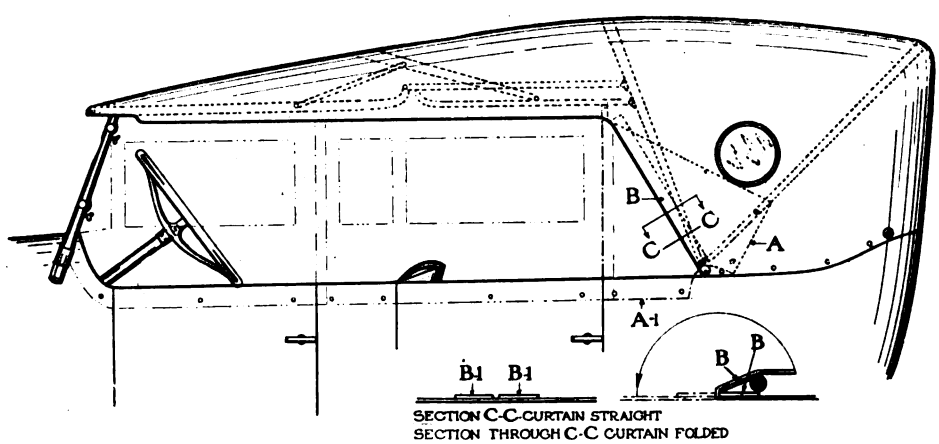
Design Problems in New Semi-Victoria Touring Top

There have been a number of cars recently equipped with a new type semi-victoria touring top, which presents some interesting problems of design. The following article discusses these problems and describes how they were solved by the writer in a particular case.

By George J. Mercer

SEVERAL car models seen for the first time this year are equipped with the new semi-victoria touring top, which presents for examination a number of interesting features. This type of top offers a completeness in appearance and a nicety of balance that is generally lacking where only the gypsy quarter is used. Some of the semi-victoria tops are equipped with detachable curtains so that the gypsy quarter can be used alone when desired.

The results of some recent experiments carried by the writer in connection with this top are shown in the accompanying diagram. The problem in this particular case was to provide some effective way of closing the triangular opening back of the rear door, without resorting to the use of a detachable curtain. The doors opened from the rear on this car and door curtain rods were used. A detailed discussion of the drawing will point out the way in which the problem was solved in this instance.



The semi-Victoria top with folding curtain described in the text

A and A-1 indicate the bottom edge of this curtain part as finally worked out in the two positions. The side is integral up the door line, where the door curtain laps over. The dot and dash line shows it assembled and the storm curtains in place, while the dotted lines show it folded back inside and fastened with a button to the rear bow. The round glass is set just above so that the fabric does not cross the line of vision.

B-1 and B-1 are reenforcements sewed inside the curtain with a space of about 3/32 inch between. This makes a natural hinge, so that the goods will fold with the minimum liability of cracking. Moreover, since no pressure is ever exerted at this point, such a curtain should last as long as the top.

The section through C-C shows some details of construction. The section at the right shows the flap turned back and fastened to the bow, while the section at the left shows how the folding operation is controlled. Through the method used a straight line is presented when the flap is back, thus giving to the top a pleasing and finished appearance.

There are several very definite advantages to be gained from folding the flap back in this particular manner. Among the chief of these are:

1. The flap is always in place for instant use.
2. There is one less curtain to attach than would be the case were a different method used.
3. A more finished appearance is presented on both sides, whether the flap is folded or open.
4. There is a saving in weight.
5. Less space is taken up in the storm curtain storage pocket.

Thoroughly satisfactory methods of storing curtains have not yet been evolved by manufacturers, even after many years of experience and experiment. One of the chief difficulties encountered has been the spoiling of celluloid when rolled or folded. For this reason, it has been necessary to discard curtains on rods and wires attached to the bows.

Some success has been attained by the use of a large flat pocket attached to the bows at one end. The difficulty with this arrangement, however, is that the curtains cannot be taken out or put away unless the passenger leaves the car.

Most of the new cars are using space at the rear of the front seats for this purpose. Considerable expense is attached to such a method, however, since the framing and the door cost more than does a roof pocket. Nevertheless, no means has been devised to equal it for practical service, so that its utility value well repays the added cost. The more general use of the five-passenger model, moreover, eliminating, as it does, the space necessary for folding seats, gives added room which may advantageously be devoted to curtain space.

The relative value of the service rendered to the cost of using a certain method will always constitute a nice problem, of course, which must be solved for each case.

Government Research in Road Construction

The road construction research work, being carried on by the U. S. Bureau of Public Roads, is discussed in detail by Mr. Heldt. The tests aim to enable engineers to predetermine the adequacy of roads. Impact and subsoil tests the subjects of exhaustive experiment.

By P. M. Heldt

ROAD building is one of the oldest engineering arts, dating back to the time of the Romans, and a large amount of technical data has accumulated on the subject. Unfortunately, however, little of it is directly applicable to modern road construction, for the reason that the character of road traffic has undergone fundamental changes during the past 20 years.

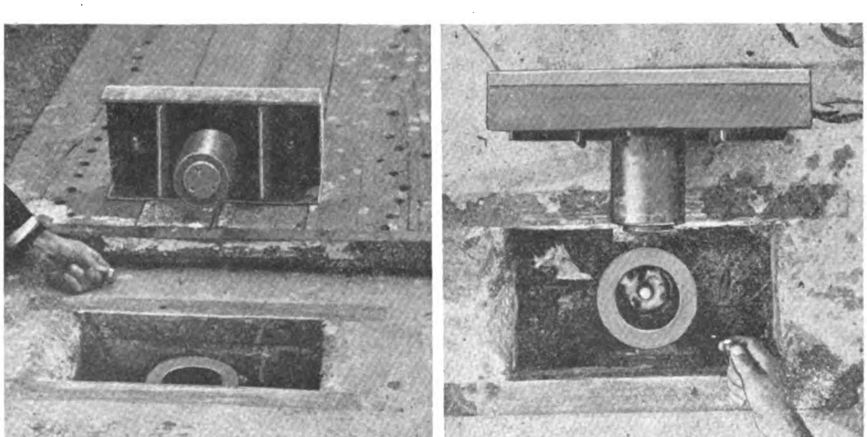
At the beginning of the present century the macadam road was considered a nearly perfect construction, and for light and moderately heavy horse traffic it served well indeed. Then came the high speed passenger automobile with its large size pneumatic tires and proved exceedingly destructive to these roads. The so-called suction of the tire as it left the road drew the binding material from between the stones, and the wind distributed it over the roadside and surrounding fields. After this had been going on for some time the road became rutty and defective and then quickly went to pieces. The solution of this problem was found in oiled roads and in tar macadam.

During the war period motor truck traffic over country roads first assumed considerable importance, and this led to another kind of road trouble. Most of the improved highways constructed in this country from 1900 on were built for light traffic, that of motor-propelled passenger vehicles being the class of traffic chiefly in view. These roads were not equal to the heavy concentrated pressure of the wheels of heavily loaded trucks, especially in spring time when the frost came out of the ground and the subgrade was unusually wet and soft. As a result they were rapidly ruined. Meanwhile large appropriations for road building were being made by many states, and it was realized that if these appropriations were to be spent to the best advantage it was absolutely necessary to make a careful study of the wearing or destructive effects of different kinds of road traffic, the wear and impact resisting qualities of different road surfacings, the bearing values of different subgrade materials, effectiveness of various drainage methods, etc. This research work was undertaken by the U. S. Bureau of Public Roads. Most of the experimental work is being carried out at Arlington, Va., a short distance from Washington, D. C. The work is in charge of A. T. Goldbeck, engineer of tests of the Bureau of Public Roads. Mr. Goldbeck has prepared a number of reports to the Department and papers for meetings of road engineers on the progress and results of the tests up to date, on which the following discussion is based.

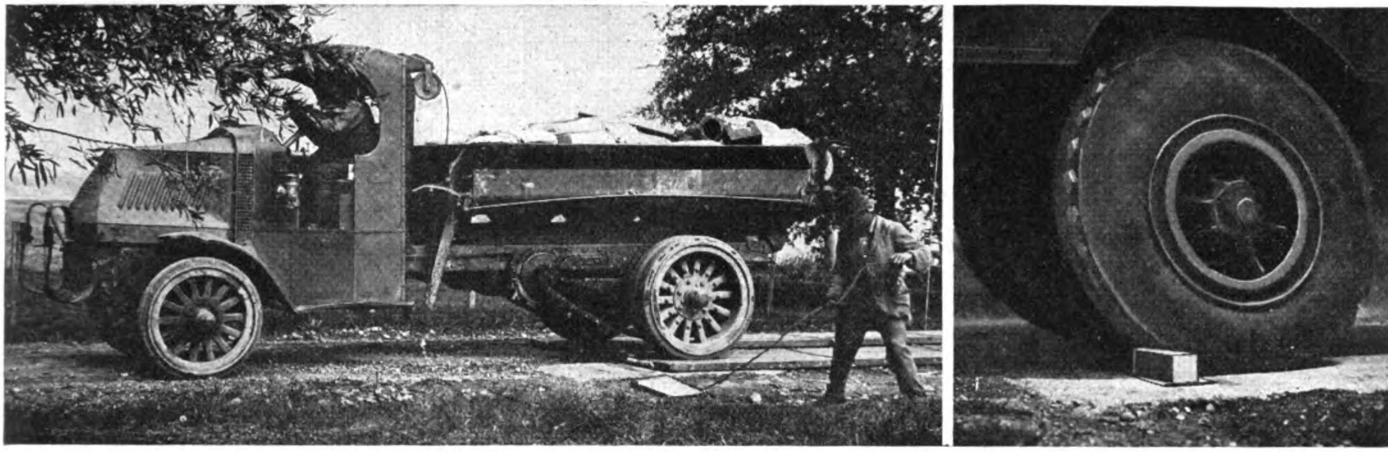
A Basis for Road Designs

It is the aim of these tests to establish the basis for a rational method of road design which would enable engineers to design roads with the same assurance regarding their adequacy for the traffic to be carried and their durability with which it is now possible to design bridges. The line of research work to be carried out was intended to bring to light all the basic facts bearing on road design. First it was to be determined how the impact varies with the speed, weight and tire equipment of a vehicle and with the relation between sprung and unsprung load. Another series of experiments was to determine the ability of road slabs of different materials and thickness to withstand such impacts, and finally the effect of the subgrade was to be investigated.

In the impact determination tests the rear wheel of a loaded truck is allowed to deliver its blow to the plunger of an hydraulic jack buried beneath the road. In some of the tests the truck wheel is allowed to drop off the end of a 2-in. plank directly onto the jack and in others it is driven over an obstruction in the form of a square sectional bar lying directly over the jack. The force of the blow is transmitted to a prepared copper cylinder, the deformation of which is a measure of the intensity of the blow. By subjecting the



Figs. 1 and 2—Two views of impact testing arrangement. Note copper cylinder in observer's hand



Figs. 3 and 4—The two methods of making impact tests (drop test and obstruction test)

copper cylinder to successively increasing pressures in a testing machine and taking note of corresponding pressures and deformations, it is possible to effect a calibration. It is realized that this method does not give the force of the blow in absolute terms but it serves well as a practical method of comparison. The harder the blow, the greater will be the deformation and it stands to reason that the blow causing the greatest deformation of the copper cylinder would also have the most destructive effect on a road slab. Figs. 1 and 2 herewith show the hydraulic jack as buried in the road, the plunger being carried by a section of channel steel flush with the road surface. The observer holds in his hand the small copper cylinder on which the force of the impact is spent.

Several thousand impact tests with this apparatus have been made to date. It is obvious that the impact must depend on the weight of the truck, but it also depends on a number of other factors, including the relation of sprung to unsprung weight, the tire equipment, the characteristics of the spring suspension, the unevenness of the road, etc. The method of conducting the tests is illustrated in Figs. 3 and 4, the truck wheels dropping off the end of a 2-in. plank onto the jack plunger in Fig. 3 and passing over an obstruction on the plunger in Fig. 4. In Fig. 3, in order to prevent the front wheel from delivering a blow and thus deforming the copper cylinder before the rear wheel blow takes effect, a bridge piece is placed over the jack, which is withdrawn by an assistant immediately the front wheel has passed. A similar plan is put into effect when making the obstruction tests illustrated in Fig. 4.

Results of Impact Tests

A summary of the results obtained in these impact tests is given by the four charts of Fig. 5. In each of these charts the speed at which the truck passed over the impact testing device is plotted along the horizontal scale and the force of the impact, in thousands of pounds, along the vertical scale. Chart A permits of a comparison of the impact caused by trucks of different load capacities. It will be noticed that at the same speed the impact increases with the load capacity, being greater for the 5-ton than for the 3-ton truck, greater for 3-ton than for the 2-ton and greater for the 2-ton than for the 1½-ton. But the smaller trucks are capable of considerably higher speed and the maximum impact seems to be substantially the same for all trucks. Mr. Goldbeck, however, cautioned his hearers that this must not be taken as conclusive evidence that large trucks are no more destructive to roads than small trucks.

The influence of tire equipment is brought out in Chart B. All experiments recorded in this chart were made with the same truck, the only thing that was changed being the tire equipment. As would be expected, the impact is greatest with solid tires, least with pneumatic tires and intermediate with cushion tires. With the solid and cushion tires the blow due to passing over an obstruction varies substantially in direct proportion to the speed. With the pneumatic there is very little increase of impact with the speed while passing over an obstruction. While dropping off the end of the plank the impact with all forms of tire equipment increases with the speed up to a certain point, in this case between 12 and 13 m.p.h., after which it remains substantially constant. This is the minimum speed under which the wheel can drop freely under the action of gravity and the spring action. The deflection given in the chart is the flattening of the tire under the dead load on its wheel, which in this case was 4500 lb. It will be noticed that the greater the deflection of the tire under load the smaller the impact, which is exactly what would be expected. No investigation has yet been made of the effect of springing characteristics of the suspension on the impact.

Effect of Unsprung Weight

Chart C is intended to bring out the effect of the relation between sprung and unsprung weight. In this test two trucks were used, one having an unsprung weight of 1950 lb. and the other of 1350 lb. and both were loaded to the same total weight on each rear wheel (10,100 lbs.). The wheels were allowed to drop 2 in. and ½ in. and in both cases the wheel carrying the greater unsprung weight gave the maximum impact. Mr. Goldbeck, however, expresses the view that within the limits of present truck design the influence of differences in the relation of sprung to unsprung weight is not sufficient to influence road design. But he urges truck designers to keep down the unsprung weight to a minimum, as this will reduce road wear. Fortunately, the truck designer has a reason of even more direct importance to him to keep down his unsprung weight because a high ratio of unsprung to sprung weight is also very destructive to tires.

A comparison of the blows struck a road slab by solid and pneumatic tires, respectively, mounted on trucks of 5 tons capacity, is made in Chart D. It will be noted that a solid tired wheel passing over a ½-in. obstruction delivers a heavier blow than a pneumatic tired wheel passing over a 4-in. obstruction. At moderate speeds with pneumatic tires the blow increases with the air pressure, but at rather high speeds the blow is greater with low than with high pressures of inflation. Here

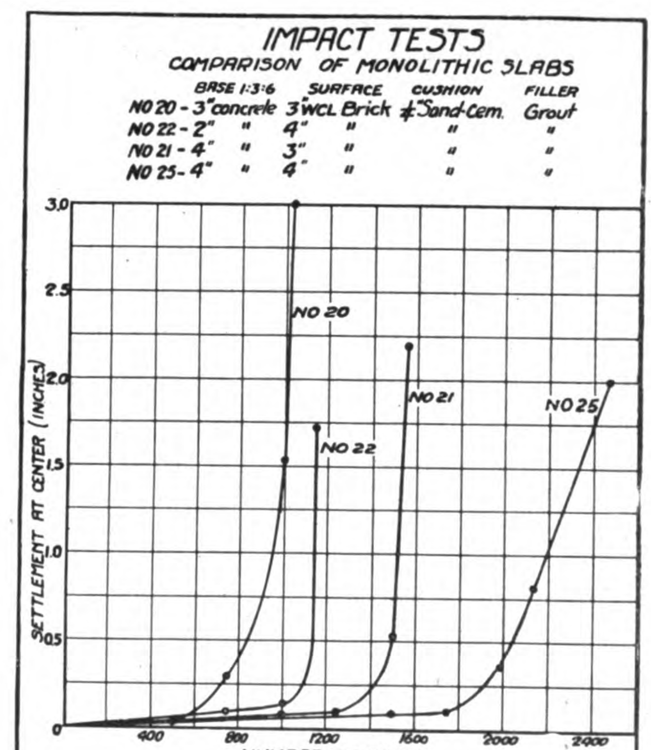
again the slight dependence of road impact on speed with pneumatic tires is shown.

Tests of Road Slabs

One of the important factors affecting the endurance of roads is the resistance of the road slab to impact. A series of tests were therefore made in which slabs measuring 7 ft. square were laid on subgrades in duplicate, one of the slabs being laid on subgrades purposely rendered wet, and the other on a subgrade which was carefully drained. In these tests the effect of impact by truck wheels was simulated as closely as possible by means of a specially constructed testing machine illustrated in Fig. 6. All specimen slabs were tested to destruction. The apparatus comprises a weight of 1800 lb., which is shod at the bottom with a section of 12-in. solid rubber tire, and carries at the top a 5-ton truck spring on which is supported a weight of 6000 lb. The entire weight is raised and allowed to fall repeatedly on the center of the slab, the height of fall being increased after every 500 blows. At first 500 blows are struck with a drop of ⅛ in., then with a drop of ½ in., then



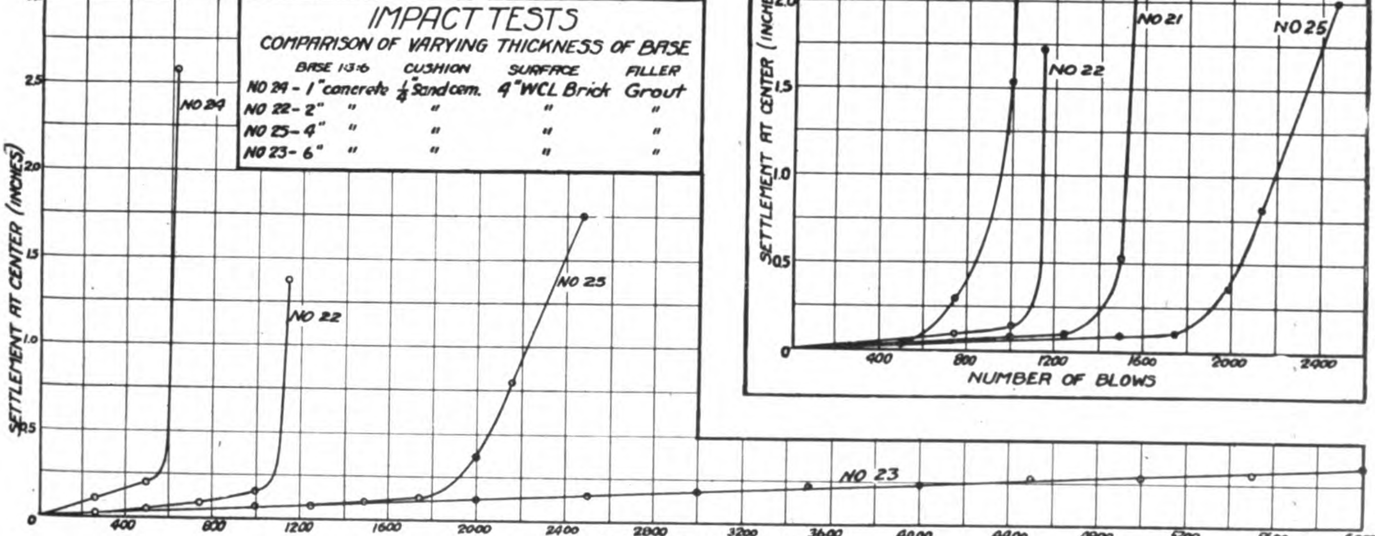


Fig. 9—Results of impact tests on monolithic brick slabs

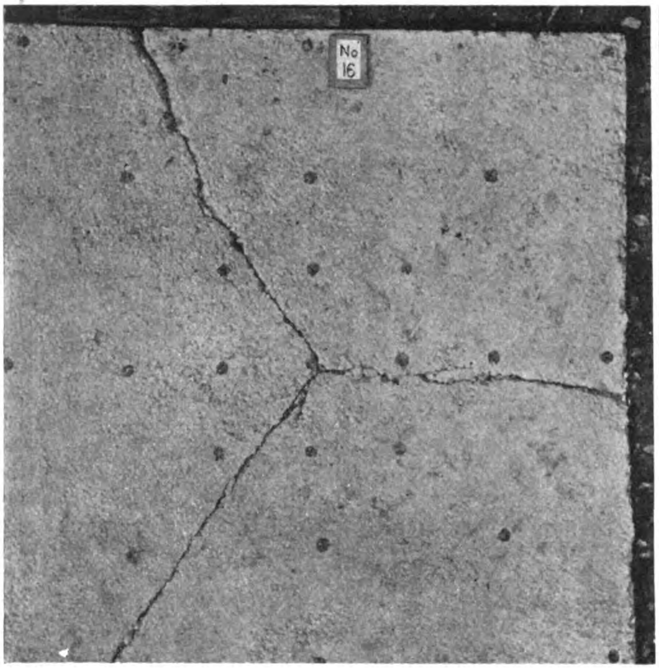

Fig. 10—*Section of concrete pavement broken during tests*

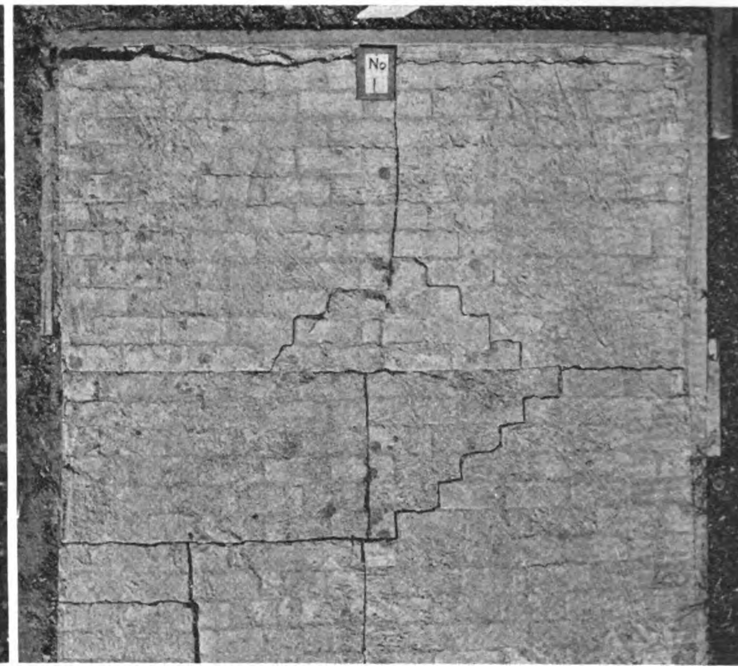

Fig. 11—*Brick section broken during test*

with 7/8 in. and so on until a height of drop of 2 in. is reached or the slab is destroyed. In this test the 1800-lb. weight represents the unsprung weight (the truck wheel and axle) and the 6000 lb. the sprung weight of the truck. The pressure exerted by the falling weight upon the slab depends, of course, upon the time in which the weight comes to rest. A general view of the slabs prepared for impact tests is shown in Fig. 7.

In making impact tests it is essential that the specimen be supported in the same way as the road surface is supported in regular service. Service conditions must also be duplicated in respect to weight of falling bodies and range of drop, as any departure from these conditions would give results which it would be difficult to interpret. Fig. 8 shows the influence of the thickness of concrete slabs on their life, as determined by this experimental apparatus. In the tests, all of the slabs were supported on a very poor subgrade. It will be seen that the resistance to impact varies nearly as the square of the depth. It was found that a 4-in. concrete slab has about the same resistance to impact as a 4-in. wire cut slug grouted brick pavement on a 1-in. concrete base. Also, that a 6-in. concrete slab has about the same resistance as a monolithic brick pavement on a 2-in. base. An 8-in. slab has about the same resistance as a 4-in. monolithic brick pavement on a 4-in. concrete base. The deflection curves for a 10-in. concrete slab and monolithic brick on a 6-in. base are quite similar.

Fig. 9 gives the results of comparative tests between monolithic brick pavements, using both 3-in. and 4-in. bricks. In the upper chart are plotted the results of tests with pavements alike in every respect except that the thickness of the concrete base was increased from 1 to 5 in. in three steps. In these charts the number of blows are plotted on the horizontal scale and the settlements at the center of the monolithic slab on the vertical scale. The lower chart represents a comparison of pavements of the same total depth but with varying depths of brick and concrete base respectively, and a comparison of roads with the same depth of concrete base with different thicknesses of brick.

Figs. 10 and 11 show a concrete slab and a monolithic brick slab tested to destruction in the impact test. Tests on tar-sand cushions show less deflection before failure than sections laid on sand. Sand cushion sections have the peculiarity of large settlements before failure. When a pavement is built with a sand cushion, there are two separate slabs, which can move independently one of the other. With a sand cushion the upper slab does not get as firm a support as a monolithic or semi-monolithic construction. A comparison of the sand cushion construction with monolithic and semi-monolithic types shows the monolithic to be stronger that the semi-monolithic and the latter to be stronger than the sand cushion road, the thickness of the base being the same throughout. A 6-in. concrete base proved stronger than a 4-in. base.

Whenever a slab is broken, complete data of the circumstances were noted down. Tests of the subgrade were made with a small impact machine, comprising a 10-lb. steel plunger, having a face area of 10 sq. in. A 10-lb. weight, guided by means of a rod, was allowed to fall on this plunger from a definite height, and the penetration of the plunger under a certain number of blows was noted. This furnishes an arbitrary but convenient method of determining the bearing power of the subgrade. Moisture samples of subgrade were also taken.

(To be continued)

English as She's Writ in Continental Europe

From a circular on a new mechanical direction indicator:

The taxi is drawing great drafts on the public's patience and commodity. No wonder that the taxies are being fitted with apparatus that can reduce the friction of the traffic, to common pleasure. The public, the society ought to demand it, and for the owner of the taxi it should be a dear duty. Ships have turning and speed signals, just as much required in darkness as by day. Autopil ought to be found on every motor-car or truck. The millions of mollifications of the nerves that are yearly quoted over the whole world will be reduced by Autopil. Quiet and flegmatically the public can at any time by only looking on Autopil assure it-self about the taxi's intentions and turning-direction.

The Aeronautic Research Laboratory at the Institute of St. Cyr

Facilities for aerodynamic investigations include two sizes of wind tunnels, a whirling arm, and two electrically operated trucks running on rails, all of which are equipped for determining the characteristics of airfoils. One truck is designed for testing propellers.

By John Jay Ide

THE Aerotechnical Institute of St. Cyr, near Versailles, was founded in 1911 by the late Henri Deutsch de la Meurthe, the eminent French patron of aeronautics. It originally formed part of the University of Paris. The first director was Prof. Maurain and his associate was M. Toussaint.

Between 1911 and 1914, in addition to wind-tunnel tests, experiments were made with complete aeroplanes and propellers by means of electric trucks running on a track about a mile long. During the first two years of the war the buildings of the Institute were used as a cantonment for 3000 soldiers of the balloon service. In 1916 the Institute was attached to the Technical Section of Aeronautics and in December, 1917, Major Caquot (then chief of the Technical Section) reorganized it and changed the motive power of the apparatus from steam to electricity. The Institute has now returned to the control of the University of Paris and is under the direction of M. Toussaint.

The equipment for aerodynamical research at the Institute comprises wind tunnels, electric trucks and a whirling arm.

With the three wind tunnels of different sections, complete models of aeroplanes or wings up to one meter span can be tested. The tunnels are also used to determine resistance of streamlined bodies, the working of air-speed indicators, anemometers, etc.

In principle, the object to be tested is subjected to an air stream of known speed and the action of the wind on it is determined by means of a special balance to which the object is attached. This action includes *drag* due to the relative wind acting on the object and, in the case of oblique surfaces, the vertical component or lift.

Description of Wind Tunnels

The large wind tunnel (Fig. 3) is 119.8 ft. in total length and 13.1 ft. in diameter at the propeller end. The range of speeds is between 16 and 147 ft. per second. The tunnel consists of:

1. An intake trumpet which collects in the entrance to the test chamber sufficient air for the air stream. At the time of my visit there was under construction a honeycomb of 8-inch squares to be fitted in the mouth of the trumpet to eliminate turbulence. This honeycomb was to replace the one at that time in use placed at the entrance to the test chamber, as is the customary practice.
2. The test chamber, 6.6 ft. in diameter and 19.7 ft. long.
3. The diffuser, a diverging cone prolonged by a wood lattice cylinder 31.2 ft. long.
4. The six-bladed screw. An electric motor of 120 hp. operates the screw which sucks the air from the room into the intake trumpet. The air stream reaches its maximum speed in the reduced section of the test chamber where the pressure is below that of the outside air. At the exit of the test chamber the air passes into the diffuser, which brings the pressure back to normal.

In the center of the test chamber is the movable arm (*B*) (see diagram) of the aerodynamic balance protected from the wind by a casing. The model to be tested is attached to the end of the beam in the center of the tunnel.

The balance is composed of two systems of joined parallelograms interconnected but independent as to the measurement of horizontal and vertical forces to which the model is subjected. The balance is carried by a truck with four rollers permitting easy displacement on two rails perpendicular to the axis of the tunnel and four jackscrews to raise the truck on the rails and to clamp it in desired position. This balance is shown in Figs. 1 and 5.

The vertical support carrying the bearing points of the mobile system is attached to the cars. This system is composed of a series of steel levers of cross-shaped tubular section. The joints of the different lever arms are provided with ball bearings.

The Aerodynamic Balance

The intermediate cross arms of aluminum form a rigid connection between the two systems of parallelograms. The carbon steel cross beam of T section is attached to the vertical rod, of which the thin arm carrying the model is a prolongation. The model is attached to the arm by adjustable rods.

The case (*A*), Fig. 5, inclosing the vertical rod is bolted to a plate arranged to close the tunnel completely between the two doors. Four vertical bars attach the head directly to the truck so that the balance, plate and case comprise an assembly that can be moved at will.

An arrangement with a mercury joint, while permitting freedom of movement, renders the passage of the bar through the plate airtight, while the depression inside the tunnel translated into a downward vertical force is neutralized. Finally there are provided gages registering simultaneously the forces of lift and drag.

Aerodynamic experiments with the wind tunnel are made in the following manner:

Once the model is adjusted to a predetermined angle to the horizontal and the needles of the lift and drag indicators (*K*) and (*K′*) set at zero, the air stream is given the desired speed which the observer reads on an alcohol manometer connected to the test chamber. Weights placed on the scale pans (*C*), (*D*) balance the lift and drag forces so that the measurements are made simultaneously.

The small wind tunnel is distinguished from the large

one by the various diameters 0.66, 0.98 and 1.31 ft. of the test chamber which can be obtained. An electric motor of 20 hp. operates the centrifugal suction pump, which gives to the air stream speeds varying from 65 to 278 ft. per second. This small tunnel is intended particularly for experiments on the resistance of bodies of small diameters in high-speed air currents. Coefficients of similitude have also been determined for different scales by testing various shapes of streamlined hulls in the small tunnel and comparing the results with those obtained by testing similar bodies in the large tunnel. The small tunnel is likewise used for calibrating speed indicators, Pitot tubes, anemometers and other aeroplane instruments.

The wind tunnel of Captain Lelarge originally at Chalais-Meudon and later removed to St. Cyr differ in principle from the tunnels described above. It is of the single duct continuous circuit type. It has an effective section of 4.9 x 8.2 ft. and the air stream varies in speed from 13 to 65 ft. per second.

There are two electric trucks designed to run at high speed along a track 0.9 mile long. One of them (Fig. 2), for testing full size wings and airplanes, is in reality an aerodynamic balance moving through still air; it measures forces comparable to those measured in a wind tunnel.

The truck has a 120 hp. electric motor mounted on a platform and carries a superstructure forming an aerodynamic balance to which is attached the aeroplane or wing section to be tested. The tubes carrying the test section compose the superstructure; these tubes are carried at the end of four vertical struts jointed with the superstructure at their upper ends. The struts, movable about an axis perpendicular to the direction of motion of the truck, form a jointed parallelogram deformable under the action of the forces of head resistance. On the other hand, a system of horizontal levers themselves jointed at the points of the fixed framework of the truck support the struts and permit them to be displaced parallel to themselves in the vertical direction under the action of the forces of lift.

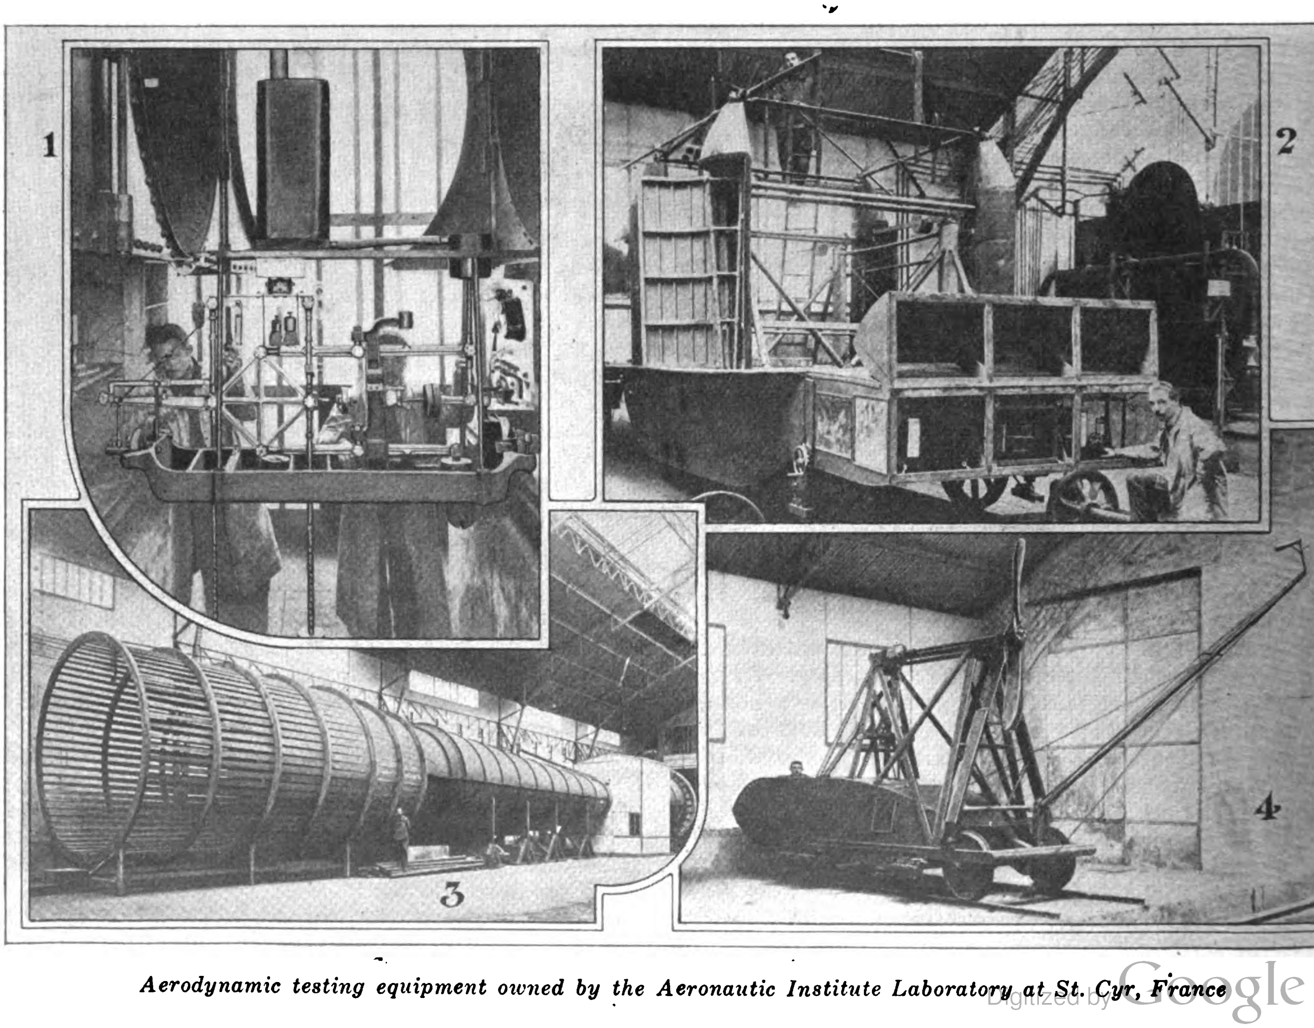
Counterweights balance the system as to inertia and force of gravity, while dynamometers measure the forces of drag and lift which the speed of the truck with reference to the air registers by means of an anemometer calibrated in calm weather.

For testing, the truck is sent over the track at speeds between 0 and 55 miles per hour. The recording instruments show the values of lift and drag on the surface as well as speeds relative to the ground or air. Care is taken to experiment in calm weather although a wind vane gives the component of the relative wind which is taken into account in the calculations.

An electric current scores a reference mark at the right moment on the record of each instrument and thus facilitates taking all the measurements simultaneously. Comparative wing tests between the truck and the large wind tunnel show that the two methods are in substantial agreement.

The truck for propeller testing (Fig. 4) differs from the truck just described in that it is driven by the propellor under test. An 80 h.p. motor drives the propeller through two bevel gears at speeds between 0 and 50 miles per hour.

The vertical shaft connected to the universal joint between the two transmission cases can be displaced parallel to its axis. The shaft is partially held in place forward by a ball thrust bearing at the top of the frame jointed at the base. The shaft is supported by a plain bearing.



Aerodynamic testing equipment owned by the Aeronautic Institute Laboratory at St. Cyr, France

Under the action of the pull of the propeller the horizontal shaft tends to move forward, taking with it the top of the frame. This movement is checked and recorded by dynamometers. The forward speed is measured by means of a tachometer giving the speed of rotation of the back axle and it is checked by an anemometer giving directly the speed of the truck with reference to the air. The speed of revolution of the propeller is read on a tachometer giving the revolutions per minute of the motor. Watt meters indicate the power delivered and absorbed by the screw.

From the information furnished by the various recording instruments which includes the traction of the propeller, revolutions per minute, absolute ground speed, relative speed with respect to the air, power delivered and absorbed, the efficiency curves of each type of propeller can be drawn.

With the whirling arm the same tests can be made as with the wind tunnels, the objects to be tested being moved through the air. Difficulties in connection with neutralizing centrifugal forces have resulted in discontinuing experiments with the whirling arm at the present time.

In addition to the apparatus described above the Institute possesses physical and chemical laboratories, a low pressure air chamber used for physiological tests and machine shops for metal and woodworking and for making models.

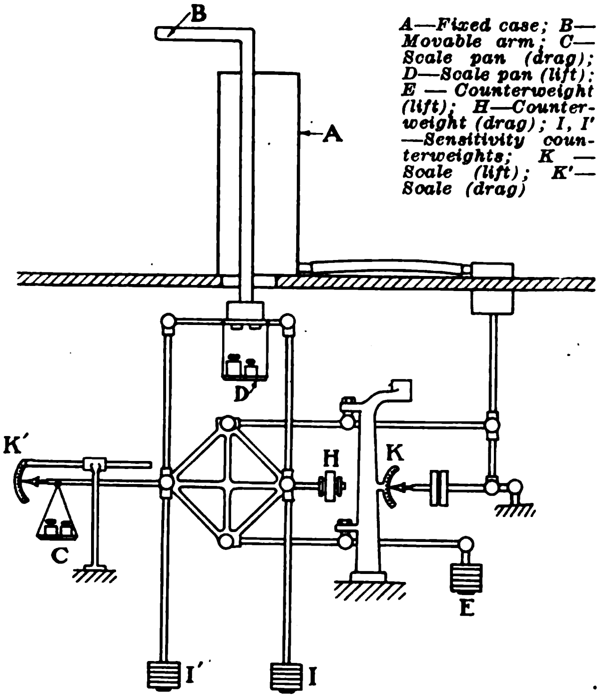


Fig. 5—Diagram of aerodynamic balance used at St. Cyr

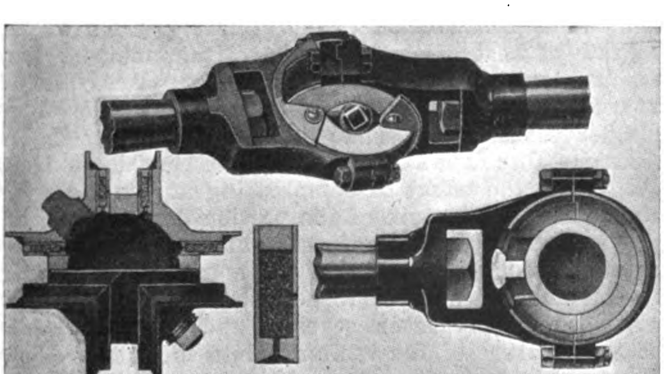
A Self Lubricating Universal Joint

A METAL universal joint containing a large lubricant reservoir, having large bearing surfaces and permitting of great angularity between shafts, has been developed by the Noyes-Richards Engineering Co. As will be seen by the cut it is somewhat similar to the type of universal joint used on machine tools, as the central member connecting the two forks is of spherical form and is provided with two circumferential grooves at right angles to each other in which the forks of the joint engage. The two forks are arranged at right angles, as usual, and are secured to their shafts by a taper joint with key and nut. Each fork is provided with a cap which has a stepped joint with the fork and is held in place by two cap screws.

The central, spherical portion is a hollow bronze casting and has two holes closed with pipe plugs, through which the lubricant can be introduced. These plugs are located on opposite sides of the ball, and one or the other will always be in an accessible position. Adjacent to the grooves in the ball into which the fork rings fit there are lubricant cartridges. These cartridges are embedded in the flanges of the ball, which between them form the grooves for the fork rings. Each cartridge has a lubricant inlet opening to the lubricant chamber in the ball. The cartridge is bored out and is filled with compressed felt, which is saturated with lubricant. The felt is compressed by forcing a plug into the end of the cartridge. At the side of the cartridge there is an outlet through which the lubricant reaches the bearing surface.



A new all-metal universal joint with reservoir for lubricant

The fork ring is formed with an internal flange which fits into the groove on the bronze ball. The web or backbone of the fork ring fits into a widened portion of the groove on the bronze ball and its inner corners are chamfered so as to make room for triangular leather packings in the groove at both sides of the ring. Metal dust clips lined with leather washers can be secured to the bronze ball so as to exclude dust from the joint.

It is claimed for this joint that it has more bearing surface and more angularity and is much lighter than a pin joint built to transmit the same power. We understand that this joint has been thoroughly tested out and that its freedom from oil-throwing has been demonstrated.

Carbureter Tests for Fuel Economy

THE fuel economy of motor cars, which can be affected by adjustments of the carbureter, has recently been demonstrated by the Royal Automobile Club. Tests made at Brooklands on six different makes of car showed that by merely changing to smaller carbureter jets an average increase of mileage of 22 per cent. was obtained. The average loss in maximum speed was only two miles per hour, and the average extra time taken to climb the test hill was only 1 4-5 seconds. It is proposed to organize a competition on lines similar to those of the tests, for which some prizes are being offered by a motor car paper.

The Influence of Various Fuels on Engine Performance

Part II

In this instalment of the report upon the investigation of fuels, detonation and the effect thereon of combustion chamber design, turbulence, speed of rotation, temperature and pressure are discussed at length, and measurements of the value of a fuel in terms of its tendency to detonate are tabulated and plotted in their relation to other important factors.

By H. R. Ricardo*

PREVIOUS experience had indicated very clearly not only that the tendency of fuels to detonate was probably by far the most important of the factors controlling the power output and efficiency of an internal combustion engine of the explosion type, but also that the tendency to detonate varied widely as between different fuels, and was likely to prove much the most important factor in determining their suitability or otherwise for use in an internal combustion engine. This has proved to be the case. It was, of course, common knowledge that certain brands of gasoline detonated more readily than others, that commercial benzol would not detonate under any circumstances in an engine of normal design, and that the addition of benzol to gasoline always reduced its tendency to detonate. Beyond this little was definitely known. It was decided, therefore, to make as thorough an investigation as possible into the whole phenomenon of detonation.

Before dealing with the influence of the nature of the fuel upon detonation it will be well to consider first the influence of detonation itself upon the performance of an engine.

All engines using volatile liquid fuels operate on a cycle in which a combustible mixture of fuel and air is drawn into the cylinder, is compressed, ignited and then expanded until it occupies the same volume as before compression. From any given weight of mixture, the power output and efficiency obtainable depend upon the degree of expansion, and since, in this cycle, the ratio of compression and expansion are equal, it follows that both power and efficiency are dependent upon the ratio of compression. Setting aside for the time being such questions as dissociation at high temperatures, change of specific heat and loss of heat to the cylinder walls, all of which reduce the absolute efficiency obtainable, but which do not alter materially the relationship between compression ratio and efficiency, we find that the limiting theoretical efficiency is as given by the formula

$$E = 1 - \left(\frac{1}{r}\right)^{\gamma - 1}$$

where r = the compression ratio and γ the ratio between the specific heat of air at constant pressure and at constant volume.

*From a preliminary report on extensive research work conducted by the author and other prominent British investigators for the Asiatic Petroleum Co. and published in *The Automobile Engineer*.

Fig. 1 shows the relationship between efficiency and compression over the range from 3.5:1 up to 7.5:1 according to this formula, which is known as the air standard of efficiency, and is the accepted basis of comparison.

It will be observed that the air standard efficiency rises rapidly at first as the compression ratio is increased, but the gain in efficiency diminishes considerably with the higher compression ratios. It is doubtful whether, but for exceptional cases, any material advantage would be obtained from the use of a compression ratio higher than 7:1, on account of the relatively small gain in efficiency obtainable thereby, and the very high maximum pressures involved. To withstand these high pressures would necessitate a considerable increase in the cost and weight of the engine, and an increase also in the internal friction due to the heavier reciprocating and rotating parts.

The compression ratio which can actually be employed is governed in practice by the tendency of the working fluid to detonate under the high pressure and temperature of compression.

The phenomenon of detonation appears to be substantially as follows. When a mixture of hydrocarbon vapor and air is compressed to a high pressure and to a temperature approaching that of its self-ignition temperature and then ignited from any one point, the flame at first spreads by the normal process of combustion, compressing before it the unburnt portion of the charge. When the rise in temperature of the unburnt portion due to compression by the burning gases exceeds the rate of heat dissipation by a certain margin, spontaneous ignition of the former takes place, and an explosion wave is set up which strikes the walls of the cylinder with a hammerlike blow, thus causing the familiar metallic ring known as "pinking" or "detonation." It also has the effect of compressing and still further raising the temperature of the portion first ignited, and with it the temperature of the ignition plugs or other partially insulated objects in their immediate vicinity. If detonation be allowed to persist it will, unless it be very slight, increase in severity and ultimately raise the temperature of the igniter points to such a degree as to cause pre-ignition, or self-ignition of the charge, during compression and before the spark has passed; this is quite a distinct phenomenon and must not be confused with detonation.

It will be seen that detonation depends upon the normal rate of burning of the fuel, and occurs only when the rate of spread of flame is appreciably greater than the rate at which the unburnt portion can get rid of its heat. It is dependent also to a lesser degree upon a number of other factors which will be considered shortly.

Before proceeding further, it is well to point out that there are several stages of detonation, depending upon how far the normal spread of combustion has extended throughout the mass of the working fluid before spontaneous ignition occurs. Detonation, in its incipient stages, is sometimes very difficult to detect, because it is often unaccompanied by any audible noise, but rather by what may be termed harsh running.

The following very interesting and instructive experiment was frequently carried out:

A fuel was selected which, in the variable compression engine, was known to detonate with a compression ratio of say 5:1. The compression was set at, say, 4:1, and the engine run wide open at a constant speed. The compression was then gradually increased, and the general running and behavior of the engine carefully watched. As the compression rose gradually from 4 to about 4.7:1, the power output would rise also, approximately in proportion to the air-cycle efficiency, and the running of the engine generally would be smooth and silent, with very little vibration. Between 4.7 and 4.8:1 the running would become slightly harsher; from 4.8 to 4.9:1 there would be a very noticeable increase in harshness, accompanied by a considerably greater volume of noise and a marked increase in vibration, while at 5:1 the first audible signs of detonation would be detected, though they would be apparent only when ignition was fully advanced and the mixture strength also was adjusted to give maximum possible power.

With a compression ratio of 5:1 the engine would continue to run developing maximum power for an indefinite period, but pinking slightly all the time. If the compression ratio were further raised to about 5.1:1 and the ignition and mixture settings unaltered, detonation would increase in severity until, after about 5 or 10 minutes, pre-ignition would set in, and the power would fall off. If, however, the mixture strength were increased to give a slower burning mixture or the ignition timing retarded, the compression could be raised considerably higher, even to as high as 5.25:1 without any perceptible detonation. The same result could also be obtained by reducing the mixture strength, though freedom from detonation would become apparent only when the strength was so far reduced as to leave very little range. The total available range of mixture strength on the weak side is very narrow in the case of all volatile hydrocarbon fuels, so narrow indeed that to attempt to escape detonation by working entirely on the weak side would be completely out of the question in any practical multi-cylinder engine on account of irregularities in distribution. That it is possible to defer detonation by working between these very narrow limits is only what one would be led to expect from a consideration of the factors controlling detonation. This condition can readily be demonstrated as a laboratory experiment on a single-cylinder engine equipped with very delicate adjustments, and is interesting from a scientific point of view, but it can hardly be considered to be applicable in practice.

So far as practical considerations are concerned the rate of burning can be reduced, and at the same time stable conditions of running can be maintained, only by working on the rich side of the range. Under these conditions, however, the power output and economy cease to rise with increase of compression because the time of ignition or the mixture strength is no longer the most favorable. By further enriching the mixture and retarding the ignition, the compression can be increased to as high as 5.4:1, but, of course, only at great sacrifice of economy. The m.e.p. and thermal efficiency curves obtained from such a test are shown in Fig. 2.

It will be observed that, although the first indications of detonation occurred with a compression ratio of about 4.75:1, it is possible by suitable adjustments of the mixture strength and ignition timing to raise the compression to as high as 5.4:1 without allowing the detonation to become so severe as to set up preignition. **Although the precise compression at which detonation becomes serious varies with different mixture strengths or ignition timing, the compression at which it develops with the most efficient mixture strength and ignition timing is quite clearly defined, and that to within very narrow limits.** This point, namely, the compression at which detonation first becomes audible with certain definite temperature conditions and with both the ignition and mixture strength adjusted to give the highest efficiency, is taken hereafter as representing the highest useful compression ratio for any fuel. It is not the highest compression which can be employed, but the highest that it is worth while to employ.

It is necessary to emphasize this definition because it has a very important bearing upon what follows, and largely explains why certain fuels or mixtures of fuels appear to give more power and increased efficiency than others in the same engine.

The explanation of this is evident enough. Most engines have already too high a compression to enable them to run efficiently on many or even most of the brands of gasoline now on the market, with the result that they have to operate with the ignition too far retarded, and the mixture too rich. On changing over to another fuel having a higher detonation point, it at once becomes possible to advance the ignition timing and correct the mixture strength, with an immediate gain both in power and economy. Had the same two brands of gasoline

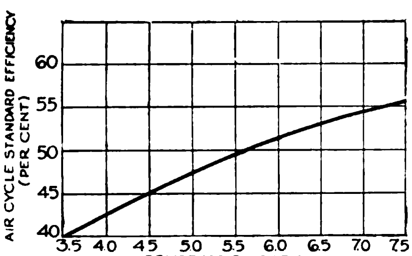


Fig. 1—Relation between the air cycle standard efficiency and compression ratio. (Total volume ÷ clearance volume)

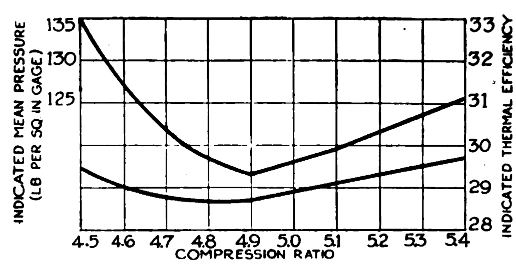

Fig. 2—Variation in mean effective pressure and thermal efficiency with different compression ratios for a fuel detonating normally at a compression of 5.0:1

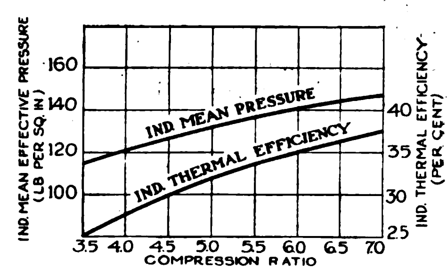

Fig. 3—Variation in indicated m.e.p. and indicated thermal efficiency with different compression ratios for a fuel not detonating below a ratio of 7:1 (say for toluene) in the variable compression engine

been tried in an engine with a lower compression ratio no perceptible difference in power or efficiency would have been observed. **It will be shown later that when various fuels are compared at a compression ratio low enough to permit of the most efficient mixture strength and ignition timing being used in each case, the efficiency is substantially the same on all fuels. Likewise it will be shown that so long as the liquid fuel is completely evaporated before its entry to the cylinder, the power output also is substantially the same for any fuel.**

Before dealing with the effect of the composition of the fuel upon its tendency to detonate it will be well to consider first certain other factors which influence detonation.

Factors Which Influence Detonation

(1) The design of the combustion chamber and the position of the ignition plug have a very important influence. **The more compact the combustion chamber, and the more central the position of the igniter, the less will be the tendency to detonate.** For it is clear that with a compact combustion chamber there is less danger of any unburnt portion of the gas becoming stagnant and therefore unable to give up its heat at a greater rate than it is generated by compression due to the burning portion of the working fluid. Again, it is clear that the ignition plug should be as nearly as possible in the center of the combustion space, in order to reduce as far as possible the distance the flame has to travel. With the exception of sleeve-valve engines, it is usually impracticable to place the ignition plug in the center of the combustion space, and the question therefore arises as to the best position for it. **Consideration will show that if the gases must be ignited from one side of the combustion chamber, the ignition plug should be placed on the hottest side, that is to say, on the side nearest the exhaust valve, so that the unburnt gases are compressed against the coolest surfaces, and can therefore get rid of their heat the more rapidly. When the ignition plug cannot be fitted centrally in the head it is clearly preferable to provide two plugs at opposite sides so that the spread of flame takes place from two opposite points and has only about half the distance to travel. The use of two plugs is, however, of little value unless the time of passage of the spark across both is perfectly synchronized.**

(2) **Turbulence.**—The greater the degree of turbulence within the combustion chamber the better, since turbulence tends to spread and distribute the flame uniformly throughout the working fluid and so reduces the danger of portions of it being entrapped and detonated. **From the point of view of detonation the worst possible condition is reached when the exhaust valve is fitted in a side pocket in which the mixture may become more or less stagnant, and the igniter fitted at the opposite side of the combustion chamber.** In such a design (and it is not an uncommon one) a portion of the working fluid will be entrapped in a position ideal for detonation where the bulk of the surface to which it can impart its heat is made up of a hot exhaust valve head and, generally, an uncooled plug for the removal of the valve. Under these conditions, detonation will occur very readily, but it may not so readily develop into pre-ignition, because the sparking plug may have very good facilities for getting rid of its heat, and the points are not so readily overheated by the return wave.

(3) **Speed of rotation.**—It is, of course, common knowledge that the tendency to detonate varies with the speed of rotation, and indeed this is only what might be expected, for the lower the speed, the lower the turbulence. As the speed is reduced not only is the velocity of entrance reduced in the same proportion, but the time during which turbulence may die down is correspondingly prolonged. Again, although the mean temperature of the working fluid at the end of the compression is, no doubt, somewhat lower at low speeds, yet the temperature of the surface of the combustion chamber necessarily varies considerably, and this, coupled with the lack of turbulence, results in the formation of local zones of gas, in the neighborhood of the exhaust valve for example, of much higher temperature than the average, and which may in fact attain a temperature approaching very nearly to the self-ignition temperature of the fuel. The existence of these hot zones coupled with a condition of general stagnation naturally predisposes the very conditions favorable to the development of detonation.

(4) **Effect of temperature** upon detonation. Since detonation is brought about by the compression of some portion of the working fluid to a temperature in excess of its self-ignition temperature, it follows that **for any given normal rate of burning, the higher the temperature of the working fluid the greater will be its tendency to detonate,** since the rise of temperature required to produce spontaneous combustion is correspondingly less.

(5) **Effect of pressure** upon detonation. Apart from the composition of the fuel, **the pressure of compression appears to be by far the most important factor controling detonation.** It appears that the normal rate of flame propagation prior to the formation of an explosion wave bears some direct relation to the pressure of the gases, the explanation presumably being that under high pressure the fuel and air are in more intimate contact, and therefore each particle of fuel can the more readily find the oxygen necessary for its combustion. It will be shown later that the pressure of compression was found to play relatively a considerably more important part than the temperature of the gases at the end of the compression.

Use of Supercharging Engine

For the investigations into the relationship between the composition of the fuel and the tendency to detonation both the research engines referred to previously were employed. In this connection the supercharging engine working with a stratified charge proved particularly valuable. This engine was, for the purpose of these tests, fitted with a piston giving a normal compression ratio of 5.18:1, corresponding to a compression pressure of 116 lb. per sq. in. gage. When desired, additional air, compressed below the piston, could be admitted to the cylinder after the completion of the suction stroke through ports cut near the bottom of the cylinder barrel, thus raising the compression pressure to approximately 155 lb. per sq. in. Before entering the cylinders, the air —compressed to a pressure of 9 lb. per sq. in.—is forced to pass through an intercooler by means of which it is cooled to a temperature approximating that of the cylinder contents. It will be seen, therefore, that when the supercharge is admitted by opening the ports in the cylinder wall, the pressure of compression is raised by approximately 35 per cent, but, since the ratio of compression is unaltered, the temperature is unchanged. By this means, therefore, it became possible to raise the compression pressure without raising appreciably its temperature.

By admitting the air supercharge through ports near the bottom of the cylinder and by suitable formation of the ports and the head of the piston, it was found possible so to separate the active working fluid and the air that they did not completely mix during the compression stroke, and by this means the presence of a considerable excess of air over that required for complete com-

bustion could always be assured, thus permitting what is not obtainable in an ordinary engine, namely, a very wide range of mixture strength over which combustion was complete. In the supercharging engine, therefore, two variables, always present in any normal type of engine, were almost eliminated, namely, the temperature of compression and the mixture strength. Thanks to the absence of these two variable factors it was found possible to arrive at the detonation point of any fuel not only very quickly but also with a very high degree of accuracy.

To attempt to analyze fully the process of combustion in such an engine is beyond the scope of this report, but it is sufficient to state that this method afforded a means of comparing the detonation points of various fuels under strictly comparable conditions, with great readiness and fair precision. It is, however, open to the obvious objection that it does not afford any means of expressing the detonation point in terms of compression ratio, which, of course, is the practical issue; this deficiency was, however, met by means of check tests in the variable compression engine.

Use of Variable Compression Engine

In the case of the variable compression engine, the actual compression ratio at which detonation first became apparent could be found by gradually raising the compression. Since, however, the tendency to detonate depends largely upon the mixture strength, it was always necessary to insure, by making fuel consumption tests, that the correct mixture had been found, and in view of the fact that for every fuel tested a different carbureter adjustment had to be found, it will readily be realized that the detonation point could not be determined so quickly or with quite such precision as in the supercharging engine. Also in the variable compression engine, probably owing to its more rigid construction, detonation was less easily detected.

The procedure adopted in nearly every case was first to test each fuel against the standard fuel in the supercharging engine, and so determine its detonation point in relation to that of the standard, the detonation point as found on this engine being expressed in terms of the indicated mean pressure at which detonation became apparent. The same samples were then tested in the variable compression engine and a definite relationship established between the mean pressure at which detonation occurred in the supercharging engine, and the corresponding compression ratio in the variable compression engine. With one or two notable exceptions the results tallied reasonably closely, so that once the relative detonation point of any fuel had been determined in the supercharging engine, the highest useful compression ratio for that fuel could be predicted fairly closely. There were, however, one or two exceptions to this rule, and in the case of these exceptions it must be assumed that the relative influence of temperature and pressure upon the tendency to detonate differed from that of the majority.

In view of the influence both of speed of rotation and of temperature upon the tendency to detonate, great care was taken to insure that the same temperature conditions prevailed in both engines and that the speed of rotation was always the same.

In all, many hundreds of tests of the nature described above were carried out. Not only were samples of practically all the brands of commercial gasoline and benzol tested, but also nearly pure samples of several members of each of the series comprised in gasoline, including various sulphur compounds, also alcohol, acetone, acetylene, ether, etc., were investigated.

Effect of Fuel on Detonation

In the case of ethyl-alcohol, acetone, toluene and xylene, it was found quite impossible to induce detonation under any circumstances in either engine. The relative detonation point, however, of these fuels could be determined by preparing mixtures of each of them with the standard aromatic free gasoline or with hexane. It was found that, in all cases, the detonation point of such mixtures followed a straight line law when the mixture was apportioned by weight and not by volume: that is to say, the addition of 40 per cent by weight of, say, toluene to hexane would raise the detonation point exactly four times as much as the addition of 10 per cent. One interesting point was repeatedly observed. When benzol and certain other fuels also were tested alone in the variable compression engine and attempts made to induce detonation by raising the compression, occasional pre-ignition would occur when the compression ratio exceeded 7:1 these pre-ignitions being denoted by a dull thud and an immediate drop in speed and power. It would appear, therefore, that such fuels when used pure, pre-ignite without preliminary detonation, but the addition of a comparatively small proportion of paraffins would induce preliminary detonation at high compression ratios. The same applies also to the naphthenes, methyl alcohol, methylated spirits and one or two others.

Table III gives the detonation point as found in both the variable compression and supercharging engines.

In Fig. 3 is shown the variation in mean pressure and efficiency with compression ratio as found by actual experiments on the variable compression engine. These curves represent the mean of a great number of tests carried out on a large number of different fuels, and

Table III—Effect of Compression on Detonation

	A	B	C	D

Notes.—* Denotes that the value given for compression could not be exceeded owing to preignition occurring before audible detonation.

( ) Where values are given in parentheses they are arrived at by extrapolation of the curves obtained from tests made with mixtures of these fuels with aromatic free gasoline.

ND Signifies that there was no detonation up to the limit of pressure obtainable in the supercharging engine.

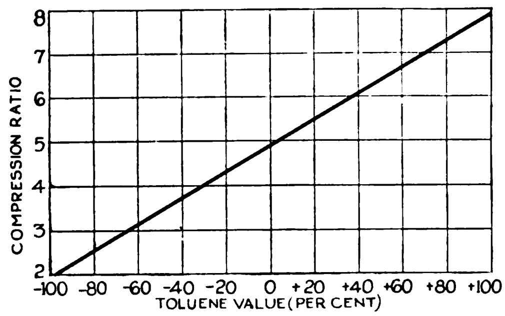

Fig. 4—Relation between toluene value and compression ratio in the variable compression engine

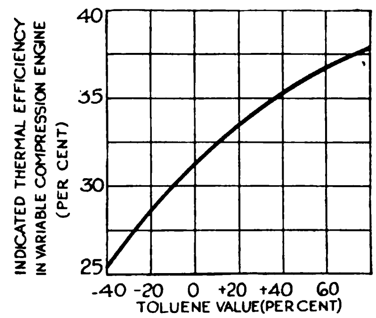

Fig. 5—Relation between toluene value and indicated thermal efficiency in variable compression engine

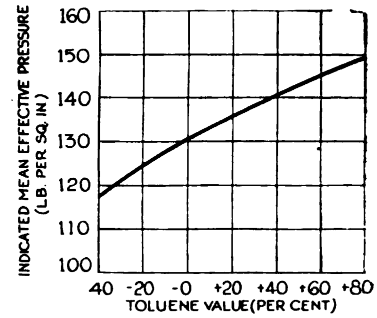

Fig. 6—Relation between toluene value and indicated mean effective pressure in variable compression engine

since in no case did the results vary by more than 1 per cent, the accuracy of the mean result may be accepted as being of a high order. It is very important to note that the relationship between power output (expressed in terms of indicated mean pressure), and of economy (expressed in terms of indicated thermal efficiency), and compression ratio was found to be the same for all fuels. Examination of these results will reveal that the inter-relationship between power output and thermal efficiency varies at different compressions. This can be partially, but not, in the writer's opinion, wholly, explained by certain investigations which will be dealt with later on.

In Table IV are given the efficiency and power output obtainable from many different relatively pure samples, and a number also of composite fuels, comprising representative samples of most of the brands of gasoline now on the market. As already explained, it is improbable if it will ever be worth while to employ a compression ratio in excess of 7:1, and the efficiency corresponding to this compression ratio has been taken as 100. It is well to bear in mind, however, that toluene, xylene, alcohol and one or two others will, in fact, withstand a considerably higher compression without detonation. **Prior to the investigations on ethyl alcohol, and the members of its group, the highest detonation point observed was that of toluene, and it was therefore decided, for the sake of conve-**

Ether	0.735	(2.95)	(19.5)	52.0	(116.5)	79.2

Notes.—* The sample of hexahydroxylene was very impure, namely, not more than 60 per cent.

( ) The values for ether are deduced from tests made with a mixture containing 50 per cent by volume of ether and 50 per cent of aromatic free gasoline, since the detonation point of ether alone was below and beyond the range of the apparatus.

Column C shows the indicated thermal efficiency actually observed when each of the fuels named was tested in the variable compression engine. The efficiencies given in this and other columns stating efficiencies are based on the assumption that the available energy of each fuel is equal to its lower calorific value plus its latent heat of evaporation. Justification for this assumption will be dealt with later. Calorific values and latent heats for the fuels named here are shown in Table II.

Column D shows the relation between the indicated thermal efficiency actually observed (as shown in column C) and that which was obtained in the same engine at a compression ratio of 7:1 when using toluene, *i.e.*, 37.5 per cent is taken as = 100.

Column F gives the ratio between the indicated mean effective pressure actually observed (as shown in column E) and that obtained with a compression ratio of 7:1 and using toluene as the fuel, *i.e.*, 147 is taken as = 100.

Columns D and *F* therefore give, respectively, relative figures of merit for thermal efficiency and power output obtainable for each of the samples named.

nience, to express the tendency of fuels to detonate in terms of their equivalent toluene content. This value will in future be termed the "toluene value" of the fuel.

With the exception of alcohol and the members of its group, the efficiency obtainable with all fuels appears to be the same at the same compression ratio to within less than ± 0.5 per cent. Since the toluene value defines the compression ratio which can be used, it forms a definite and precise measure of the efficiency obtainable from any fuel when used at its most efficient compression ratio. The curve, Fig. 4, shows the observed relationship between toluene value and compression ratio, and Fig. 5 the observed relationship between toluene value and efficiency, while Fig. 6 shows the relationship between toluene value and indicated mean effective pressure or power output. The curves shown in Figs. 4 and 5 are strictly applicable to all fuels outside the alcohol group, and with but very slight amendment to that group also. The relationship between toluene value and indicated mean pressure assumes that all fuels have the same total internal energy per unit volume of mixture, which is very nearly, but not strictly, true. This subject will, however, be dealt with when discussing the maximum power output obtainable from different fuels.

Table V gives the toluene value for a large number of different samples and composite fuels. Reference to this table will show that, **of the aromatic group, benzol is markedly inferior to toluene in checking detonation, while xylene occupies a position intermediate between the two. Ethyl alcohol is by far the most effective of all. With the exception of ether and acetylene, the members of the paraffin series are the worst, and, generally speaking, their tendency to detonate increases with increase of molecular weight.** In the estimates of toluene values, the standard aromatic free gasoline is taken as zero, and toluene as 100 per cent.

It would possibly have been better to have selected either a pure paraffin fraction or a range of pure paraffins as a zero standard, but neither of these was procurable either in sufficient quantity or of a sufficient degree of purity for the purpose. It must be borne in mind when making comparisons that, although the aromatic free gasoline contains less than 2 per cent of aromatics, it does, nevertheless, contain a substantial proportion—about 35 per cent—of naphthenes, and that these have a positive toluene value of about 25 per cent.

Table V—Toluene Value of Various Fuels**

Notes.—** The toluene value of a fuel bears a definite straight line relation to the maximum compression ratio that can be used without detonation. The author establishes the scale of values (as will be seen by reference to Fig. 4) by arbitrarily assuming that the standard aromatic free gasoline used as the basis for comparison has zero toluene value and that toluene has 100 per cent toluene value. The standard gasoline can be used without detonation when a maximum compression ratio of 4.85 is employed while toluene can be used with a maximum ratio of 7.8. If these values be plotted on a chart using compression ratios as ordinates and toluene values per cent as abscissas, and the points be joined by a straight line continued to the left of the zero toluene ordinate, as is done in Fig. 4, the toluene value is easily read off when the maximum useful compression ratio is known. When the compression ratio is less than 4.85 the toluene value will be negative. Thus the toluene value can be considered as an index of susceptibility to detonation. The higher the toluene value, the higher the compression ratio that can be used without detonation and vice versa.—EDITOR.

*Where this mark appears it indicates that the value given could not be exceeded due to preignition intervening before audible detonation.

( ) Where toluene values and highest compressions are bracketed thus it indicates that the values could not be arrived at from direct results owing to the detonation point being beyond the range of the apparatus. In such cases the values given are derived from extrapolation of the curves (which are practically straight lines) obtained from mixtures with aromatic free gasoline.

ND Indicates that there was no detonation up to the limit of mean effective pressure obtainable with full supercharge.

SS Cyclohexane did not behave normally in the supercharging engine. In the case of the other samples of naphthenes the toluene values arrived at from the variable compression engine exceeded those from detonation tests made in the supercharger.

All the naphthenes, however, were alike in that there was a greater tendency to preignition than with the aromatics.

If a fuel consisting of a similar range of paraffins only had been selected as forming a datum line, then the aromatic free gasoline would have a positive toluene value of about 10 per cent. The standard aromatic free gasoline was selected because it was available in very large quantities, and, the whole bulk of it having been prepared at one operation, its consistency could be relied upon as being uniform—a very important factor in the case of a fuel used throughout as a standard basis for comparison.

Ether and acetylene and the heavier paraffins have, therefore, minus values, while hexane (a very light paraffin) has a very slightly positive value. In the case of the paraffin series it was found difficult to determine the detonation point of the heavier members of the group, partly because these could not be isolated in sufficient quantities or of a sufficient degree of purity for the purpose, and partly because a considerable amount of heat had to be added to sufficiently vaporize them.

There was, however, considerable evidence to show that the toluene value falls as the molecular weight increases. Small quantities of heptane of a very high degree of purity were eventually obtained, and it is hoped that sufficient supplies of both octane and nonane may soon be procured. The results obtained on heptane were as interesting as they were surprising, for, contrary to all expectations, not only did this fuel detonate far more readily than the aromatic free gasoline of which it forms one of the relatively lighter constituents, but when used pure it detonated with a compression ratio of only 3.75:1, and when mixed with hexane, even in quite small quantities, it increased the latter's tendency to detonate.

Experiments on the variable compression engine showed that heptane had a negative toluene value of minus 37 per cent. The particular sample of heptane with which the experiments were conducted was of a vegetable origin. Before any tests were run, it was very carefully analyzed, and, but for a small proportion, about 3 per cent, of terpenes was found to be remarkably pure. The results obtained were so unexpected that suspicions were aroused as to the possible influence of the presence of terpenes. Experiments with mixtures of gasoline and turpentine, however, showed that the addition of turpentine served to reduce the tendency to detonate. Finally, the remainder of the heptane was eventually almost completely freed from terpenes, and its purity raised to over 99.5 per cent; but, even so, its behavior was not influenced to any perceptible degree.

The quite remarkable difference observed between the behavior of hexane and heptane, two contiguous members of the same series, emphasizes very strongly the necessity for taking nothing for granted, and for investigating, individually, the behavior of each member of a series; moreover, there is reason to believe that certain other members of the paraffin series behave in the same erratic manner.

In this connection it may be of interest to note that a sample of commercial kerosene consisting mainly of heavy paraffin fractions detonated at a compression ratio of 4.2:1. This is equivalent to a toluene value of minus 22 per cent. Under the same conditions of heating the toluene value of hexane was found to be plus 8 per cent and of pure heptane to be minus 37 per cent. However, in spite of the above and possibly other notable exceptions **there is some evidence to show that as a general rule the heavier members of the paraffin series detonate more readily than the light ones.** Applied to this series, and to this series alone, the accepted specification, based on boiling points, affords a very approximate indication of the quality of the fuel; but that when only a small percentage of aromatics or even naphthenes are present, the position is entirely reversed, and the whole basis of the accepted specification at once falls to the ground.

(*To be continued.*)

Progress of American Engineering Standards Committee

THE American Engineering Standards Committee has approved "Tentative American Standard Specifications and Tests for Portland Cement," "Tentative American Standard Specifications for Fire Tests of Materials and Construction," and "American Standard Pipe Threads." Moreover there has been submitted for approval by the committee the "National Electrical Code" as an American Standard, and "Standard Test for Toughness of Rock," "Standard Method of Distillation of Bituminous Materials for Road Treatment" and "Standard Method of Sampling Coal" as Tentative American Standards, with the "Safety Code for Head and Eye Protection" submitted for approval as "Recommended American Practice."

The committee is composed of 47 members representing 17 bodies or groups of bodies, including 6 national engineering societies, 5 governmental departments and 13 national industrial associations. The Society of Automotive Engineers is a member body. Its function is merely to see that each body or group concerned in a standard shall have opportunity to participate in its formulation, which is in the hands of a working committee, technically called a "sectional committee." Each sectional committee is organized by one or more of the principal bodies interested, such bodies being known as "sponsors." Sponsorships have been arranged for the following projects which were under way at the beginning of this year:

Electrical Projects—"Rating of Electrical Machinery" and "Term Markings for Electrical Apparatus."

Mechanical Projects—"Ball Bearings," "Plain Limit Gages," "Gears," "Machine Tools," "Nut and Bolt Heads," "Pipe Flanges and Fittings," "Screw Threads," "Shafting."

On Dec. 8, 1920, at a conference at which more than 100 organizations were represented, it was unanimously voted that a comprehensive program of safety codes should be undertaken. Active work is in progress on 24 such codes.

THE Engineering Subcommittee of the Empire Motor Fuels Committee, under the chairmanship of Dr. W. R. Ormandy, is conducting tests and experiments on the design and operation of internal combustion engines running on alcohol fuel and on alcohol-benzol-ether mixtures.

Analyzing of the Elements of Production Cost

The following paper discusses production costs from the angle of the industrial executive. It is a practical analysis of the kind for cost knowledge needed, viewed from that standpoint, and was read before a recent meeting of the Pittsburgh Section of the Industrial Cost Association.

By W. E. Hundley

WE are not here this evening to discuss elementary principles of cost accounting. I assume that everyone present is more or less familiar with the usual formula found in text-books and referred to in most publications regarding costs; namely, that direct material, plus direct labor, plus manufacturing expense, equals manufacturing cost.

No doubt the equation is fundamentally correct, but I am going to ask you to consider Cost of Production from a somewhat different angle; to forget the narrow accounting view of the problem and to look at it from the standpoint of the stockholder and the Industrial Executive. These men are vitally interested to-day in getting maximum production at minimum cost, and they must know *definitely* what constitutes that cost if any progress is to be made toward reducing it.

We are now confronted with a situation that demands an immediate and thorough analysis of the vital facts that are back of the figures we are using.

We must take time to analyze our cost problem; to consider each factor that enters into it, and to determine the most practical method of applying the indirect charges which cause most of our trouble in calculating Cost of Production. To do this effectively we must first visualize the problem as a whole. We must stand off and get a good general view of the big basic sources of cost.

When we approach the subject in this way we find that the manufacturing and marketing of an industrial product involves seven fundamental factors, each spelled with an "M," which might appropriately be called "The seven M's of industry":

First—Money.
Second—Millsite.
Third—Mill.
Fourth—Machinery.
Fifth—Material.
Sixth—Men.
Seventh—Management

Each of these factors is the primary cause of certain expenditures which begin as soon as an enterprise is launched and continue as long as it exists. It is no more difficult for a capable cost accountant to classify expenditures with respect to these causes than it is for the naturalist to tell from the characteristics of a leaf the kind of tree on which it grew. I will endeavor to show how the ordinary expenditures of an industrial enterprise are related to these prime sources of cost and how they may readily be classified into three main groups:

First: Administration.
Second: Production.
Third: Distribution.

The first factor, **Money,** is the motive-power of industry. It is obtained, primarily, by financing the enterprise and represents wealth accumulated by men who are willing to risk the loss of it by exchanging it for pieces of paper which entitle them to participate, under certain conditions, in the profits which they feel assured will be earned by the venture and which they believe will exceed the ordinary rate of interest afforded by other investments involving little or no risk.

This return, which they expect to receive on their investment, is a combination of interest for the use of their money and profit for conducting the enterprise, which should be in proportion to the risk involved and cannot reasonably be expected to approximate a fixed rate for all industries. This has been duly recognized in England, where the percentage of profit allowed on invested capital, for income tax purposes, varies with the class or nature of the business.

I mention this matter of interest and profit because it has a certain bearing upon the problem we are going to discuss and cannot be entirely ignored, as it is still the storm center among professional cost accountants and engineers, many of whom contend that interest on investment *must* be included in determining Cost of Production, reasoning that an enterprise must pay for the use of capital before it can show a profit.

We will have to put ourselves on record, sooner or later, on this point, but I think we need not include it in our discussion this evening.

This factor of Money involves the employment of treasurers, credit managers, comptrollers and auditors, with their retinue of clerks and accountants concerned primarily with the handling of receipts and disbursements, the recording of transactions with employees, customers and creditors and the keeping of accounts which reflect the financial condition of the business and guide the management in directing its activities and determining its policies.

All expenses in connection with the housing and maintenance of this organization, which are common to the business as a whole and cannot be apportioned on any equitable basis to productive departments or product and have no direct bearing upon "Distribution," are classified as "Administration."

Millsite, the second factor, although it plays a most important part in the economy of production and often limits the extent to which improvements may be made that would tend to reduce costs, is not, of itself, the source of much expense, and has very little effect upon Cost of Production.

Money spent for a millsite constitutes a permanent investment which can neither be depreciated nor appreciated and on which no direct profit can be realized except through rental or sale.

Taxes and maintenance are the usual items of expense, and these are apportioned to Production on the basis of space occupied by each department or building.

Mill, the third factor, constitutes an important element of investment which is slowly absorbed into Cost of Production through the medium of depreciation charges and also is the source of certain expenditures which may readily be classified as "Building Expense," and apportioned on the basis of available floor space or cubic contents. These expenses are of two classes:

First—A more or less fixed expense, independent of production, which includes such items as depreciation, taxes, insurance, fire protection and general maintenance.

Second—A variable expense, increasing with the use of buildings and the number of men employed, including light, heat, water, ventilation, elevator service, janitor service, etc.

Under normal conditions this distinction is not important, but when certain departments are idle or production is curtailed the difference in expense may be worth considering.

Machinery, the fourth factor, which embraces all mill equipment directly or indirectly connected with manufacturing, is the most important element of invested capital and the source of most trouble for the industrial executive, the cost accountant and the income tax examiner in determining Cost of Production.

It used to be very difficult to persuade manufacturers that depreciation of machinery and equipment constituted an important element of cost. Now they not only swallow depreciation but they hunger and thirst for amortization, obsolescence and inadequacy, and the cost accountant, who is trying to show actual Cost of Production, has a hard time keeping his feet on the straight and narrow path while trying to satisfy the demand for this home-brew concoction made in accordance with the formula handed out by the income tax department.

It is most important at this time to know the actual valuation of plant equipment; the value in use, and this, of course, cannot be satisfactorily determined without making some kind of an appraisal which entails adjustment of book values. Depreciation allowances charged into cost from year to year are merely estimates for accounting purposes and cannot be depended upon as an indication of actual depreciation. Unless the reserves set up have been properly handled, the balance when deducted from the book value of the assets may show a valuation that cannot be reconciled with the actual physical condition of the equipment. This is frequently found to be the case where large amounts have been charged for repairs and maintenance, which, in fact, have involved important renewals or replacements and, in some instances, complete rebuilding of machines, disguised under the familiar mask of "General Overhauling."

Assuming that we can establish a reasonably accurate cost for machinery and equipment, we have a basis for determining the charges to be made to Cost of Production for the gradual wear and tear which will eventually cause the scrapping or disposal of such property, regardless of how much may be spent for repairs and maintenance. But the extent to which the repairing of machinery tends to prolong its useful life is an important consideration.

Machinery is a constant source of expense, whether idle or operating, and we may, therefore, very properly assemble the items of this expense under these two headings:

1—Idle Machine Expense.
2—Operating Machine Expense.

Idle Machine Expense includes the items usually referred to as fixed charges, such as

Depreciation—Insurance—Taxes—Space Charges—Small Maintenance Charges.

Operating Machine Expense covers all of the above charges plus the following, which vary more or less with production:

Wages of Operator—Indirect Labor—Labor Expense—Power — Tools — Supplies — Maintenance and Repairs — Crane Service—Miscellaneous Works Expense.

In departments where the work is done chiefly by machines a cost per hour can be calculated for units, groups or classes of machines. Where the work is done chiefly by hand hourly rates can be developed for various classes of labor or occupations which will absorb all expense of maintaining the equipment used.

These plans constitute what are generally known as machine-rate and man-hour cost methods. Some accountants prefer to figure separate hourly rates for machines and operators but the combined rate works out very satisfactorily in practice if reasonable care is exercised in checking the rates from month to month.

Material, the fifth factor, is generally considered an easy matter to dispose of chiefly because the tendency is to ignore most of the expenses incurred in connection with it, absorbing them as part of the "General Manufacturing Expense." As in the case of labor we have both direct and indirect Material Costs.

Direct Material Cost should include all items which can be charged direct to a particular quantity, lot or class of material, such as—Amount of Invoice—Freight, Express or Drayage—Cost of Unloading—Labor Charges for Cutting, Grading, etc., and should be credited with such items as—Cost of Containers—Allowances and Adjustments, etc.

Some accountants argue that cash discounts should also be deducted from invoices.

Indirect Material Cost should cover all other expenses incurred in connection with material until it is delivered to the department that has requisitioned it. It would include—Purchasing—Tracing—Demurrage and Switching Charges—Inspecting and Testing—Storing—Handling—Breakage and Shortage—Repairing and Adjusting—Returned Goods Expense—Inventory Expense—etc.

Special expenses in connection with material bought for a particular job should be charged direct to the shop order covering it and in some cases charges for demurrage, inspection, testing, etc., might be charged direct to a department. Otherwise, Indirect Material Cost should be distributed on some equitable basis that would take account of weight, bulk, etc. This might necessitate classification of material into several groups, each group having a common unit of measure such as weight, pieces, feet, etc., but there would always be certain general expenses that would have to be distributed on some such basis as the number of requisitions handled, or the total direct cost of purchases.

Applying a percentage on cost of material disbursed is the favorite answer to this problem, but it is just as inaccurate and illogical as using a "General Factory Burden."

There are other phases of the Material Factor that will stand a good deal of discussion. I refer to the proper disposition of charges for defective and spoiled material; the use of average cost, lot cost or last cost; the proper allowance to be made for normal waste; and to what extent salvage value should be credited to direct material cost.

Men, the sixth factor mentioned, not only constitute the greatest problem in the industrial world, but are the direct source of so many expenses that cost accountants as

a rule, have used what they call, "Productive Wages" and "Productive Hours," as an arbitrary basis for distributing all "Manufacturing Expense."

I need hardly say that such items as power, tools, supplies, repairs, etc., cannot be thrown into a melting pot called "Burden" and distributed to production on a basis of wages or labor hours if we are to get anything approximating actual costs. But we can and should analyze wages and the expenses incurred in connection with the employment and handling of men and classify them into groups as, for instance:

1—Direct Labor. 2—Indirect Labor. 3—Departmental Labor Expense. 4—General Labor Expense.

Direct Labor would consist of all wages paid for time actually consumed by employees when engaged on operations or processes definitely identified with shop orders or with units, lots or classes of material for product (regardless of the purpose for which such material or product might be used).

Indirect Labor would include all wages paid to employees for work that could not be charged to productive operations, processes, etc., such as—

Supervision—Inspection—Testing—Checking—Helping—etc.

Departmental Labor Expenses would constitute direct charges to operating departments for lost time of employees and expenses resulting from Defective Work—Delayed Operations—Idle Time—Instruction—etc.

General Labor Expense would cover all expenditures for maintenance of the departments which deal directly with the men and the expense of which could readily be distributed on the basis of total man-hours, men employed, men handled, etc., such as

Employment Department—Time Keeping Department—Hospital—Safety-First Department—Police Department—Welfare Department—Educational Department—Cafeteria.

As to the method of charging labor to Cost of Production there is much to be said in favor of a system of average rates for classes of labor worked out by departments and occupations, and for the practice of establishing hourly rates combining labor and expense for departments where work is done mostly by hand. This plan has been satisfactorily carried out in foundry practice and on repair work for carpenters, painters, bricklayers, tinners, electricians, pipefitters, plumbers, riggers, etc.

Management, the seventh factor, affects Administration, Production and Distribution, but it does not present any particular difficulties except in connection with Production.

Under "Administration" we find the salaries of all executives who are not identified with Production and Distribution. Also such items as legal expenses, traveling, telephone and telegraph, association dues, donations, etc.

Under "Distribution" are the salaries and expenses of the Sales Manager and the sales force, branch office expenses, advertising department, etc. If the company distributes its product locally there may also be the expense of operating motor trucks.

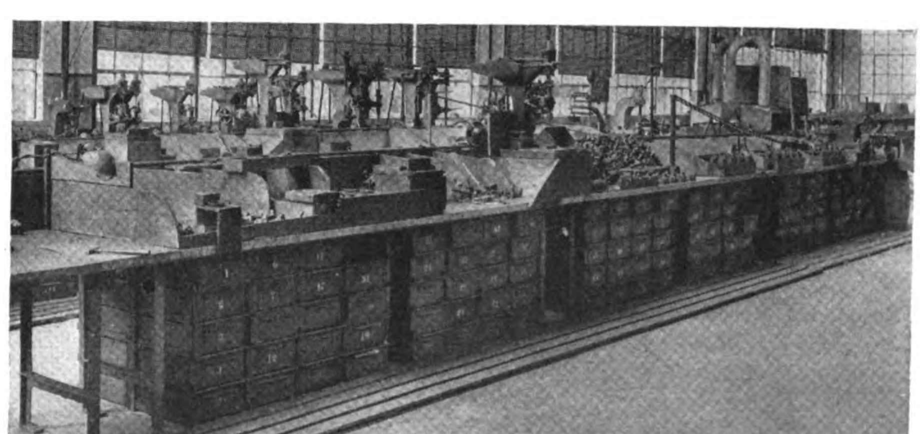
Management of Production involves a certain class of expenses which are variously referred to as "General Manufacturing Expense," "Plant Administration," etc. As a rule these expenses cannot be applied as direct charges to productive processes or operations but there is one element that is frequently separated and handled as a productive department. Engineering and Drafting can and should be handled on an hourly basis, each shop order, or department being charged with the direct time of engineers and draftsmen, as reported daily and a cost rate established to absorb all salaries and expenses.

The departmental activities generally identified with the Production Manager and which cannot be distributed on hours of direct labor are:—General Supervision—Planning and Dispatching—Timesetting—Inspection—Packing and Shipping—Works Accounting and Records—Costs and Statistics.

These general expenses of Production must be distributed on some equitable basis to departments, processes and operations but there is seldom a satisfactory basis available for this purpose. Theoretically each operating department should absorb an amount of this expense proportionate to its activity. Neither the hours nor wages of direct labor will adequately express the activity of all departments. Total hours or wages of direct and indirect labor would be a nearer approximation but even this would not be an adequate measure for departments consisting chiefly of machines. Inasmuch as the Production Manager is concerned with every feature of direct and indirect cost in each department, the total cost of operation is perhaps the best basis available. Pro-rating the expense on this basis would reach every department and keep every department manager on his toes to hold down his cost of production.

Tool Lockers Under Benches

ONE of the problems in any machine shop or manufacturing establishment is what to do with tools at night. The Holley Carburetor Co. has solved this problem in a very ingenious manner and in a way which has resulted in saving both time and space. In the system where the workman turns in all of his tools at the tool crib at night, a long line-up results with the consequent loss of time. In the morning he has to go with his tool checks again and another delay occurs. In the Holley system each man has a tool box of his own provided with a number and lock. This box is placed below the bench and contains just what the workman needs to go on with his work.



Tool boxes placed beneath work bench give a compact storage space and eliminate delay at the toolroom window

Striking Survey Shows Success of Farmer-Owner with Tractor

Results of a recent tractor survey by the Agricultural Experiment Station of the University of Idaho are presented. The facts are of special interest, as showing the success obtained by the farmer-owner as opposed to expert handling a new machine in national tractor demonstrations.

By John C. Wooley

THE national tractor demonstrations have shown that while new and in the hands of experts the tractor will do the work it is designed to do. These demonstrations have been very valuable aids in the development of the tractor as a form of power and of the business of making tractors. At the present time, however, we are most interested in knowing what success the farmer-owner is having with his machine. In order to secure information regarding the success of the tractor on the farm questionnaires were sent to 520 tractor owners. Two hundred twenty-six answers were received. One hundred twenty-seven of the questionnaires were filled out completely and it was from these that the conclusions were drawn.

Several studies were made of these data and some of the results are given below:

Study Number 1

PURPOSE.—To determine the success with which tractors have been operated in Idaho during the past ten years.

Date of Purchase	Has the Tractor Been a Paying Investment? Yes	No
1908	1	2
1909	0	2
1910	0	0
1911	2	0
1912	2	2
1913	1	0
1914	9	4
1915	15	7
1916	14	10
1917	42	14

Of the 127 reports, 86 indicated the tractor as a profitable and 41 as an unprofitable investment. In other words, 69.3 per cent of all the tractors that have been used in the state have been profitable. Considering alone the tractors purchased in 1917, we find that 75 per cent of them have been profitable to their owners. Some of the failures are due to poorly designed machines, but in many cases the trouble can be traced to a lack of knowledge regarding the care and proper method of operation of the machine, or to carelessness on the part of the operator.

The selection of the proper size and type of machine also has much to do with its success or failure.

Study Number 2

PURPOSE.—To find the relation of size of farm to the success of the tractor.

On less than 200 cultivated acres	70%	were successful
On 200 to 300 cultivated acres....	81.5%	were successful
On 300 to 400 cultivated acres....	50%	were successful
On 400 to 500 cultivated acres....	77%	were successful
On 500 to 600 cultivated acres....	75%	were successful
On 600 to 700 cultivated acres....	57%	were successful
On 700 to 800 cultivated acres....	63%	were successful
On over 1000 cultivated acres.....	78%	were successful

It is seen from this that the highest percentage of success was secured on the small farm and the next best results were secured on the farms with over 1000 acres in cultivation. On the smaller farm the owner was in all probability his own operator, which, no doubt, has something to do with this high percentage of success. On the larger ranch there is a tendency to overload the machine and this at once makes the tractor an unprofitable investment. On the largest ranches an expert operator is often hired and less loss of time and less expense is usually the result.

Study Number 3

PURPOSE.—To determine the relation of size of tractor to the profitableness of the investment.

Size	No. Reported Profitable	No. Reported Unprofitable
8-16 horsepower	10	5
10-20 horsepower	16	3
12-25 horsepower	18	8
15-30 horsepower	14	7
20-45 horsepower	13	6
30-60 horsepower	7	4
40-75 horsepower	5	1

The higher percentages here are found in the 10 to 12 draw bar horsepower class and in the 40-75 size. The smaller type has been, in most cases, used to supplement the horsepower on the farm, while in many cases, the larger type has been used for all the work on the wheat ranch. Both have been found profitable investments.

Study Number 4

PURPOSE.—To find the size of tractor favored by owners of different size farms.

Cultivated Areas	Favored Size
Less than 100 acres	8-16 horsepower
100-200 acres	12-25 horsepower
200-300 acres	10-20 horsepower
300-400 acres	20-40 horsepower
400-500 acres	12-25 horsepower
500-600 acres	15-30 horsepower
600-700 acres	25-50 horsepower
700 acres and over	40-75 horsepower

The size of tractor selected will depend upon other factors beside the size of farm. One of these factors is the requirement for belt power. Another is the type of soil and still another is the type of farming. On the specialized wheat ranch, where the plowing, disking, seeding and harvesting can be done with the tractor, one of the larger

sizes will be necessary for success. While on a ranch where diversified farming is followed, one or two smaller machines may be more successful.

Study Number 5

PURPOSE.—To determine the effect of dependability on success of the tractor.

Size of Tractor	Number Reporting	Profitable Days Out of Repair When Needed	Unprofitable Days Out of Repair When Needed
Less than 10 D. B. Hp.	26	8.3	60
10 to 16 D. B. Hp......	42	3.2	30
Over 16 D. B. Hp......	21	7.0	33
Average	..	6.1	41

Note.—D. B. Hp. is the abbreviation for Draw Bar Horsepower.

Dependability is one of the most important factors in the success or failure of the tractor as an investment. If the tractor can be depended on to work when the busy season comes, it proves to be, in most cases, a profitable investment. Where it fails in the busy season, it is certain to be a marked failure.

Study Number 6

PURPOSE.—To find the number of horses displaced by different size tractors and to determine the effect of this displacement on the success of the tractor.

Size of Tractor	—Horses Displaced— By Profitable Machines	By Unprofitable Machines
Tractors less than 10 D. B. Hp...	4	2
10 to 16 D. B. Hp...............	7	4
Over 16 D. B. Hp................	14	6

In every case the tractors reported as having been profitable investments have displaced a larger number of horses than those that have not been reported as profitable. A tractor can be made more easily a financial success if it displaces some horses, but quite a few owners feel that they have made money by supplementing the horse power with the tractor. They have taken some of the hardest work off the horses and have had an abundance of power for the rush seasons.

Study Number 7

PURPOSE.—To determine the effect of the tractor on the labor situation.

Size of Tractor	Percent of Owners Reporting a Decrease in Hired Help: Profitable Machines	Unprofitable
Less than 10 D. B. Hp.....	73%	12½%
10 to 16 D. B. Hp.........	83%	19%
Over 16 D. B. Hp.........	90%	55%

Eighty-two per cent of all tractor owners reported that the tractor enabled them to get along with less hired help. The men who have been able to displace some man labor with their machines are the ones who in a majority of cases have made the greatest financial success with these machines.

Study Number 8

PURPOSE.—To find the different farm operations in which the tractor is being used in Idaho.

Ninety-seven per cent of the owners make the greatest use of the tractor in plowing. A few operators use their machines in plowing as many as 120 days each season.

About one-third of the owners use their tractors in the preparation of the seed bed. A large number of the men who use their tractors in this work are among the successful operators. By use of the tractor this work can be done rapidly and without expensive equipment, and such use will help the tractor to pay its way.

Twenty per cent of the owners use their machines for harvesting and about 40 per cent of the machines are used in threshing. Clearing of land, pumping, silo filling, feed grinding, grading, and hauling are other lines of work in which the tractor is being used successfully.

Study Number 9

PURPOSE.—To learn the troubles that tractor owners encountered.

Quite a large number of men have reported trouble with ignition and in almost every case this has been due to dust that has found its way into the magneto. A dust-proof cover should be carefully kept in place and by this means much of this trouble will be avoided.

Lubrication was one of the difficulties encountered last season. Some of the most successful operators are the ones who take the greatest care with their lubricating oil. Lubricating oil is destroyed by being burned, by being cut with kerosene that works past the piston rings, and by being worn out in the bearings and cylinders. One successful operator drains his crank case at the end of each day's run. He allows the oil to stand until morning and then pours off any washy material and filters the remainder. At the end of one week he uses new oil in the crank case. Tests have indicated that the oil should be changed after thirty hours of work where the engine is being operated under maximum load. Trouble with bearings, with rings, and with loss of power are very often the result of poor lubrication.

Gears and chains come in for a large share of the trouble in this State, due to the large amount of dust that prevails. It is well to inspect the gears and chains often and thus anticipate the need for new parts.

Study Number 10

PURPOSE.—To determine the items in tractor cost to the owner.

One of the items that is quite important is that of deterioration. If a tractor gives service for only five years, then one-fifth of the original cost must be charged to deterioration each year, and at this rate this will be one of the big items. If the tractor will give service for ten to twelve years, as it should under proper usage, then this item will not be so great. Loss of time when power is most needed is an expensive item and must be avoided by care in operation and by effective service on the part of the dealer, in case of a breakdown during the busy season. Fuel and oil should probably be listed next, with repairs as one of the lesser items in cost. Fuel and oil costs for plowing should be kept below 50 cents per acre. The other items of cost are so variable that no accurate figures can be given.

Conclusions

1. The tractor, when carefully selected and intelligently operated, is a profitable investment.

2. The farmer must be able to make all minor repairs himself and to get repairs and expert help quickly for larger installations.

3. Dependability is probably the largest factor in the success of the tractor.

4. The three plow size is favored in this State.

5. Proper care of lubrication will prolong the life.

6. The best quality of oil is the cheapest.

7. The tractor motor is required to pull its rated load the greater portion of the time. The automobile motor is very rarely subjected to full load for a ten-hour day. Care for the tractor accordingly.

8. The tractor that displaces half its value in horses can easily be made to pay its way.

9. The man who makes up his mind to care for his machine and to be as independent as possible of outside help is the satisfied owner.

10. Taking off one plow may enable the tractor to operate at its rated speed and bring better results.

11. Overloading brings trouble and reduces results.

Foreign Import Duties on American Automotive Products

Argentina:
Cars and trucks..............32% A.V.
Motorcycles ....$36.80 each
Parts ....32% A.V.

Bolivia:
Cars .... 8% A.V.
Trucks .... 4% A.V.
Motorcycles ....15% A.V.

Brazil:
Cars and trucks....7% A.V. nominal duty: 25.71% A.V. actual duty. See note *.

  - 110 lb. or under, per 100 lb.. 16.22
  - Over 110 lb. to 220 lb., per 100 lb. ... 12.97
  - Over 220 lb. to 550 lb., per 100 lb. ... 9.72
- Automobiles:
  - Over 550 lb., but not over 1100 lb., per 100 lb. ... 6.48
  - Over 1100 lb., but not over 2200 lb., per 100 lb. ... 4.32
  - Over 2200 lb., per 100 lb. ... 2.16

When duties are paid in paper there is a surtax of 900%.

Greece:
- Motorcycles ... $11.58 each
- Motor vehicles: Trucks and omnibuses, per 100 lb. ... 2.31
- Passenger cars:
  - 1320 lb. or under, per 100 lb. 6.23
  - Over 1320 lb., per 100 lb. ... 7.91
- Chassis, with or without motors or motors separate, per 100 lb. ... 1.26
- Bodies for trucks, per 100 lb.. 11.07
- Bodies for omnibuses and passenger cars ... 154.40 each

Hungary:
- Automobiles, chassis and motorcycles:
  - 880 lb. and under, per 100 lb. 13.81
  - Over 880 lb. to 3960 lb., per 100 lb. ... 11.04
  - Over 3960 lb. to 7040 lb., per 100 lb. ... 9.22
  - Over 7040 lb., per 100 lb. ... 5.49

These duties are paid in paper and should be multiplied by 20.

Italy:
- Motorcycles ... 15.44 each
- Cars and trucks weighing:
  - Not more than 880 lb., per 100 lb. ... 10.53
  - Over 880 lb. up to 1980 lb., per 100 lb. ... 10.04
  - Over 1980 lb. up to 3520 lb., per 100 lb. ... 5.68
  - Over 3520 lb. up to 5500 lb., per 100 lb. ... 6.54
  - Over 5500 lb. up to 8800 lb., per 100 lb. ... 8.31
  - Over 8800 lb., per 100 lb. ... 5.22

Automobiles with or without bodies weighing not more than 5500 lb. will also pay a surtax of 35% A.V. Duties paid in paper are to be multiplied by 3.

Jugo Slavia:
- Cars, motorcycles and parts ... 30% A.V.
- Trucks ... 20% A.V.

There is a 10% surtax on luxuries.

Netherlands:
- Cars, trucks and motorcycles.. 5% A.V.

Norway:
- Motorcycles (motors are dutiable separately), per 100 lbs.. $487.22
- Automobiles of all kinds including motorcycle side cars ... 18% A.V.
- Motors, including motorcycle motors ... 15% A.V.

Portugal:
- Cars and trucks complete ... $129.60 each
- Cars and trucks incomplete, with motor ... 75.60 each
- Motorcycles ... 54.00 each
- Surtaxes:
  - Cars complete:
    - Up to 18 hp. ... 540.00 each
    - Over 18 hp. ... 1,080.00 each
  - Cars incomplete:
    - Up to 18 hp. ... 270.00 each
    - Over 18 hp. ... 756.00 each
  - Incomplete bodies ... 334.80 each
  - Trucks—Complete or not ... 129.60 each
  - Motorcycles ... 54.00 each

Import duties and surtaxes in Portugal are payable in English exchange, one-half being converted at normal rate and one-half at current exchange rate.

Roumania:
- Cars, trucks and motorcycles, weighing each:
  - Less than 220 lb., per 100 lb. 7.63
  - From 220 to 550 lb., per 100 lb. 6.36
  - From 550 to 1100 lb., per 100 lb. ... 5.08
  - From 1100 to 2200 lb., per 100 lb. ... 3.81
  - Over 2200 lb., per 100 lb. ... 2.54

These duties are to be increased five times.

Spain:
- Motorcycles and parts (including motors) per 100 lb. ... 78.62
- Chassis, with or without motor weighing, net:
  - Not over 2200 lb., per 100 lb. 26.31
  - More than 2200 lb., per 100 lb. 31.54
- Cars—with or without motors in addition to the duty on chassis:
  - Open ... $115.80 each
  - Closed ... 185.28 each
- Trucks, per 100 lb. ... $13.13

(A new tariff is to be issued at an early date.)

Sweden:
- Motorcycles (complete) ... $16.08 each
- Vehicles with or without motor, chassis wheels with rubber tires for such vehicles ... 15% A.V.

Switzerland:
- Motorcycles—not covered with leather or upholstered, per 100 lb. ... $4.36
- Motor vehicles, including chassis, bodies, axles with driving gears, and radiators, not covered with leather or upholstered, per 100 lb. ... $3.49
- Same, covered with leather or upholstered, per 100 lb. ... $6.98
- Motor vehicles, covered with leather or upholstered, per 100 lb. ... $5.22

Turkey:
- Cars, Trucks and Motorcycles. 11% A.V.

United Kingdom:
- Motor Cars and Motorcycles and Parts:
  - General tariff ... 33⅓% A.V.
  - Preferential ... ⅔ of full rate

(In calculating the value, the value of the tires is deducted from total value.)

NOTES

*The "actual duties" include 2% gold surtax and increase due to proportion of duty payable on a gold basis. The calculations are based on a value of 14 cents to the paper milries and are subject to change in accordance with variations in its value.

**Surtax included in each case where a surtax is imposed unless otherwise noted.

Gas and Electric Welding

THE welding of steel, cast iron, aluminum and other metals has become an important factor in industry during the past two decades. Both in the manufacture of machinery and in the repair of breaks much welding is done. There are two general processes of machine welding—the gas flame method and the electric method. Under each of these heads there are a number of distinct processes differing considerably in their details and adaptability. In industrial work where welding of this kind is to be used it is well to make a thorough study of the different methods available to see which one lends itself best to the work in hand. Such a study will be facilitated in the future by two books just issued by the McGraw-Hill Book Co. dealing with Gas Torch and Thermit Welding and Electric Welding respectively. The author is Ethan Viall, formerly editor of *American Machinist*.

Mr. Viall deals with the different gases used in gas welding, namely, acetylene, Blaugas, coal gas, Drigas, hydrogen and thermalene, giving their flame temperatures, ignition temperatures and other physical properties affecting their value as welding fuels. He outlines the field of gas torch welding and cutting, stating that the welding process is used in automobile and airplane construction, in lead burning and in sheet metal work, such as the manufacture of light air tanks, tubing and oil storage tanks. In aircraft manufacture gas welding is used for welding water jackets to the cylinder, valve cages to the cylinder, flanges to manifold connections, of manifolds, spark plug thimbles, tubular frame sections, splice plates, sockets to frame, aluminum crankcases and water tank. In automobile manufacture it is used for welding rear axle housings, defective gears and pinions, manifolds, shafts, steering posts, automobile bodies, tubing used in windshields, crankcases, transmission cases, wheels which are made of stamped-out parts, mufflers, valve stems to valves, rims, repairing crank shafts and frames and extending the frame to convert passenger cars into commercial vehicles.

In the book on gas welding are described the different methods of producing oxygen and the manner of its delivery to the trade, acetylene welding outfits and welding methods. The last part of this book deals with the Goldschmidt Thermit process of welding.

The book on Electric Welding deals in a similar manner with that subject. All methods are divided into two classes—arc welding and resistance welding.

What Do You Know About Your Factory Doctor?

The necessity for a careful selection of industrial physicians is emphasized by Major Magnuson of the Surgeon General's Office. Major Magnuson is associated with the Illinois Industrial Board and is thoroughly familiar with the various phases of medical work in industrial plants.

SEVERAL years ago there was a young man practicing dentistry in a Pennsylvania mining town. He had prepared at a second-rate dental school and had failed three times to pass the examinations necessary to obtain his State certificate. He had many friends in the town, however, and for several years was able to practice, in spite of his lack of license, and to elude the law through the support of his following and political friends.

This man, an incompetent dentist, obtained a position as assistant to the chief physician at one of the largest shipbuilding plants in America, held that position throughout the war and still holds it. He acted in the capacity of a medical man, not of a dentist. He started at $25 per week but has been greatly advanced.

The work of this pseudo-physician was unsatisfactory to the employees almost from the start, and later the suspicion got out that he was not a medical doctor at all but a dentist. Not only did the medical work suffer, but the reputation of the plant among outsiders was seriously affected by it. Had it not been for the excellent ability of the chief physician things might have been in bad shape.

This failure of employers to investigate carefully the qualifications of the men whom they employ as plant physicians is forcefully brought out by Major P. B. Magnuson, of the Surgeon General's Office of the War Department, in an address to the International Association of Industrial Accident Boards and Commissions.

"I don't know," Major Magnuson said in part, "how much the layman is expected to know about the different classifications of medical schools in this country. We have a number of classifications under the American Medical Association, the A-plus school—standing the highest—and the A, B-plus and the B, and these are rated according to their faculty, their equipment, their clinical facilities. Now, it makes a good deal of difference to a man in his education as to what sort of contact he has had during his student days—in the formative period. A man who has gone to one of the schools that we have in Chicago, which we call the "mill" and which the State Board of Licensors has been trying to put out of business for a good while, is not apt to have very high ideals when he comes out of school. He gets a job, usually, as a night surgeon at some large plant to help himself through school, and when he comes out, instead of taking an internship, he goes right into industrial work nine times out of ten.

"Why does he go into industrial work? Principally because, to the average corporation, the doctor is a doctor. The president of that corporation wouldn't take that man on as his own family physician, but it never occurs to him that a cheap doctor is an expensive proposition.

"I would like to tell something that happened to me when I first went into industrial work. I had been with Doctor Murphy of Chicago for several years as his assistant, and upon his advice went over to the stockyards —along Halstead Street—to get a little more experience. I went in to see the president of one of the large corporations and asked him if he didn't want a doctor.

"'No,' he said, 'We have one doctor; we don't need any more.'

"I said, 'How much do you pay him?'

"He said, 'I don't know, but I will find out;' so he called up the claim agent. They were paying the doctor $75 a month. They were being cheated, I think.

"He said, 'What do you want to do it for?'

"I said, 'I want to do it on a fee basis.'

"He said, 'How much will that cost?'

"I said, 'It will cost you $2 for the first office visit and $1 for every other one after that; $3 for the first call and $2 for every one after that.'

"He said, 'That will run over $75 a month.'

"I said, 'I hope so, or I don't want the job.'

"After thinking it over—I had quite a conversation with him—I asked him if he knew anything about his doctor. I said, 'Where did he graduate from?'

"He said, 'I don't know.'

"'What experience did he have before he came to you?'

"'I don't know.'

"I said, 'Do you know who he is?'

"'Well,' he said, 'I know his name is so and so.'

"'Well,' I said, 'Do you think it would save you any money if you had surgical treatment which was a little better than you are getting now?'

"He said, 'I don't know, but I am willing to gamble with you. I will pay you on a fee basis and I will let the other fellow stay here and pay him a salary, and the fellow that has the most business at the end of three months I will let have the job.' He added, 'You are starting out with a handicap, because the boys know this other fellow and they don't know you.'

"I said, 'Maybe that is no handicap; that may be an advantage.'

"So we went to it. At the end of three months I am glad to say I had about 80 per cent of the business. At the end of six months the bill for that one company, on a fee basis, totaled more than $600—the same work the other fellow was doing for $75.

"At the end of the year this was the record: We had had almost ten per cent more accidents than we had had the year before; we had had only one

lawsuit filed, as against thirty-one the year before. There was a total saving of $20,000 in the claim department, and the surgical department expense had been boosted almost $900.

"The training of a surgeon should be brought to the attention of an employer as much as the training of his general manager.

"He should look into the training of the surgeon he employs and the man's character as carefully as he does the general manager's, because it pays in dollars and cents, and, if we are going to talk to a corporation head, we have got to talk in dollars and cents and not in medical ethics, because he isn't interested in medical ethics; he is interested in dollars and cents saving at the end of the year.

"The weighing of medical testimony as it comes before the industrial board from the men who have examined a case and had it under observation is sometimes a rather difficult thing.

"We have tried, in Illinois, to put ourselves in a position so that the employers and employees would have enough confidence in the medical department and the industrial commission to eliminate all expert testimony; to send their case to the commission and to say, 'You tell us how much this thing is worth in dollars and cents.'

"We would like to be able to talk in dollars and cents to the employer and to show him the difference saved in compensation by the supplying of expert surgical treatment and poor surgical treatment; and, to that end, I have a rough surgical report to be filled in by the commission on every case, in order to trace our accident cases down and find out what the dollars and cents saving is per case in certain classes of injuries occurring in industry.

"If we get that information we can say to a company, 'Last year cases treated by men who rate as class A-1 men cost in compensation $350 for certain classes of injuries, on an average. Cases treated by class B men cost $850 per case. The medical treatment paid for class A men cost $75 more per case than the medical treatment paid class B men. Therefore, you have a saving of $400 or $500 per case.'"

S. A. E. Summer Meeting Program Nearing Completion

PLANS for the semi-annual meeting of the Society of Automotive Engineers to be held at West Baden, Ind., May 24 to 28, are nearing completion. Of the technical sessions at this meeting the Research and Fuel Sessions will undoubtedly rank first in point of general interest: Although the visit of Sir Dugald Clerk, the noted British scientist, has been canceled because of illness in his family, his paper will be read and discussed at the Research Session. In this session will also be included a paper by C. W. Stratford of the Associated Oil Company on automotive engine and vehicle lubrication as well as a description by Professor W. E. Lay of the new research laboratory at the University of Michigan to be used in connection with their newly established Bureau of Research Investigation. The paper by Dr. H. C. Dickinson at the Fuel Session will discuss fundamentals affecting passenger car economy. Fred C. Ziesenheim of the Carnegie Institute of Technology will present at this session a paper on the Development of a High-Compression Oil Engine for Automotive Purposes and a description of a new manifold for the Dorris car will be the subject of the paper by George P. Dorris.

Other technical sessions will be devoted to aeronautics, farm power, highway transport and engineering relation to sales. V. E. Clark's paper scheduled for the Aeronautic Session will discuss the economic reasons for the present unsatisfactory status of commercial aviation and contain suggestions of possible remedies. S. H. Philbin will emphasize the necessity of adequate Federal legislation to secure the support of the substantial business man for air transportation. G. J. Mead's paper will criticize the present practice of powerplant installation in aircraft and point the way to probable future development.

The tractor testing work and operation study at Purdue University will be the basis of a paper by Professor G. A. Young. The United States Department of Agriculture has recently spent several months making a survey of the farm tractor under varied conditions, and H. R. Tolley, who has been engaged in this work, will present data resulting from these investigations. It is planned to have the recent progress of the Government highway research work described at the Highway Session. The Economic Status of the Automotive Industry is the title of a timely paper to be read by F. R. Pleasonton at the Engineering Sales-Stimulus Session, stressing the importance of economy of operation in future car designs.

The sports program this year will be one of the most comprehensive ever conducted by the Society, including everything from a tug-of-war to croquet, with appropriate prizes. Golf, tennis and trapshooting tournaments are planned, as well as two baseball series. The ladies will find card parties, clock-golf, croquet and tennis tournaments arranged for them, not to mention the dancing contest that has proved so popular at past meetings.

The reduced-fare plan which has been arranged with the railroads differs from the one in effect at the annual meeting last January. A reduced-fare certificate will be mailed by the Society to its members about May 1. This must be presented when transportation to West Baden is purchased in order to secure a 25 per cent reduction. Round-trip tickets only may be purchased under this plan; no stop-overs are allowed and the same route must be used in both the trip to West Baden and return. A map, which will be mailed with the certificates, will show the area in which this reduced-fare plan applies.

While the meeting at West Baden will open with a session of the Standards Committee on Tuesday, May 24, it is planned to hold a joint session with the American Society of Mechanical Engineers at McCook Field, Dayton, Ohio, on the preceding Saturday, May 21, at which time the members of the two societies are to be the guests of the Air Service. Opportunity will be given for inspection of the Air Service laboratories and flying equipment at McCook Field, and special arrangements for exhibition flights are being made. The session at McCook Field will include a talk by Major Thurman H. Bane on the Future of the Air Service, to be accompanied by motion pictures of aircraft and aeronautic devices in operation.

On Saturday evening the Dayton Section of the S. A. E. will entertain members of the S. A. E. and A. S. M. E. at the Dayton Engineers' Club, the functions including a dinner at 6:30, to be followed by a ball to which members and their wives are invited. C. F. Kettering will make an address at the dinner.

"Bunk" or a Fair Deal? A Discussion of Mental Attitudes

Mr. Tipper discusses how honest attempts at fair dealing by the manufacturer may be regarded as "bunk" by the worker. The worker's point of view must be recognized when information is being presented to him. Ignorance may bring as bad results as deliberate deception.

By Harry Tipper

THE men were filing out of the plant after the day's work and receiving their pay at the pay office on their way out. As each man received his envelope, attached to it was a larger envelope evidently containing some kind of a notice from the concern.

A little group of men who had received their pay were engaged in counting it up and perhaps speculating upon the contents of the other envelope which no one had opened up to that time.

Another man came up to the group with his envelopes in his hand.

"Say, fellows," he said, "what's the dope?"

"Some more bunk from the old man; suppose we might just as well see what it is, any way."

After the man had left the group to go home the old man caught up with him.

"Look here, Bill; I heard you say you supposed this was more bunk. Is that what you really think about it?"

"Why, sure. When you've worked in as many places as I have you will find out that just so much of the stuff they hand you is bunk, pure bunk, that you don't pay any attention to anything they say."

"Well, now," returned the old man, "that's all right, Bill; but you have been here about four months and you have had time to find out what is happening in this shop. Have you found us giving you any bunk?"

The man thought a minute.

"No, now that I think about it, I guess I have not. Everything you handed me has meant something and you stood by it. I guess I got into the habit of thinking everything was bunk, and had not figured out the difference."

"That's fine, Bill," returned the old man, "I am glad to hear that; now if we have been on the square with you you should have been on the square with us. You have some influence with some of these other fellows, and it makes them suspicious when they hear you talking about the bunk we are handing out. Don't you think it would be only fair to let them know what you have found out?"

It was a custom of the old man to stick around the pay office once in a while after the shop was closed, and get next to the man who had a grievance or who indicated that he had a suspicion of the treatment he was getting. It had paid. The family spirit had continued in the organization even when it had grown large enough to employ two or three thousand men and conducted a business big enough to occupy the full time of any leader.

Bill's remark about the bunk illustrates a point of view which is quite prevalent among intelligent workers, and the man who is sincerely endeavoring to be square with his employees suffers from this condition. Even his own executives in their attempt to be fair and to give the worker a proper knowledge of the organization, are likely to address employees through factory house organs or bulletins or in other ways, in inspirational talks, things which look like preachments. They don't appeal to him, the worker, and are classified as mere bunk.

In many establishments the same care for the individual human relations is not evident, and in such establishments the methods employed to communicate from the management to the worker are irritating to him and the methods of expression destroy the interest that might be established or throw doubt on the sincerity of the information itself.

The men talk freely among themselves about these things. They are inclined to suspect the motives of the management and they get into the habit of regarding most of the material from the management as meaningless or as an attempt to put something over.

No man likes to feel that his point of view has been entirely neglected by the boss; every man has some sense of his own worth and some self respect. Every man expects an acknowledgment of his individuality and his individual interest.

A man must be a pretty close friend before we will permit him to preach to us about what we should do or advise us as to our mistakes without resenting it. That is particularly the case where business obliges us to work together and to conceal our resentment to some extent.

A good many of the attempts to establish understanding within the factories have developed into the definite development of propaganda to the men, instead of working out any discussions with them. Many factory house organs published by the management have turned out more copy about the company, its strength and its facilities, the high character of its organization and so forth, than they have about the practical difficulties of the shop and the practical necessities of the workers.

Some house organs in their editorial approach to the worker remind me very much of the politician to whom the colored voter had been listening for a considerable time as he expounded his platform. Afterward the colored man was asked what he thought of the candidate, to which he replied: "He certainly do recommend himself most highly."

A good deal of the material sent from the management to the workers, supposedly for the purpose of establish-

ing the co-operative or family spirit in the organization, is so definitely a high recommendation for the concern that it cannot fail to evoke a similar but stronger comment from the worker who reads it.

The unfortunate part of the matter is the influence exercised upon the attitude of the worker by these experiences. Labor turnover is considerable in most industries; even the skilled workers float from job to job. There is considerable free masonry among men of the same occupation, and the comments arising out of some of these experiences are carried far and wide beyond the area of the establishment in which they exist.

Very few men, even those who are writing to the factory workers through house organs or other contacts between the management and the workers, get out among the men so that they can study the attitude of the worker and his reactions to his own work. This cannot be done by simply going among the men in the shop; the freedom of their conversation is lost as soon as a stranger gets into it and the man who sees his workers only when he is in his official capacity will not get their full reaction unless he has been able to prove by patient acquaintanceship with them, that he respects their confidence and their individual point of view. It is very easy to lose the atmosphere in which influence is created and through which differences are erected when the circumstances of the work removes one from the continual pressure of that atmosphere.

Some years ago I had occasion to write some advertising relating particularly to conditions in the State of Texas. I spent a month in Texas at that time and had been in that State a number of times before. The first pieces of advertising were written while I was in Texas. After I had been back about three months in New York it was necessary to write more of the advertising to continue the campaign. I found it impossible to duplicate the work which had been done in Texas, even though conditions were fairly fresh in my memory, because the suggestion arising out of the pressure of the atmosphere was lost.

Unless we constantly refresh ourselves by contact with various kinds of people, we lose the understanding of their attitude and the reason for their influence. When we do that our attempts to interest them must appear absurd and of little value. A lot of the things which appeal to the worker as bunk are sincere efforts to improve his understanding of business, his capacity as a worker and the co-operative spirit of the plant.

They fail not from lack of sincerity but from ignorance of the man to whom they are addressed. Of course there are many plants where there is no attempt to understand the worker at all, and these plants are always sources of possible dissatisfaction and trouble. Ignorance is responsible for more misunderstanding than the deliberate attempt to deceive, but well-meaning ignorance will be just as certain in its results as the deception created by the deliberate desire.

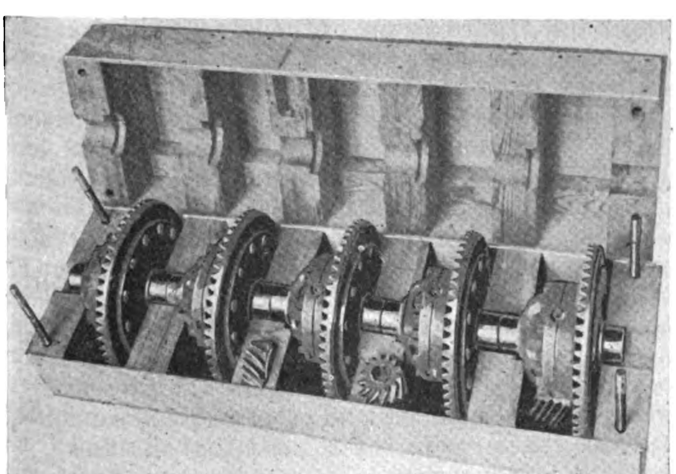
It is worth while that every approach to the factory worker should be carefully considered from his standpoint, so that the things which he should understand are understood in their proper relation.

New Type Returnable Container for Differentials

A NEW type of returnable container suitable for use in shipping five differentials has been developed by the Forest Products Laboratory of the U. S. Department of Agriculture. The new container was perfected after two experimental types had failed to withstand the severe test to which the boxes were subjected.

This new container is not only so constructed as to prevent damage or breakage of any kind, but also protects the differentials from dirt, dust and moisture. The construction of this crate was as follows.

Longitudinals—1¾ x 1¾ x 36 in., Southern yellow pine. Spacing blocks—2⅝ x 3⅝ x 10¾ in., Southern yellow pine. The longitudinals are nailed to spacers with 2-16d cc. box nails at each intersection. Bolts at the four corners are ½ x 11-in. machine bolts. A covering of 3/16-in. 3-ply birch is used.



Returnable shipping container for differentials

Three-ply material is used for covering because it is much more durable under rough handling than single-ply material. Practically any species can be used in this wood covering, but hardwoods, such as black ash, soft or silver maple, red gum, sycamore, white elm, hickory, beech, birch, oak, white ash, or rock elm, are preferable.

Four pieces of a 4½ x 36-in. size, and two pieces, size 9 x 32 in., are required to cover the crate.

The cover is nailed on with large headed nails. Sixpenny cement coated box nails are best to use with plywood of the hardwood groups, but special large head nails are advisable if any of the softer woods are used.

This crate was developed by the Forest Products Laboratory at the request of a large manufacturer of differentials, and can be built as described at a cost of about $3. A similar crate, built along slightly modified lines, can be made at a cost of about $1.75, although this latter type is possibly somewhat less efficient than crate described.

TESTS are being carried out by the Bureau of Standards on special blended fuels at the request of other government departments. Conferences have been held with members of the Fuel Research Committee of the S. A. E. and other organizations, including representatives of the government, looking toward the formation of a definite program for the investigation of various fuel problems of interest in connection with automotive engineering practice. During a recent visit of one of the members of the Bureau's staff to Europe a special study was made of fuel conditions abroad.

Industrial Investigations

ANNOUNCEMENT is made from Washington that President Harding has asked that Congress initiate a movement to inquire into the methods of a number of industrial associations. The idea behind this movement appears to be that the Federal Trade Commission believes that a number of industrial associations are given to price fixing. It is not the idea that these associations actually fix prices for their members, but the members exchange such price information as leads to practically uniform prices on similar products. The rather informal method of reaching a uniformity of price is called the "open price system."

The idea developed by the Federal Trade Commission, and furthered by President Harding, is that these lines of business must be brought to a competitive basis. Most of the industries involved are basic from a cost of living standpoint. They include coal, sugar, lumber, petroleum and similar articles.

The industrial organizations of the automotive industry are not included in this list. It perhaps is somewhat unfortunate that our organizations are not to be investigated, considering what one hears in some quarters. There are persons who cannot see any use for an industrial organization unless it is to fix prices. We believe that the automotive organizations have a much worthier objective than this, and that it would be little trouble to prove this objective in any inquiry that Congress might authorize. While an inquiry of an organization or an industry is not desirable ordinarily, it is sometimes worth while as an opportunity to show clean hands.

The industrial organizations named as likely to be investigated are perhaps to be envied by some others against whom the tongue of scandal has been turned. An opportunity to answer a false charge should always be welcomed.

Better Papers Needed at S. A. E. Section Meetings

MANY of the papers presented at meetings of the Sections of the Society of Automotive Engineers are excellent engineering treatments of the subjects considered, but it happens quite frequently that Section meetings are given over to papers and discussion which center around some single commercial device which the author of the paper is desirous of exploiting in engineering circles. Such papers are no credit either to the Society, the Section or the author. They are, in fact, a liability, for they lay the Society and the Section open to the criticism of allowing itself to be used for commercial rather than strictly engineering purposes, and they leave a bad taste in the mouth of the engineer who attends the meeting in expectation of hearing a genuine engineering discussion and is disappointed when he hears a sales talk, of which he gets a plenty through legitimate channels.

Few things can do a professional society greater injury. It is a thing which every engineering society must continually watch. Engineering ethics condemn it, yet men who call themselves engineers not infrequently "put over" papers open to criticism in this regard. Fortunately, the S. A. E. (the parent Society) has for many years been at least as free from criticism in this regard as any of the large, well organized engineering societies, but the S. A. E. Sections still have much to do in this direction.

The same methods which are used by the parent Society to prevent abuse in this direction can and should be used by the Sections, and the Society should insist upon this being done. Section papers should be requested long in advance of the meeting at which they are presumably to be used, subject to reasonable rules in regard to their acceptance and use. They should then be passed upon by a papers committee, and if acceptable be printed, at least in abstract form, and circulated prior to the date set for presentation among Section members and other engineers qualified to discuss them, with the request that discussion be prepared in advance.

At the meeting the paper should preferably not be presented in full, if printed and distributed in ad-

vance. An outline should be given, and the paper then be thrown open to discussion. Engineers naturally hesitate to discuss a paper which they have not had an opportunity to digest but will gladly do so if given an opportunity to study it. The primary idea of an engineering meeting is to bring on an interchange of ideas, and a meeting in which the discussion is meager and ill considered fails in its main purpose.

Discussion can be controlled to a considerable degree by the chairman, especially if he knows the subject and is as familiar with the paper as he should be. Discussions should be held strictly to the subject and not revert, as it often does, to some more or less irrelevant topic raised by someone in the audience.

Importance of Foreign Trade

FOREIGN trade is to be an important topic at two national business organization meetings which will be held in the very near future. The first is the meeting of the Chamber of Commerce of the United States at Atlantic City next week and the next the Foreign Trade Convention at Cleveland, the week following. It is interesting to note that in both of these conventions the importance of foreign trade to the industrial welfare of this country is the big thought. Also it is interesting to note the attention given to the leaders in automotive export trade in the formation of these programs. Practically all industries in this country are recognizing the importance of the automotive industry as a leader in export affairs.

Recent announcements of the development of the program of the Chamber of Commerce of the United States call particular attention to the group meeting on taxation. One of the chief speakers at this group meeting will be C. C. Hanch, chairman of the Taxation Committee of the National Automobile Chamber of Commerce. Mr. Hanch will present the N. A. C. C. tax program which has been attracting so much attention.

Economics of Tractor Plowing

THE remark has often been made that a farmer purchasing a tractor does not do so, as a rule, because of an expected gain in economy, but because he wants to farm a greater acreage without any additional help or because he wants to be able to get his crops into the ground in time in spite of unfavorable weather. While this statement is undoubtedly true, yet it cannot be denied that many more farmers would buy tractors if they felt certain that by doing so they could reduce their operating costs. Farming in this respect is very similar to manufacturing. Operations on a larger scale permit of increased profits, but a reduction in operating costs allows of an increased profit on the same turnover.

The three largest items of cost in tractor operation are labor, depreciation and fuel. Repairs and interest on investment are smaller items, while the cost of lubricant is rather unsettled. All of these items of cost when reduced to a basis of acreage plowed depend upon various conditions. The labor charge comes especially high in the case of a small tractor. Theoretically it should cost twice as much for labor per acre if the work is done with a two-plow tractor as when it is done with a four-plow tractor. In practice the difference is not quite so great because the small tractors usually operate at somewhat higher speed. The way costs run at present, labor is easily the largest item in plowing cost with a two-plow tractor burning kerosene, whereas with a four-plow tractor fuel is the main item.

This would point to the desirability of increasing the capacity of tractors. However, farms are usually either one-man, two-men or three-men farms; that is, they are of such size that the number of men indicated can do all the necessary work. A larger tractor might save a few days' work in plowing, but would not permit of dispensing of the services of one man and hence would be of little added advantage to the farmer. The only way that the greater capacity of the larger tractor can be taken advantage of is to increase the acreage under cultivation, and this is what frequently happens when a farmer buys a tractor or substitutes a larger tractor for a smaller one. The fact is that the labor supply on the farm is not very flexible and in order to take advantage of labor-saving machinery the easiest way is to increase the scale of operation.

Interpreting Failure

THE proper handling of industrial relationships is a definite aid to reducing costs and increasing production, both as to quality and quantity. Only upon this basis should any labor policy or plan be based; and upon this basis it should be judged. When it is regarded in any other way, it will not be beneficial to either employer or employee, viewed over any considerable period of time.

Until such a conception becomes more widespread, there are likely to be additions to the already long list of ineffective labor policies. When an industrial relations plan is put in as a sop to the worker, lacking any more fundamental purpose, it will fail. But such failures do not indicate that an everlasting battle constitutes the only possible future. They do indicate that sufficient study of the problem has not yet been made to enable us to devise really effective plans.

Spread the Good News

PRESIDENT CLIFTON of the National Automobile Chamber of Commerce has suggested that every car and truck manufacturer shall print on his letterhead this quotation from the President's message:

> The motor car has become an indispensable instrument in our political, social and industrial life.—President Harding.

This is such an excellent suggestion that its promotion should not stop with the manufacturers but should extend to all persons whose chief business is with the automotive industry.

Collins to Head Durant Subsidiary

Cadillac President Soon to Quit Post

Will Resign from General Motors to Direct Durant Manufacturing in Michigan

NEW YORK, April 18—R. H. Collins will resign as president and general manager of the Cadillac Motor Car Co. to associate himself with W. C. Durant in the development of Durant Motors, Inc. He will head the Durant subsidiary company in Michigan which may be known as the Durant-Collins Co. In this capacity he will be in charge of the chief manufacturing activities of Durant Motors, which will be centralized in the Detroit district. The main factory will be located either in Detroit or Flint. Collins is said to be in favor of locating in the former city.

The addition of Collins to the Durant organization is regarded as a strong acquisition. He will have much to say regarding the development of the Durant line and it is thought probable that in addition to the Durant "four" there also will be a Collins car.

Collins has been intimately associated with Durant for years, having joined him in the old Durant-Dort Carriage Co. at Flint in 1907. After remaining there 3½ years he went to the Buick Motor Co. as sales manager. When Durant regained control of the General Motors Corp. after it was taken out of his hands by a bankers' committee, he brought Collins on to New York as his assistant.

Collins remained in this city until Henry M. Leland resigned as president of the Cadillac company in 1917. He then took charge of the Cadillac operations and has conducted them successfully ever since that time. He is credited with having had much to do with building up the reputation for sterling worth which the Cadillac line now enjoys. His most recent announcement in regard to that company was that there would be no change in prices for the remainder of this year at least.

The formal resignation of Collins has not been submitted to President duPont of General Motors but he will retire in a short time and take up active direction of the affairs of Durant Motors in Michigan. Formal denial of the resignation was made by General Motors and also by Collins.

QUASH TEMPLAR SUIT SUMMONS

COLUMBUS, April 16—Service of summons in the receivership suit filed by S. B. Clyburn against the Templar Motor Car Co. of Cleveland in the Columbus courts has been quashed upon orders of Judge Sowers. The suit was also filed against the Templar Fiscal Co. and W. O. Cooper. President Bramley of the company was served while in the State capitol and this was fought on the grounds of illegality. The court held that the service on the president, who is a co-defendant, is legal but that the corporation must be served in Cuyahoga county, which is now being done by the plaintiff. It is expected to have the case finally decided by a commissioner.

Milwaukee Parts Plants Speed to Meet Demand

MILWAUKEE, April 18—Further extension of operating schedules and the steady addition of men to working forces is a feature of the situation in the automotive parts and equipment industries of Milwaukee. The A. O. Smith Co., for instance, which was virtually down on Feb. 1, is now employing more than 1200 operatives, and re-employing more almost daily. This is due to the revival of demand for pressed steel frames, forgings and pressed steel parts for passenger cars as well as trucks.

Makers of ignition apparatus and similar specialties, likewise are enlarging the scope of operations as a reflection of brisk activity in the retail trade which gradually is crowding dealers and in turn the manufacturers. The scale of factory wages is now about 20 per cent lower, on a broad average, than on Jan. 1.

The revival of demand for passenger cars in the last two weeks has been astonishingly good, and while in ordinary years this was to be expected with the progress of spring, nevertheless the extent to which business has expanded is considerably greater than the most enthusiastic dealers had looked for earlier.

HARDING RENOMINATES BAIN

WASHINGTON, April 18—President Harding last Saturday sent to the Senate the name of H. Foster Bain for renomination as director of the Bureau of Mines. It is believed that the appointment will be confirmed. There had been reports current that the Secretary of the Interior might send in the name of another for the position, though recognizing the ability and services of Bain, who had taken the appointment under President Wilson as a duty rather than through any personal desire.

AIR MAIL HELPS COAST TRADE

ROCKFORD, ILL., April 18—The Fyrac Mfg. Co., makers of spark plugs, has brought its San Francisco office one day nearer the factory by making use of the air mail service.

Government Suggests New Tire Standards

Rubber Association Gets Copy of Tentative Specifications for Further Revision

WASHINGTON, April 19—Ways and means for revising government tire specifications with a view to adopting better standards were discussed at a meeting at the Bureau of Standards this week. Specifications for tires which the Bureau had prepared were submitted to the committee present, comprised of tire manufacturers and representatives of the Government and of the District of Columbia, and the various members suggested such changes as seemed desirable.

The committee decided to send a copy of the specifications together with these recommended changes to the Rubber Association of America for its consideration and possible further revision. The specifications and the resulting changes are then to be returned to the Bureau of Standards when a second meeting will be called for further consideration of the problem. When completed, these specifications for tires, the Bureau has announced, will be available to the various branches of the Government, to municipalities, and to private corporations who buy tires in quantity.

The Motor Transport Corps, as a large user of automobile tires, it was stated, is particularly interested in the question of tire specifications, and it assisted by sending announcements of the meeting to the various tire makers. Representatives of the different companies were especially requested to be present and in addition the Government was represented as follows: War, Navy, Treasury, Agriculture, Interior, Postoffice, and Commerce Departments, the Panama Canal, Shipping Board, Compensation Commission, and the Commissioners of the District of Columbia.

OHIO GETS ROAD ASSURANCES

CLEVELAND, April 18—Ohio hereafter is not going to build roads that start nowhere and get nowhere, Fred H. Caley, secretary of the Cleveland Automobile Club, declared at the annual meeting of the organization. "Our club officers have been assured that State and Federal funds are to be systematically expended in the construction of main highways and intercounty roads," he declared. He spoke of the increase in the rates of insurance on theft of cars that had been imposed in the last thirty days and scored leniency in dealing with automobile thieves.

Governor Raps Reserve Bank Action

Harding to Take Up Kansas City Policy

No Instructions Ever Issued to Ban Car Paper—Reserves Show Big Gains

WASHINGTON, April 18—A personal investigation into the relations between the Kansas City Federal Reserve Bank and the automobile industry will be made by Governor W. P. G. Harding of the Federal Reserve Board, as a result of a conference here to-day between the governor and C. A. Vane, general counsel of the National Automobile Dealers Association.

Governor Harding promised Vane that he would visit Kansas City, May 21, and at that time he would take up with the directors of the Kansas City bank the question of policies that have been pursued toward the automobile trade in that district and that he would additionally give a committee from the Kansas City Automobile Dealers Association, which is affiliated with the N. A. D. A., an opportunity of presenting their side of the case. Vane immediately wired E. E. Peake, secretary of the Kansas City association, to get his committee and his information together for the hearing.

At Vane's request, Governor Harding also agreed to address a gathering of representative Kansas City business men, bankers, merchants, automobile dealers and the like, and give a talk on business, economic and financial conditions in Kansas City, Saturday night, May 21. Peake will have complete charge of the arrangements for this meeting.

Decision Rests With Bank

Governor Harding displayed intense interest in the Kansas City district situation. As the result of information given him by Vane, the Governor said that he would tell the bankers of the State of Kansas in a speech he will make at Topeka, May 20, that if they refuse to extend credit to the automobile business or to any other business that they should admit that such refusal is a result of their own decision and not be so cowardly as to hide behind the declaration that they were acting upon instructions from the Federal Reserve Banks or the Federal Reserve Board.

"No such orders ever have been issued," the Governor said. "Commercial paper is either eligible for rediscount or it isn't eligible. We never have ruled against automobile dealer paper. Under no circumstances could we order a discrimination against paper which is legally eligible. Either the member bank will accept it or refuse it. It accepts or refuses on its own decision."

Governor Harding was asked if there had been an improvement in the general credit situation and if a further improvement could be expected. To both questions his reply was "yes." The following question was then put to him:

"If there is a general credit improvement do you know of any reason why the Federal Reserve banks should single out the automobile industry for restriction?"

(*Continued on page* 882)

Packard Bonds Sold Out Two Hours After Offered

DETROIT, April 15—President Alvan Macauley of the Packard Motor Car Co., in announcing that the issue of $10,000,000 bonds by the company had been subscribed in less than two hours after being offered, declared it was simply proof of public confidence in the automotive industry.

The money received from the note issue will be used as working capital, and will permit of increased production, Macauley said. Packard had planned an output of 1000 single Sixes for April and at the beginning of the month was employing 3000 men. With ample financial resources production schedules will be increased rapidly, and it is expected the May output will be double that of April.

While practically all efforts of the company are being directed at production of the single Six, twin Sixes are coming through every day in small numbers. Sales demand throughout the country except in three sections which have not yet recovered from the depression, Macauley said, assures a ready market.

COLLISION RATES INCREASE

NEW YORK, April 15—Following the failure of the automobile committee of the National Workmen's Compensation Service Bureau and the National Automobile Underwriters' Conference to abolish full collision insurance, rates on this cover have been increased 60 per cent. On the $50 deductible cover (where the assured undertakes to pay all losses less than $50) the rates have risen only 40 per cent and on the $100 deductible 33 1/3 per cent.

PIERCE-ARROW AT CAPACITY

BUFFALO, April 19—The Pierce-Arrow Motor Car Co. shipped 280 passenger cars in March, and April schedules call for 300. This is approximately capacity production for the passenger car plant. Sales of motor trucks are slow.

Better Relations, Hope of Dealers

Dealers Look to Detroit Conference to Correct Evils of Present Factory Relations

MILWAUKEE, April 20—President Jesse A. Smith of the National Automobile Dealers Association, at a meeting of the Milwaukee Automobile Dealers Association, said the conference between committees of his association and the National Automobile Chamber of Commerce at Detroit on May 9 will mark the opening of a new era of factory and dealer relations.

Appointed to serve on the N. A. D. A. committee are President Smith, Milwaukee, Hudson-Essex; H. B. Harper, Philadelphia, Overland; F. W. A. Vesper, St. Louis, Buick; A. J. Shorey, Boston, Velie; P. H. Greer, Los Angeles, Maxwell-Chalmers and Hupmobile, and N. H. Cartinhour, Indianapolis, Federal truck.

The dealers believe there are eight subjects which need discussion and that revision of some of the principles of operation is necessary before the selling of automobiles can be satisfactory. In the main these are the subjects discussed at the N. A. D. A. convention in Chicago in February, and they are:

1—Contract cancellation clause.
2—Discounts.
3—Exclusive representation.
4—Used car problems.
5—Parts, discounts and stocks.
6—Service policies.
7—Advertising.
8—Freight rates.

In the correction of evils affecting the dealer, which come under these general heads, the dealer association believes much of the friction resulting from present methods of intercourse will be abolished. Fundamental policies are changed too readily by certain factories, it is felt, and these changes, declare the dealers, do not tend to increase stability in the dealer organization.

AVIATION RISKS DECLINED

NEW YORK, April 16—The association of casualty insurance companies writing health and accident insurance, known as the Bureau of Personal Accident and Health, has adopted the following provision relative to the participation by the assured in aeronautics:

"Nor shall it cover any injury, fatal or unfatal, sustained by the insured in or on any vehicle or mechanical device for aerial navigation, or in falling therefrom or therewith, or while operating or handling any such vehicle or device."

Ford Does Not Need Aid of Banks

Gets Back on Feet and Pays Back Loans

Financial Recovery in Few Weeks Remarkable—Proves Strength of Industry

NEW YORK, April 15—One of the most remarkable financial comebacks in the history of the automotive industry has been staged by Henry Ford. Only a few weeks ago financial circles in this city were asserting positively that he would have to negotiate a large loan at the banks upon the bankers' own terms but no similar prediction ever was farther from the actual facts.

Ford not only has been able to avoid asking the banks for new financing but he has just paid $25,000,000 in notes a few days before their maturity. This wipes out the bank obligations. Besides paying the bank notes standing against him, Ford has discounted his April trade acceptances and last Thursday had $8,000,000 in cash.

It is confidently believed that Ford will have ample cash to meet his trade acceptances for May, but if he is unable to clean them all up on the due dates, Detroit banks have agreed to extend him all the accommodation necessary for a brief period. In addition to meeting his bank loans and merchandise obligations, Ford paid his quarterly income tax instalment before it was due.

The marvelously rapid turnover in cash in the Ford treasury for the past two months has been due in large measure to the fact that his traffic department has worked out a plan under which deliveries which formerly took eighteen days now are made in eight days. Increased labor efficiency has made it possible to operate the plant at approximately 80 per cent of capacity with 60 per cent of the normal labor quota. Overhead costs have been cut to the bone. This process has gone so far as to discontinue some of the telephone trunk lines which ran into his factories and surplus office equipment has been sold.

Lower Material Prices Help

The prices of all materials used in the manufacture of Ford cars have been substantially reduced and this has added a substantial sum in the aggregate to the profit on car sales. These manufacturing economies were what finally turned the scales and they will permit continued large scale operations without further financing except, perhaps, for temporary loans of comparatively small sums by Detroit banks.

The detailed story of Ford's negotiations with New York bankers was told in AUTOMOTIVE INDUSTRIES several weeks ago. The facts did not coincide in any way with the stories printed with so much gusto by the financial publications which seemed to take delight in picturing him as on the verge of ruin. The only negotiations which actually were instituted were on the most friendly basis and he could have had any sum he needed on reasonable interest terms without turning over the control of his factory to bank representatives. He pulled through, however, without any assistance.

Franklin April Output Sold Out on April 9

NEW YORK, April 18 — Franklin Automobile Co. reports that the entire production for this month, totaling 940 cars, had been sold on April 9 and that in addition there remain 420 orders for April delivery which could not be filled. In the first quarter of the year Franklin sold and shipped 2546 cars.

Inventories of the Franklin company were reduced more than $1,250,000 in the first three months of 1920. This is from the peak of $11,100,000 recorded early last fall and the total reduction since that period amounts to approximately $5,000,000. Current accounts and notes payable were reduced 40 per cent in the three months period ended March 31.

In order to increase its present supply of bodies, the Franklin company has reopened its body plant which occupies 65,000 ft. of floor space and has been closed since Dec. 1. Production of bodies is expected to reach 3 a day by June 1.

GEORGIA GETS FEDERAL AID

ATLANTA, April 16—The sum of $550,477.35 has been received by the State of Georgia from the Federal aid road fund during the months of February and March to reimburse the State and counties that are constructing modern roads as a part of the State highway system. There are numerous other projects in operation with county funds or State funds alone, representing several million dollars. Many of these projects will be completed this year, the State highway department announces, giving Georgia one of the best highway systems in the South.

MICHIGAN PASSES THEFT BILL

LANSING, April 16—The Condon bill which establishes a system of abstracts governing all transactions in automobiles which was passed by both houses of the legislature was approved yesterday by Governor A. J. Groesbeck. The measure is one which was offered by the Detroit Automobile Club and other automobile interests in the effort to put a check on thefts in Michigan.

Cleveland Factories Advertise for Help

Papers Carry Ads for First Time in Months — Production Gradually Grows

CLEVELAND, April 18—The Grant Motor Car Co. has given one of the most striking demonstrations in the local field of the progress made in the production end of the automobile industry since the first of the year. The March program provided for production of 350 cars, but a flood of orders came in from all over the country and there were 450 cars made and delivered from the factory.

The schedule for April calls for 450 cars, but the volume of orders the first week in April were in excess of the number received in the same period in March. Predictions are made that the company will be forced to exceed its April schedule by from 50 to 75 cars. The company has made a practice of exceeding its production schedule each month since the first of January.

For the first time in months, help wanted ads are appearing in local newspapers over the signature of automobile companies. Manufacturers are advising former employees to get in touch with them at once, as positions are open.

The Jordan Motor Car Co. has been advertising for the return of its men to their old positions. This company has gradually increased its production each month, and April will be no exception.

The Chandler Motor Car Co. reports better business in April so far than it had during March. The same is true of Peerless, Templar, White and Cleveland. The Merit car, which just recently has been produced in this city, has encountered a nice demand, the management reporting 500 orders received.

On an average, it is estimated that local automobile factories are working on about a 50 per cent of capacity basis, with prospects favorable to a considerable increase in production in the next two or three months.

MICHELIN ADDS TWO TIRES

MILLTOWN, N. J., April 18—The Michelin Tire Co. has added two new cord sizes, a 30 x 3½ soft bead clincher and a 32 x 4. The former size fits all 30 x 3½ clincher rims and is considerably oversize, being actually 31 x 4. The price is $30. The 32 x 4 regular size cord is $37 which is only $3.50 more than the fabric tire of the same make and size. A reduction in the price of the 32 x 3½ cord from $40.70 to $37.50 has also been made. This size fits the Dodge and other cars of similar type.

Ansted Takes Over Spring-Axle Plant

Connersville Factory of Standard Parts to Make Parts for Lexington Cars

CONNERSVILLE, IND., April 18—Ansted Spring & Axle Co. has been organized under the laws of Indiana with an authorized capital of $500,000 by Frank B. Ansted, president of the United States Automotive Corp. and the Lexington Motor Co., and has taken over the property in Connersville formerly owned by the Standard Parts Co. of Cleveland.

Under the plans of the management, all springs for Lexington cars will be made in this plant and, in addition, springs will be made for other car manufacturers. When running at capacity the plant employs between 300 and 400 men and is modernly equipped throughout.

The acquisition of the spring plant is regarded as another step in the expansion of the United States Automotive Corp. and will bring under unified control and central management the making of all major parts entering into the assembly of Lexington cars.

In calling the company the Ansted Spring & Axle Co., the plant is resuming an original title. When first organized by Edward W. Ansted, father of Frank B., Arthur A. and George W. Ansted, it was called by this name until merged with other plants under the name of the Western Spring & Axle Co. Edward W. Ansted was vice-president of this company until its sale to the Standard Parts Co., just before his death in 1916.

Ansted Finds Business Coming Back Sanely

INDIANAPOLIS, April 18—Frank B. Ansted, president of the Lexington Motor Co. at Connersville, Ind., declared that "business is coming back along sane paths and through legitimate channels," in speaking at a reception given in his honor at the Connersville Country Club. "We are recovering under a sound monetary system," he said, "and although the processes of recovery must be slow, they are being furthered on safe grounds."

The occasion for Ansted's address was upon his return from a two months' tour of the West which took him to all the principal cities of the Western states and Pacific Coast. His trip was made for the purpose of studying business conditions.

KING WOULD PROBE ROADS

WASHINGTON, April 18—Senator King of Utah has introduced a resolution authorizing the appointment of a special committee to investigate Federal aid expenditures in the construction and maintenance of highways throughout the country. The Senator reflected the opinion of President Harding as expressed in his address to Congress, that there had been wastefulness in the distribution of Federal monies. It is pointed out that sums aggregating more than $266,000,000 have been expended since July, 1916.

The Commission would be authorized to conduct hearings in all sections and in places where complaints have been made of political patronage on government money.

Indiana Plants Show Increased Activity

ANDERSON, IND., April 16—Automotive industries here have shown some slight improvement in the month. The Remy electric division, General Motors Corp., is now employing about 1300 men, according to information this week. This is about 33 per cent of the normal force. The plant has been working on about 10 per cent basis for a number of months.

Laurel Motors Co. is working about half a force. It is filling motor block orders for one or two standard cars. Officials of the company assert they have sufficient business in sight to make them certain of almost normal production after May 1.

The Bull Tractor Co. is in the hands of receivers and developments are uncertain at this time.

Colonial Tire & Rubber Co. and the Quality Tire & Rubber Co. are still shut down and none of the officials reached would commit themselves to statements. Both companies are said to be in fair condition that will permit them to resume operations if the tire consumption produces a market. Inventories were liquidated some time ago.

Government Undertakes Farm Equipment Survey

WASHINGTON, April 18—The division of rural engineering of the Department of Agriculture has begun a compilation of statistics of the production and sale of farm operating equipment, a subject on which there is comparatively little information of a reliable character. No such comprehensive efforts have been undertaken heretofore. A questionnaire will be sent to all manufacturers requesting information on the number of machines manufactured, their total value, the number sold in the United States and number exported. One division of the questionnaire includes tractors and traction engines. The survey is expected to give accurate information on the relative demands of domestic and export trade.

TO OPERATE MEXICAN PLANES

TAMPICO, MEXICO, April 15—The Eastern Mexican Aviation Co. has been formed in Tampico under the management of R. H. Maloney and will operate planes in and around this city and between Tampico and the City of Mexico, San Luis, Monterey, Vera Cruz, Tuxpam, Matamoras and other cities.

Hart-Parr Suspends Tractor Production

Finds Conditions Unfavorable for Manufacturing—Will Clear Off Unsold Stock

CHARLES CITY, April 18—The tractor plant of the Hart-Parr Co. has suspended operations for an indefinite period. Notices posted at the plant state that it seems unwise to continue manufacturing under existing conditions with a large number of tractors on hand. Business is sound, but it is quiet at this time and buying is extremely light. The company will retain many of its superintendents and foremen who will look after the plant while it is closed. Resumption of operations is expected within the next 30 or 60 days.

Checks for their share of the profits for 1920 were distributed by the Hart-Parr company on March 18 to employees eligible under the continuity of service participation plan. This plan was announced more than a year ago to apply to those supervisional employees who had been in continuous service for two years or more prior to Jan. 1 last. Checks ranging from $10 to more than $500 were distributed. This plan is said to have resulted in much closer co-operation with the company on the part of the workmen.

The balance sheet of the company for the year ended Dec. 31, showed assets of $3,102,519, including $215,000 in cash; $94,000 in certificates of indebtedness; $10,000 notes receivable; $14,000 in trade acceptances; $245,000 in customers accounts, and $1,144,000 in merchandise inventory. The current liabilities included only $226,000 in accounts payable and $60,000 in mortgage bonds payable.

TO BUILD NEW BYARS TRACTOR

WICHITA, KAN., April 15—A new farm tractor designed by Edgar Byars, one of the original designers of American tractors, will be manufactured in this city by a company which will be organized by the designer. The Byars is an all-purpose tractor; the width of tread is adjustable from 46 in. minimum to 90 in. maximum. A new method of attaching lugs is provided; a simple gearing provides a positive square turn either right or left, and the speed on turn is the same as at straight going.

INDIANA S. A. E. MEETING SET

INDIANAPOLIS, April 15—The Indiana Section of the Society of Automotive Engineers has arranged to hold its next meeting April 29, at the Independent Athletic Club, this city. A six o'clock business mens' dinner will be served, after which the regular meeting of the Section will be held. The subject for discussion will be a paper on "Chassis Design." There will also be a four reel film on "The Making of Petroleum" gotten out by the Bureau of Mines

March Makes Record in California Sales

Southern Part of State Reports Exceptional Selling with Demand Increasing

LOS ANGELES, April 18—Indications are that the month of March established a new record for motor car and truck sales in Southern California. A recapitulation of car and truck registrations issued to-day shows 6259 cars and 747 trucks were registered during the month. This applies to new vehicles only and does not include motorcycles and tractors. There is no reason to doubt the authenticity of the report, and if it is correct it means that more new cars and trucks were sold last month than ever known before.

Ford deliveries came through with a bang during March, and of the totals 2820 cars and 407 trucks were of this one make. There are ten counties in Southern California and there was a liberal increase in sales, in all counties, with the biggest addition in Los Angeles city and county. From this city alone 4010 new cars were registered. The next big sensation of the registrations is the number of Studebakers sold. The figures credit Studebaker with 345 registrations, and this car led everything in its price class. Next to the Ford the Chevrolet was the biggest seller.

Truck registrations were particularly heavy. The registrations show that next to the Ford and Dodge came the Mack, which distanced all of the exclusively heavy-duty trucks. The sales of Macks show truck business outside of Los Angeles was exceptionally brisk, as 28 of a total of 41 were registered from elsewhere than this city.

Dealers assign the increasing number of motor vehicle sales to a return of confidence upon the part of the public, heavy advertising and consistently hard work. There has come an awakening to the fact that business has to be dug up and those who are driving the hardest are the ones who are getting results. To date this month indications are that April will prove even better than March.

MAXWELL PLANT ORDERED SOLD

DETROIT, April 18—A final court decree directs the sale at public auction of the Oakland Avenue plant of the Maxwell Motor Co., Inc., on May 12. The minimum bid acceptable is $10,925,000 under the court order. The sale will be a part of the reorganization plan under which the Maxwell company will be merged with Chalmers.

TO BUILD KENTUCKY REFINERY

LOUISVILLE, April 18—Construction of a new oil refinery, with a daily capacity of 1500 bbl., will be begun within the next thirty days by the Dixie Belle Refining Co. The new refinery will cost about $500,000 and will be built to convert crude petroleum into kerosene, gasoline and lubricating oil. The Dixie Belle Refining Co. does not itself own the wells from which this crude petroleum will be drawn, but will purchase it.

Construction of the refinery is expected to require five or six months for its completion. After the refining of oil has been begun the company will sell its products through the Kentucky Consumers Oil Co.

Premier Reorganization Brings New Confidence

INDIANAPOLIS, April 15—Work of reorganizing the old Premier company into the new Premier Motor Car Corp. is progressing rapidly, according to B. H. Miller of this city, who represents the creditors of the organization, among which is the Fletcher American National Bank. The company has been incorporated under Indiana laws, the corporation having taken over the Delaware corporation. By this method it is possible to add about $500,000 of new money. Under the new organization J. A. Price has been named president; I. F. Schaeffer, treasurer, and M. A. Whipple, secretary. Schaeffer is the only director remaining from the old organization.

Men back of the organization, including Miller, are more optimistic than they have been for some weeks past concerning the future of the corporation. Miller says it begins to look as though the company would pull itself together and get back on its feet in good shape. A. E. Doty, the new sales manager, has begun work and according to Miller, results already are being shown. Fifty cars have been sold during the past two weeks and to-day orders were received for twelve cars and thirteen were shipped from storage.

Studebaker Increases Light Six Production

SOUTH BEND, IND., April 18—Production jumped to 125 cars a day on the Studebaker light six this week. This brings the new plant within sight of its designed capacity of 150 cars a day which it is expected to reach in the near future. Vice President and General Sales Manager Biggs of the corporation said that it has been impossible to meet delivery requests for some time, and that production is steadily being built up to capacity. He believes that the present increase in sales is based upon a sound foundation and that there is every indication that it is permanent.

IOWA ENGINEERS MEET

WATERLOO, IOWA, April 16—A meeting was held here yesterday with the object of standardizing certain parts of stationary and portable gasoline engines, and similar manufactured products, as has been done in the case of automobiles, and other automotive products. R. S. Burnett, manager of the Standards Committee of the Society of Automotive Engineers of New York, represented the Society at the meeting.

Kansas City Trade Reacts Temporarily

Slowness of Farm Products to Move Delays Steady Business Progress

KANSAS CITY, April 18—Nearly every line of merchandise suffered a reaction the second week of April. Manufacturing, wholesaling and retailing were all on a lower level than the week previously, and much lower than the average for March.

Automobile sales showed a like reaction. The trade during April has been spotty. Sales rise for a day or so, and then fall—apparently all dealers having the same experience day by day. Wholesale trade continues extremely slow. Retail trade has on the whole been good, with movement close to normal, until the past few days. Declines in farm product prices constitute one factor.

Truck sales have declined more radically than passenger car sales. The farm demand has not yet arisen to constitute a balance for offsetting any temporary reaction in demand from city sources.

"Normal movement will come when surpluses are disposed of," said a Kansas City business man. The farmer must move his stocks on hand, and forget the prices he gets for them; merchants must move their surpluses—and the consumer must use up his surplus, and get normally into the market again, before trade can go ahead steadily.

It is reported that cheaper cars have a far greater demand than more expensive ones. A low-priced car dealer in Kansas City has been buying cars by wire from country dealers to meet his local demand for immediate deliveries.

COURT CONTINUES RECEIVER

INDIANAPOLIS, April 18—The petition to have a new receiver appointed in the place of William R. Hirst for the VanBriggle Motor Device Company, manufacturers of shock absorbers and trailers, was refused by Judge A. B. Anderson in adhering to his rule that a creditor who has accepted the appointment of a receiver for an insolvent in a State Court cannot come into the Federal court and have another appointed.

Bids have been received by Hirst on the company's plant which will not be made public until some time next week.

TO REVIVE ITALIAN RACE

NEW YORK, April 15—The famous Grand Prix of Italy will be revived during 1921 under the auspices of the Automobile Club d'Italia. Details are being arranged by the Automobile Club de Milan and the race will take place this summer on the same lines as the Grand Prix de France. In connection with this important event the light-car Grand Prix will take place at Brescia at the same time.

Alabama Business Rallies in Cities

Dealers Heavily Stocked, However, Due to Drop in Country District Demand

BIRMINGHAM, ALA., April 18—Motor car sales in this iron and steel center of the South, with a population of 178,000, are from 50 per cent to 60 per cent of normal in standard makes, and have shown a very great improvement in the last two months. With the exception of Fords and one or two other makes there is a 30-day supply of new cars in the territory and at least a 90-day supply of used cars.

One reason why new car sales are so good is that 75 per cent of the dealers are trading too heavily and making foolishly large allowances on trades. Some of them have had to do this because the banks are insisting that they move stocks and reduce loans. A bank calls on the dealer to pay a certain amount on a certain date, and to raise the necessary cash the dealer makes too large an allowance on new car sales. This is one of the reasons why the city is overstocked with used cars.

The market for used vehicles is not as strong as usual because the steel mills are not running at more than 50 per cent of capacity, and as a consequence many of the workers who might otherwise buy are out of the market. This condition prevails to a greater extent among the miners, because the mines are working at only 20 per cent of capacity. The Buick dealer reports that whereas he formerly sold 50 per cent of his cars to steel workers this business has ceased and sales are being made to salaried men and others not connected with steel.

Wholesale Trade at Standstill

Birmingham distributors generally have all of Alabama as their wholesale territory, and in most of this territory business is at a standstill. They have had no wholesale trade since September. Many of the territory dealers are liquidating their business as rapidly as they can and a considerable number already have closed up their affairs. Liquidation in many instances has been because of the fact that dealers were loaded too heavily with cars. They were financed by local bankers up to 80 per cent of the value of the cars, and these loans have been called because the same bankers financed the farmer for his 1920 crop.

The farmer has not sold his cotton, and for this reason has been unable to meet his loans. Most bankers are endeavoring to finance the farmer for his 1921 crop, and they must have cash. Many of the country dealers would gladly lose the 20 per cent they paid to the distributor for the cars, but the banks will not take over the automobiles and the dealer is forced to continue in business until he can dispose of them.

The cotton farmer will be out of the buying market for at least a year, and perhaps longer. There is little probability that he will be able to buy in September or October when the new crop comes in as he still has his 1920 crop on which the bank financed him, and if he disposes of it at the present price of 11 cents he will not be able to pay the bank which loaned as high as 14 cents a pound. In addition to his bank obligations, the cotton farmer has yet to pay for provisions, clothing and other supplies purchased from the town merchant. Many farmers already have made loans on the 1921 crop. The merchant is still giving credit on provisions and clothing. It is estimated that the cotton acreage this year will not exceed 50 per cent of last year.

Look for Fall Business

The conservative motor car dealer does not expect much business this fall in the rural sections and does not look for normal conditions before July or August, 1922. There are several counties in the State where the bankers are telling the farmers they will make loans on the 1921 crop provided motor cars are placed in warehouses. The only apparent reason is that the banker desires to force economy in every way.

Another unhappy phase of the situation for the motor car dealer is that banks are being compelled to take over cars on which farmers cannot complete their payments and turn them back to the dealers. This condition does not prevail to so great an extent in Birmingham, Montgomery and Mobile.

Some of the distributors have dismissed their wholesale organization and are centering their efforts on business in the cities and larger towns of the State. They have found that many of their salesmen are helpless now that an era of competition has returned and real salesmanship is necessary. Conditions in Birmingham probably are better than in any other city in the State notwithstanding the slump in the iron and coal industries.

Bank deposits in the cities have held up well but have fallen heavily in the country sections. There is a feeling that a great deal of money has been drawn from the country banks by farmers and hoarded as the banks have been unable to trace investment of these funds. Savings deposits in Birmingham banks have increased, and while bank clearances have fallen off 20 per cent, this is explained by the shrinkage in the value of commodities.

Cotton Sections Worst Hit

The southern section of Alabama is dependent largely on cotton and is in worse condition than other parts of the State where crops are more diversified. Mobile is surrounded by large vegetable areas from which shipments are made to northern cities during April, May and June. This should be a good time to exert sales efforts in this district.

Montgomery is a cotton center and business there is very slow.

Texas Finds Sales Improved on Farms

Dealers See Million Dollar Field When Normal Conditions Are Restored

DALLAS, TEX., April 16—The motor vehicle business in Texas was slightly improved this week, though dealers complained that the business was not up to the standard and said it probably would not be for several months. There was an increase in tractor sales and there was also an improvement in the automobile lines. Some dealers were reporting increased business in cream separators to farmers and small dairymen, and others found a good field for washing machines.

Financial conditions appeared to be improving and the dealers assert when these are back to normal the business would grow by leaps and bounds. The dealers declared the people are awake to the need and necessity of motor vehicles and motor implements, but are not buying them so readily because they can do without them for a time. Some of the dealers who are conducting intensified sales operations, coupled with considerable terms, are disposing of their goods about as easily as they did four years ago.

Not a dealer in Texas but realizes that people are alive to the advantages of motor vehicles, want them and are going to have them sooner or later. They are selling about what the people are able to assimilate under present conditions, and are awaiting the time when business will hum. As they put it, Texas is a virgin field for the business and one which will mean the spending of millions for motor vehicles and machinery in the next few years.

OHIO CODIFICATION DEFEATED

COLUMBUS, April 18—The bill introduced in the Ohio Legislature providing for a codification of all automobile laws of the state, has been killed by the house committee to which it was referred. This bill sought to codify all of the laws and to make radical changes and was opposed by the Ohio Automobile Association, an owners association. On the other hand the Ohio Automobile Trade Association favored the bill but the opposition was too strong.

REORGANIZE WRENCH COMPANY

WORCESTER, April 18—Reorganization of Walden-Worcester, Inc., manufacturer of wrenches here, is in progress, and in the meantime the business is being successfully operated by three receivers, William Woodward, Frank Kilmer, and Representative Edwin G. Norman. The new plant is being operated at normal capacity, running about 50 hours a week with a working force of more than 100. Under the proposed reorganization, it is expected there will be a number of changes among the officials.

Harding to Take Up Kansas City Policy

Credit Scrutiny to Be Lessened This Year—New Crops to Cost Less

(*Continued from page* 877)

The Governor, after first declaring that there never had been any singling out by the Federal Reserve Board, said that so far as he knew there was no reason why the automobile business should feel any special restrictions not equally applicable to other lines of industry.

The Governor was then asked if the Federal Reserve banks and in turn the member banks were calling upon borrowers for new credit statements. To which the Governor replied:

"We call for credit statements annually. I think this can be said safely now:

"CREDIT STATEMENTS ARE NOT GOING TO BE SUBJECTED TO THE SAME DEGREE OF SCRUTINY THAT THEY WERE A YEAR AGO."

Asked as to whether there would be a lowering of the discount rates, the Governor said:

"The average reserves in all the banks of the country is around 53.7 per cent. On April 16 the reserve in the Boston bank had been built up to 71.3 per cent. This is the ratio of total reserves to deposit and Federal Reserve note liabilities combined. Now the rate in the Boston district has been lowered. I leave it to your own judgment as to what will happen in the other districts when this ratio has been built up. It is largely mechanical and governed automatically."

In his conversation with Vane, Governor Harding said, among other things, concerning the general business situation:

Shortage Changed to Surplus

"This is no time to conduct a 'wake.'

"We thought a year ago that there was an actual shortage. The cry was 'Increase Production.' Consumption, however, has been reduced so that whatever over-production there is, is relative, rather than absolute. About a year ago it began to be noticed that the insistent demand for various commodities was falling off. From that position we advanced a step to a point where we found that there was no shortage as we thought, and then it developed that we had a surplus. While last year was one of physical plenty and the crops were bounteous the consumers' demand fell off. That is due primarily to the lack of a potential buying power in other countries."

"The reserve position of the Federal Reserve banks is now 53.7 per cent, against 42 per cent a year ago. This means a great deal."

"New crops ought to be produced at much less cost than crops of a year ago."

"People must make up their minds (in some sections) that they must get some capital loans—they may even have to mortgage property in order to tide the situation over."

"The agricultural sections are much interested in peace. We need an official peace and we need a cessation of hostilities and general pacification all over the world."

"Those people who have solved all their problems are in the cemeteries."

"Some of us fancied we had prosperity 18 months ago. Didn't we know conditions then were too good to last?"

"In nature we have the storm and the sunshine. There are some regions of perennial sunshine—Death Valley and the Sahara Desert."

"Now, so far as credit is concerned. Times like these are not the times when banks make new losses. In a period such as this banks must realize that they have a loss on transactions previously made, but it is a time also to be constructive. *It is safer to lend money now on present valuations than it was a year ago, and I think banks generally realize that what we want to do is to hold our domestic situation in hand, avoid drastic action of any kind, formulate constructive plans to live and let live and go the limit in extending renewals to those whose character and business ability show that they are entitled to accommodation.*"

The Governor's parting message to Vane was that:

"It is time to end the buyers' strike."

Boston Federal Reserve Reduces Discount Rate

WASHINGTON, April 18.—The Federal Reserve Bank of Boston has reduced its discount rates from 7 per cent to 6 per cent. This does not mean of necessity that changes will be made in the rates of other Federal Reserve banks, nor is it indicative of any contemplated changes, according to Governor Harding. Authorization of the reduction was granted because of the lessened demand for credit in the Boston district and because of the strength of the bank's reserves which have been as high as 70 per cent in the last six weeks. As credit conditions improve in other districts, it is not improbable that similar action will be taken.

SHERIDAN SEDAN COMPLETED

MUNCIE, IND., April 19—The first sedan from the production chain of the Sheridan Motor Car Co. has been wheeled out of the plant. A few minor changes in appointments will be made, it was said, but the general design and equipment will be unaffected. Production has not reached capacity, but shipments are taking all that present operations can turn out. Sales Manager Wilmoth expressed the fear that they would be oversold in a very short time. Frank Sealand, Cleveland distributor, was at the factory attempting to arrange for a large shipment.

Harvester Prices Cut to Steel Basis

Ten Per Cent Reduction Follows U. S. Steel Action—1920 Biggest Year

CHICAGO, April 18—The International Harvester Co. has announced a straight 10 per cent reduction, effective at once, on products in which steel is the principal raw material. This action is based on the reduction in steel prices announced by the U. S. Steel Corp.

"The reduction of steel comes after our year's production had been provided for and will have no bearing on the manufacturing cost of machines we sell this year," said an announcement by the company. "It does establish a lower replacement cost, and serves as the basis of a price to which our customers are entitled and which we are willing to accept."

The reduction applies chiefly to harvester machines. Reductions of from 10 to 15 per cent on machines made principally of wood and iron were announced on March 7.

The annual report of the Harvester company shows that notwithstanding domestic depression in the latter part of the year and difficulties in the way of foreign trade, its business for the year ended Dec. 31 was larger both in the home and foreign market than any previous year in its history. Sales amounted to $225,000,000, compared to $212,000,000 in 1919 and $204,000,000 in 1918. Foreign sales last year aggregated $60,000,000.

The report shows net profits, after all charges, of $16,555,353, equivalent after preferred dividends to 13.86 per cent on the $90,000,000 common stock outstanding at the end of the year, compared with $12,608,726, or 10.51 per cent on the $80,000,000 common stock outstanding in 1919. In the latter year, however, $7,403,033 was written off to complete a writing off of all war losses. The surplus for 1920, after deducting $10,000,000 transferred for stock dividends last September, was $68,350,741, compared with $71,645,388 in 1919.

The balance sheet shows cash amounting to $12,291,000, net receivables of $56,969,000 and inventories of $131,134,000. The liabilities include $33,153,000 in accounts payable and $11,785,000 in bills payable.

Deere Reduces Prices

MOLINE, ILL., April 18—Deere & Co. have announced a reduction of 10 per cent upon its general line of farm implements, effective immediately. The statement says: "The company's raw materials have been purchased at the higher prices and in its 1921 production receives no benefit of the recent steel reductions. The steel reduction, however, does furnish a new basis of replacement cost and the company is willing to take a loss to benefit dealer and farmer."

Sterling to Start Production at Once

Company Is Chartered with $1,000,000 Capital to Build High Priced Car

CLEVELAND, April 20—The Sterling Knight Motor Co. has been chartered with a capital stock of $1,000,000 preferred and 20,000 shares of no par value common stock to manufacture an automobile using the Knight sleeve valve engine. The car will rank in the high priced class. The vice-president and general manager of the company will be J. G. Sterling, for years engineer of the F. B. Stearns Co., which also manufactures a car using the Knight engine.

Associated with Sterling will be P. H. Withington of Toledo as president and treasurer, and Alonzo M. Snyder of Cleveland as secretary. In addition to the officers, the directors will be Alva Bradley, W. D. Gongwer, J. V. Thomas, C. O. Mininger, R. D. Jacobs and R. H. York, all of Cleveland.

It is understood that $250,000 of the preferred stock already has been subscribed and that payment on it will be handled through the Union Trust Co.

The new company will take over the work carried on during the past year by the Sterling-Knight Syndicate, an organization of Cleveland interests which financed the experimental work on the new automobile. Three cars of six cylinders have been built and tested and were exhibited at the automobile shows in Cleveland and Chicago. The new company intends to begin production immediately.

New Company Formed to Take Over Biddle

NEW YORK, April 20—The plant, equipment and assets of the Biddle Motor Car Co. have been purchased from the receiver by Ralph R. Owen, F. L. Crane of Cleveland, R. W. Stanley and associates, who will continue operations under the name of the Biddle-Crane Motor Car Co. Crane will be president of the company, Stanley, vice-president, and Owen general manager. Stanley was associated with the old company.

Operations will be continued with practically the same models as those previously built by the Biddle company and it is the purpose of the new owners to turn out a small, high class job which will sell at around $3,400. No attempt will be made to reach quantity production and if 200 cars are built this year the new owners will be well satisfied.

The Biddle car enjoyed an excellent reputation and the failure of the company was considered unfortunate. The inventory which was on hand at the time the receiver was appointed was adequate to complete a considerable number of cars except for two or three essential parts. These are now available.

NEWS BULLETINS

MEXICO CITY, April 20—(Special) Because of transportation difficulties, the automobile exposition, which was to have opened today in the National theater, has been postponed for ten days.

SHARON, PA., April 21—The Sharon Pressed Steel Co., with plants at Ellwood City and Wheatland, Pa., has been taken over for refinancing and reorganization by Harry W. Torney, of Torney & Co., Inc., New York; Albert W. Morris, formerly of the Harley Co., Springfield, Mass.; Arthur E. Swain, formerly of the Crucible Steel Co., Harrison, N. J., and their associates.

NEW YORK, April 21—Directors of the B. F. Goodrich Co. decided here yesterday to pass the dividend of $1.50 a share on the common stock. A. A. Tilney, of the Bankers Trust Co., and Harold Stanley, of the Guarantee Trust Co., were elected directors to succeed A. H. Marks and A. B. Jones, resigned.

NEW YORK, April 21—The directors of the General Motors Corp. were reelected at the annual meeting of the stockholders yesterday.

At the organization meeting of the directors to-day all the old officers were re-elected. This list includes R. H. Collins as president of the Cadillac company.

NEW YORK, April 21—Creditors of the Bethlehem Motors Corp. probably will decide in the near future to wind up the affairs of the company, as proposals for a reorganization have met with little success. A meeting of creditors' committees is being held at Allentown to-day to consider the sale of certain assets, and the same subject will be taken up in Federal court at Philadelphia to-morrow.

Freight Reduction Asked on Trucks Shipped West

NEW YORK, April 18—A plea for revision of freight rates charged by Western railroads on motor trucks was made before the Consolidated Classification Committee here to-day by J. S. Marvin, general traffic manager of the National Automobile Chamber of Commerce. He urged that they be placed on a second-class basis subject to a minimum carload weight of 12,000 lb. This adjustment already has been granted by Eastern and Southern roads. The Western roads charge first class rates on both trucks and passenger cars.

Classification of several automobile and truck parts also was discussed at the hearing. The change in classification is of great importance to manufacturers because it would mean to them a difference of from $40 to $80 and more a carload on trucks shipped to points west of Chicago. The Consolidated Committee has entire control of freight classification under the reorganized system.

Control of Goodyear Passes to Syndicate

Bankers Will Direct Affairs of Company During Life of New Bonds

NEW YORK, April 21—Control of the Goodyear Tire & Rubber Co. has passed from F. A. Seiberling, now the president, to a syndicate headed by Dillon, Read & Co., New York bankers, which has underwritten $30,000,000 first mortgage 20 year 8 per cent sinking fund gold bonds due May 1, 1941.

During the life of the bonds the management of the company, with the right to elect a majority of the directors, will be vested in Clarence Dillon, John Sherwin, chairman of the board of directors of the Union Trust Co. of Cleveland, and Owen D. Young, vice president of the General Electric Co., or their successors, through management stock or a voting trust. Some changes in the present personnel are expected.

The syndicate which has underwritten the bonds, includes Goldman, Sachs & Co., which a few months ago made a temporary loan of $15,000,000; the National City Co., the Guaranty Co., Lee, Higginson & Co., the Chase Securities Co., and Blair & Co. The bonds are offered at 99, and the mortgage provides for the retirement of the entire issue at 120 and interest by drawing by lot $750,000 on each interest date beginning November 1, 1921.

The proceeds of the first mortgage bonds together with the proceeds of $27,500,000 10 year 8 per cent debentures, which will be offered to stockholders, will be used to pay the company's current obligations and to increase working capital. The mortgage provides that the company must maintain at all times net current assets equal to 125 per cent of the entire amount of bonds outstanding.

Approximately 70,000 stockholders and merchandise creditors assented to the plan for reorganization as presented by the bankers.

NEW YORK LICENSE BILL LOST

ALBANY, N. Y., April 19—The bill introduced by Senator Lusk, majority leader in the Senate, which would have increased the license fees for passenger automobiles and motor trucks, was lost in the shuffle in the closing hours of the legislature and did not pass.

The legislature adopted a resolution providing for a committee of senators and assemblymen to sit anywhere in the state and compel the attendance of witnesses preparatory to making a report at the next session recommending changes in the motor vehicle law and remedial legislation.

A bill also was passed transferring the automobile licensing bureau from the office of the secretary of State to the State tax department which will administer the motor vehicle law after July 1.

Willys and Chrysler Not at Odds

Working Together in Perfect Accord They Both Assert

Chrysler Has No Intention of Leaving—Companies Making Good Progress

NEW YORK, April 19—Walter P. Chrysler has not the most remote intention of severing his relations with John N. Willys. The executive vice-president of the great Willys enterprises has no differences with his chief and has had none. They are in thorough accord on all questions of policy. The main object in life for both of them is to bring the Willys-Overland Co. and the Willys Corp. back to their former impregnable positions, and in this endeavor they are making splendid progress.

Many unfounded, exaggerated and vicious reports regarding the relations of the two men and the two companies have been circulated for months, but each has deemed it wisest not to dignify them with denials. In the days when the Willys enterprises, like most of those in the automotive field, were at a standstill, they adopted as their own the old adage that "silence is golden."

Conditions now are rapidly changing. The industry has come to life and business is forging ahead. Willys-Overland is coming back and Willys is at the helm. He has taken the field for a long series of conferences with dealers, distributers and bankers, and the results have been amazing even to his own organization.

Willys has told his dealers the exact truth about the affairs of his company, and at last has come to the conclusion it is time to spike the insinuations that he had stepped into the background and that his relations with Chrysler have been strained to the breaking point.

Never Had Any Differences

His positive and emphatic statement that there never have been any differences between them was made in response to an inquiry from AUTOMOTIVE INDUSTRIES as to whether there was any truth in the report that Chrsyler soon was to join the General Motors Corp.

In this denial, Willys was joined with equal emphasis by Chrysler. They were together in the former's office when they declared without equivocation that there was no foundation whatever for reports of friction between them. Willys asserted there never had been any differences. They sometimes disagreed on questions of policy, Willys said, but he usually was convinced Chrysler was right, although the reverse frequently was true. He asserted he was thoroughly "sold" on Chrysler.

Chrysler declared he was "sold" on Willys and was proud to work for him. He told his chief he had no intention of going with General Motors.

"I know that," said Willys. "We have no secrets from each other."

Willys dismissed as unworthy of consideration the assertion that he had been criticized because he was paying so large a salary to Chrysler at a time when his companies are not in the best of financial position.

White to Reduce Force Until Surplus Is Sold

CLEVELAND, April 18—It was learned here to-day that the White Motor Co., one of the largest truck manufacturing concerns in America will on May 1 reduce its working force from 5000 to 3000 employees. Orders are being received at the plant in excess of the production, but the curtailment in the working force is the result of the policy of the company in keeping up maximum production for months when other similar corporations were either closed or were operating on a greatly reduced schedule.

All last winter, the White company kept its full force of night and day workers going at maximum capacity. There was a slight reduction in hours worked each week after Jan. 1 and later the night staff was combined with the day. That was but a few weeks ago. As a result the company accumulated a large reserve stock of trucks. It is now drawing on these. Hence the curtailment in production.

MOTORCYCLE RATE ADVANCED

NEW YORK, April 16—The London Bureau of the Eastern Underwriter reports a radical revision of motorcycle insurance rates in Great Britain, after what one official calls "two years of appalling losses." The multiplying of accidents, the increased cost of repairs and the alarming number of thefts necessitate an entirely new scale of rates. In consideration of higher premiums, the insurance companies are assuming unlimited public liability risks.

P. O. EXTENDS TIRE SHIPMENTS

WASHINGTON, April 15—Under a new ruling of the Postal Department, automobile tires up to a weight limit of 35 lb. may be sent by parcel post to points in Mexico reached by the railroads from the United States. Tires, likewise, may be sent under the same conditions from Mexico to this country.

Mott Heads Staff to Advise G. M. C.

Will Take Over Work Formerly Devolving Upon A. P. Sloan —New Members Named

NEW YORK, April 18—The following statement was authorized to-day by the General Motors Corporation:

"C. S. Mott, who has been a vice-president and director of General Motors Corp. for some years, has been made chief of the advisory staff with headquarters in the General Motors Building, Detroit. Mott will take over all duties which heretofore devolved upon Alfred P. Sloan, Jr., New York, who found it impossible to devote the time necessary to the corporation's affairs in Detroit. The advisory staff being located in Detroit, it was necessary for the vice-president in charge of that staff to be similarly located in Detroit.

"The advisory staff consists of a board of experts in the various sections of the corporation's activities who can be called upon when desired by the various operating divisions for consultation and advice upon broad and fundamental matters which each division could not attempt to develop for itself. Mott will be responsible for this organization.

"The appointments on the advisory staff made up to this time consist of: A. B. C. Hardy, director purchasing section; H. L. Barton, director of manufacturing; Eric L. Bergland, director of power house and building construction and design; Norval A. Hawkins, as already announced, recently joined the advisory staff as director of advertising, sales and service; C. F. Kittering, who is also a vice-president of the corporation, is a member of the advisory staff in charge of the research engineering and design section, with headquarters at Dayton, Ohio."

MULLINS TO MOVE BODY PLANT

NEW YORK, April 19—Because of labor trouble in its plant in Salem, Ohio, the Mullins Body Corp. announces that it has taken an option on a fully equipped plant at Detroit and will be in a position to start operations there on a large scale in a short time. The labor difficulties developed at Salem a month ago after the corporation announced a nine hour day to which the men objected and were locked out. Subsequently every large plant in Salem adopted the same policy, and as a consequence the five largest factories of the town are closed. The Mullins corporation has a large number of orders on hand.

Industry to Oppose Road Tax Bill

Fears Perpetuation of Excise Burden

Struggle Expected Because of Senate Backing—Work on Tariff Measures

WASHINGTON, April 19—Introduction of the Stanfield bill providing for a Federal highway fund through the segregation of revenues derived from automobile taxes has brought new complications for the industry. It is understood that the National Automobile Chamber of Commerce is opposed to the principles contained in the Stanfield amendment because it believes it would practically perpetuate the war-time taxations which have of late proved extremely burdensome.

Indications are that the industry will have a fight on its hands in opposing this proposed fiscal legislation because it has the indorsement of leaders in the Senate Finance Committee.

This amendment transcends in importance other tax proposals, principally because it may eventually block efforts of the organized industry to have the excise tax repealed. It is stated that the taxation committee of the N. A. C. C. will adopt a practical program opposing this plan. It is evident, however, that it must proceed with caution if it is to adhere to the plan for a national highway system.

The Stanfield amendment reads as follows:

Stanfield Bill Feature

"That on and after July 1, 1921, the receipts from the taxes imposed by subdivisions (1), (2), and (3) of section 900 and subdivision (11) of section 1001 of the Revenue Act of 1918 shall constitute a separate fund in the Treasury, to be known as the "Federal Highway Fund," to be used only for the expenditures authorized by law incurred in building or aiding the several States and territories in building public highways. The Secretary of the Treasury may use such fund for other purposes, but such fund shall be reimbursed for any portion thereof so used.

"Section 2: That when used in this Act, the term 'building' includes the selection, designation, location, survey, planning, improvement, maintenance, and all other necessary expense incident thereto, as well as the construction of such roads, trails, or highways."

Senator Stanfield, in a statement to AUTOMOTIVE INDUSTRIES said:

"If this becomes a law it will provide a continuing fund limited only by the amount of revenue this source will produce annually. A tax of three per cent is now imposed upon motor trucks and five per cent on automobiles, motorcycles and tires. For the year ending June 30, 1920, the revenue collected from this source amounted to $145,963,039.62. It is stated there are 2,500,000 miles of public roads in the United States of which about two per cent are of national or interstate importance, ten per cent State and eighty-eight per cent county and district roads."

Would Segregate Taxes

In segregating this fund, it is intended to provide any additional amounts in provisos, if necessary, that the war tax is not to be included in the price bill. In other words, it is the intention of the Oregon Senator to make the manufacturer pay the excise tax directly and not pass it on to the owner. It is said that he has a measure pending in the drafting committee which would require the manufacturer to make tax returns separately and not include other Federal taxes. By this provision it is expected that simplification would result in accounting for the amounts due the Federal highway fund which would be created under the bill. The tax on company earnings, etc., would continue to be used in the general tax fund.

Senator Penrose announced to-day that tax hearings before the Senate Committee on Finance would start after the Senate had disposed of the emergency tariff and its companion measure, the anti-dumping bill. Hearings have been held here this week on the affiliated measures and a bitter fight is anticipated when the bill is reported out of the Finance Committee. Senator Penrose has announced that he will personally direct the campaign on the Senate floor. Hence, it will not be possible to hold hearings on Internal Revenue revision for several days.

Discussions to Open in May

If the well laid plans of Senate leaders are fulfilled, the tax discussion before the committee will begin about the first week in May. Senator Penrose, however, does not expect to have the tax measure written into the statute before September. Therefore, whatever measures are finally adopted by Congress must of necessity be largely retroactive, as the fiscal year will be well under way when the revenue bill is enacted.

The anti-dumping bill, which passed the House as part of the emergency tariff, has met considerable opposition in the Senate, particularly as to the exchange items. George Davis, chief special agent of the United States Customs Service, has suggested that the duty should be based on prices paid by American importers abroad, and the amount thus determined could be converted at current

Buick Discontinues St. Louis Operations

All Machinery and Equipment Moved to Flint—G. M. C. to Retain Plant

ST. LOUIS, April 19—It was learned to-day that the Buick plant of the General Motors Corp. in this city is being moved to Flint, the home of the Buick company. The transfer of the equipment and much of the machinery has been going on for several days. All except office equipment has been moved, it was said at the plant to-day. The purpose of the move could not be learned from L. E. Kurtz, general manager. "We are not yet ready to make any announcements," he said.

J. S. Hunt, manager of the Chevrolet plant which occupies half of the $4,138,000 structure, said Buick cars will hereafter be manufactured exclusively in Flint, where General Motors already has its largest Buick plant. He was unable to say at this time what use will be made of the St. Louis plant. He denied that the building would be used by any other than the General Motors Corp.

Construction of the General Motors plant on Natural Bridge Road started in April, 1919, on 40 acres of a 105-acre tract. The plant had a large assembly capacity and employed 1200 men when running full force.

G. M. C. Confirms Discontinuance

NEW YORK, April 20—Confirming the discontinuance of operations at the Buick St. Louis branch, General Motors Corp. to-day issued the following statement:

"The Buick Motor Co. has removed all machinery and equipment from St. Louis and will for the present concentrate all manufacturing operations at Flint. Plans for the future utilization by General Motors Corp. of the plant at St. Louis have not been formulated."

Indianapolis-Chicago Air Service to Start

INDIANAPOLIS, April 15—Aerial transportation service between Indianapolis and Chicago starts April 15, according to announcements by Dr. John K. Kingsbury of the Indianapolis Aero Association, for which a charter was filed in the office of secretary of state yesterday. The company is capitalized at $100,000. John P. Koehler and Leslie Sanders are associated with Dr. Kingsbury. C. S. Crawford, formerly with Premier, has been elected a director.

Industry to Oppose Road Taxation Plan

Retroactive Features of Proposed Anti-Dumping Measures Not Favored by Officials

(*Continued from preceding page*)

exchange rates at the time of importation.

J. D. Nevins of the same Federal organization has asked that the equalization of exchange clause contained in the emergency anti-dumping bill should apply only to shipments after the passing of the emergency act, and not to be retroactive as proposed.

It is anticipated that the exchange provisions of the anti-dumping bill will do much to check the influx of surplus war materials, including motor trucks which have been sold in large quantities by foreigners at prices far below American production costs. It is believed that in making the exchange provisions retroactive the large profits derived from the sales of surplus trucks on American markets would, to a large extent, be wiped out.

Senator Smoot of Utah has declared that he will oppose a permanent anti-dumping measure which does not contain provisions applicable to reimportation of trucks. Automobile dealers of the West and Middle West have appealed to the Utah Senator to protect them against unfair foreign competition. They claim that the sales of American made trucks originally sold to the Army, and then resold as surplus to foreigners, are being offered on domestic markets here at prices which they cannot meet.

Coast Highway Bill Offered

WASHINGTON, April 19—Congressman Baker of California to-day introduced a bill in the House which would authorize the examination, survey and report by the War Department as a preliminary to the improvement, construction and maintenance of a system of motor truck highways to make the transport requirements of heavy commerce in time of peace and of heavy ordnance in time of war and to serve as post roads. with proper and sufficient laterals, in the States of California, Oregon and Washington.

Propose Highway Department

WASHINGTON, April 18—Congressman Osborne of California has introduced a bill to create a Department of Federal Highways, to establish a national highway system, to promote efficient and economical highway transportation, and to amend an Act to provide that the United States shall aid the State in the construction of rural post roads.

The bill is similar to that printed at the last Congress and discussed before the Senate and House Committees on Post Office and Post Roads. The principles enunciated in this measure have been indorsed by the National Automobile Chamber of Commerce, the American Automobile Association and other leading organizations who have advocated a system of interstate roads.

It is provided that bonds shall be issued on and after July 1, 1921, up to and cluding July, 1926, to be named as United States National Highway bonds, to an amount not exceeding in any fiscal year the amount of the appropriation in this act provided for the current fiscal year during which bonds may be issued.

President Gives Assent to Aviation Program

WASHINGTON, April 19—President Harding submitted to Congress to-day a special report of the National Advisory Committee for Aeronautics which made numerous suggestions for the development of air navigation. The President stated that the program of the committee met with his approval. From the viewpoint of commercial aviation, the most important suggestions are:

Establishment of a bureau of aeronautics at a cost of $200,000 a year under the Secretary of Commerce for the regulation of air navigation and the encouragement of civilian and commercial aviation.

Development of a system of national continental air routes to cover the United States and include a meteorological service.

Extension of the air mail service.

To enable the army to go forward with its air routes to cover the country an appropriation of $2,000,000 is recommended. Legislation also is requested definitely authorizing the Post Office Department to establish air mail routes between Chicago, Minneapolis and St. Paul, between Chicago and St. Louis and other routes advocated by the Postmaster General.

APEX MOTORS REORGANIZED

DETROIT, April 19—Apex Motor Corp. of Ypsilanti, manufacturer of the Ace car, has undergone a reorganization and H. T. Hanover is president and general manager, succeeding O. W. Heinz. The creditors' committee with representatives of the finance companies who are back of the Apex has agreed to a year's extension on outstanding accounts. This covers about 97 per cent of the creditors and puts the company in good condition.

ALL-AMERICAN MAKES PROGRESS

CHICAGO, April 20—The creditors' committee which has been conducting the affairs of the All-American Truck Co. since last November has sent a letter to holders of the serial notes of the corporation informing them that from the standpoint of creditors, conditions are as satisfactory as they could be under the circumstances and continuation of the business under the present plan will yield the greatest profits.

Willys and Chrysler Working in Harmony

Activity of President Among Dealers Restores Confidence—Reticent on Financial Plans

(*Continued from page 885*)

"He's the cheapest man on the pay roll," he declared, "and worth every cent he gets. When you have a $115,000,000 business you need men with brains, and Chrysler has them. That's what we're paying him for."

Willys returned late yesterday from a long series of conferences with Willys-Overland dealers and distributers, in which he filled them with enthusiasm over the future. He will start out again to-morrow, and the hours in between had been filled with conferences, but he was full of fight, aggressiveness and confidence.

"This trip of Mr. Willys' out among the dealers has been wonderful," said Chrysler. "The whole situation has been turned directly about. The dealers are full of confidence and enthusiasm. We're selling cars and we're building them, but we're not making any more than we're selling, and we're not going to. I made that statement months ago and it stands. It wouldn't be good business. But we're working 6000 men at Toledo and with Charles B. Wilson at the head there and the present fine organization, we're going to fill orders as fast as we get them."

Willys spoke delightedly of his conferences with dealers and distributers in Chicago, Omaha, Kansas City, Oklahoma City, Dallas, St. Louis, Minneapolis, Charlotte, N. C., and Atlanta. He starts out again to-morrow for similar conferences at Indianapolis and Toledo.

"I've shown the boys," Willys said, "that I'm not dead and that the company is not going broke. I've nailed a lot of misstatements that have been going around and have tried to clarify the situation. I've just given them facts and the response has been wonderful. After each of these conferences the distributers have been busy booking orders, although we didn't ask for any business. I've invited bankers to come to these meetings, and I feel certain they understand a lot of things that they didn't before."

Delay Opening New Plant

On the subject of the refinancing program for Willys-Overland and the Willys Corporation, the "chief" was somewhat reticent.

"If I talked about it," he said, "a wrong impression might get out. Everything is running along smoothly."

Chrysler was asked about the opening of the great new plant at Elizabeth.

"Mr. Willys can answer that better than I can," was his reply.

"That's in the future," remarked Willys, "and let the future take care of itself."

Cleveland Section Hears L. H. Pomeroy

Possibilities of Higher Efficiency by Increasing Compression Ratio Are Shown

CLEVELAND, April 16—At the meeting of the Cleveland section of the Society of Automotive Engineers held here last night, Lawrence H. Pomeroy delivered a talk on the fundamentals of engine design. Pomeroy emphasized the importance of lightweight construction in order to realize the greatest possible efficiency in engine design. He pointed out the possibilities of obtaining higher efficiency by increasing the compression ratio. He stated that compression ratios of 4½ to 1, which is about as high as it is well to go in the overhead type of engine, are suitable for obtaining good performance results.

The speaker, who has on previous occasions pointed out the advantages of lightweight pistons, connecting rods and other reciprocating units, also emphasized these points in his talk on engine design. The lecture and the discussion which followed brought out the fact that many engineers are committed to the school of design, which favors the lightest weight construction, not only in the reciprocating parts, but in the revolving engine parts such as the crankshaft and camshaft. The use of the drilled camshaft and crankshaft has resulted in a material reduction of weight in these parts without sacrificing rigidity.

Regarding the oiling systems, Pomeroy stated that normal oil pressure should range from 20 to 30 lb. per sq. in. The oil should be supplied not only at this high pressure, but in sufficient volume to permit the oil to act as a cooling medium as well as a lubricant. The use of high pressure oil, fed in large volume, fits in well with the hollow crankshaft and camshaft construction, permitting of leads through the center of these shafts, thus not only providing the natural lead for the oil, but also taking advantage of centrifugal force in the oil feed.

Dr. Pomeroy confined his talk to engine design and did not take up the question of fuel which he regards as an entirely separate problem. His stand for a 4½ to 1 compression ratio, however, indicates that with this type of engine design, the use of some means to prevent detonation would be necessary.

In addition to the talk by Pomeroy, some interesting entertainment features were included on the program and an informal banquet was held just before the meeting. The annual election of officers also took place.

SUBMIT HEADLIGHT PROPOSALS

NEW YORK, April 18—The Illuminating Engineering Society has submitted its "Automobile Headlighting Specifications" to the American Engineering Standards Committee for approval. The specifications are submitted in accordance with the special provision in the procedure of the committee, under which important standards in existence prior to 1920 may be approved without going through the regular process followed in new work.

The specifications have been adopted in their essential details by the states of Wisconsin, Connecticut and Maryland, and by the Province of Ontario, and have been endorsed by the Standards Committee of the Society of Automotive Engineers; by the International Traffic Officers' Association, and by the conference committee on Uniform Vehicle Laws, representing some 30 different organizations, under the auspices of the National Safety Council.

Restrict Patent Rights in Advance-Rumely Suit

MILWAUKEE, April 18—The Court of Appeals for the Seventh Circuit has sustained the findings of Judge Ferdinand A. Geiger of the United States District denying the claim of the Advance-Rumely Co. of Illinois, against the John Lauson Mfg. Co., New Holstein, Wis., alleging infringement of patents purporting to cover broadly the practical use of kerosene as a fuel for internal combustion engines. The case has been in the Federal courts for five years.

Judge Geiger of Milwaukee held that in view of prior usage and expired patents the patents of the Advance-Rumely Co. must be restricted to minor details of construction, and that these patents involved no broad novelty in the use of kerosene as a fuel and were not infringed.

The suit was of vital importance to engine builders using kerosene as a fuel, due to the fact that if the courts had placed an interpretation upon the Advance-Rumely patents, as put upon them by its attorneys, all manufacturers of engines using kerosene as fuel in the United States would have been compelled to pay tribute to the Advance-Rumely Co. The alleged invention was specifically directed to the well-known principle of hydrating kerosene to prevent pre-ignition.

BATTERY RECEIVER PETITIONED

BLOOMINGTON, ILL., April 18—Four creditors of the Illinois Storage Battery Mfg. Co., Hoopeston, Ill., filed a petition in involuntary bankruptcy in the United States District Court, asking that the concern be declared bankrupt and asserting that it is insolvent. An investigation is sought by the referee in bankruptcy. The battery company was organized nearly two years ago by Ray Murray. It was capitalized at $25,000, most of the stock being held by residents of Hoopeston. Following the organization the company appeared to flourish. Later disagreements arose in the ranks of the stockholders resulting in the departure of Murray, who sold out his stock. During the past few months business has slumped and the plant has been inactive. It is probable that a receiver will be appointed.

METAL MARKETS

MUCH mischief has been done by the exaggerated headlines under which the news of the recent change in the U. S. Steel Corporation's prices was published in many of the daily newspapers. An utterly false impression has gone forth that as the result of this price revision by the leading interest the steel market rules considerably lower than it did before this announcement was made. The fact is that, excepting in a few specialties, bargain offerings, which were plentiful a few weeks ago, have largely disappeared and the views of independent producers, as to prices for the time being at least, have become firmer. The Corporation, to all intents and purposes, had been "out of the market" when it revised its prices downward and the independents had what market there was to themselves. The quotations of the latter to-day are, barring a few exceptions such as steel pipe, at least as high and in some instances higher than before the Corporation's change in prices. Utterly absurd are statements like the following telegraphed to one of the New York dailies by its Pittsburgh correspondent: "With a stabilized steel market, builders and manufacturers are expected to go ahead with the knowledge that steel prices are virtually fixed for the next year or two." No one in the steel industry, either within or without the Corporation's breastworks, whose opinion is at all worth while, deludes himself into the belief that steel prices "have now been virtually fixed for the next year or two." Those with whom the wish for stability is father to the thought will go only so far as to say that from now on further cuts in prices must wait upon corresponding cuts in wages and freight rates. Inasmuch as the best economic thought is unanimous in the opinion that if general economic disaster is to be averted, both wages and freight rates must be brought down to saner levels without delay, the more conservative element in the steel industry is of the opinion that the prevailing quotations will continue as at least nominal prices until the advent of lower wages and freight rates. There are those, however, who fear that failure of present prices to bring out a sufficient quota of orders will lead to renewed price cutting in the near future. This element is of the opinion that the tonnages which the Corporation's price revision will add to its unfilled orders will be relatively light, and that before very long the independents will be setting the pace once more by cutting under the Corporation's new prices.

Pig Iron—Automotive foundries in Michigan and Ohio are releasing additional tonnages of foundry and malleable. The market is flat, with $25, Valley, for malleable and foundry No. 2 the maximum quotation.

Steel—Some independent producers appear willing to accept fresh orders for cold-rolled strip at around 5.75c., base, Pittsburgh, while others quote 6c. Automotive consumers have about finished quotas due them on old contracts, but are not placing fresh contracts. Hot-rolled has been reduced by a leading independent to 2.85c. Automotive spring steel is in better demand. The sheet market is a shade firmer, but this may be only the temporary result of advances by some of the independents in response to the Corporation's price changes. Youngstown district mills have booked some light business for full finished sheets at 5c.

Aluminum—Quiet with light routine demand from the automotive industry.

FINANCIAL NOTES

Marathon Rubber Products Co. of Wausau, Wis., has been incorporated with a capital stock of $300,000. The company will take over the plant and equipment of the defunct Burlock Rubber Clothing Co. of Wausau. The property was bid in at receiver's sale by J. H. Hieb of Merrill, Wis., for $61,000.

Stephenson Motor Truck Co., Milwaukee, which failed about nine years ago, has been brought into court for final adjudication by the adoption of the final report of the trustee and the declaration of a final dividend of 2 per cent, making a total distribution of 35 per cent of claims.

Doss Rubber & Tube Co., Atlanta, has been granted license to sell $100,000 of preferred stock, paying 8 per cent, by the Georgia Securities Commission. The Doss company manufactures tires and tubes, having a factory in Atlanta that has been in operation some years.

Brown Mfg. Co. has been organized at Brunswick, Ga., with a capital stock of $100,000, by Samuel E. Brown and others, for the manufacture of a quick change rim for automobile tires invented by Brown.

Templar Motors Co. has formed a subsidiary to be known as the Templar Motor Co. of New York, which will have an authorized capitalization of $1,500,000.

Fisher Body Corp. will pay a dividend of 1¾ per cent on May 2 to preferred stockholders, and a dividend of $2.50 a share on the no par value common stock.

Rolls-Royce of America, Inc., has placed, privately, $2,000,000 in 8 per cent notes due March 1, 1931, and there will be no public offering.

O. K. Giant Battery Corp. has been organized in Atlanta with a capital stock of $75,000, by F. K. Adams, F. L. Cook and J. C. Rucker.

INDUSTRIAL NOTES

Diamond-Holfast Rubber Co., Atlanta, manufacturers of automobile tire patches and other patented rubber products, has purchased an eleven acre site in suburban Atlanta for $20,000, and will build a modern factory, to include salesrooms and general offices.

Air Reduction Sales Co. has secured control of the National Carbide Corp. of Virginia, with a new plant at Ivanhoe, Va., and beginning May 1 will direct the policy and control the operation and sales of the Carbide corporation.

E & W Co., Milwaukee, manufacturer of commercial car attachments for passenger car chassis, trailers, trailer-trucks, etc., has accepted the proposition of business men of Cedarburg, Wis., to transfer the operation to that city.

General Device Corp., New Lisbon, Wis., will start work at once on the erection of a factory, 75 x 150 ft., one story, equipped with new machinery and tools for manufacturing a line of patented devices and appliances.

G. Elias & Bro., Inc., Buffalo, has acquired membership in the Manufacturers Aircraft Association, New York. This is the twenty-first airplane company to join the organization, sixteen of which are active still.

Allan-Diffenbaugh Wrench & Tool Co., Baraboo, Wis., has filled original orders calling for 80,000 wrenches, and is receiving forgings and other materials for a second complement of the same size.

Flood Tractor Co., Spokane, is to change its name after May 1 to the International Automotive Corp., and will be reorganized with increased capital to manufacture a new standard tractor.

Kelsey Wheel Co., Memphis, Tenn., is nearing completion of its new body plant, which is expected to have a production capacity of 500 bodies a day.

Badger Brass Co., Milwaukee, is contemplating the erection of an entirely new and much larger foundry and machine shop during the summer and fall.

Tubular Steel Automobile Wheel Mfg. Co., Spokane, has started the manufacture of patented wheels made of tubular steel with galvanized iron spokes.

Modern Tool Co. announces arrangements whereby the E. L. Essley Machinery Co., Chicago, becomes exclusive selling agents in Chicago territory.

Kenison Mfg. Co., Solomon, Kan., has adopted the Climax Model KU, 5 x 6½ kerosene engine, as regular power equipment for its 15-30 tractor.

Victor Tool Co. has opened a New York office at 131 West Thirty-ninth Street, with F. W. Curtis as manager and Warren J. Boe sales engineer.

Laminated Shim Co., manufacturers of laminum for shims, will remove on May 1 to a new plant and offices in Long Island City, N. Y.

Motor Wheel Corp., Lansing, has opened a New York office, which will be under the management of Thomas J. Wetzel.

Armstrong Rubber Co., Garfield, N. J., reports operating 24 hours daily and production of 100 per cent of capacity.

Antigo Tractor Corp., Antigo, Wis., has five machines in process and will place them in the hands of users by June 1.

Emerson-Brantingham Implement Co., Inc., will locate its New York export office at 50 Church Street after May 1.

Paragon Motor Car Co. will remove its plant and general offices from Connellsville, Pa., to Cumberland, Md.

Republic Rubber Corp. has adjourned its annual meeting, scheduled for April 14, for another thirty days.

Petroleum Motors Buys Rockford Factory Site

ROCKFORD, ILL., April 15—Petroleum Motors Corp., organized to manufacture a low grade fuel burning engine, has acquired a tract of ten acres in this city on the Chicago, Milwaukee & Gary railroad, a belt line put in by the city of Rockford for the benefit of its manufacturing interests, on which to erect its factory.

The product, designed for truck use, is a four-cylinder, four-cycle, opposed piston engine with cylinders cast in pairs and has been under experimental observation for two years. The company is incorporated under the laws of Delaware for $1,250,000 with Chester A. Harris, president; T. G. Jackson, vice-president, and Charles C. Grassell, secretary-treasurer. They with L. A. Peil and B. J. Knight constitute the board of directors. R. C. Dale is manager.

BANK CREDITS

Written exclusively for AUTOMOTIVE INDUSTRIES *by the Guaranty Trust Co., second largest bank in America*

NEW YORK, April 21—The most noteworthy feature in the money markets last week was the announcement by the Boston Federal Reserve Bank that its discount rate on commercial, industrial and other unsecured paper had been reduced from 7 per cent to 6 per cent. At the same time the discount rate on notes secured by certificates of indebtedness was raised from 5½ per cent to 6 per cent, making all the published discount rates of the Bank uniform.

The New York call money market last week was much firmer than a week ago, with rates at 6 per cent to 7 per cent, as against 5 per cent to 7 per cent the previous week. Renewals were consistently at 7 per cent. Time money was also a trifle firmer, with 6½ per cent quoted for all maturities from sixty days to six months, as against 6¼ per cent to 6½ per cent the week before.

The total foreign trade for March showed a decline of more than $700,000,000 from the figures for March, 1920. Exports for the month totaled only $384,000,000, as compared with $489,000,000 in February and $820,000,000 in the corresponding month a year ago. Imports at $252,000,000 were larger by $37,000,000 than the total for February, and compared with $524,000,000 in March, 1920. For the nine months ended March, 1921, exports totaled $5,509,000,000, as against $6,050,000,000 for the same period a year ago.

Imports for the nine months' period totaled $3,009,000,000, as against $3,759,000,000 for the nine months ended March, 1920. March exports were the smallest for any month since the beginning of the World War, while imports made the largest monthly total for any month in 1921. The excess of exports for March at $132,000,000 was the smallest since last August.

U. S. SURPLUS $10,000,000

NEW YORK, April 20—Stockholders of the United States Rubber Co. were informed by Samuel P. Colt, chairman of the board of directors, at their annual meeting yesterday that earnings for the year 1920 were about $10,000,000 over and above dividend requirements and that regular dividends at 8 per cent have been paid on both preferred and common stock.

All the directors of the company were re-elected and John W. Davis, former ambassador to Great Britain, was added to the board.

ADVANCE-RUMELY CUTS PRICE

LAPORTE, IND., April 20—The Advance-Rumely Co. announces a 10 per cent reduction in price on all its farm machinery in which steel is the chief raw material used. This follows the price reduction recently made by the United States Steel Corp.

MEN OF THE INDUSTRY

H. M. Salisbury has been appointed export manager of Maxwell-Chalmers. Salisbury is a veteran of the industry, having been connected with General Motors Export Corp.; F. B. Stearns Co., New York, and John N. Willys Export Corp. In joining Maxwell-Chalmers he succeeds H. W. J. Russell, who resigned because of ill health.

Charles S. Crawford, former chief engineer of Premier, has been elected a director and consulting engineer for the Kant Kut Ignition Tube Co., Indianapolis. He has also been elected a director of the Indianapolis Aerial Association, which will operate a passenger air service between Indianapolis and Chicago.

Henry G. McComb, who for several months past has been doing sales engineering survey work for the American-La France Fire Engine Co., Inc., Elmira, has definitely joined the forces of that concern in connection with its new motor truck development. McComb will be stationed at the sales office, New York.

P. A. Tanner, who for the past five years has been connected with the Splitdorf Electrical Co. of Newark, N. J., and its subsidiaries in various capacities, has resigned as advertising and service manager and will spend the summer touring and looking after personal interests in Iowa and Missouri.

E. S. Crocker, who used to serve in an engineering capacity at the Chalmers Motors Co. and who during the war was connected in the development of the four-wheel-drive artillery tractor, has become chief engineer for the Rainier Truck Corp. at Flushing, L. I.

Victor T. Goggin, late New England sales manager of Fred T. Ley & Co., Inc., of Springfield, Boston and New York, has severed his connection with that concern to associate himself as contracting engineer with Dwight P. Robinson & Co., Inc.

W. G. Clay has been appointed assistant sales manager of the truck and tractor division of the Traylor Engineering & Mfg. Co., Cornwells, Pa. C. H. Patten and J. L. Fulton were appointed chief engineer and production engineer, respectively.

H. G. Egbert, treasurer of the Master Tire & Rubber Co., Dayton, and H. J. Alperin, owner of a chain of tire stores in Cleveland, Chicago and New York, have become connected in executive capacities with the Chillicothe Tire & Rubber Co.

J. E. Tracy, for the past four years general sales manager of the Sterling Motor Truck Co., Milwaukee, has become actively connected with the Hicks-Parrett Tractor Co., of Chicago Heights, as vice-president and director of sales.

George Pearson, Jr., former district supervisor for Maxwell-Chalmers in San Francisco, has resigned to become sales manager of the Union Motors, Inc., a new Los Angeles concern handling Maxwell-Chalmers products.

Henry H. Knapp, formerly treasurer of U. S. Light & Heat Corp., Niagara Falls, N. Y., has been elected treasurer of the H. B. Shontz Co., New York distributors of USL batteries and also distributors of equipment.

S. N. Clemons, for the past seven years assistant purchasing agent for the Northway Motor & Mfg. Co., recently resigned to become identified with the Mid-Western Sales Corp., Detroit, as general sales manager.

E. F. Jones, who recently resigned as president of the Republic Rubber Co., has been appointed assistant to Jerome R. George, vice-president of the Morgan Construction Co., Worcester, Mass.

E. E. Eby has joined the Remy Electric Co. in the capacity of purchasing agent. Eby was formerly American director of Delco-Remy, Ltd., and Hyatt, Ltd., with offices in New York.

N. C. Beerend has been named sales and advertising manager for the Jorgensen Mfg. Co., Waupaca, Wis. Beerend was formerly connected with Walters, Gemco and Badger, all of Milwaukee.

Robert R. Keith, formerly of the Moline Plow Co. in charge of the Universal Tractor Works, has been made superintendent of tractor works of the International Harvester Co. at Chicago.

Russell B. Reid, for several years past with Edward R. Ladew Co. as assistant sales manager, has been made manager of sales for the Sharon Pressed Steel Co., of Sharon, Pa.

Harry Schleininger, for nine years general sales manager of the Motor Car Equipment Co., New York, has been appointed sales manager of the Kellogg Mfg. Co., Rochester, N. Y.

James A. Patten has been elected to the board of directors of the Advance-Rumely Co., to succeed F. N. B. Close, of New York, who resigned to take up business in France.

J. Emerson, who was the purchasing agent of the King Motor Car Co. before it went under new ownership, again is connected with the company in the same capacity.

H. A. Winterknight, Jr., sales manager of the Manley Mfg. Co., of York, Pa., has resigned and is now associated with the Finchbaugh Machine Co. of that city.

A. H. P. Leuf has succeeded Robert I. Erlichman as president of the General Utility Co., makers of automotive necessities, Philadelphia.

Ward H. Marsh has been appointed assistant sales and advertising manager of the Lincoln Motor Car Co.

F. H. Shaw has been elected a director of the Elgin Motor Car Co., succeeding J. M. Snitzler.

Edwin S. Beggs has been appointed sales manager of the Planet Mfg. Corp., Detroit.

Class Journal Editors Visit Standards Bureau

WASHINGTON, April 19—Direct personal contact between representatives of technical journals and of the Bureau of Standards made during visits to the bureau are of the greatest possible value, according to a statement issued by the bureau relating to a trip made by a number of business paper representatives. During recent years, the bureau announcement says, the co-operation between the bureau and the industries has been particularly close and this work has been greatly aided by the valuable publicity given the bureau's researches by the technical journals.

Those making the visit on the date named were from leading journals in the automotive field, the statement says, who made a general inspection of the bureau's laboratories and equipment. They were: Erik Oberg, editor of *Machinery;* David Beecroft, Ray W. Sherman and James C. Dalton, of the Class Journal Co.; Clyde Jennings of AUTOMOTIVE INDUSTRIES; Neal G. Adair, of the *Motor World*, and George E. Quisenberry, of *El Automovil Americano.*

Dodge Tells Dealers of N. A. D. A. Advantages

DETROIT, April 15—Recognition of the National Automobile Dealers Association as the big factor in development of the retail end of the industry, has been given by Dodge Brothers. Letters now are being prepared to be sent out to the 4000 Dodge dealers throughout the country advising them to affiliate closely with the national association and the local dealer organizations which are connected with the parent body.

C. W. Matheson, general sales manager of the Dodge Brothers, in conference with Harry G. Moock, general manager of the N. A. D. A., said that he was anxious to have all Dodge dealers participate in N. A. D. A. activities and expressed the opinion that the organization was a vital force in the industry.

In a statement to AUTOMOTIVE INDUSTRIES this week, Matheson said Dodge Brothers executives fully realized the important work that was being done by the association in behalf of the individual dealer and the entire industry, and declared it would be the effort of that organization to have a full representation of Dodge dealers on the local and national rosters.

Tarkington to Build Light Car in Fall

ROCKFORD, ILL., April 15—The Tarkington Motor Car Co., with a plant already completed in this city, plans to begin the production of a quality, light-weight, six-cylinder car next fall. It will have an overhead motor, carry seven passengers and offer many details in refinements designed to give the car a high saleability.

The company was incorporated about a year ago by P. A. Peterson, who is identified with 25 or 30 different enterprises in this city. The factory manager is J. A. Tarkington, who has been in the automobile business for 21 years, with Rutenber, Apperson, Stoddard-Dayton and Kissel as a production executive. He is a brother of Booth Tarkington, the writer.

The company will make practically all of its own chassis.

EDWIN HALL PARIS DIES

NEW YORK, April 18—Announcement has been received here of the death of Edwin Hall Paris, treasurer and general manager of the Schuman Carriage Co., Ltd., at Honolulu, March 25.

Calendar

SHOWS

Sept. 28 - Oct. 8 — New York, Electrical Exposition, 71st Regt. Armory, Electric Equipment, Machinery and Vehicles.

FOREIGN SHOWS

May 28, 1921 — Czecho-Slovak International Automobile Exposition of Cars, Trucks, Tractors, Motorcycles and Equipment. Prague.

May 28-June 8—International Automobile Exhibition, Basle, Switzerland.

June, 1921—Reykjavik, Iceland, Agricultural Exhibition—Agricultural Machinery—Icelander Agricultural Society, Reykjavik, Iceland.

September—Buenos Aires, Argentina. Passenger Cars and Equipment. La Pabellon de las Rosas. Automovil Club Argentino.

September — Buenos Aires, Argentina, Cars, Trucks, Tractors, Farm Lighting Plants and Power Farming Machinery. Palermo Park; Sociedad Rural Argentina.

September—Luxemburg, Luxemburg Agricultural Sample Exhibition.

Oct. 5-16—Paris, France, Paris Motor Show, Grand Palais, Administration de l'Exposition Internationale de l'Automobile, 51, Rue Pergolèse, Paris.

Nov. 4-12 — London, British Motor Show, Society Motor Mfrs. and Traders.

CONVENTIONS

May 4-7 — Cleveland, National Foreign Trade Council.

May 6—Detroit, N.A.C.C. Advertising Managers Meeting, Detroit Athletic Club.

May 17-19—Buffalo, Convention of Factory Service Managers, Auspices of Service Committee, N. A. C. C.

May 23-26 — Chicago, A.S.M.E. Spring Meeting, Congress Hotel.

May 24-28 — West Baden, Ind., Summer Meeting Society of Automotive Engineers, West Baden Springs Hotel.

July 4-9 — Mackinac Island, Mich., Summer Meeting Automobile Equipment Association.

Oct. 12-14, 1921—Chicago Twenty-eighth Annual Convention National Implement & Vehicle Ass'n.

RACES

May 31 — Indianapolis, International Sweepstakes.

June 18—Uniontown, Pa., Speedway Events.

July 25—Grand Prix, Le Mans.

Labor Day—Uniontown, Pa., Autumn Classic.

S. A. E. MEETINGS

Dayton section—May 3.

Indiana Section—May 5.

Washington Section — May 6, Shaped Piston Rings, Cosmos Club.

Midwest Section — May 13, Smoker, Dinner and Entertainment at Chicago Automobile Club.

Dayton Section—May 17, H. L. Horning.

Cleveland Section—May 20.

Chassagne and Wilcox to Drive Peugeots Here

PARIS, April 8 (*By Mail*)—Jean Chassagne has entered a Peugeot racing car for the forthcoming 500-mile grind on Indianapolis track, where he will make his fourth appearance. Officially the Peugeot company is out of all racing for this season, but owing to the intervention of Jules Goux, two of the cars which had been begun for the French Grand Prix have been completed, and one of these has been given to Chassagne and the other to Howard Wilcox. Owing to his business engagements, for Goux is Peugeot agent in Paris, it is impossible for the winner of the 1913 race to come to America this year.

Chassagne's Peugeot is a four-cylinder model of 80 by 148-mm. bore and stroke with cast cylinders and four valves per cylinder in the head, on the same general lines as the pre-war Peugeots. Last year's design, with three camshafts and five valves per cylinder has been abandoned. Weight has been kept down very low and will be only a little more than the minimum imposed by the racing rules. Road tests recently carried out show that the car has a sufficiently high turn of speed to be a possible winner in the Hoosier contest.

Zeppelin Engined Car Wins British Contest

LONDON, April 4 (*By Mail*)—Chief interest at the Brooklands racing season opening Easter Monday centered in the contest between Count Zborowski's six-cylinder Maybach Zeppelin-engined car rated at 600 hp. and the Sunbeam-Coatalen "six" rated at 450 hp. Though the Maybach engined car had 150 hp. more to its credit on rating, it was given four seconds start over a 5¾ miles distance, and for the first quarter of a mile its time was only 15 3/5 seconds.

Going round it increased speed, and starting the descent seemed to perform a little leap in the air and a swerve. The crowd caught its breath, but the driver (the owner himself) got straight in an instant, and on the bank on the far side of the course he "let her go" and flashed by all the other competitors, racing home an easy winner from the Sunbeam. The official speed was given as 100.78 m.p.h.

Advertising Managers to Map Out Campaigns

NEW YORK, April 18—Directors of the National Automobile Chamber of Commerce have authorized a meeting of all advertising managers at the Detroit Athletic Club, Friday, May 6. The purpose of the meeting is further co-operation between the educational department of the N. A. C. C. and the advertising men of the motor car companies together with one or two papers of a definite character. This program will be followed by a series of five minute talks on plans and methods to be pursued in motor car and motor truck advertising for 1921. The meeting is designed not only to consider the best advertising policies to follow to increase sales but to consider those things which must be done further to sell the public on the position of the American vehicle in American life.

Racers Assigned Places in French Grand Prix

PARIS, April 8 (*By Mail*)—Ralph de Palma, on an eight-cylinder Ballot, and René Thomas, on a Sunbeam with the same number of cylinders, will be the first pair to be sent away in the French Grand Prix race—the first of its kind since 1914—at 9 o'clock on the morning of July 25. The start of the race will be given in pairs at intervals of 30 seconds.

After having completed a set of four-cylinder racing cars the Fiat company has built a series of eight-cylinder engines which have just completed their bench tests and probably will be used in the Grand Prix.

Metropolitan Section Hears Carburetion Talk

NEW YORK, April 15—The Metropolitan Section of the Society of Automotive Engineers, at its regular monthly meeting, planned to discuss the subject, "Carburetion of Low Grade Fuel," but the papers of the evening dealt largely with the kerosene carbureter developed by the authors, H. R. Beach and A. J. Weiss, and failed to develop the subject broadly. In consequence, many of those who attended the meeting in the expectation of hearing an engineering discussion along basic lines were disappointed.

Results of the canvass of the mail ballots cast in the annual election of Section officers, announced at the meeting, showed substantially unanimous choice of the regular ticket. Harrold Slauson, the newly elected chairman, was also elected to serve as the Section's representative on the parent Society's nominating committee, which will meet at the S. A. E. summer meeting in West Baden, Ind.

C. F. Scott, chairman of the S. A. E. meetings committee, and President David Beecroft, briefly outlined the plans for the summer meeting.

Advance-Rumely Starts New Truck Division

BATTLE CREEK, MICH., April 15—The new farm truck division of the Advance-Rumely Co. is now in operation here. The department, formerly in Clearing, Mich., has been moved here to replace the threshing machine department. Besides the new truck the plant will also make the Oil-Pull tractor. Working forces will gradually be increased.

According to present plans the truck will be built without the engine because officials have not yet decided on the type and specifications wanted. Officials are optimistic over the future since they declare the farmer is turning fast to motor driven and improved farming machinery and should again be buying heavily soon.

AUTOMOTIVE INDUSTRIES
THE AUTOMOBILE

VOL. XLIV. NEW YORK—THURSDAY, APRIL 28, 1921 NO. 17

Our Government and Business

High taxes and low business totals have combined to interest industrial leaders in government as never before, and coincidentally the government leaders are more inclined to unbend to business. Results should be beneficial to both interests.

By Clyde Jennings

BUSINESS men and business interests have accepted very generally the invitation of the Harding Administration that business take more interest in government for the dual purpose of assisting Government and of getting more benefit from Government. The idea is abroad that this is to be a business administration—for the benefit of both business and Government.

The present is opportune for such a blending of interests. Before the war Government cost so little that business did not pay much attention to it. It was too cheap. Anything cheap never commands much respect. The smokers, liquor drinkers and consumers of imported articles were paying the bills; the politicians were doing the planning and the fairly well paid employees in government bureaus were doing the work. It was all very satisfactory to the business man, so why worry.

Then came the war and Government called a lot of business men to Washington to help run things. These men were paid an average of $1 a year. Most of them went there thinking that they would settle the problems of Government and war in a few days and then go back home and get busy again with their own business. But a good many of them remained in Washington until the armistice was signed and had the busiest days of their lives in trying to attend to Government business. A whole lot of men found that Government business was real business, especially in war time.

Then these men got back home and the next interest in Government was caused by their tax bills. Excess profit taxes, income taxes, corporation taxes, luxury taxes on the most ordinary articles, a series of questionnaires and, likely, investigators in the plant were next in order. These incidents made business men think more and more of Government. A good many of them concluded that the Administration in power was not a good one or Government would not cost so much. So they sought a change.

Now we have the change. The new Administration has started working quite nicely with business. But Government is still quite costly, so costly that business wants to know what makes it cost so much. They are interested, and good many business men are going to Washington and are sending their agents there to reduce the price of Government.

They have been received with open arms. Government is openly courting help and advice, to a certain degree. When this advice conflicts with what is desired by the instrument of Government—for the politician is still on the job—it is not so welcome. Sales tax suggestions for instance.

Herbert Hoover, as Secretary of Commerce, is to all appearances the special liaison officer of the ad-

ministration with business. Secretary Hoover is studying all lines of business and his own department with a view of making each more valuable to the other. He is striving to learn from business what it wants to know from his Department—and from Government in general if you please.

Also, he is striving to learn what it is possible for his department—and for Government—to do for business. He has indicated that he thinks it entirely possible that he can obtain much information that is really vital to business but which the industrial organizations in many lines have been unable to obtain.

Secretary Hoover's general program in aid to business is quite well defined. Before he took the Cabinet job he was directing a survey to lessen industrial waste. It is no secret that he still holds that industrial waste is a considerable factor in high prices. The work he so well started through his engineering associates is continuing and he hopes to further this work as Secretary of Commerce.

Industrial waste, as Secretary Hoover sees it, is chiefly "blindfold production"—if we may coin a phrase. This means that many industries are going but they do not know where they are going. They are depending solely upon chance to find signposts at the cross roads.

Sometimes the signpost is lettered sufficiently plain that the manufacturer sees the direction and has time to change his course. But usually he is going at such speed, or he is talking so earnestly with his companions, that he does not see the sign in time to make a good turn. As a result he wastes a lot of time getting back on the right road. He wastes fuel by going full speed ahead after the demand has lessened; or perhaps, that he has not estimated his market and the warehouses are full; or perhaps public fancy has turned away from the particular style of article he makes; or—well all manufacturers know the dangers.

The result is that there is a waste of manufacturing labor; there is waste in carrying heavy inventories; there is a very heavy waste in the unstable character of employment in industries and establishments that follow only current market reports in their quantity and kind of output.

It is Secretary Hoover's idea that almost any manufacturing problem can be stabilized by a better examination into the probable consumption over an extended period by a study of consumption figures. This in turn will make the demand all through the industries, from raw material to labor in the final distributing stations, more equitable.

Here comes in one of Secretary Hoover's strong points in this program: That of stabilizing the demand for labor, so that there will be less unemployment and consequently less economic waste. It is decidedly a human factor and the beneficial effect it would have on wage controversies can be seen at a glance. All manufacturers know how much less troublesome is the labor problem in an industry that provides 50 weeks of employment a year than one which is entirely seasonable and whose factory staff will vary from a long shut down period to a crowded workroom, with two or three shifts at other seasons of the year. Enforced idleness is always an important factor in wage scales.

Secretary Hoover is quite willing to aid any and all industries in this stabilization work through his department. He discussed this problem with the business paper editors a few days ago and asked what figures were wanted. First, of course, export and import figures came up for discussion, chiefly because they are now being given out and it is a less problem to remedy defects in a present practice than it is to establish an entirely new activity. But the additional aids to business are on the books to be worked out.

The important question, however, is not what Secretary Hoover and the present administration plan to do, or what they want to do, but WHAT CAN BE DONE.

All business men know that investigation problems, research activities and in fact all activities of this sort require money.

Secretary Hoover is quite plain in his statements that what his department will do is not so much a problem of plans as of money. His greatest problem is to get money with which to pay clerks for making the computations that he knows are desired and for establishing new sections in his bureaus, under charge of competent men, for the initiation of new activities.

At this point the treatment of this subject appears to take a slightly different turn. We will admit for the present that:

The Administration is sold on aiding business.

Business is sold on the possibility of being aided by government.

Business wants the costs of government reduced. The Administration was to lower costs, if possible; obtain fair treatment for people who patronize business, and co-operate with business in every legitimate way.

But here comes a new angle. First of all, Government is political; an Administration depends entirely for its success and continuance upon popular opinion. This popular opinion may be wrong, but the Administration must meet it. Actual good that Administration may do for business is secondary to popular opinion.

Business men generally cannot blame the individual units of the Administration (and the Administration as a whole) for looking to the life line first. **There are few, if any, men in public life who put the cause before the man.**

The idea of public men, first of all, is self preservation, and you cannot blame them for that. Put yourself in the place of the politician and reason this way:

"I want to do the most good I can while in office. I want to help business and consequently help the country and the people, because business is the life blood of the nation. I can only do this by staying in office. If I am defeated at the next election, Jones will succeed me. He does not favor any of the plans that I favor. My plans are better than his. If I can get my plans started this term I must come back next term to carry them through. Consequently, while starting my plans for good, I must look out for votes at the next election."

Under the ideal of making the cause bigger than the man, this course of reasoning would be fallacious. **Under the expediency and ideals of politics it is not. Business to-day must take conditions as it finds them, until there is time and opportunity to educate the great mass of voters to mark their ballots with greater idealism.**

Our forefathers, especially those who lived in Hamlin Garland's great west, studied backfires with a great deal of care. So do the politicians of the present day. So should business men. The backfire is the greatest weapon in the electoral government.

The hope of business to-day is not so much to consult with the Administration as to have some in-

fluence with the voters at home, so that business can start backfires in the home district.

The power of Government lies in Congress. And it is well that it does. You may obtain the co-operation of the powers that be in Government or the Administration, but without Congress these powers are not of much use. Witness Secretary Hoover, anxious and willing to aid business, who cannot enlarge the activities of his department until he can obtain the money.

You all have heard of the man who was forced by necessities of domestic peace, to take his pay envelope home unopened. You have heard many tales of woe from your own employes on this very subject.

But to-day administration executives are bound by much closer purse ties than the hen-pecked man. The executives do not even get the pay envelope until Congress has closely inspected the contents. And Congress is quite proud of this power.

The power of business to-day lies with the home Congressmen. The business man who expects to take his own part in the effort to get Government to come to the aid of business needs have on his desk a list of the local Congressmen, Representatives and Senators, and the chairmen of the various committees. He must use this list very often. He should write to these men on subjects that he wants acted upon.

Also the business man must take his friends into his confidence. He must get them to write on the subjects that he is talking about.

Of course, the head of a big business organization has much power in the world and he often feels that he wields much influence, but he should remember that unless he exerts this influence **he is only one voter on election day.** Some business men are so regarded by their helpers in business and at home, so that every man and woman in their employ delights in learning **"how the boss is going to vote" so that they may kill his vote.** It is only on election day that the humble helper is fully equal to "the boss" in public affairs. And, believe me, this fact is well known to the servitor. Perhaps the servitor has the most power in the election, at that. Remember in "Peg o' My Heart" the lesson of the two dogs. Michael was forced to sleep in the stable, but when it came to grips on the lawn, Michael was much the better of the two dogs. Politics is a good deal of a rough and tumble fight, and Congressmen and other politicians are likely to know just how much influence a man wields on election day. Some politicians are shrewder than they look.

Business cannot get what it wants from politics—which unfortunately is to-day a practical synonym for Government—unless it plays with politics all of the time. Business must learn to discriminate in men and platforms; especially men, rather than in party names.

Business to-day has the greatest opportunity in the history of this Government. What business realizes from this opportunity is solely up to the men of business, for business collectively does not vote and it is votes that count in the last analysis.

THIS article is not in any sense a presentation of an ideal of government. It is an expression of opinion as to present expediency. It should be the ideal of every American citizen to raise the standard of government to a point where the present political methods will not be paramount; then the best interests of the people will be the aim of every member of the legislative, executive and administrative branches of government.

This desirable state of affairs will be reached only when voters are as careful in their selection of legislative candidates as they are of the men with whom they have personal dealings.

Business organizations have a great potential power. To-day every business or industrial organization should be judged solely as it co-operates with Government for the betterment of business and the intelligence with which it works to interest Government in business and the men of business in Government.

Association work is co-operation. An association is powerful only as its members work with each other for the same purpose. Then the association's power is for good or evil, as its purpose is a worthy or a selfish one. The fact that the Administration has advised an inquiry into the activities of certain business organizations should not be construed as an overt act against business. Perhaps these associations should be inquired into. We hope not, but associations are as likely to be selfish and unworthy as men, and a good many men should be inquired into.

This act on the part of the Administration should not be construed entirely as an unfriendly act. We do not believe that there is a business man to-day who is willing to risk his reputation in giving to all business organizations a "clean bill of activities."

The fact that the Administration is doing a little housecleaning only illustrates the more the fact that Government is politics—often mob rule. It cannot be denied that the people generally believe some business associations are instruments established solely for the purpose of robbing the consumer. **If that belief is true, then a housecleaning is needed. If it is not true, the business represented in the associations should welcome an opportunity to tell the truth.**

Some very strange things have been uncovered in association inquiries this year and perhaps more of them will be uncovered during the year. This should not discourage the effort for honest co-operation between the right kind of business men and Government.

Have you the names of all local legislators on your desk?

Taxes and Registrations in England

CONSIDERABLE interest attaches to the working out of the new motor vehicle registration law which went into effect in England this year. The London *Times* of March 11 reports that "the revenue from the new motor taxation . . . has been coming in remarkably well and from the licenses issued during January and February it is evident that the estimates of £8,000,000 as the yield of the tax will be reached, if not exceeded."

The final registration figures are not yet in, but should furnish later the first really close estimate of the number of cars in the United Kingdom. The only information available at present states that "while comparative figures are to some extent deceptive, for all motor vehicles must now be registered in the district in which they are normally kept, the increase in vehicles registered in some areas as compared with last year is already large."

Factors to Be Studied in Merchandising Analysis

The advantages to be gained from a systematic and scientific study of the merchandising problem are being recognized by many manufacturers. Work along the lines of territorial analysis and the establishment of quotas is being recognized as essential. One company's start described

THE marketing phases of industry have never received the careful and scientific treatment accorded the engineering and production phases in the past. Intensive merchandising has now become almost an essential to existence, however, and the scientific methods which have proved so valuable in the shop and the engineering department must be brought to bear upon the efforts of the sales department.

With this fact in mind, the charts recently prepared by the Commercial Research Department of the Franklin Automobile Co. are of special interest. These charts, which are presented herewith, were prepared for use in connection with sales analysis and production plans and are of value as being the result of an intelligent and practical guess as to what the future holds in store for the automobile industry.

The chief conclusion presented by the charts is that there will be nearly 31,000,000 cars and trucks registered and 5,300,000 produced in the United States in 1940, but the process by which this conclusion was determined and the production probabilities for the next twenty years also comprise an important part of the analysis.

The figures from which the various curves are drawn all go back to the data shown in Fig. 1.

The chief feature is that this forecast is based on a study of ratios of registration to population, whereas most similar forecasts are made by merely plotting past statistics and extending the curves on that basis. The forecast for 1940 is based on an assumption of ratio of registration to population for 1940, and is therefore of little interest as compared with the forecasts obtained thereby for the next few years. The theory is that if the assumption of ratio is made for a date far enough ahead, even a material error in that assumption will not throw off to any

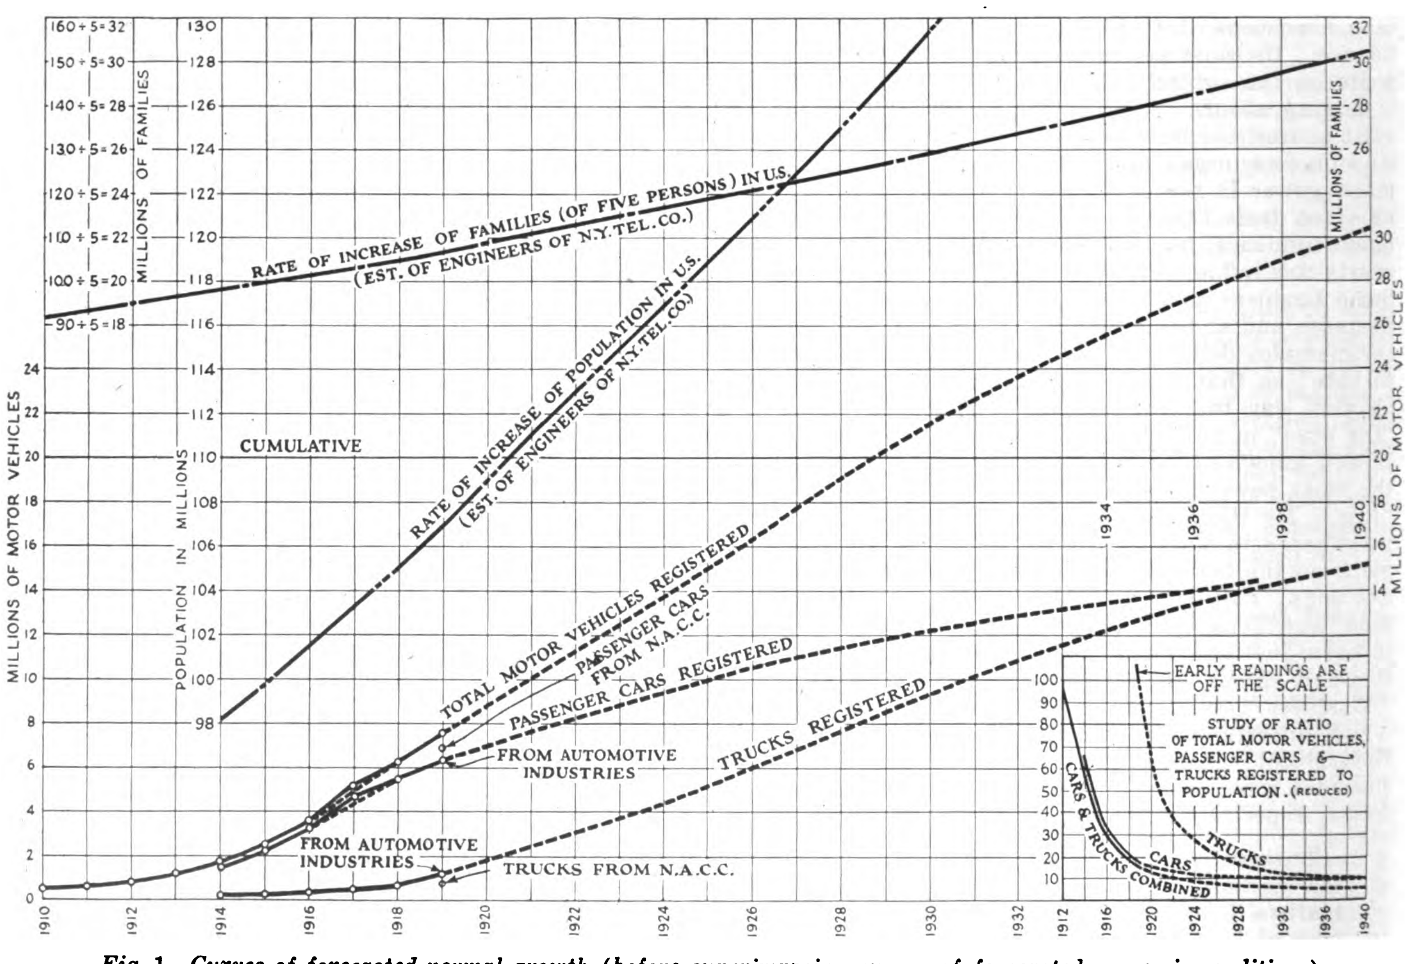

Fig. 1—Curves of forecasted normal growth (before superimposing curves of forecasted economic conditions)

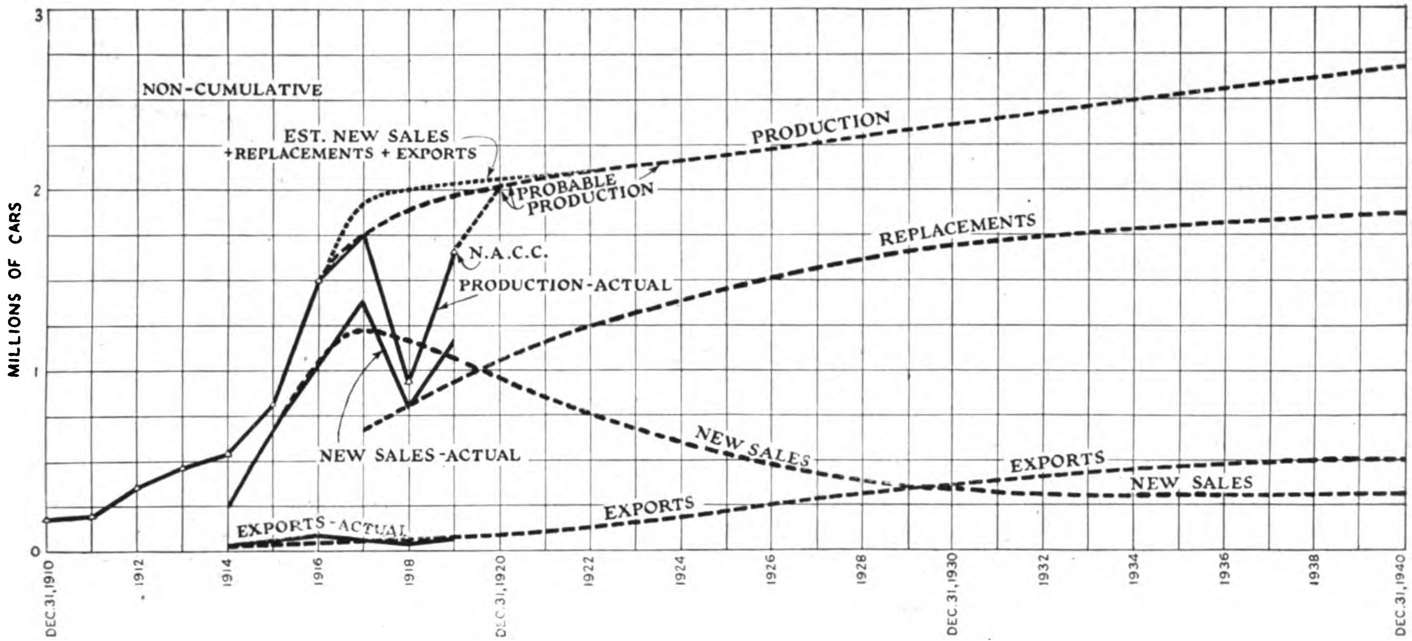

Fig. 2—Preliminary forecast of passenger car production (new sales + replacements + exports)

great extent the forecast for the next few years. This was tried out in this case and found to be true.

The curves were built up on that basis, in the following manner:

The highest ratios of motor vehicles to population in 1919 were:

California	1 car for every 6.07 persons
Iowa	1 car for every 6.12 persons
Nebraska	1 car for every 6.54 persons

The lowest ratio was in Mississippi, which had 1 car for every 45 persons, while the average for the country was 1 vehicle for every 14.14 persons—or 1 vehicle for every three families.

A superficial study of conditions then led to the assumption that in 1940 the average for the United States would be 1 vehicle for every 5 persons, so divided that there would be 1 passenger car and 1 truck for every 2 families.

Ratio Chart

The small chart in lower right-hand corner of Fig. 1 shows the ratio of the total registration, passenger car registration, and truck registration to population. The solid part of the lines represent actual figures to date, while the dotted parts of the lines are the predicted figures to 1940, based upon the assumption just discussed.

The readings thus obtained were then applied to the population curves furnished by the New York Telephone Co. Thus the curves for estimated vehicles registered were drawn.

It will be noted that the curves for passenger cars and trucks are constructed on the assumption that there will be an equal number of cars and trucks in the country in 1940; that is, one car and one truck for every two families.

For the purposes of this calculation, population rather than business houses, factories, etc., was used as a unit of measure for both cars and trucks, because it is, in the final analysis, the determining factor regarding future needs of the country.

On the basis of these curves shown in Fig. 1, the curves shown in Figs. 2 and 3 were constructed. It should be noted, however, that there has been no attempt to take into account such events as the present industrial depression or other economic circumstances which would disturb the natural progress of business. This attitude is warranted, since such depressions have only a temporary effect upon marketing problems.

The forecast of passenger car production is shown in Fig. 2. Again the solid lines show past figures, while the broken lines are the predicted trends. The war caused the radical dip in the production curve for 1918, but the dotted line above shows what the normal production would probably have been, based upon the theoretical standards upon which the future predictions are made.

Bases of Curves

Certain other factors should be explained in connection with Figs. 2 and 3. The average life of a car at present is figured as being between five and six years. But as automobile manufacture improves each year, the average life of a car will probably increase. It is assumed for the purposes of this calculation that the average life of a car in 1940 will be ten years and the replacement curve is drawn on this basis.

In drawing the export curve, it was assumed that the export market has a limited capacity in that manufacturing and assembly plants will be established in a foreign country after a certain point has been reached.

According to the prediction of this chart it will be noted that passenger car production in 1940 will reach about 2,680,000, while truck production at that time will have passed the 3,000,000 mark.

It is interesting to note on the passenger car chart that the replacement business has already become greater than the new sales, and that exports are expected to pass new sales about 1929.

In the truck field, however, it is predicted that new sales will be greater than replacements until 1925, while exports will not equal new sales until 1938.

Large Replacement

According to this forecast there will be more than a million and a half passenger cars needed for replacement alone after 1926, while the estimate gives necessary replacements for 1921 at about 1,300,000 passenger cars and about 300,000 trucks. This would indicate a thriving business for the automobile industry without taking into account the new sales which undoubtedly can be made.

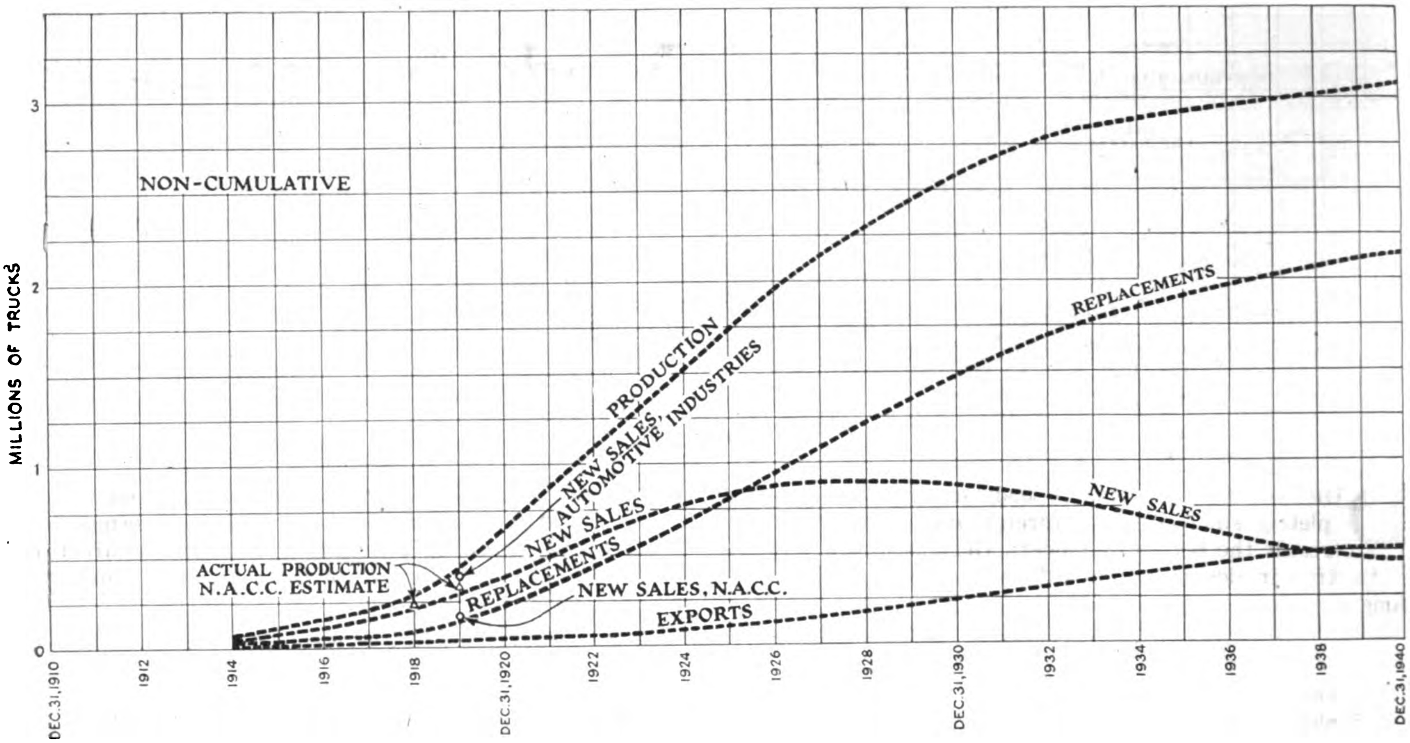

Fig. 3—Preliminary forecast of truck production (new sales + replacements + exports)

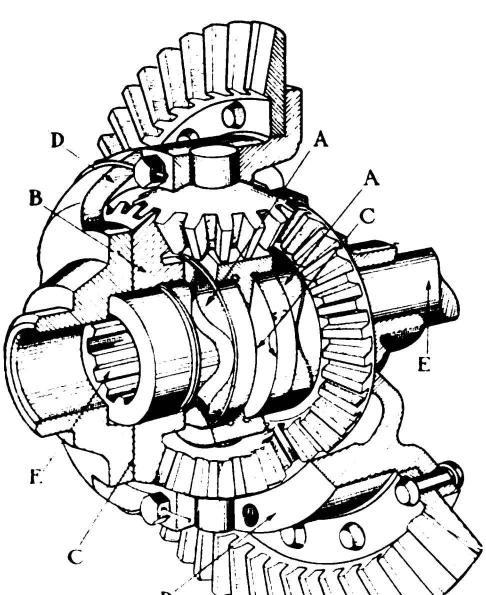
While such estimates as this cannot, of course, be expected to predict the future with strict accuracy, they are very much worth while as a general basis upon which to speculate as to the best plans to make. The charts are presented here as an example of the way in which one automobile manufacturer is going about a study of the problem and as a preliminary report on the results which have been attained.

A Sinusoidal Type Differential

A POSITIVE-DRIVE differential of the sinusoidal type designed by A. T. Nogrady has been the subject of investigation by the General Motors Co. and other concerns in the industry. The differential is fitted with the bevel pinion and side gears in the usual manner. However, the bevel gears are fitted with either helical splines or sinusoidal cams that engage with external and internal members, the latter a portion of a member fitted to, or integral with, the main axle shaft.

When the traction in either of the rear wheels varies, the cam shown in the drawing at *A* tends to thrust the differential bevel gear, or side gear *B*, against clutch faces *C*, thereby setting up a frictional load which is transmitted to the cage *D* as a torsional load, and thus to the main axle shafts *E*.

When operating under ordinary conditions, the effect due to the cam is to thrust the side gears inward and away from the provision for friction, and since the clutching faces are brought to bear one against the other, the thrust is equalized between the inner and outer clutching faces.



Nogrady differential. A, cam; B, differential bevel gear; C, clutch faces; D, cage; E, axle shafts

Automobile Industry in Canada

THE following brief statistics are of interest as showing the present size and development of the automobile industry in Canada, compiled by the Dominion Bureau of Statistics:

Canadian companies manufacturing cars...	10
Cars manufactured since 1916............	351,000
Annual necessary replacement............	80,000
Value of 1920 production of passenger cars.	$84,500,000
Dealers in Canada 1920..................	5,500
Persons employed in automobile and allied industries	80,000
Persons involved, including families of workmen	400,000
Capital investment in dealers' companies...	$43,000,000
Capital investment in manufacturing companies	$110,000,000

Some Examples of Modern Passenger Car Bodies Designed in Germany

Result of isolation during the war seen in distinctive designs with embodying V-type radiator and windshield, concealed top and divided rear seat. Some touring bodies have light detachable limousine top.

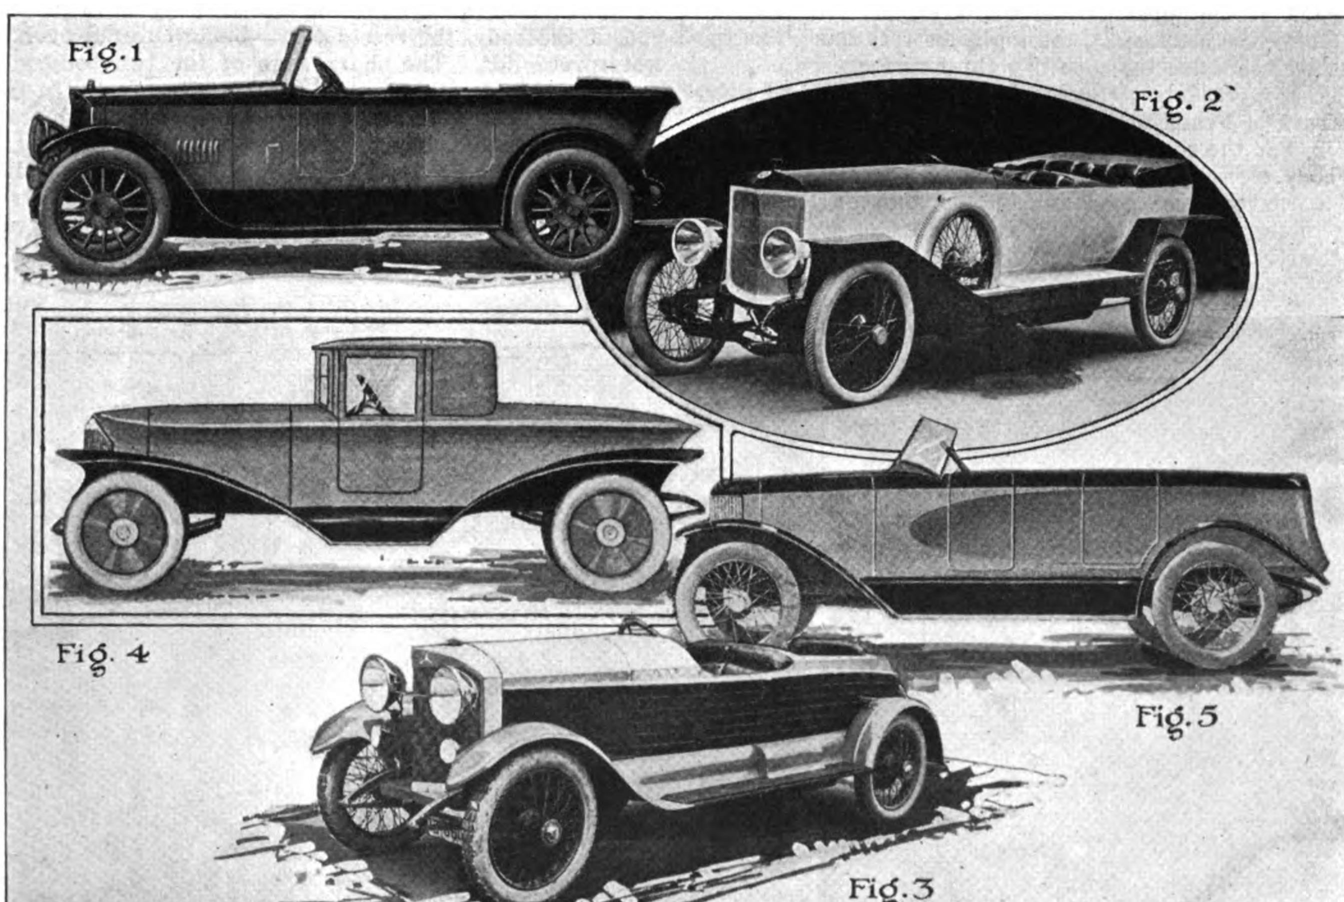
By Benno R. Dierfeld

DURING the war German body designers were completely shut off from foreign influences, and as a result the bodies of modern German cars are quite distinctive in design. The differences as compared with American and other foreign bodies are particularly accentuated in open bodies, but can also be found in closed cars. They are:

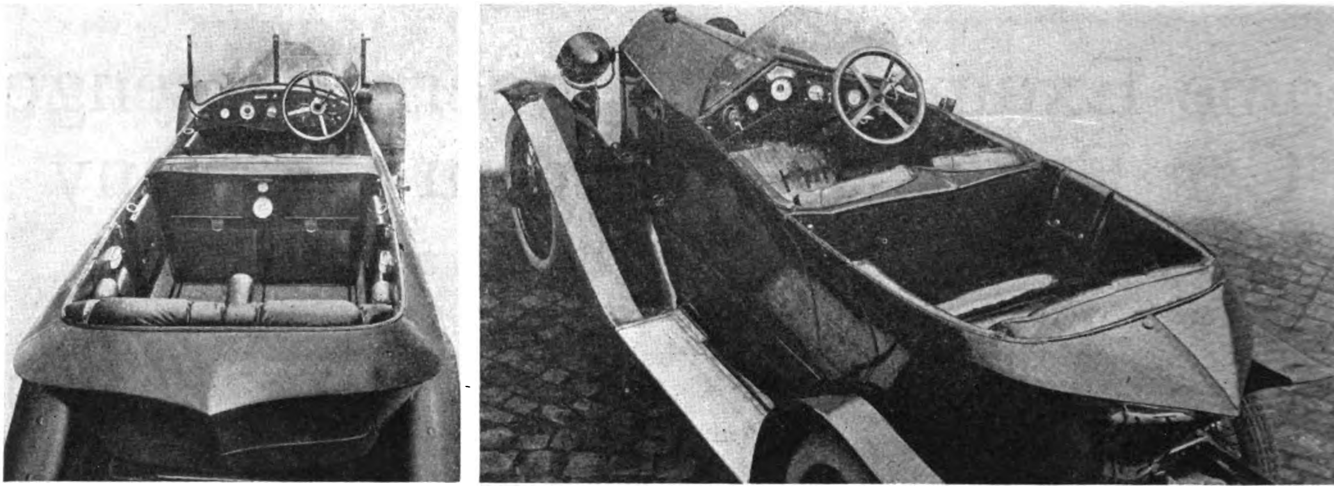
1. V-shaped radiator.
2. V-shaped windshield.
3. Sharp horizontal top line, running from the upper part of the engine bonnet to the rear end of the body.
4. Two-color finish with the horizontal top line mentioned above as line of demarcation.
5. Top concealed in the rear part of the body.
6. Rear seats generally divided by an arm rest and only wide enough for two passengers.

Of course all these features are not always combined in one body, but they are found in most of the German open cars. In the following a number of bodies manufactured by German automobile factories and body works are briefly described.

Fig. 1 shows a typical open body built by Benz. The car seats six passengers and the two rear seats are separated by a central arm rest. The radiator is V shaped, as in all German cars. This construction, while expensive and more difficult to repair than the ordinary flat radiator, gives the car a speedy, rakish appearance. For the same reason the windshield is V-shaped, a design that also reduces the wind resistance, and the top is concealed in a recess, between the rear seat back and the extreme end of the body, which is normally closed by a lid. The radiator is narrow, but very high, so that a horizontal line can be



A variety of German automobile bodies, mainly of the sporting type



Figs. 6 and 7—Interiors of two German open bodies

run along the top edge of the body from the radiator to the rear end, forming a sharp edge and separating the two colors. The body part lying above this line or edge is painted in black or a dark color, the same as the fenders, while the sides of the body are painted a light color.

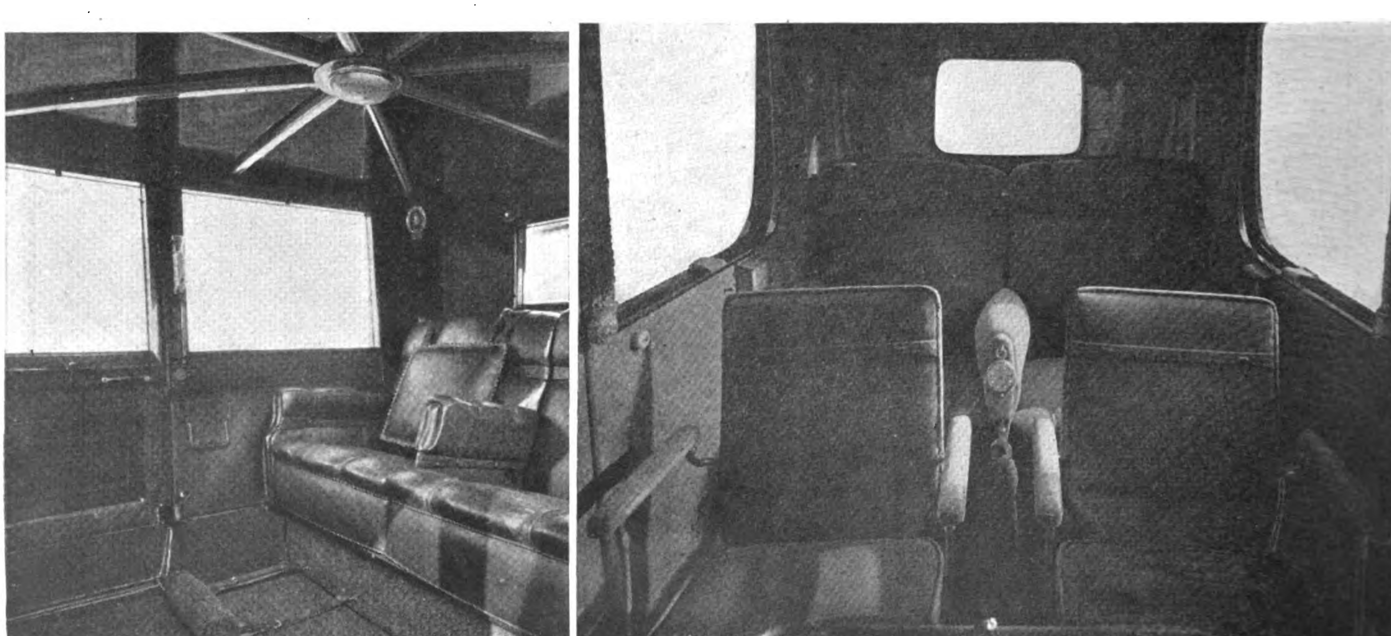
Sporting bodies also have been influenced to a certain extent by the new development in German body design. In Fig. 2 is shown a smart sporting four-seater built by Neuss of Berlin. The V-shaped windshield is here omitted; the fenders have straight lines and below the running board there is a long shallow box for carrying tools, spares, etc. The top does not disappear in the body, but rests upon the rear end of the body and is covered by a buttoned leather envelope. As this envelope is black, the same as the upper part of the body, and does not project above the body walls, the top looks very much like the so-called concealed top, but is lighter and cheaper.

Fig. 3 represents a torpedo body built of natural wood by Kruck of Frankfort. It shows lines similar to those of Fig. 2, but the top is really concealed in the rear part of the body.

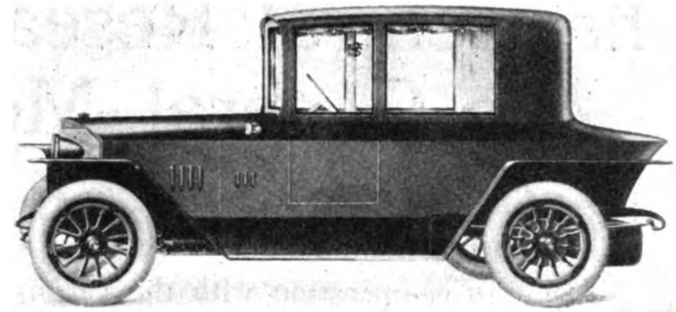
The conventional roadster and runabout are scarcely seen in Germany; indeed the appearance of most of the two-seaters does not differ materially from that of four seaters, and only with the top up can the two types be clearly distinguished. Fig. 4 shows a fine example of a German two-seater, built by Szabo & Wechselmann; it embodies all the characteristics of the four seaters—V-shaped radiator and windshield, horizontal sharp edge, concealed top, etc., the fenders have graceful lines, while in the rear deck there is a dinky seat and storage space for baggage, spare tires, tools, etc.

Fig. 5 shows another touring body, built by Szabo & Wechselmann, that combines all the distinctive German features, but also embodies unusual lines, the body side walls being concaved, producing an unusual, but attractive appearance.

An open six-seater by Voll & Huhrbeck of Charlottenburg, is shown in Fig. 6. The top is concealed in the rear end of the body, the recess for it being covered by large waterproof lids. The sharp edge of the two body sides end in a point at the rear, a feature often found in German cars. The rear seats are real club chairs with arm rests, etc.; the seats proper can be pulled out at will, so that during long runs the passengers can change their position. The two folding seats are of the usual construction, but the V-type windshield is built in three parts with metal frame.



Figs. 8 and 9—Interiors of two closed bodies



Figs. 10 *and* 11—*Conservative and radical types of German closed bodies*

Fig. 7 shows a three-quarter rear view of a four-seater which in outside appearance resembles the body of Fig. 6. The hood can be concealed in the rear pointed part, if so ordered by the customer, or is carried in the form of a small parcel and put up in case of bad weather. The V-shaped windshield is one bent piece of glass without metal frame, very light and rakish looking; the fenders also are of V-section, to harmonize with the radiator, windshield, etc. All tops have detachable side curtains with celluloid windows.

The transition from open to closed bodies is formed by bodies with detachable limousine top. Fig. 8 shows an interior view of such a Kruck body with limousine top in place for winter use. The limousine top is very light and can be put on or taken off within a few minutes by two men. When this top is removed it is replaced by a box containing a complete summer top, and then the open car cannot be distinguished from an ordinary touring car.

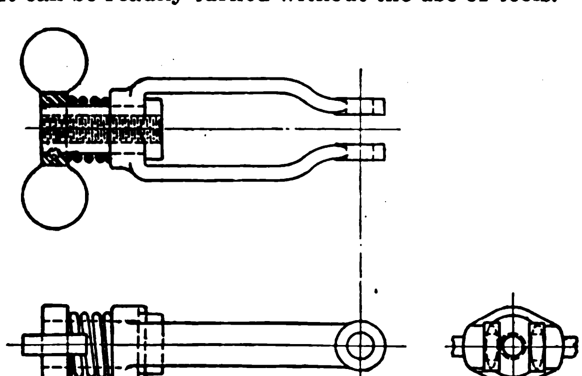
The view of the interior shows the characteristic German design, i. e., divided rear seats with central arm rest and foot rests. The detachable top is built entirely of natural-finished wood in order to prevent damage by moths. Of course it must be very carefully constructed, otherwise it would warp during the summer and not fit in winter. Landaulets are built in the conventional manner but are seldom used. Closed bodies are always built with inside drive; Fig. 10 shows a six seater limousine built by Neuss; the V-shaped radiator harmonizes with the V-shaped windshield and the top is finished in black and contrasts with a dark green body. At the driver's side the windshield is divided and can be opened at will; the front windows can be let down. An interior view of this limousine is seen in Fig. 9. The rear seats, as well as the auxiliary seats have arm rests at both sides. All limousines have doors on both sides at the rear seats and a door at the left side of the driver's seat.

Town cars or coupés are built with or without inside drive; Fig. 11 shows a coupé with inside drive built by Daimler. A dark horizontal stripe runs along the side at the height of the arm rest. The body has a compartment for spare tires, tools, etc. under the rear deck. There is only one door, at the left side. The large windows and the graceful arrangements of the side curtains gives the vehicle an attractive appearance.

An Improved Yoke End

WITH the ordinary yoked rod ends used in brake connections it is not as easy a matter to make an adjustment of the brakes as may seem to be the case. First the cotter pin has to be removed from the pin of the yoke end, then the yoke pin itself must be removed, the yoke end rotated one or more half turns on the end of the rod, the yoke pin replaced and the cotter pin reinserted. With a view to facilitating this operation the Gemmer yoke end, illustrated herewith, has been brought out by the M. J. Ford Mfg. Co. An intermediate piece between the yoke end proper and the rod is provided with ears or finger pieces so that it can be readily turned without the use of tools. This intermediate piece is in the form of a threaded collar which turns comparatively freely in the hub of the yoke proper, but the tendency of vibration to work it out of adjustment is prevented by providing one head with a V-shaped projection which engages with a corresponding notch in the hub of the yoke under the pressure of a coiled spring.

This adjustable yoke end takes the place of the adjustable yoke and turnbuckle. It is claimed to be easier to assemble, to adjust either by hand or wrench and to be less expensive than a separate yoke end and turnbuckle.



The Gemmer yoke end

THE Merchant Venturers' Technical College, which provides the Faculty of Engineering of the University of Bristol, and maintains a separate Department of Automobile Engineering, is just completing the re-equipment of the automobile laboratory. Several firms, recognizing the value of such a department devoted to the study of the problems of the industry and to the training of automobile engineers, have presented valuable specimens of engines and equipment to the college from time to time. The latest gift, presented by Douglas Motors, Ltd., is a standard 2¾ twin air-cooled engine. The same company has also promised one of its new O. H. V. engines immediately they are in production. The engine will be used both for demonstration and research work, with results, it is hoped, beneficial to the makers, students and the motor trade generally.

The Central Research Laboratory of the General Motors Company

Occupies a building 1000 ft. long by 270 ft. wide in Moraine City, a suburb of Dayton, and is operated as an independent unit of the G. M. C. but in co-operation with the various automobile and parts plants of the company, under the direction of C. F. Kettering and a staff of specialists.

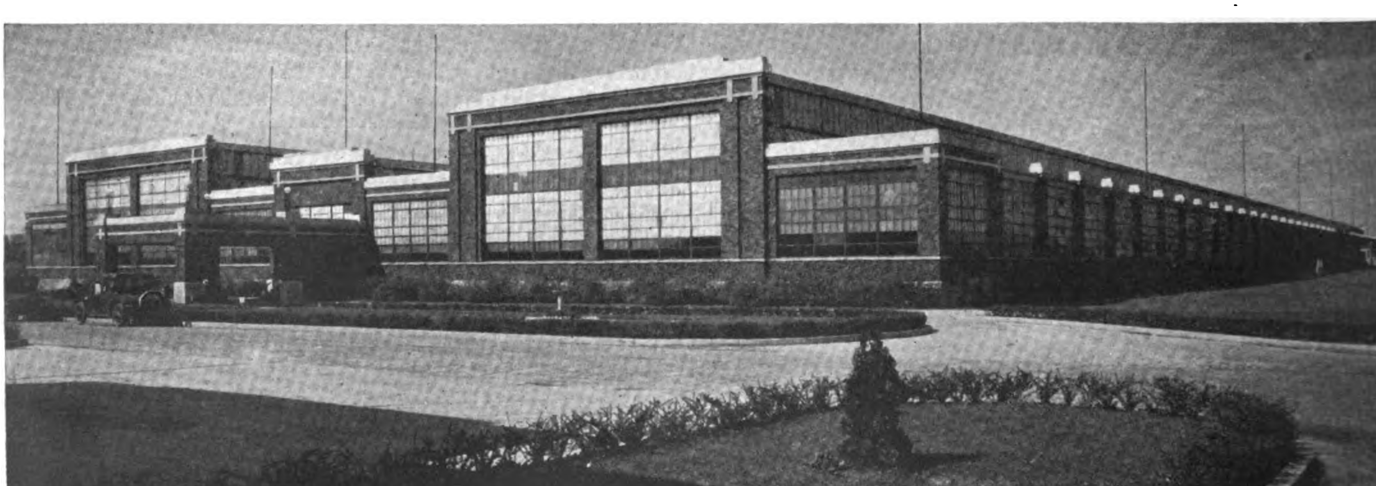
By J. Edward Schipper

REALIZING the advantages of bringing under one roof a number of branches of research activity, the General Motors Company is concentrating a great proportion of its activities along this line at the laboratory at Moraine City, Ohio. The research unit is a separate corporation known as the General Motors Research Corp., having its own officers and directorate, and operates as an independent unit, although co-operating with the different automobile and parts manufacturers in the General Motors group.

The organization occupies a building 1000 ft. long by 270 ft. wide. It has been possible to divide this structure into a number of laboratories, each equipped with all of the necessary devices for carrying on research work in the different departments into which this activity is being extended. At the same time, these small laboratories, which are 20 by 30 ft. in dimension, are elastic enough in their arrangements so that as soon as a research job is completed another one of entirely different characteristics can be started. The laboratories are all equipped with compressed air lines, vacuum lines, necessary electrical equipment and are provided with electric current of different characteristics, and are, furthermore, excellently lighted. Some of the research rooms are equipped with devices which render them permanently adapted to specific lines of research work. The majority of laboratory rooms, however, can be adapted to any of the general classes of research work which may be undertaken.

This centralization of the laboratory idea into one building has naturally led to a gathering together of specialists and experts in the various lines, giving an opportunity of so co-ordinating the work of these various lines that the work of the different divisions of the laboratory can be made to dovetail into a general scheme of research which renders it of highly practical value. In fact, a strict point of practicability is made in all of the laboratory work which is being undertaken. All of the development and research points to some commercial end, which, although it may be in the remote future, is, nevertheless, some day going to find its way on the market as a practical product. In addition to these activities which have to do with future products, there is also a great amount of routine work at the laboratory having to do with current problems in the General Motors plant.

The research corporation is fortunate in having at its head C. F. Kettering, whose personal research work has made him sufficiently acquainted with the different lines of activities going on at the laboratory to have an intimate and detailed knowledge of practically all the work under way. In order to allow the division heads who are in the actual research work to be absolutely free to devote all of their energies to the research part of the business, the control division is entirely separate and handles the business, accounting and personnel of the laboratory. In the direct research department there are eleven principal divisions: these include mechanical engineering, fuel, chemical and metallurgical control,



Exterior of the laboratory building of the General Motors Research Corporation at Moraine City, Ohio, which is just outside of Dayton

which has to do with current manufacturing processes, and chemical and metallurgical research, which has to do with future methods. There are also included divisions for electrical engineering, dynamics, refrigeration, farm engineering, experimental production, which has to do with reducing design to production, by means of model-building, etc.; semi-works engineering, which has to do with the development of manufacturing methods, such as special machines and tools, and instrumentation, which includes experimental and development work on matters requiring accurate dimensions, such as speedometer designs, etc.

These activities are carried on in forty-four laboratory rooms, and in addition there are machine shops in some of the laboratory departments where they are necessary to carry on the work. The laboratory is equipped with its own heat-treating plant, foundry and pattern shop, and carries on hand a stock of the different necessary steels for this work. With this equipment, and by the selection of men who are all highly practical in their line and who are willing to get right into the work themselves, some very noteworthy results should be accomplished. In order that the work is continually being co-ordinated and checked up at all times, frequent conferences are held. As a matter of routine, there is a conference every Saturday afternoon presided over by C. F. Kettering. At these Saturday afternoon conferences reports are made by the different divisions as to the status of the work under way. Problems are assigned to the divisions, and by a system of progress reports the advancement of the work is kept in view. With the wide range of activity carried on by the eleven principal divisions, which have their sub-divisions, two or three hundred problems may be receiving attention from the laboratory at a time.

The laboratory staff and equipment are at the disposal of all of the General Motors plants, and there is a growing tendency for the chief engineers and their assistants from all of the General Motors plants to get together at the laboratory every few months for discussion. A library is provided with an up-to-date supply of technical literature and it is large enough to act as a very advantageous lecture room. In addition, there is an exhibit room into which may be brought various products of the laboratory for display at the conferences.

The laboratory is not as yet a year old, the research corporation having been started in July, 1920. Consequently, the activities of the laboratory are not as yet by any means up to their full development. There has, however, been sufficient work going through to indicate that this plan is going to work out in a highly successful manner, and a great many advantages are going to result from the ability of the various plants in the General Motors group to place in the hands of a highly selected staff of experts, not only their current problems, but also those of future marketable devices.

The matter of fuel alone is sufficient to occupy a considerable share of attention. The fuel division at the laboratory is equipped with complete distillation apparatus for producing any of the possible fuels which may come into future use. The development of fuel "dope," which promises to be one of the matters of prime importance to the automotive industry in future years, is before this division at the present time.

With a mechanical engineering division under the same roof as the fuel division, after a fuel has been developed the engine design necessary for the utilization of the fuel can be handled, perhaps jointly by the mechanical division and the fuel division. By allowing the various divisions to co-operate, even though their activities demand widely divergent classes of knowledge, the solution of a problem involving ramifications which lead it into many special fields is far more feasible than it would be with a single-purpose laboratory.

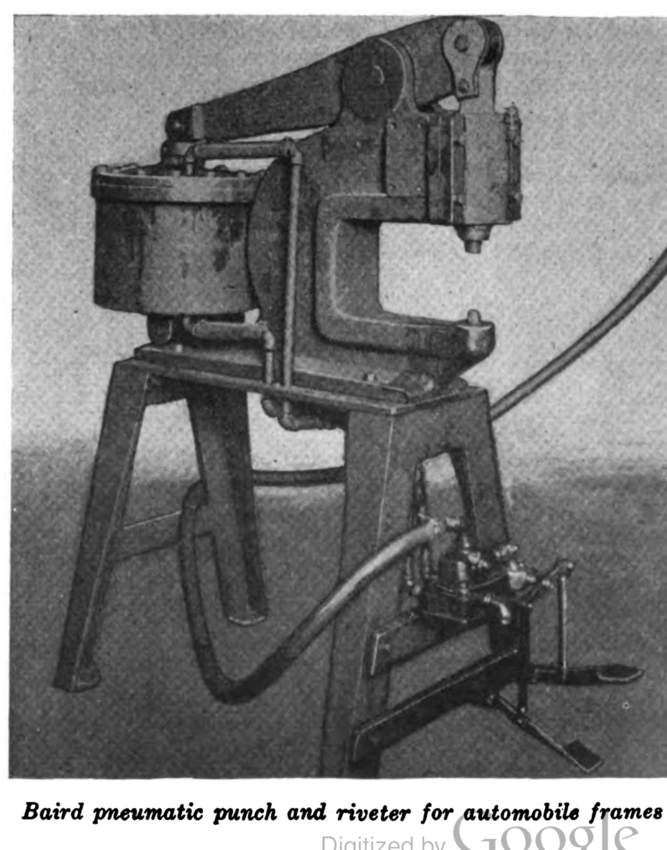
Production Short Cut in Frame Fabrication

A PUNCH and riveter for the fabrication of automobile frames is manufactured by the Baird Pneumatic Tool Co. It is operated by compressed air and does its work best with an air pressure of 100 lb.

With this tool the services of two men are required for maximum production, one to set up the frame and the other to guide it and operate the pedal of the riveter. The work is brought to the machine, which is stationary.

We are informed that during a test in an automobile assembly plant two men with the Baird riveter did in the same time the same amount of work previously done by four men. Two men with the Baird tool riveted 150 automobile frames in an eight-hour day, while previously four men with pneumatic hand hammers could rivet only 75 frames in the same length of time. Without special effort, eight rivets were set in thirty seconds.

By the use of this machine the rivet is headed with a single stroke or thrust, and there is said to be no vibration attending to loosen joints already made. Each rivet is uniformly headed and completely fills the rivet hole. A pressure of approximately 70,000 lb. is exerted on the rivet dies.



Baird pneumatic punch and riveter for automobile frames

COMMENTING on Sir Henry Fowler's presidential address before the Institution of Automobile Engineers, *The Engineer* says "he was in high gear all the way through it and took the hills and a few distinctly sharp corners at the same amazing velocity. If after dinner speeches were taxed on their horse power, we stand aghast at Sir Henry's R. A. C. rating."

Government Research in Road Construction

Part II

A continuation of the article dealing with the extensive investigation being conducted by the U. S. Bureau of Public Roads of factors entering into the strength and durability of different types of roads.

By P. M. Heldt

A SPECIAL investigation was conducted to determine how heavy wheel loads are transmitted to the subgrade. Several years ago a small pressure cell was developed by the Bureau of Public Roads. This was first used on the Camp Humphrey's concrete road to determine the maximum soil pressure under the rear wheels of a Class B army truck, which carry a weight of 8500 lb. each. Recently similar tests were made with a 5-ton, 6-wheel truck, in which the load of the truck is distributed over four instead of two wheels. Sectional and plan views of the diaphragm cell for determining soil pressure are shown in Fig. 12. The cell consists of three cast iron disks A, B, C, and a malleable iron ring D, A and B and D and C being secured together respectively by means of machine screws. The top is covered with a brass diaphragm 0.002 in. thick, pressed over the sides and cemented, to the sides only, with asphaltic cement. The brass top is protected by a covering of cheese cloth cemented to the top and sides with a blown oil asphalt. A brass diaphragm 0.002 in. thick is clamped between A and B and between C and D. The clamped joints, which must withstand air pressure, are treated with a special compound of rubber, vaseline and beeswax. The block E is of steel and is insulated from C, on which it is supported by a layer of Bakelite cement No. 5. From the block E extends a No. 16 copper wire with triple braid weather-proof insulation, through a ⅛-in. galvanized iron pipe. Evidently when Block E is in metallic contact with disk B an electric circuit is closed through the ground. The soil pressure tends to close this circuit, and by admitting compressed air through the iron pipe until the circuit is broken and then measuring the air pressure, the soil pressure per square inch is directly determined.

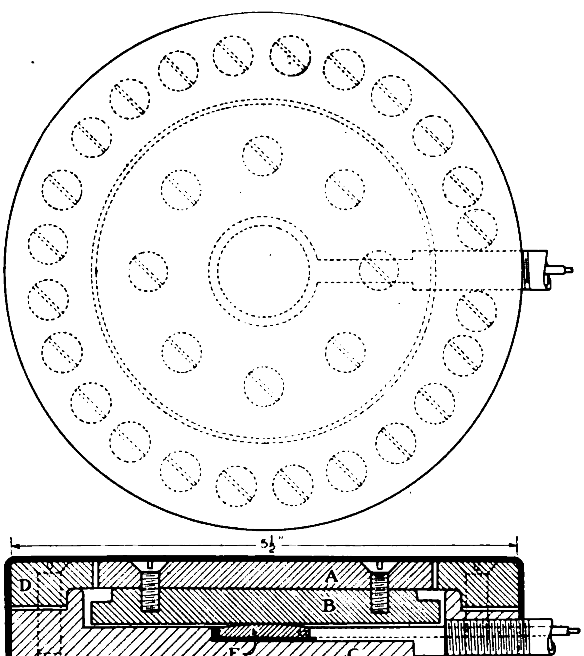


Fig. 12—Diaphragm cell for determining soil pressure

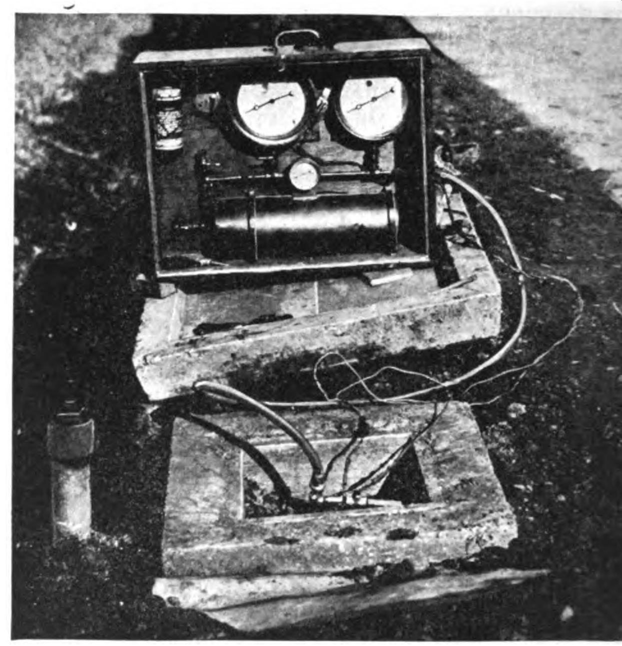

Fig. 13—Apparatus for reading pressure on soil pressure cells

Distribution of Subgrade Pressure

Fig. 13 shows the measuring box and connection for reading the soil pressure cell. In Fig. 14 a cross section of the Camp Humphrey's Road is shown, the location of the four cells used in making this test being indicated. This road had an 8-in. concrete slab of great strength, which naturally has the effect of distributing the concentrated wheel load over an extended area of subgrade. In spite of this fact, the maximum subgrade pressure under the wheel was greater than certain kinds of subgrades will support when water soaked. It is perfectly

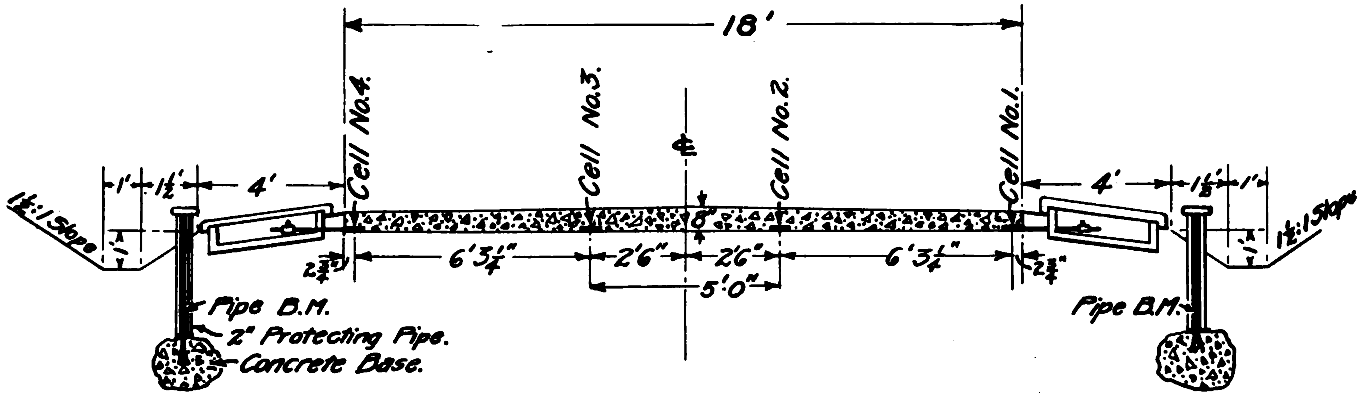

Fig 14—Section of Camp Humphreys road showing location of cells

obvious that roads, if they are to stand up, must be so designed that the maximum subgrade pressure will not exceed the minimum subgrade bearing capacity. Once the subgrade bearing capacity under all conditions is known, it is then a comparatively simple matter to determine the proper type and thickness of road surface which will support the traffic to be expected. A complete series of tests on subgrade bearing pressures with rigid and non-rigid road slabs is now being conducted.

In Fig. 15 are plotted the pressures obtained from the different cells when at different distances in the line of travel from the center point of contact of the wheel on the ground. The upper curves show the distribution of pressure when the truck travels in the center of the road and the lower curves when it travels to one side. These tests were made with a Class B army truck carrying 8500 lb. on one rear wheel and 2500 lb. on one front wheel. Comparative tests were made with the Goodyear six-wheeled truck, in which 9480 lb. were carried on two rear wheels, and it will be noticed that the maximum subgrade pressure is only about one-third as great, although the load carried is greater. This shows the advantage of distributing the load, or in other words, of not carrying too much load on one wheel.

A series of tests to determine the causes of subgrade failure is now being carried through. In certain parts of the country where there is heavy traffic, road failures have been directly traced to poor subgrades. It has been found that similar road surfaces under similar traffic conditions will stand up in some parts of the country but not in others, and the reason must be looked for in differences of subgrade. The exact qualities of soil which make for good subgrades are not definitely known at the present, and research work on the subject has been started. Almost 100 samples of subgrade soil have been selected from different parts of the country, for tests at the laboratories of the Bureau of Public Highways. Some of these samples are from parts where failure took place, and others from parts of the same roads that withstood the traffic.

Investigation of Subgrade Soils

Soil samples of a volume of 1 cu. ft. were sent to the laboratory and tests were made to determine the percentages of clay and silt, the colloidal properties, mechanical analysis, slaking value, cementing value, bearing value, specific gravity, capillary properties, moisture equivalent and miscellaneous properties such as volume changes with moisture, volume changes with freezing, and compressive strength. At the same time that the samples were taken, notes were made on the drainage system and the topography of the vicinity, and borings were made to a depth of 5 ft. to investigate the subsoil for the presence of seepage layers on impervious strata. These borings often throw light on the reason for excessive water content. Notes were also taken on construction features of the road and on the character of the traffic over it.

Results so far obtained have made it quite clear why roads stand up on some kinds of soil and fail on others. It has become quite apparent that the bearing value test is the most important of all those enumerated above. Roads must support their traffic under a wide variety of conditions. Sometimes the subsoil is completely saturated with moisture, while at other times it is perfectly dry. Frost occasionally will expand the subsoil when it is thoroughly saturated, and again the subsoil may be thoroughly compacted. In the test it is attempted to simulate all road conditions. The method of making this test is as follows:

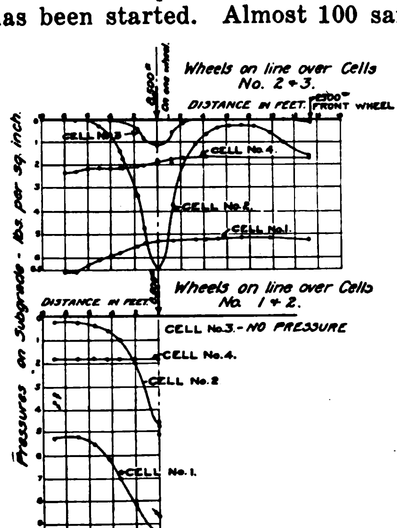

Fig. 15—Distribution of subgrade pressure under wheels of Class B Army truck

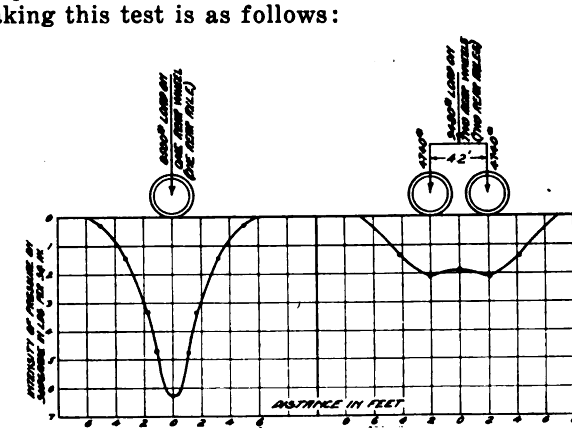

Fig. 16—Distribution of pressure in subgrade under 8-in. concrete slab with two and four rear truck wheels respectively

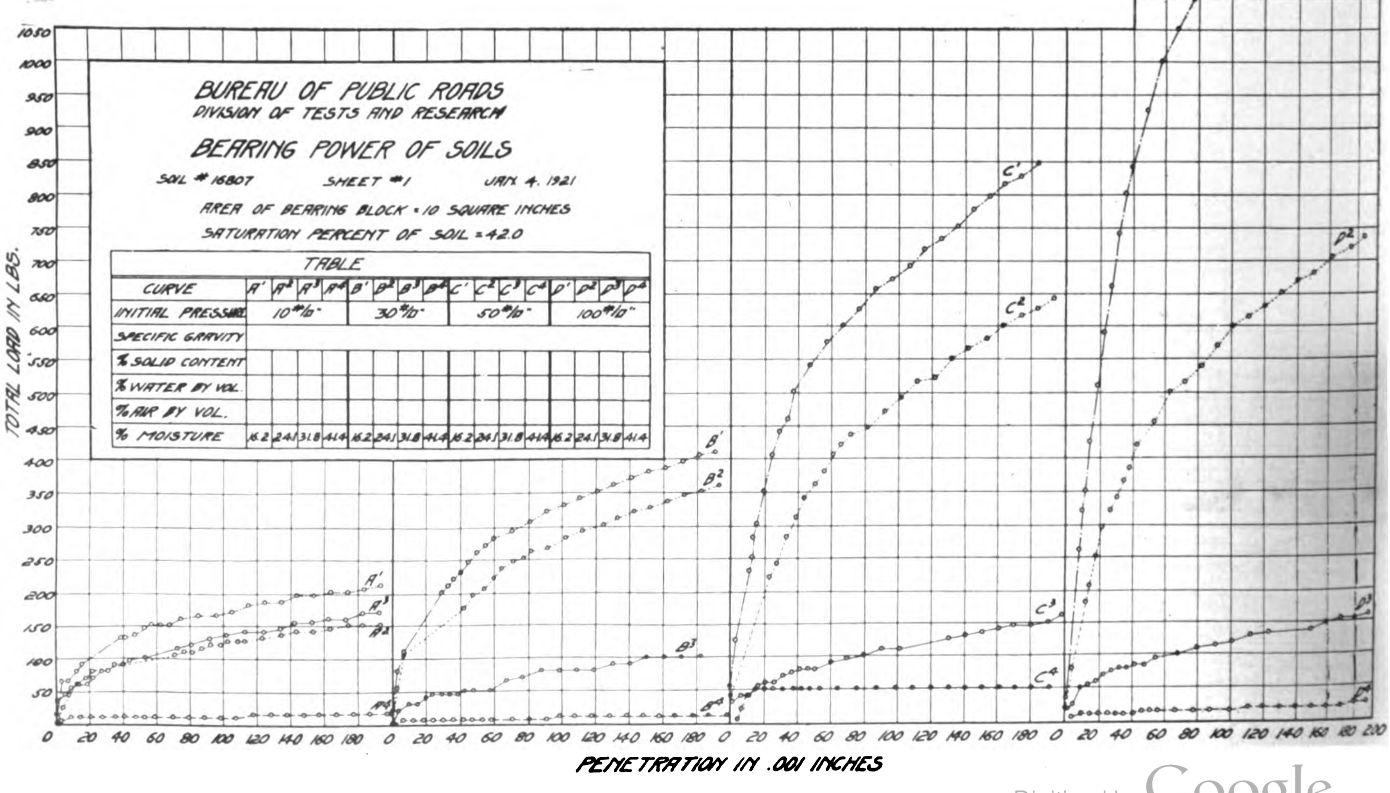
The soil is broken up in a mortar with a rubber-covered pestle and then is passed through a ¼-in. mesh screen. The material passing through this screen is pulverized by rubber rollers, without grinding it, however. The pulverized soil and the coarser material sifted out are then combined again and thoroughly mixed. Bearing value tests are made on the soil with four degrees of moisture content. One set of tests are made on soil containing only just enough moisture to enable it to be thoroughly mixed and placed in a small mold; another set of tests are made on the saturated soil and two other sets on soil with intermediate moisture contents. The saturation point is that percentage of moisture which the soil will take up by capillarity when loosely compacted. The bearing capacity of a subgrade also depends on the initial pressure. In the tests, initial pressures of 10, 30, 50 and 100 lb. per sq. inch are used. Each sample is therefore tested with four different moisture contents and under four different initial pressures.

After the sample is prepared as described, it is mixed with a small amount of water, kneaded with the hands protected with rubber gloves, and placed in a vertical cast iron cylinder of 6 in. diameter and 6 in. height. A plunger is then placed in the cylinder on top of the soil and the soil is compressed in a testing machine under a definite pressure for a period of 5 min. Then the plunger is removed and a circular bearing block is placed on top of the soil and pressure applied at the lowest speed of the testing machine. Readings are taken simultaneously of the pressure applied and of the penetration of the plunger, the latter being read off on an Ames dial gage, which reads to 1/1000 of an in. Between tests at different initial compressions the soil is removed from the cylinder and replaced, and when the tests at all four compressions have been completed, water is added and the tests with a new increased water content are begun. This artificial preparation of the soil is very similar in its effects to natural changes in soil conditions. Fig. 17 shows the results of the test on one type of soil. The enormous difference between the bearing value of a saturated and practically dry soil, when under 100 lb. per sq. in. initial pressure, is brought out very strikingly. In the saturated condition this soil has a bearing value of only about 2 lb. per sq. in, whereas in the dry condition the bearing value exceeds 150 lb. per sq. in. The soil to which these tests refer is an adobe soil, which absorbs 42 per cent of moisture and shows about the lowest bearing value in the saturated condition of any soil tested. The road from which this soil was taken failed badly.

A sand clay mixture made up of 75 per cent of coarse sand and 25 per cent of clay absorbed only 18 per cent of water by weight of the dry sample and showed considerably higher bearing value. Soils of this character, having a large percentage of coarse material, show higher bearing values when highly compacted than when loosely compacted even when the soil is saturated.

In the tests of the Class B truck on the Camp Humphrey's Road above referred to, it was found that the soil pressure under the 8-in. concrete road slab figured out to 6.5 lb. per sq. in. By comparing this value with the 2 lb. per sq. in. minimum bearing value of the adobe soil in the saturated condition, it will be seen that difficulties must be encountered in building roads for heavy motor traffic in some sections of the country. But even adobe soil will support heavy pressure when reasonably dry, which emphasizes the importance of proper drainage. This is further confirmed by the fact that city pavements of small depth stand up so well under the heaviest kind of traffic, the only explanation being that the subsoil here is well drained and never becomes saturated. Fine grained and very plastic soils when saturated are apt to give considerable trouble, while coarse

Fig. 17—Bearing values of adobe soil with different moisture contents and different initial pressures



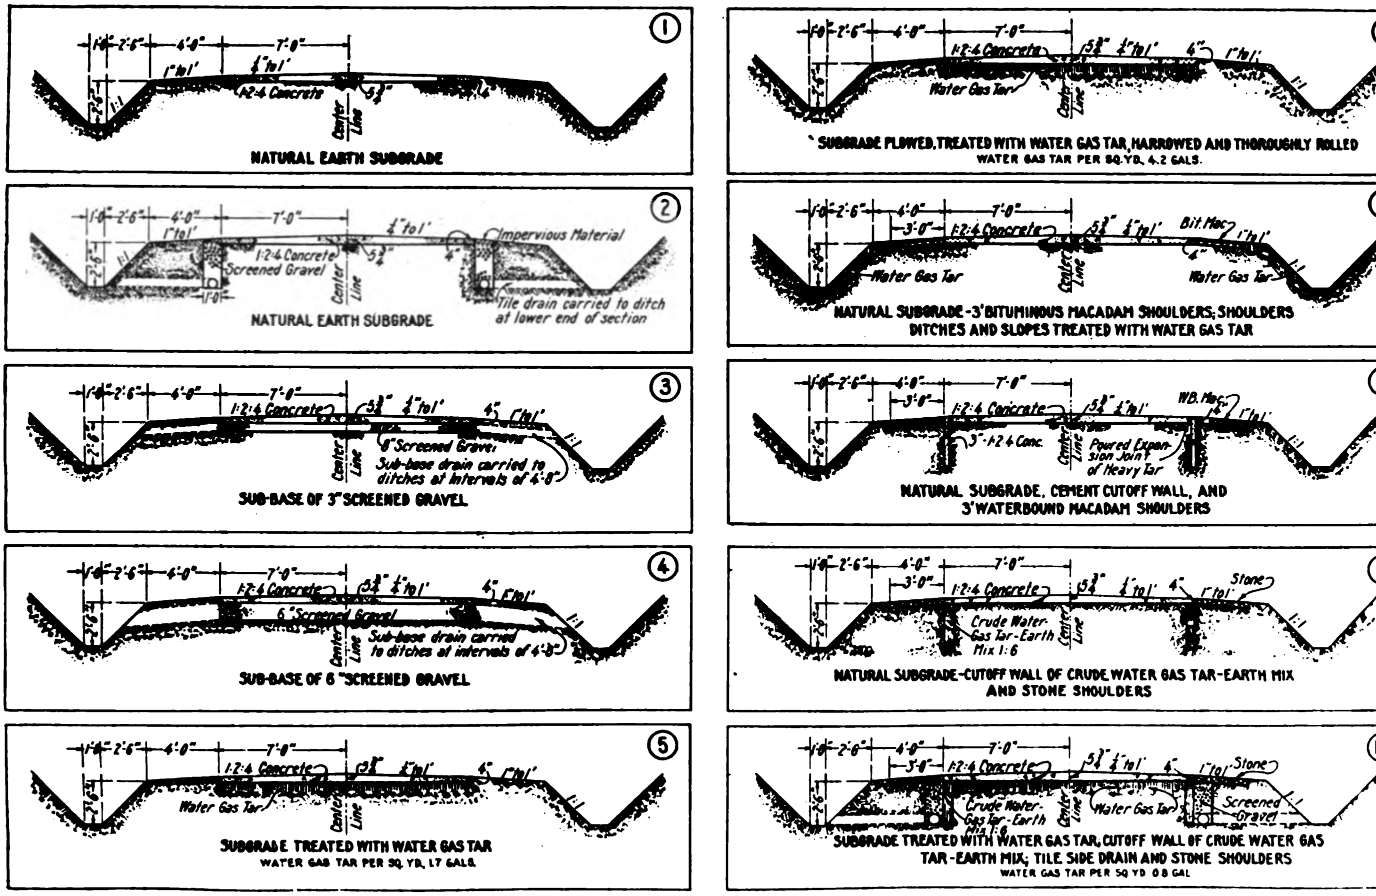


Fig. 18—Road sections showing different drainage schemes

grained and more porous soils are free from such trouble.

An attempt will be made by the Bureau of Public Roads to grade all soils with respect to their bearing value. Subgrade failures have occurred in many parts of the country where drainage was employed, but in view of the fact that in the cities very heavy traffic is successfully supported on light section pavements, the conclusion is arrived at that the drainage of our roads in many cases is not very effective during the wet season.

The next step in the Bureau of Public Roads investigation therefore was a series of tests on road drainage which was carried out at Arlington Farms, Va. The ideas underlying these tests are illustrated in Fig. 18.

Subgrade Drainage

The idea occurred to the officials in charge of the tests to try whether it was not possible to exclude water from the subgrade by the use of water proofing materials. This, of course, involves principles diametrically opposite to those on which the present drainage system is based, which only serves to carry away the water after it has saturated the subgrade and rendered it extremely soft. At 1 (Fig. 18) is shown an ordinary concrete pavement on natural earth subgrade with drainage ditches 2½ ft. deep on both sides. At 2 this construction is varied by providing at both edges of the concrete pavement screened gravel walls with a covering of impervious material, the walls forming a sort of blind ditches of the same depth as the drainage ditches with which they communicate through tiles. At 3 the concrete slab is laid on a 3 in. screened gravel subbase from which tiles extend to the ditches every 4 ft. 8 in. At 4 the thickness of the subbase is increased to 6 in. At 5 the subgrade of natural earth is treated with water gas tar, 1.7 gal. to the square yard. At 6 more of this water gas tar is used, 4.2 gal. to the sq. yd. The subgrade is plowed, treated with the water gas tar, harrowed and thoroughly rolled. At 7 the subgrade is of natural earth but on each side of the concrete there is a 3 ft. bituminous macadam shoulder, and shoulders, ditches and slopes are treated with water gas tar. At 8 there

Fig. 19—General view of construction for road drainage tests

are 3 ft. water bound macadam shoulders and cement cut-off walls 2½ ft. deep. At 9 there are crude water gas tar cut-off walls, earth mix and stone shoulders, and at 10 this construction is combined with screened gravel drains outside the cut-off walls with tile connection to the ditches. The results of these drainage experiments were to be observed this spring, and if they proved successful it was the intention to repeat them on a larger scale with the aid of the state highway departments.

According to the latest information available, the section with the gravel sublayer promised the most success. It is concluded that such a layer not only serves to keep the subgrade dry by aeration but also helps to distribute the wheel pressure over the soft subsoil. Fig. 19 is a general view of the subgrade drainage experiments.

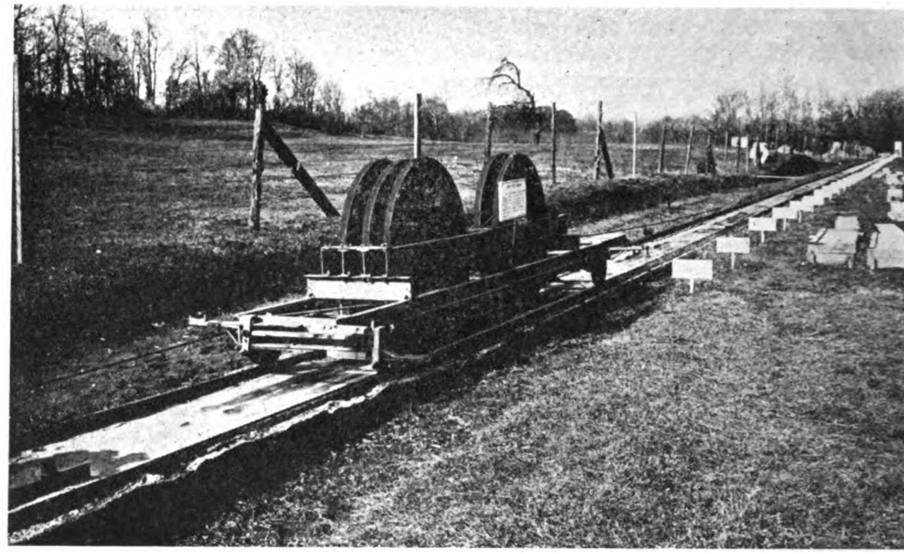

Fig. 20—General view of construction for accelerated wear tests

To quickly determine the wear-resisting qualities of different kinds of road pavement, an experimental road section was built, 400 ft. long and 2 ft. wide, made up of sections of different types of pavement. Concrete side walls were constructed on both sides of the experimental sections the whole length. The pavements were laid on a sub-foundation of compacted cinders 18 in. deep and the subgrade below this was tile-drained throughout its whole length. All wearing sections except those of concrete were laid on a 2-in. concrete base of 1:3:6 mixture. The concrete wearing sections were made 6 in. deep. The wearing machine (Fig. 20) consists of 5 cast iron wheels weighing 1000 lb. each and having a face width of 2 in. Three of these wheels are arranged side by side, spaced 3 in. apart, and the other two are to

The FORUM

Hub, Wheel and Tire Standardization

Editor AUTOMOTIVE INDUSTRIES:

(1) The very interesting letter of John Younger in the March 10 issue of AUTOMOTIVE INDUSTRIES brings out many points in connection with hub standardization and standardization generally and shows the weakness and fallacy of the S. A. E. in entering into the design in detail rather than laying out the broad basic points to be covered in axle standardization.

(2) In the third paragraph he seems to have struck the key to the whole thing where he says: "There is a lurking suspicion in the back of my mind that such a standardization may eventually lead to loss of individuality." If the detail of design is furnished, the axle makers and designers, as intimated, become in fact mere rubber stamps, and all produce unified axles, all having the same merits or demerits, and all presumably producing at the same price, or under an association of prices, absolutely against the laws of the country, they become in effect *one* axle manufacturing corporation.

(3) All progress and improvements cease, and all individual incentive is lost. However advantageous a unified design of construction may be temporarily, as in the case of war, to bring this about as a permanency, is quite another matter, especially in an industry as large and varied as the automobile and truck business, and would in effect result in a complete centralization and monopolization.

(4) It is not the function of the S. A. E. to go into the detail design or the manufacturing business, and especially to present a design of proposed axle standardization for one type of bearing.

(5) The merits and advantages of the ball bearing are well recognized the world over, and especially it must not be overlooked that the ball bearing is the recognized standard, and practically the only completely standardized bearing, in every civilized country of the world outside the U. S. A.

(6) Therefore the car or truck maker seeking a worldwide market must determine for himself the advantages or desirability of adopting one or the other types of bearings. The ball bearings are universally standardized as regards interchangeability of size the world over, and it would therefore seem to be up to the roller bearing makers and all makers of other types of bearings to provide for an interchangeability of their bearings.

(7) In my view the S. A. E. should never recommend any individual maker's details of construction and dimensions. Instead it should collect and distribute data in regard to various recognized constructions to enable the car and truck maker and assemblers to have in a convenient form complete information for reference. The suggestion of Mr. Younger to gather the engineering practices as Professor Unwin did in his text book is an excellent one. The S.A.E. should co-operate with the makers in bringing this about and bring all this information into their data sheets. Undoubtedly the makers would appreciate this and would willingly co-operate and even reimburse the S. A. E. for the actual printing and distribution of such data sheets as a part of their publicity. This has been done in the past by the makers, but quite independently of the S. A. E. in regard to the arrangement. Of course the expense of any general data sheets should be continued and borne by the Society.

(8) Mr. Younger's contention is quite correct that any step tending toward a leveling of the design is to be deplored and lack of individuality is the result, as instanced in the experience of his English friend that to him all American cars look alike. This criticism is true, for the methods of assembling American cars all tend this way, as in reality many of the elements are alike, and, as Mr. Younger puts it, all the front axles are alike, and when in addition all radiators and front ends are also made alike (for apparently many so-called designers are only copyists), the reason for the criticism becomes apparent.

(9) The final result, therefore, of such a standardization would be the concentration and the manufacture of all passenger cars in one large corporation, for at the most it is only possible to make four different sizes of passenger cars to cover the entire field, and this might easily be undertaken by one such corporation, or the field extended to cover all trucks as well, as this would only take ten sizes, and by this means we get *absolute standardization* and *absolute monopolization.*

(10) Unless we have arrived at perfection to standardize all details at the present time would mean to standardize *all defects.* Would you suggest standardizing the front axle construction embodying the unmechanical and unscientific and heavy offset steering knuckle, which is perhaps the cause of more serious accidents than any one element of automobile or truck? The logical steering knuckle is the central or castor steering knuckle, having the steering pin in the center of the plane of rotation of the wheel, and this knuckle properly designed can be made much lighter and stronger and cheaper than the present "offset" steering knuckles and have only *half the number of parts.* It reduces to a minimum all strains, is much easier steering, especially in the larger sizes, and having a true "castor" effect, all machines *tend to run straight without steering,* and only need to be pulled out of the straight line and when left alone automatically revert again to the same position. This results in a simpler and cheaper steering post mechanism and absolute irreversibility becomes of secondary importance, as the steering wheel is not knocked out of the hand by every slight road obstruction. By this means also the front wheels can be made vertical instead of inclined, bringing the wear central upon the tire, the same as for the rear wheels. This inclination of the front wheel is the cause of many accidents resulting in crushed wheels in turning corners and oftentimes causing the complete machine to "turn turtle."

(11) Similarly to standardize the rear axle construction as at present made would be to standardize similar *defects.* As regards the three present types of rear axles, full floating, three-quarter floating and semi-floating, it would be a needless complication to attempt to standardize all three, as there is so little gained or saved in the manufacture of one over the other, and the best only should be recommended and standardized. It has never yet been demonstrated that an overhanging bearing is superior to a cen-

trally supported bearing, and until this has been done or demonstrated there does not seem to be much doubt as to where the superiority is. In fact, it seems to be the same condition as is met with in the front axle and referred to above as to the relative merits of the central steering knuckle or the offset steering knuckle, or in this case the overhung wheel and the centrally supported wheel.

(12) Therefore, as stated above, if it is desired to completely kill all progress, standardize present defects, or if the automobile has reached perfection, *complete standardization* cannot be brought about too soon. At the present time one maker of a so-called standardized car produces half of all the passenger cars made in the U. S. A., and a second maker has only to standardize two or three larger sizes to make the rest. That is assuming that No. 1 and Nos. 2, 3 and 4 standardized cars stay standardized and then all axle makers and special parts makers go out of business.

(13) Now the fact is that there are many parts of the car that can be legitimately standardized, and if the S. A. E. would devote themselves to this field they will be fully occupied and will be of great help to the industry. This is said not as a criticism, for having been one of the original subscribers or founders of the S. A. E. 'way back in 1904, I know something of the history of the Society and appreciate what has been done, and also what there is to do in the future if the S. A. E. is to continue to maintain its position.

(14) The first thing to be done before any axle standardization can be considered is the *standardization of pneumatic tires*, as everything depends upon the size of tire. There has been talk for two or more years of basing these tire diameters (wheel or rolling diameters) on a 24-in. tire seat diameter so as to get interchangeability of rim and also to reduce the number of sizes of tires. If this is what is wanted why not adopt it and then all designers know what the fundamental condition is to be and can proceed. A ballot could be sent out to every member and the result known in thirty days, and the Council of the S. A. E. could, if so decided, make this effective at once. This would in no way affect the present making of other sizes of tires, and it would be years before these old sizes would become completely obsolete.

(15) **Pneumatic Tire Specifications.**—A general form of specification to cover pneumatic tires is necessary covering sizes, diameters and general dimensions, and it is suggested that these be on the following lines:

The sizes of all *round pneumatic tires* shall be based upon a 24-in. diameter of rim seat, and the diameter of the tire proper shall be based on its outer diameter at its center cross section, and these standardized sizes shall be 3 in., 3½ in., 4 in., 4½ in., 5 in., 6 in., 7 in., 8 in., 9 in., 10 in., 12 in. and 14 in. diameter, and no other sizes shall be recommended or recognized, and all tire details shall be expressed in functions or percentages of the tire diameter and shall be as follows:

Width of tire rim seat	.75	of tire diameter
Width flat tread of tire	.75	of tire diameter
Center of tire	.50	of tire diameter from rim seat
Allowable deflection assumed	.10	of tire diameter
Added depth of tread assumed	.10	of tire diameter
Thickness of tire wall assumed	.10	of tire diameter
Thickness of tube wall assumed	.025	of tire diameter
Producing a cross-section of suspending air column of	.75	of tire diameter
Radius of curve at base of rim seat	.075	of tire diameter or nearest 1/16 in.
Radius of curve at edge of flat tread	.075	of tire diameter or nearest 1/16 in.
Molded outside diameter of tire	2.20	of tire diameter plus 24 in.

In order to make the point of ground contact of the tire "square" with the accepted nomenclature, it is necessary for the depth of added tread and the amount of deflection to be the same. In order to determine the width of the rim seat, which should be the same as the suspending air column, it is similarly necessary to assume a thickness of tire and tube wall.

(16) The making of any special sizes of tires, as say a special 5-in. tire, should be discouraged, and also the adoption of "over size" tires on a smaller rim is similarly discouraged. With a fixed tire seat diameter it should always be possible to interchange two sizes of regular tires on any given size of demountable rim properly standardized or to interchange two sizes of detachable wheels.

(17) **Solid Tires.**—To complete the axle standardization requires also the standardization of solid tires and raises at once the question whether these wheel sizes should not be so standardized as regards diameter to have as nearly as possible the same wheel diameter as the pneumatic, size for size, and it is suggested that these be as follows:

32 x 3	Based on 26-in. rim seat	36 x 7	Based on 30-in. rim seat
32 x 3½	Based on 26-in. rim seat	36 x 8	Based on 30-in. rim seat
32 x 4	Based on 26-in. rim seat	40 x 9	Based on 34-in. rim seat
32 x 4½	Based on 26-in. rim seat	40 x 10	Based on 34-in. rim seat
36 x 5	Based on 30-in. rim seat	40 x 12	Based on 34-in. rim seat
36 x 6	Based on 30-in. rim seat	40 x 14	Based on 34-in. rim seat

(18) As regards the carrying capacities of all solid tires, these are very much overloaded and should be *re-rated*, and they will be legislated off the roads unless some steps are taken in this matter. Already several states have taken steps to limit their capacity, and the S. A. E. rated loads of 1000 lb. per inch of width of tread are absurd. If size for size they were rated the same as pneumatic tires, the loads would be more reasonable, and even this would mean from 400 lb. for the smaller tires to 800 lb. for the larger tires *per inch of width of actual tread*. No state can afford to build roads, to stand such heavy concentrated loads, and no matter how heavily the trucks are taxed, these taxes will be quite inadequate for the damage and to maintain the upkeep of the roads. Unless it is desired to kill the solid tire truck completely this re-rating cannot be done too soon. Perhaps, though, it would not be such a bad idea to advocate all pneumatic tire trucks, before the people demand a heavy truck be taken off the roads on account of their damage, and also as interfering with and crowding off passenger car traffic from the roads and insisting that this heavy traffic revert to the railroads.

(19) In this connection the carrying capacity of dual tires should also be considered, and the fact that two 5-in. tires do not have the capacity of a single 10-in. tire, as the road contact of the two 5-in. tires is 6 in., and the one 10-in. tire 8 in., giving the latter 33 per cent more carrying surface. Further, the width of the two tire base bands is 11¾ in. (assuming they are placed side by side and close up), while the single 10-in. base is only 10⅞ in. Further, on crowned roads practically all the load is carried on the inner tires.

(20) When the standardization of the tire diameter, size of tires and load carrying capacity of each has been determined, the axle designer is then in a position to produce his standardized axle, embodying in it the best or the cheapest design as he may see fit.

(21) **Rims for Pneumatic Tires.**—In order to perfect the standardization it is necessary also that the rims be further standardized, as those now adopted are based haphazardly and are really "unstandardized standards," as is evidenced by an examination of the data sheets of the S. A. E. As these rims always are, at least always should be, only used with one given size of tire, the general dimensions should be based upon the functions or percentage of the tire diameter itself, at least everything except the tire seat diameter, which is a specified constant of, say, 24 in.

(22) The next important or leading dimension is the width of the tire rim seat, and this must be such as to give the tire the necessary lateral stability and should not

be less than the cross section of the suspending air column, and which could be easily determined if the thickness of the tire wall and of the tube wall were also a specified percentage of the tire diameter. An examination of the S. A. E. data sheets show that these *widths of tire seats* vary considerably in some of the smaller sizes, but in the newer and larger sizes are very uniformly taken at 0.75 of the tire diameter, and if this is right for these sizes should also be right for all the sizes. The load carrying capacity and the ease, or rather hardness of riding of the smaller sizes of tires, is undoubtedly greatly due to this narrow width of tire seat, and to bring these tires into conformity with the other sizes they should be brought to the same basis for the width of the tire rim seat.

(23) The sizes of rims and the width of rim seats as given by the S. A. E. data and the proposed standardized widths are as follows:

Size of Rim	Width of Rim, Inches	Percentage Tire Diam.	Proposed Width of Rim, Inches	Proposed % Tire Diameter
3½-in. Clincher	2.05	58.5	2.625	75
3½-in. S. S.	2.312	66.0	2.625	75
4-in. S. S.	2.688	66.6	3.000	75
4½-in. S. S.	3.12	70.0	3.375	75
5-in. S. S.	3.75	75.0	3.75	75
6-in. S. S.	4.33	72.0	4.5	75
7-in. S. S.	5.00	75.0	5.0	75
8-in. S. S.	6.00	75.0	6.0	75
9-in. S. S.	6.00	66.0	6.75	75
10-in. S. S.	7.33	73.3	7.5	75
12-in. S. S.	9.00	75.0	9.0	75

(24) **Side Flanges.**—The side flanges also are unnecessarily high, as with the present form of solid or inextensible bead they should be made as low as possible, so that the partially or completely deflated tire should ride as softly as possible upon the side flange. Further, this flange should drop away as fast as possible from the side of the tire. The only function of the side flange should be to hold the tire laterally, and as at present made the straight part of this flange is only ⅛ in. and upward, but it does not drop away quickly enough. Therefore it is suggested that the standardized rim be constructed as follows:

Width of tire rim seat................	.75	Tire diameter
Width of rim overall................	1.00	Tire diameter
Side flange overhang each............	.125	Tire diameter
Height of side flange total............	.125	Tire diameter
Height of side flange straight.........	.05	Tire diameter
Height of side flange curved..........	.075	Tire diameter
Radius of side flange curve...........	.075	Tire diameter
Inside radius at base of side flange....	.02	Tire diameter or nearest 1/16 in.
Thickness of rim	.04	Tire diameter or nearest selected gage

The saving in the weight in standardization of the rims as suggested would amount to 10 or 12 per cent and would be quite an item.

(25) The standardization of the rim, whether all the above suggestions are carried into effect or not, is absolutely essential, before fixing the wheel and demountable rim dimensions and the detachable wheel dimensions, as all of these are embodied in the proposed axle standardization.

(26) When demountable rims are used, the size and the number of the bolt should be specified for each size of tire, and the location of the center of these bolts from the center of the wheel should also be specified and should be the same for all sizes of tires using one-piece rims transversely cut. And it is suggested that this bolt center be stated as 23¼ in. for the 3 in., 3½ in., 4 in., 4½ in. and 5 in. rims, assuming eventually a 5-in. single piece rim may be made. For demountable rims using 2 or 3 piece rims it is suggested that this bolt center be 22¾ in. up to and including the 5-in. rim. Above this size the bolt diameters or centers for the 6-in. and 7-in. rims shall be — in.; for the 8-in. and 9-in. rims — in.; for the 10-in. and 12-in. rims — in. All demountable rims should be so designed that at least two sizes of rim can be used on each wheel, and it is suggested that this interchangeability shall apply as regards the 3½-in. and 4-in. rims, the 4½-in. and 5-in. rims, the 6-in. and 7-in. rims, the 8-in. and 9-in. rims, and the 10-in. and 12-in. rims.

(27) **Number and Size of Clamping Bolts.**—The number and size of clamping bolts used on demountable rims shall be as follows:

3-in. tires	5 bolts	7/16-in. diameter
3½-in. tires	6 bolts	7/16-in. diameter
4-in. tires	6 bolts	7/16-in. diameter
4½-in. tires	8 bolts	7/16-in. diameter
5-in. tires	8 bolts	7/16-in. diameter
6-in. tires	8 bolts	7/16-in. diameter
7-in. tires	8 bolts	7/16-in. diameter
8-in. tires	10 bolts	½-in. diameter
9-in. tires	10 bolts	½-in. diameter
10-in. tires	12 bolts	½-in. diameter
12-in. tires	12 bolts	½-in. diameter

(28) **Felloes.**—The width of all felloes should also be based on the tire diameter and should be 0.50 of tire diameter. The depth of the felloe (including the steel felloe band when used) should be definitely stated for each size.

(29) **Felloe Bands.**—Metal felloe bands when used in connection with demountable rims should also be specified as regards thickness and should be the same as the rim thickness.

(30) **Width of Wheel Tread.**—The width of tread for all sizes must be standardized and stated for both front and rear axles, and especially in the larger sizes involving the use of different size tires on the rear wheels from those used on the front wheels. It is all right to assume a basis of 56-in. tread for the smaller size of tires, but as a matter of fact this should be increased to 60-in. tread for the larger size of passenger cars in order to carry three passengers comfortably on the back seat, the width of the body would be such that it will extend to or beyond the center of the 56-in. tread wheel, making a very bad and clumsy looking body. In fact all rear mud guards should be attached to the chassis and not the body, the same as the front mud guards are, so that the touring body can be either removed or changed to a closed body, or vice versa, without having to disturb the mud guard.

(31) **Front Axles.**—The standardization of the front axle requires the location of the *center of the spring pad* as follows:

(a) Distance from the center of axle to the center of spring pad.

(b) Vertical distance from the center of the wheel to the top of the axle spring seat pad.

(c) Distance to the bottom of the axle seat pad when spring is placed under the axle. Axle to be designed for taking spring either above or below.

(d) Width of spring recommended for each size of axle (each size of tire) and also the size and diameter of the spring clips and bolts and the distances to the center of the bolt holes.

(e) Width of tread at center of hub and angle of wheel, if any.

(32) **Rear Axles.**—Same dimensions as above required and also:

(f) Type of axle either full floating, three-quarter floating or semi-floating.

(g) Brake drum — in. in diameter and fitted with two internal expanding brakes — in. wide as the minimum.

(h) The size and dimensions of the saddle for the differential must also be fixed for each size and probably many other dimensions may be essential.

(33) **Complete Standardized Axle and Wheel Units.**—In order to effectively standardize the axle it should also include the standardization by the axle maker of both the demountable rim wheel and the detachable type of wheel having the wire wheel form of hub detachability and an improved hub locking device. Even with the wood spoke type of wheel, the entire wheel construction bar only the wood

spider itself (which is a very small percentage of the entire wheel and can be obtained from any wood wheel maker) is entirely a metal and mechanical job as regards manufacture and assembling and should be provided and furnished by the axle maker. In connection with the detachable wheel the same applies whether the detachable wheel is wood spoke, metal spoke, wire, double disc suspension, single disc compression or any other type of wheel. Both the demountable rim wheel and the detachable wheel must be standardized and so designed as to interchange upon the same axles, and no one can do this effectively except the axle maker and the designer. In any case the axle maker must supply all the hubs, hub fixtures, rims, etc., even if he should sub-contract for the wood spider or the wire spokes, to be provided for his own hub and fixtures. In the case of the all metal wheel, its production *naturally* goes with the axle production, as the axle makers have the presses and all other facilities for making it. The result of attempting to produce metal wheels by an outsider or interloper is well illustrated by the condition of the present wire wheel makers (8 or 10 in number), all having *different standards* involving ten different sets of patterns and a tenfold expense for jigs, templates, tooling up, etc., which has now completely swamped them, and with the result that several of them are now in the hands of receivers. There is no logical reason why a car maker should buy his axles in *one place* and his wheels in *six places*. The axle maker who is in a position to supply his client with the *standardized axles* and *standardized wheels* of any type indifferently would pretty nearly control his trade and get the pick of the business, and by no other method can a practical standardization be brought about. Another important point is that the wheel repairs and replacements would be handled through the service stations of the car makers, which would be quite to their advantage.

(34) **Complete Chassis Unit.**—As several of the axle makers are also frame makers and spring makers, it is only one more step to provide the frame and springs and have a *complete chassis unit.*

(35) It will be seen, therefore, that in the hub and axle standardization there are enough basic points to be covered to give the S. A. E. sufficient to do without encroaching on the field of the designer.

W. J. P. MOORE.

Editor, AUTOMOTIVE INDUSTRIES:

I have your letter of April 20, asking whether I care to comment on Mr. Younger's letter on Hub Standardization, published in your March 10 issue, and on Mr. Moore's letter on the same subject which you propose to publish on April 28.

I have been quoted on this subject a number of times in your valued columns, and think my viewpoint has been pretty well set forth. I have purposely refrained from commenting on Mr. Younger's letter because the manner in which he has mistaken the issue is quite surprising in view of the fact that he has been conversant with the program of the Hub Standardization work since last June, and in view of his written and verbal approval of the work up to the time it was ready for submission to the S. A. E. Standards Committee.

It seems to me that the question is not one of "engineering individuality," but one of "economics." When an engineer or group of engineers produce a design that embodies the whole experience of an industry, is it not time to stop making inconsequential modifications and give the trade and the public the benefit of cost reduction and better service? Why not let the engineer turn his attention to other problems (which he will find no trouble finding), and let the manufacturing department have at least a Chinaman's chance at a good long production run? That the matter is one of economics is well borne out by the letter written to me on the subject by Mr. George E. Roberts, vice-president of the National City Bank. This letter was quoted, I think, in the March 17 issue of AUTOMOTIVE INDUSTRIES.

The Scotch have a gloomy way of regarding the efficacy of remedies that are not mixed in their own pharmacy, but I believe that a working acquaintance with the work that has been accomplished will relieve skeptics of their fears. Hub and axle design will not by any means become so petrified as one might think—in fact, the proposed recommended practice only defines the connecting assembly dimensions between definite sets of ball or roller bearings and the hubs and spindles which are to take them; it also gives similar dimensions between the hubs and the wheels that are to be mounted on these hubs. It has been done by the S. A. E. on so many other features that it is not only precedent but actually long-established custom. Moreover, nobody is obliged to follow the recommended practice if, in the course of time, he can design something economically better.

Mr. Moore seems to have used Mr. Younger's letter as an excuse for presenting another matter entirely. He devotes twice as much space to advocating standardization for tires and rims that he devotes to condemning the same thing for hubs and wheels. Before discussing his tire and rim suggestions it will be in order to hear what the members of the Tire and Rim Division of the Standards Committee have to say on the subject. As to the first twelve paragraphs of his letter: it seems to me that almost every one contains a statement that is in error, either due to his lack of information on what has been done by those working on the subject of recommended practice for hubs, or due to the inclusion of a half truth, or due to a too general and inclusive scope in expressing his views.

It should be borne in mind that the Truck Division of the Standards Committee proposes to submit through the Standards Committee to the main body of the S. A. E. the following (to apply to front hubs for motor trucks):

1. A series of inch-dimension roller bearings corresponding to the best practice of 95 per cent of the truck production to-day.
2. A series of ball bearings which was advocated by all the prominent manufacturers of ball bearings, and which has the approval of the only large truck manufacturer using ball bearings.
3. A series of millimeter-dimension roller bearings that will interchange in the same hubs as the ball bearings.
4. Definite spacing between the inner and outer bearings.
5. Definite machine dimensions on the spindles and in the hubs for the fits of the bearings.
6. Definite location and size of hub flanges.
7. Definite location and size of hub bolts.
8. Definite outside diameter of hub to fit wheel bore.
9. Definite thickness and number of wood wheel spokes.
10. Definite relation between center line of tire, spoke and shoulder for the inner bearing.

"If this be treason (or suppression of initiative) make the most of it."

The program and its details have been approved by

1. All prominent makers of roller bearings.
2. All prominent makers of ball bearings.
3. All prominent makers of wood wheels.
4. All prominent makers of steel wheels.
5. Clark, Russell, Sheldon, Timken, Torbensen and Vulcan axle companies.

6. G. M. C., Mack, Packard, Pierce, White and a large number of builders of assembled trucks.

7. The Truck Division of the S. A. E. Standards Committee.

I have lived with this proposition for thirteen solid months and have yet to hear one valid argument against it. The advantages of the work are so manifest that the tendency on the part of those favoring it is to assume that there will be little or no opposition—hence the small vote at the January meeting of the S. A. E. Standards Committee. If all those who are in favor of it turn out and vote for it at the West Baden meeting on May 24 the majority will be quite impressive.

C. T. MYERS.

Bignan Cars Entered in Corsican Race

THE special four-passenger Bignan sport cars to be driven by Albert Guyot and M. Nougué in the 3-liter race around the mountainous island of Corsica have shown a road speed of 90 miles an hour. This race is limited to 183 cu. in. sporting type cars carrying windshield, fenders, four seats of stipulated minimum dimensions and having a certain minimum distance between the steering wheel and the tangent of the rear wheels. Under such rules the competitors naturally employed a purely racing type engine and as it was not possible to diminish body width, total height was kept as low as possible.

The Bignan-Sports have four 3.42 x 4.85 in. cylinders in a single casting. A three-bearing crankshaft is employed, with only a very light external flywheel, sufficient for the cone clutch. There are circular discs on the shaft of 1.18 and 0.87 in. face width. Four valves per cylinder are employed, the weight of these being 0.28 lb. for the exhaust and 0.247 lb. for the intake. A single camshaft operates the 16 valves, and is driven by an inclosed vertical shaft and bevel gearing. Lubrication is forced, with a dry pump. Delco dual ignition is employed, the plugs being mounted horizontally on opposite sides of the cylinder. The output of the engine is 90 hp. at 3,200 r.p.m. and 95 hp. at 3,400 r.p.m. The car has been built to the designs of M. Causan, an expert in high-efficiency engines.

Standard Bignan practice has been followed in the gearbox and rear axle. Owing to the mountainous and varied nature of the course, however, direct drive is on third, and the fourth is geared up, so as to get a high rate of travel on a 20-mile level straightaway by the side of the sea. The rear axle construction is a combination of steel tubes around which an aluminum housing is cast, with the whole of the brake mechanism inside the axle housing. The front axle and brake mechanism is a copy of Delage practice. Front and rear brakes are not linked up, but have separate controls in order to give the driver an opportunity of skidding the rear end of the car on the turns. The front springs are shackled at the front end and have a fixed attachment at the rear.

The four-cylinder 3.42 x 4.85-in. Bignan sport model entered in Corsican three-liter race

The wheelbase is 114 in., the track 49 in., the body width 39 in. and the fender width 8 in. With a road clearance of 7.8 in. it has been possible to keep the maximum height of the car as low as 40 in.—less than the overall width. The seats are arranged so that the shoulders of the driver and mechanic are flush with the top of the body. The gas supply is carried in the cowl, with a reserve supply back of the driver's seat, this being adopted in order to get a good weight distribution. No passengers are carried in the race, their equivalent weight being made up, however, by ballast. This makes it possible to carry the spare wheels inside the body and thus reduce head resistance. With an all-aluminum body construction and the use of light materials throughout, it has been possible to get weight down to 1750 lb., with full road equipment.

THE Society of Motor Manufacturers and Traders (Great Britain) has voted a substantial sum for a period of years to the Institution of Automobile Engineers, subject to a stipulation as to representation that is likely to be accorded, so that it is anticipated the arrangement will very shortly become definite. The Institution some time since placed before the Society a proposed extended programme of work, together with particulars of the financial position, and the matter has received careful consideration at a number of meetings. The Council of the Society agreed that the proposed work in question would be of value to the industry generally, and that the institution should be assisted accordingly.

AN ignition system capable of higher current economy than the ordinary closed-circuit battery ignition system, has been recently invented. The feature of the system is a control cam which determines the length of time during which the primary circuit remains closed.

In the ordinary closed-circuit battery system the breaker cam must be designed to keep the circuit closed at high speed a sufficient length of time to permit of the proper loading up of the coil, and at low engine speed the primary then remains closed for a much longer time than necessary which results in waste of electrical energy. In the new system the regular breaker cam and the control cam are located side by side on the breaker shaft. The angular position of the breaker cam relative to the shaft is controlled by a centrifugal governor for the purpose of automatic spark timing. In the same way the angular position of the control cam is controlled by the governor. The two cams are both under the breaker lever, and the effect of the angular displacement of the control cam is to widen the nose of the compound cam at low speed and thus keep the circuit open for a longer time than it would otherwise remain open. The system is designed by Ralph B. Macnish.

Maintaining Continuity Throughout Roller Bearing Manufacture

The methods used to produce roller bearings in a large plant are described in this article. The company discussed operates its own steel plant and conducts the manufacturing process from the raw material to finished product. Interesting taper gaging machine used.

By J. Edward Schipper

QUANTITY production of a precision product always awakens speculation concerning the methods employed to maintain accuracy and at the same time secure large output. Exactness of dimension and quality of material are necessary to the highest degree in tapered roller bearings. The performance of the part mounted on these bearings depends directly on the accuracy and quality of the bearing and, consequently, the requirements of the purchasers of bearings are of the strictest character. At the plant of The Timken Roller Bearing Co., in Canton, Ohio, the care exercised in the production of a quality product starts with the manufacture of the steel which is used as material in making these bearings.

The Timken company operates its own steel plant, which is a part of a chain of operations which go to make up the manufacture of a tapered roller bearing. In this plant 125 tons of steel are produced each day exclusively for bearing manufacture. A large percentage of the steel manufactured is .15 to .20 carbon. This steel is manufactured from selected scrap in a battery of four Heroult electric furnaces. The total capacity of the four furnaces is slightly more than 150 tons per day. The steel produced is straight carbon, as indicated, while some chrome alloy electric steel is also made.

The molten steel from the electric furnaces is poured into ingot moulds and after having cooled into ingot form is transported to a manipulator. This is a combined hydraulic press and electric manipulator where the ingots are pressed into bloom under a pressure of approximately 5 tons per sq. in. The hydraulic press exerts the pressure on the ingot, while the electric manipulator twists and turns the ingots about in exactly the same way as human hands would do in order to bring the pressure of the hydraulic press to the proper point in transforming the ingot into a bloom.

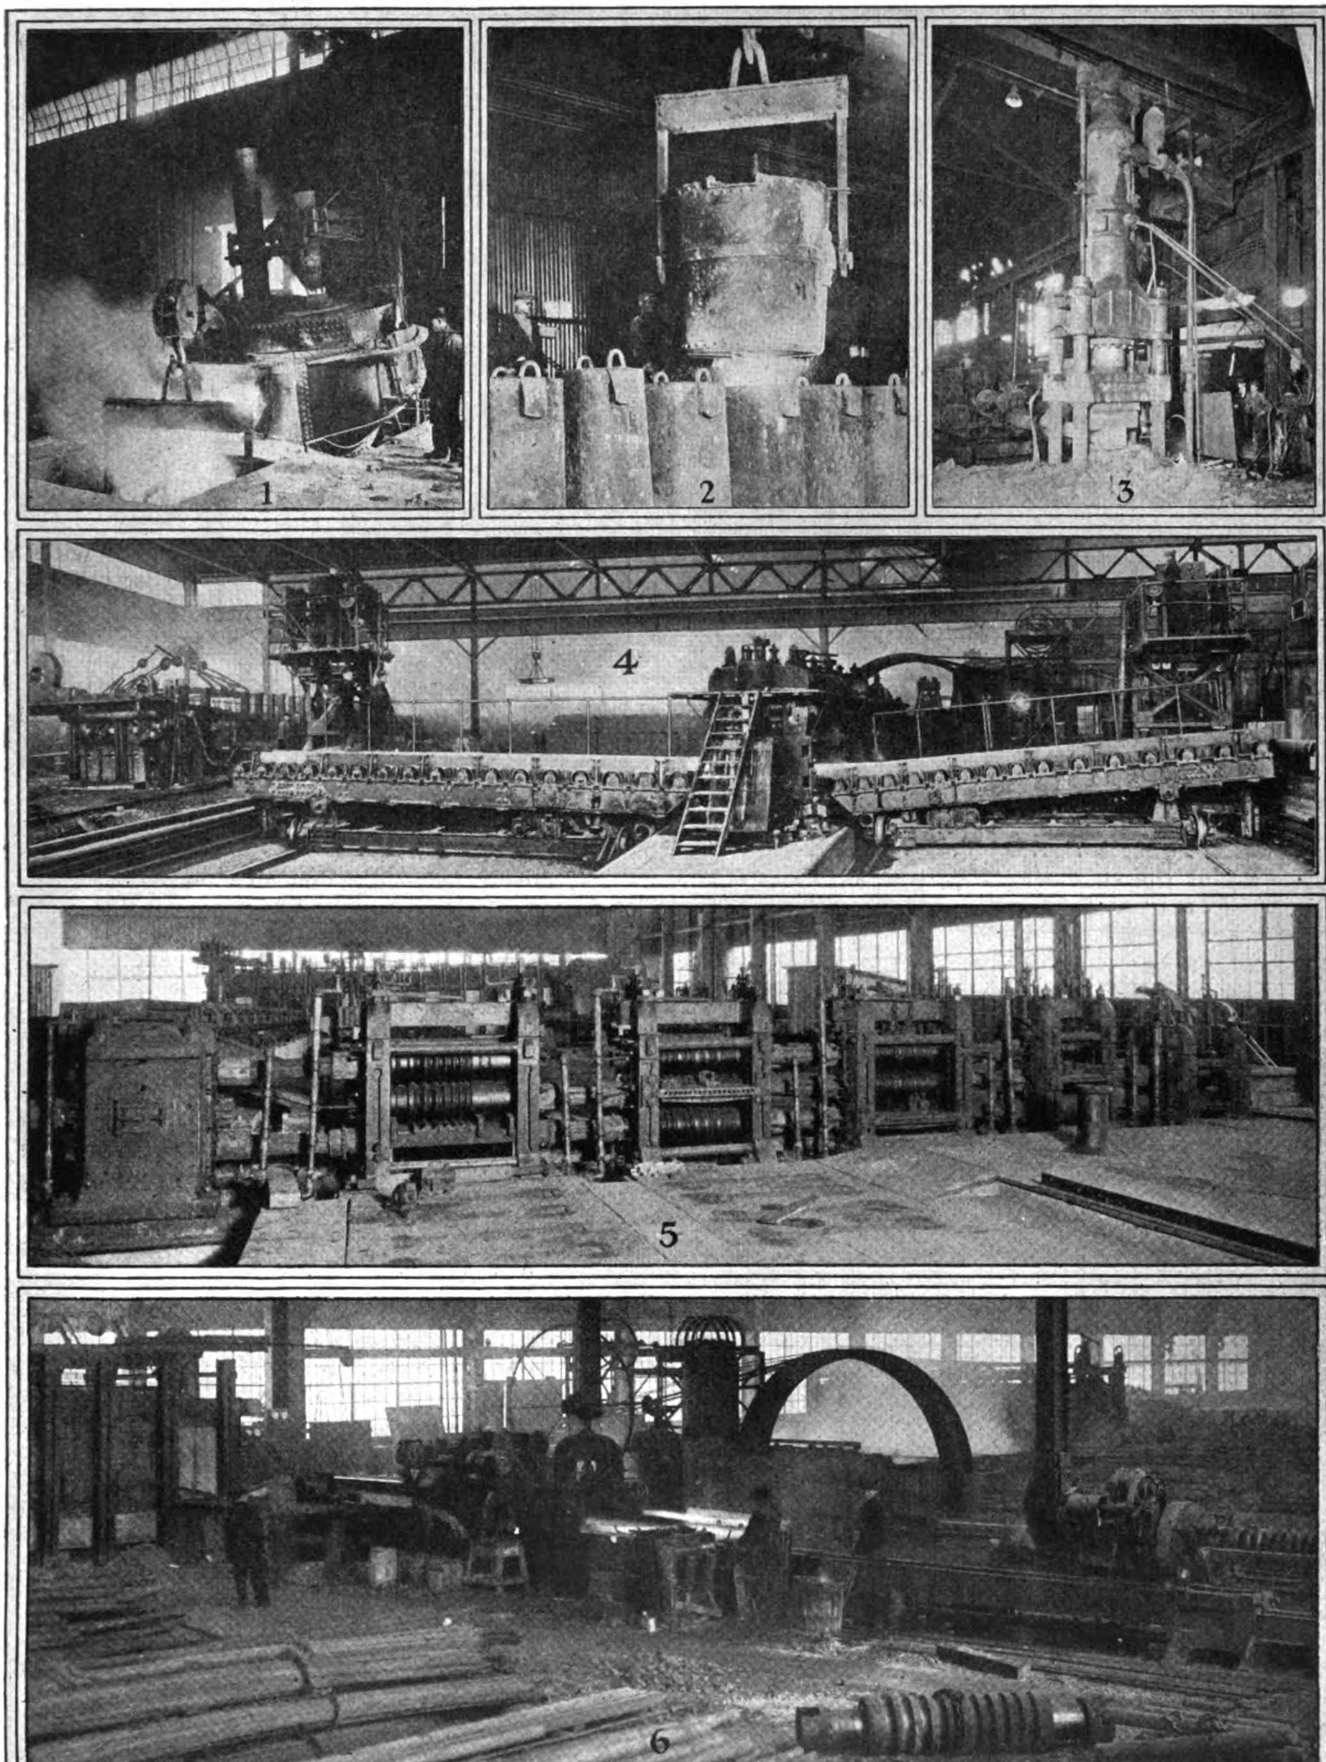
After the bloom has been formed it is transported to the rolling mills where a 22-in. three-stand rolling mill and tilting tables convert it into rounds and squares with a size range of from 2 in. to 6½ in. These are the raw stock from which the bearings are manufactured and are the forms which would be purchased if the Timken company did not make its own steel.

The first step in the actual manufacture of the bearings is to transform some of the bars into seamless steel tubes of a wide range of sizes to furnish raw stock for the cup and cone members of the bearing assembly. To do this the seamless steel tube is placed in the piercing mill, which takes the bar heated to a plastic condition and rolls it into tubular form on a specially formed device which converts the bar into a rough, unfinished piece of tubing. Another machine transforms this rough tubing into tubing of accurate size. The particular machine for the sizing of the tube is known as a reducing mill and after the tubing leaves this machine, it has been rolled accurately to size and shape externally as well as internally. The tubes are then cold drawn. As a final step in the manufacture of the seamless tubing, a straightening machine is employed. This takes out any bends or kinks which may exist in the tube. The tubes are then ready to pass on to the actual manufacturing operations as finished raw stock. They are handled in the automatic machinery from which the bearing parts are made.

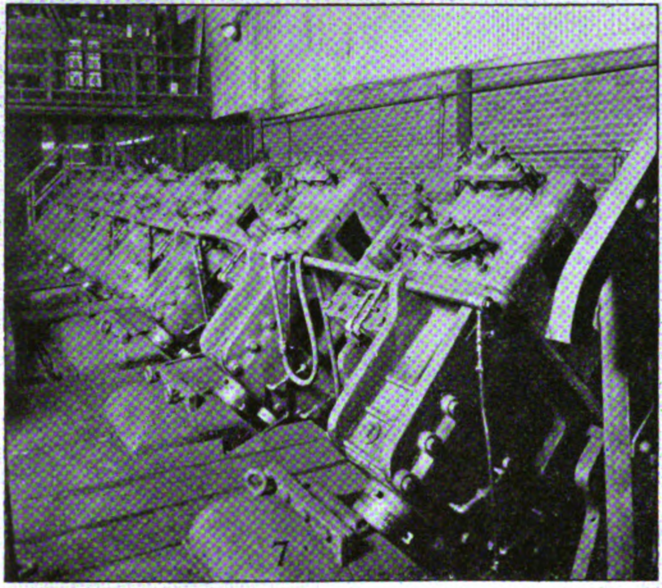
The Timken Tapered Roller Bearing consists of four principal parts. These are the cup or outer race, the cone or inner race, the rolls and the cage which acts as a roll retainer. For making the cup and cone, seamless tubing, manufactured as described, is used for the raw stock. For the manufacture of the rolls, bar stock is employed, made in the company's own steel mills by the methods described, except that instead of being rolled and pierced into tubing, the steel is rolled down to round bar form. For the manufacture of roll, retainer or cage, strip steel is used. This is bought outside.

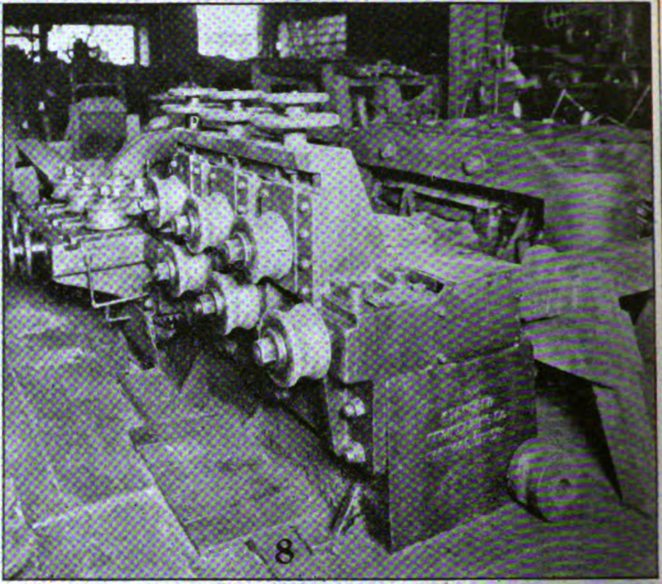
The finished steel tubes are now ready to go to the automatic screw machine department to be transformed into cups and cones. The tubes are fed into the automatic in the usual way and the operation of forming the cups and cones is completed on a single machine. This same process is true of the roll manufacture, except that in place of seamless steel tubing being used for the raw stock, the rods are employed in their place. The rods are fed into the machine through the magazine end in the usual way and the rollers, which are finish-machined, are dropped into the pan of the automatic completely fabricated except for grinding. These Gridley and National Acme automatic machines comprise the bulk of the machining department at the Timken factory. In the automatic screw machine processes where the rods are fabricated into a variety of sizes of rolls, the machining tolerances are not in excess of .003 of an inch. The tolerances on the cups and cones are .004 of an inch.

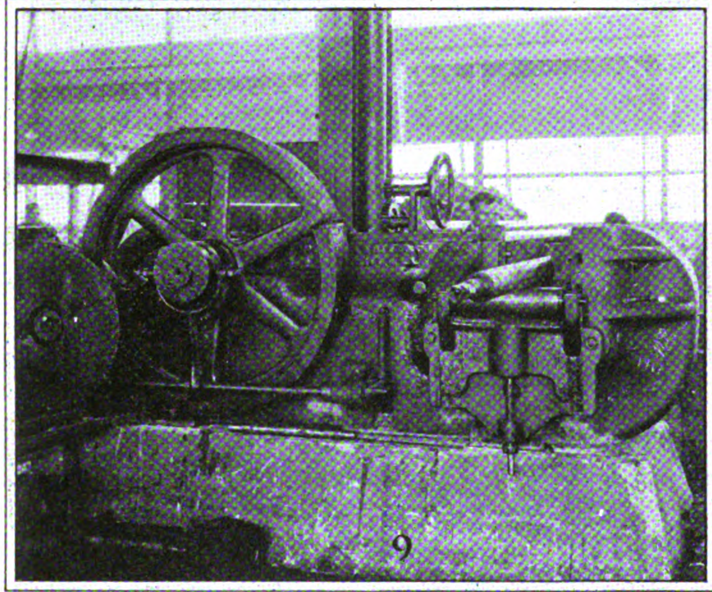
After the machining processes are complete and the parts have been gauged to size to find that they are within the limitations of the tolerances given, the products are placed in carburizing furnaces where the rolls, cups and cones remain from 16 to 48 hours, the time varying in accordance with the size of the part. Here the carbon content of the surface of the steel is increased by the aid of bone meal. The small parts are placed in rotary retort hardening furnaces where they are hardened after carburization.

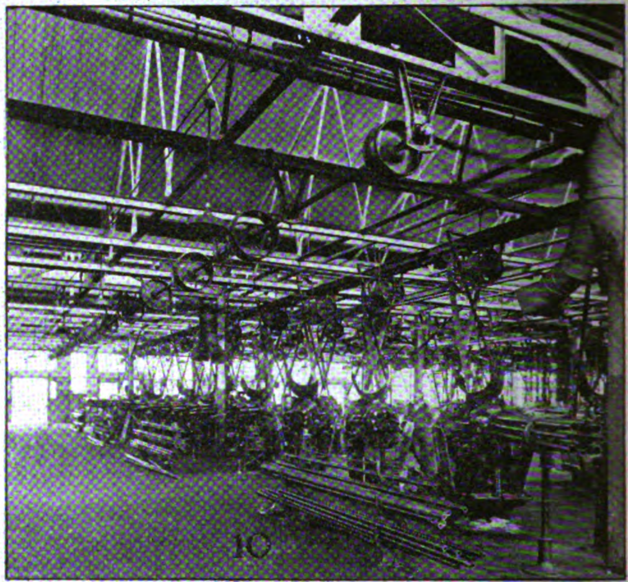


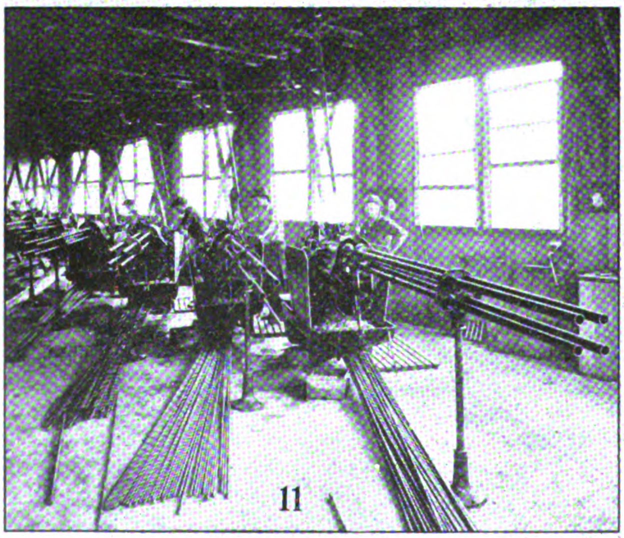
(1) *One of a battery of four modern electric furnaces with a daily capacity of slightly more than* 150 *tons.* (2) *Pouring electric steel into ingot moulds in the Timken steel mill.* (3) *Hydraulic press and electric manipulator where ingots are pressed into blooms.* (4) *Twenty-two inch, three stand rolling mill and tilting tables where blooms are converted into rounds and squares with a size range of from 2 in. to 6½ in.* (5) *Twelve inch, three-stand rolling mill where bars for rolls are converted into coils and small rods.* (6) *Piercing mill where bars are converted into seamless tubes.*

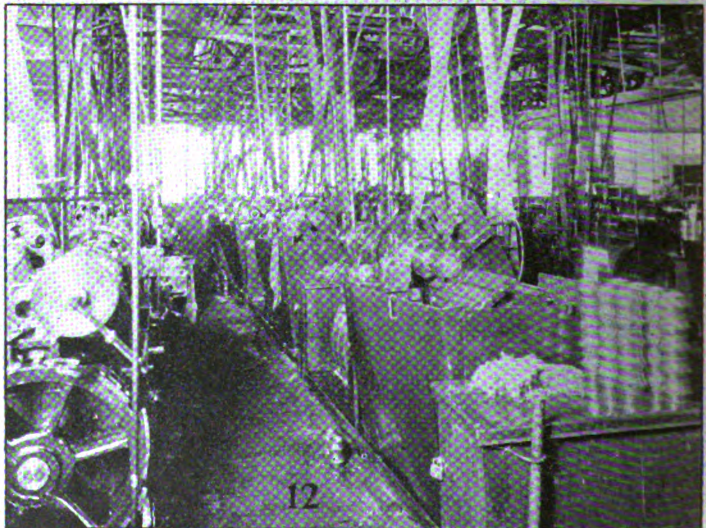




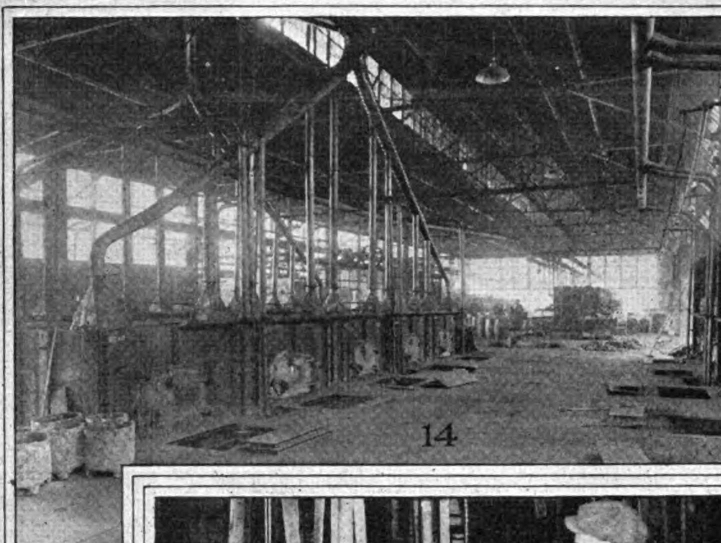


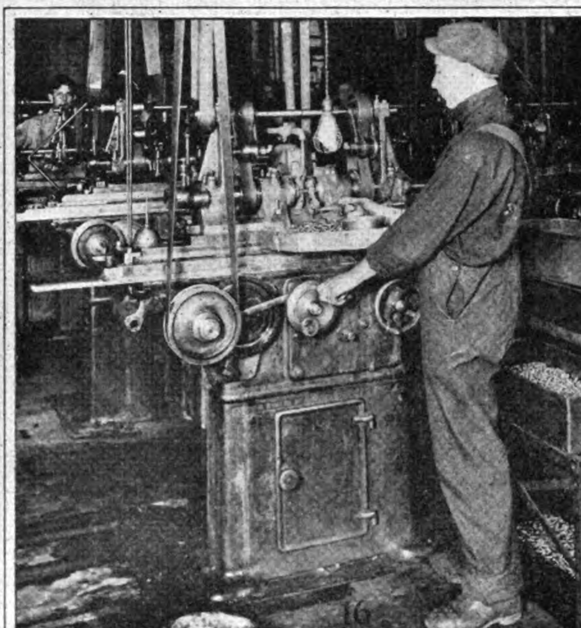


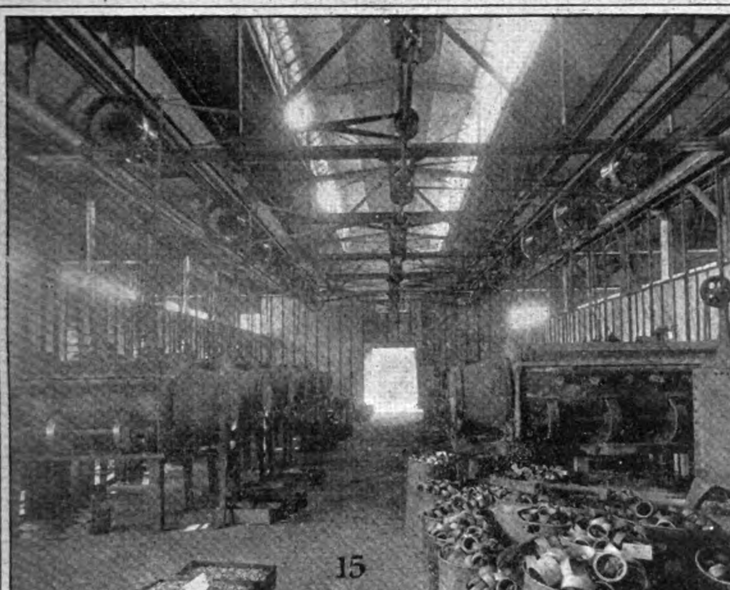


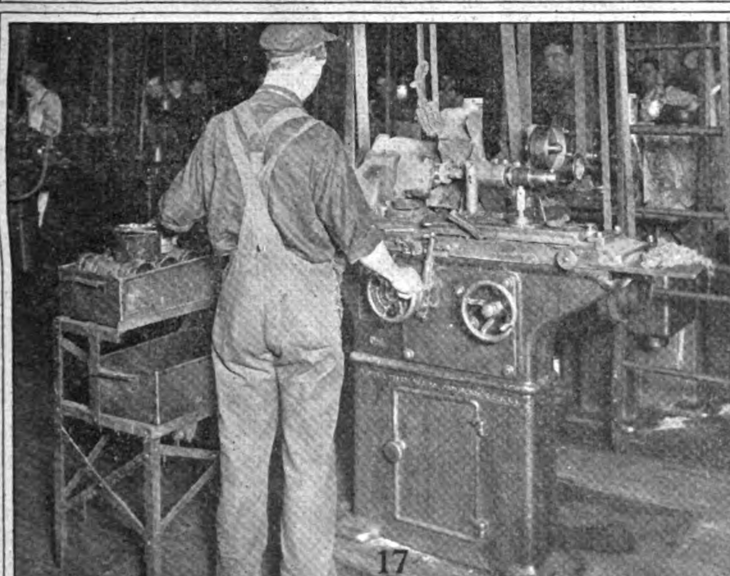


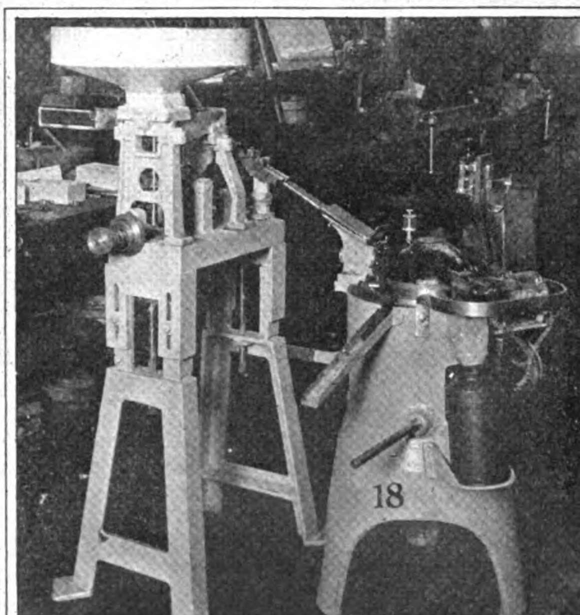
(7) *Reducing mill where pierced seamless tubes are automatically finished.* (8) *Straightening machine where finished seamless tubes are straightened.* (9) *Bulldozer for fabrication of formed seamless tubes.* (10) *Part of the screw machine department where tubes are fabricated on automatic screw machines into "green" cups and cones.* (11) *Four spindle roller fabricating machines where rods are fabricated at high speed into a variety of sizes of rolls held to machining tolerances not in excess of .003 of an inch.* (12) *Another view of the screw machine department where large cups and cones made from forgings are machined on automatic screw machines.*



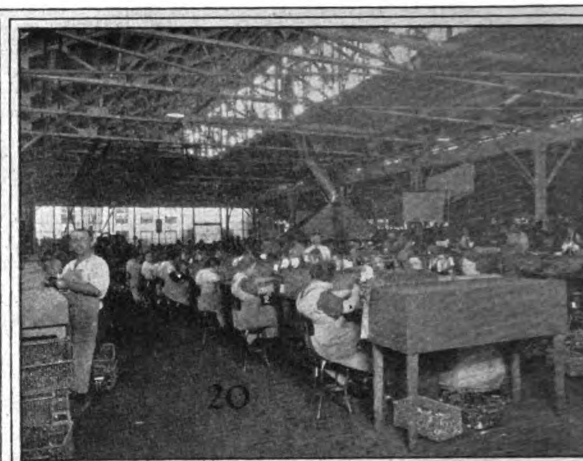


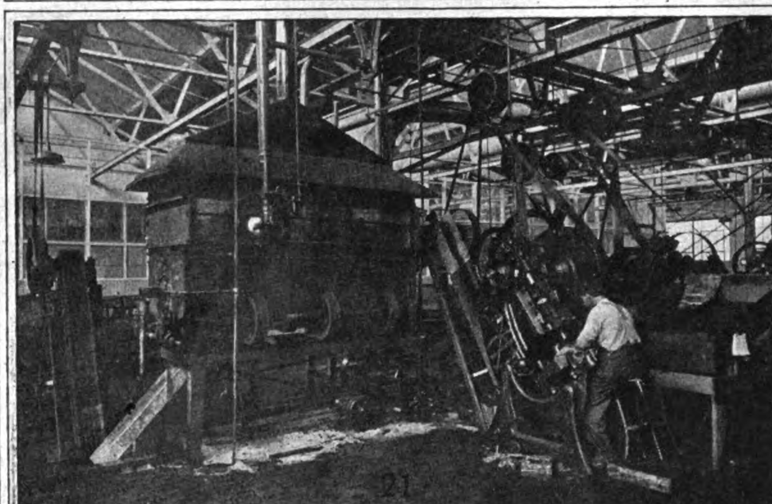


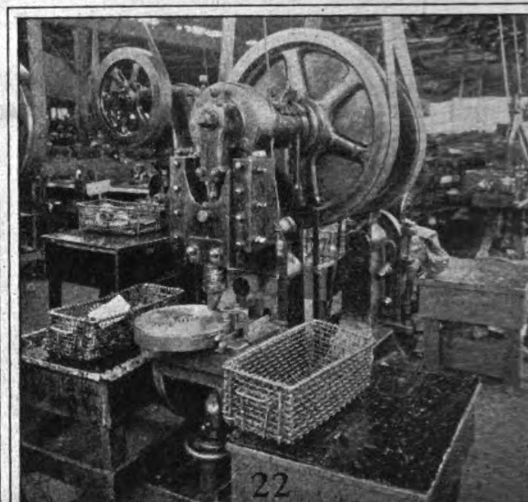




(13) *Gaging in the "green." Size gaging machine where cups and cones in the "green" are held to tolerances not to exceed .004 of an inch.* (14) *Battery of carburizing furnaces.* (15) *Rotary retort hardening furnace where small pieces are hardened after carburization.* (16) *Automatically fed roll grinders where rolls are ground to tolerances of .0005 of an inch.* (17) *Internal cup grinder where cups are ground to tolerances not exceeding .001 of an inch.* (18) *Taper gaging machines where rolls are gaged electrically. All rolls not of exact taper are automatically rejected.*







(19) *Part of the finished cup inspection department where cups are micrometrically gaged to a tolerance of .001 of an inch.* (20) *Part of the assembling department where parts which have passed the series of rigid inspections are finally assembled into complete bearings.* (21) *One of the stamping operations in the construction of the one-piece annealed cage or roll retainer.* (22) *Closing-in machine where the roll retainer or the cage of Timken bearings is formed to keep the roll in direct alignment.*

After the case hardening process is finished, the parts are ground to finished size. The cups are ground on internal cup grinders and the rolls on the same make of grinder supplied with automatic feed. The tolerances on the grinding operations are .001 of an inch on the cups and .0005 of an inch on the rolls.

One of the most interesting machines in the entire process of manufacture is the automatic taper gauging machine where the rolls are gauged electrically. All of the rolls not of the *exact* taper are automatically rejected by this machine and scrapped. The machine operates in such a way that unless the proper taper exists on the roll, the machine opens a by-pass which permits the roller to escape into a rejection chute, which drops the rejected rollers into a pan. The cups are inspected by hand, being gauged with micrometers to a tolerance of .001 of an inch after they are ground.

The manufacture of the cage or roller retainer consists of a number of press operations. The strip is first blanked to a modified cup shape. The next press has a die which sizes the interior surface of the cup and completes the forming. The next machine trims the outside of the cup, after which it is annealed and the flange left on the outer rim of the cup is drawn in. The bottom is then punched out of the cup, after which it is again annealed. The cup is then tapered and on the following machine perforated, and then winged. The winging operation consists of turning in the edges left on perforating to form the roll retainers. The cage is then spread and is ready for assembly.

The assembly of the roller bearings is a very simple proposition, the rollers being slipped into the cage or roller retainer and assembled in the cup and cone by hand. This work is largely taken care of by girls at this Canton factory. After the bearings are assembled they are inspected to see that all rolls revolve freely and that they function in the proper manner.

This routine method of manufacture is followed for practically all of the products of the company. A few of the very large size bearings have cups and cones made from forgings, and in the case of the very large bearings, the bigger cups and cones are formed hot in a special upsetting machine. Outside of this, the small and large bearings follow along about the same routine process of manufacture, the making of the bearings being distinguished by the comparatively small number of operations necessary for manufacture.

In the assembly work the rolls used on each bearing are selected by size so that even though they are held to close limits, the variation in the size of the rolls is not as great as the diametric tolerance limit. This is done by graduating the rolls with an electrical selecting machine which permits of selection by grading the rolls in very minute steps or stages. The rolls are carried around on a machine which, by a set of electrical contacts ingeniously devised, is so arranged that each roll

drops into a bin with its fellows of corresponding size. Thus, when a bearing is made up, rolls which have dropped into the same bin are selected, giving no chance for variation in the uniformity of bearing surface around the periphery of the bearing.

The interesting feature in the manufacture of this product is that in spite of the accuracy which must be maintained and the necessity for absolute uniformity and interchangeability, the machinery used is of the highest possible production capacity. The three most important parts of the bearing, the cup, the cone and the roll, are manufactured almost entirely on automatic machinery and finished by grinding.

The grinding operations have been worked out on a production basis so that the time required for chucking the pieces is reduced to a minimum. The Timken plants in America and Europe produce 100,000 bearings per day when running at normal capacity. When it is considered that this number of bearings is produced uniformly with a smooth flow from raw material through the process of steel manufacture, then the manufacture of seamless tubing, and finally to the manufacture of the finished bearing, it can be seen that an efficient production layout is required.

The reason, of course, is automatic machinery. As a matter of fact, the space required for the actual manufacture of the bearing is small compared to that required for the manufacture of steel and for the assembly and testing work. The actual fabricating operations are so concentrated by the use of the automatics that outside of a bolt and nut factory it would be practically impossible to picture any producing organization which is so highly concentrated as that of this bearing manufacture.

By manufacturing its own steel, this company is enabled to keep its product uniform, which would be difficult were the steel purchased outside, where the run of material for the Timken company would only be one of many other runs. It would necessitate a contact with the source of supply which would be inconvenient to maintain and probably unsatisfactory. On the other hand, the steels utilized in the manufacture of the bearings are of standard specifications, so that if labor trouble or any other disturbing cause arose in the steel plant of the Timken company, it would be possible to purchase the standard steel elsewhere.

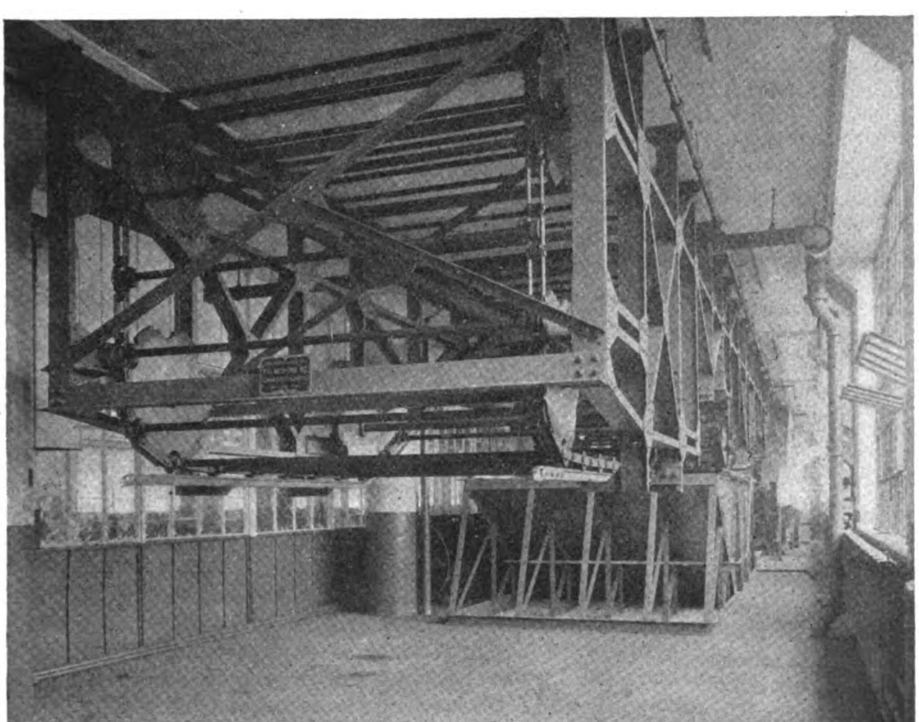
In very few industries is it possible to go back so far to the elementary material. Manufacture of the bearing really starts at the pile of steel scrap in the Timken yard. This steel scrap is stored outdoors and indoors for summer and winter consumption It is properly blended with the necessary fluxes and ferroalloys in the company's own plant, thereby putting the quality of the bearing directly under supervision at the inception of manufacture.

Continuous Motion Enameling Equipment

THREE installations have recently been completed for the baking of enamel on automobile fenders, hoods, etc., at the Cadillac Motor Car Co., Detroit; the Packard Motor Car Co., Detroit, and the Buick Motor Car Co., St. Louis.

The ovens at the Cadillac and Buick plants are of the continuous conveyor type, the work being hung on an overhead moving conveyor which automatically carries the parts down into the dip tank of enamel, up the drain board, into and through three ovens, progressively for three coat baking, without removing the work from the conveyor. Electric heaters of 2000 kw. capacity are installed in the Cadillac ovens and of 1680 kw. in the Buick ovens. These ovens are maintained at 450 deg. Fahr. by means of automatic temperature control equipment.

The Packard Motor Car Co. placed one of the largest orders during the year for heating equipment. This is in connection with the new six cylinder car, and consisted of 22 semi-continuous conveyor oven equipments, having a capacity of 3120 kw. The temperature of each oven is automatically controlled. The Packard Co. previously had some 12 or 15 electrically heated ovens in operation. Electrical equipment was manufactured by Westinghouse Electric & Mfg. Co.



General view of continuous conveyor for enameling ovens at Cadillac Motor Car Co. plant. Note the dip tank in the foreground

Heat Treatment of Valve Steel

THE proper heat-treatment for the valves of internal-combustion engines is given in an English house organ as follows: 3½ per cent nickel steel should be normalized at 830/850 deg. Cent. No further treatment is necessary. 25 per cent nickel steel should be normalized at 880/900 deg. Cent. No further treatment is necessary. 13/18 per cent tungsten valves should be heated to 950 deg. Cent. and cooled in still air, then reheated to 800 deg. Cent. and cooled in still air before machining. 13 per cent chromium valves should be heated to 900 deg. Cent. and cooled in oil, then reheated to 700 deg. Cent. and cooled in still air before machining.

Tide in Export Trade Is Turning

Stocks of automobiles in foreign trade centers are being liquidated and by the time the buying season south of equator opens there should be a steady flow of orders. Time element very different from that in domestic field and positive business should come shortly.

By George E. Quisenberry*

INDICATIONS accumulate that the export market for automotive equipment is again on the upgrade and that, despite the gravity of conditions affecting many other commercial lines, the liquidation of the surplus stocks of passenger cars, trucks and tractors in some of the larger foreign centers is progressing favorably. Manufacturers and foreign dealers are working more closely together than ever before in an effort to clear the market of these holdover goods and, as one export manager recently said, makers and sellers are beginning to get really acquainted with each other. The ultimate benefits to be derived from this can easily be imagined, and it is to be hoped that the exporters of this country will do everything possible to hold the business friendships they have made during the last few years.

The export market has not picked up to the same extent that has the domestic retail trade. It was to be expected that it would be several months behind the home market, but there is everywhere apparent the feeling that the tide has turned and that coming months will see a gradual but certain revival in the foreign sales of practically all automotive lines. One large New York exporter, naming the numerous countries in which his lines are being pushed, reported that the low points of retail sales had been January in certain districts, February in others and March in the remaining divisions. In each there has been a gradual quickening in retail sales of the foreign dealers since the low point, and, while few shipments of new stocks have yet gone forward to any of these sections, inquiries were being received and other evidences pointed the necessity of additional shipments shortly.

A second manufacturer, whose line has been very thoroughly and carefully handled in the foreign market, declared that his overseas shipments in March were 25 per cent of normal and that he expected them to be 50 per cent within 60 days of that time. Another exporter summed up the same condition by reporting a "much more favorable tone"; this is borne out by reports received from several foreign centers which spoke of a trade revival that seemed certain in the middle months of this year.

Far-Flung Field

The foreign manager has his field so far removed and covering such great stretches of territory that it is difficult for him to keep in close and immediate touch with his overseas connections. He does not, like his sales brother in the domestic field, have the unlimited services of night messages and special delivery letters, with voluminous reports from business publications and official or semi-official organizations to keep him constantly informed on the course of business in the districts where he disposes of his wares.

The export manager, taking full advantage of every available agency, must develop a sense of feeling or ability to interpret conditions in countries many days or weeks distant by steamer and mail. This ability to sense the markets is one of the chief qualifications of the good export manager and, without it, he is liable to find himself lost.

In New York, at least, it may be said that the exporters are "sensing an increased business." Certain countries, they know, have not yet passed through the business valley from which North America seems now to be ascending. But other countries have done so and are definitely on the upward trail again. Here and there may be found cities and even countries which have scarcely felt the depression, and these places, with those countries which have gotten past the bottom, are being "sensed" as offering positive business within the next few months.

The writer has recently talked with an American exporter who has just returned from a two-year trip in the foreign field. Thoroughly familiar with the district in which he traveled, this man was quite positive that extensive buying should be expected within the next two or three months. The reason for his expectation was that this particular territory is south of the equator and, consequently, enters its sales season in September and October. Last year and the year before the market was not well supplied at that time, orders had not been placed early enough, production and shipments were delayed and many dealers had scant stocks at the time when the real buying season got under way.

Time to Get Busy

This condition should not be repeated another year, the exporter declared. Manufacturers should begin now to go after this business, remembering that foreign transactions cannot be carried out in the few days that might suffice at home. If you would have good business in September and October, he said, prepare for it in March, April and May and be ready to make shipments in July and August, if not in June.

As a concrete example of this assertion the National Cattle Show of the Sociedad Rural Argentina will be held in Buenos Aires the first two weeks of September. It is to be presumed that every American exporter who sells to the River Platte territory will endeavor this year to exhibit his goods at that show. Undoubtedly it is the most important showing in all of South America, drawing hundreds of thousands of visitors from Argentina, Uruguay, Chile and other nearby countries, transcending in importance, from an automotive standpoint, even the annual motor car show of the Automovil Club Argentino, which is held a few weeks later. And, be-

*Managing Editor *El Automovil Americano.*

cause of the general conditions of business and trade, as well as the lessons learned domestically from the shows held at home this spring, there is every reason to believe that few exporters will pass up the Argentine cattle show this year. It must be used in an attempt to restore retail buying to a satisfactory level.

So, the manufacturer or exporter has learned of this show in late April or early May. He wishes to find out about space, about the arrangements for the exhibit, and he must take up these points with his distributor or other connections in Buenos Aires. He writes to Argentina the first week in May and the letter reaches its destination three weeks later, about the first of June. Let us suppose that the letter is answered immediately, although it would be rather doubtful if such quick service could be accorded. The reply requires three weeks more, and the month of June has practically passed away before it is received in the exporter's office here in the United States.

Consider the Time

Possessed with the detailed information required and having come to an agreement with his Buenos Aires connection, the exporter then must prepare for the exhibition, which starts two months later. Perhaps a new model or a special design must be shipped, as undoubtedly will be the case with many makers this year. The factory is asked to rush the order through, and the car is crated, shipped and arrives at New York in the latter part of July. Then it is rushed to a boat and sent on its way by August 1, reaching Buenos Aires just in time to get through the customs house, be uncrated and set up before the exhibition opens. Four months have passed, and it is doubtful if all the arrangements could have been handled satisfactorily in a shorter space of time, not forgetting that the exporter can take advantage of the cables to hasten his attempts to obtain information.

Previously it has been said in AUTOMOTIVE INDUSTRIES that foreign trading is not an impulse undertaking, that results cannot be expected over night from the first attempts to work up an export trade. This is even more true to-day than it was six months ago, and the statement is amply proven by the mistakes made by some companies which have attempted ill-advisedly to get into this lucrative business. But it does not mean that American manufacturers should not redouble their efforts in the foreign fields; the automotive development of the four corners of the world has no more than started.

We shipped heavily to all countries during 1919 and 1920 and, on the face of immediate business in sight or in prospect for the next two or three months, it may seem that the trade of those two years was excessive and abnormal. Perhaps it was, but the men most closely connected with the overseas markets believe that the start only has been made. The great developing countries, such as Latin America, Australia, South Africa and the Far East, have no more than begun the motorization that must come about during the next few years. Those countries to-day stand generally where the United States stood ten years ago or even longer. Then we were just beginning to use the automobile, the motor truck and the farm tractor. Our great development has come since that time. We were then beginning to talk of better roads, and the motor car was just pushing its way into the great farm areas.

Only the Beginning

That is the condition to-day throughout many countries of the foreign field. The belief that the automobile is a luxury for use only in the cities is just being overcome. Our pioneer companies—and any exporter can count them on the fingers of his hands—have done their work well and have started what ultimately will mean a much wider and more universal use of the essential motor car. Road improvement is just getting under way in many localities, and the development of the next few years in this regard doubtless will dwarf anything of the past.

The present months are no more than a breathing spell and already there are numerous indications that the immediate situation is about to mend. The stocks of cars that have been held up in ports and warehouses are being liquidated, just as they were liquidated in the domestic market. That movement is progressing slowly but certainly. In certain cases manufacturers have made concessions or affected compromises with their foreign dealers in an endeavor to wipe out the holdover stocks. Some companies, their sales policy not so well defined, are still faced with large supplies in their overseas markets and they will, of course, bear the burden for some months to come. But those which have not shipped so extensively and which have reached close cooperation with their distributers are getting to their feet again, their comparatively small stocks dwindling as retail trade has revived. These companies have nothing to fear in the future and can look forward to a continued increasing trade. Those which have erred will bear the consequences.

Thus we have a situation promising for those companies which have not compromised themselves during the last few months. Likewise, we have every reason to feel confident that the foreign trade of the automotive industry of North America will continue unabated. There will be competition that was lacking during the wild-cat days following the armistice, but that will not hurt the markets for our products.

The exporter has for his field of endeavor the entire world. As he views it to-day there are many spots and many localities under the shadow. Many others are just beginning to get into the sunlight again and to feel the beneficent results of the trade revival. The shadows will not entirely disappear for many years, but the whole world will not remain much longer under the cloud.

Service with the Car

SERVICE—the large initial belongs there—is the keynote of foreign sales, according to E. G. Poxson, export sales manager for the Dort Motor Car Co., who is, likely, more familiar with his foreign field and sales facilities than any other automotive export sales manager in this country. Poxson has lived and worked with his foreign representatives. He does not set any of these representatives up in business until he understands their motives and until they understand his methods.

He has spent much of his time abroad since he took this job, and he has seen hundreds and scores of American machines laid up indefinitely because there were no service parts in the country where the machine was sold. He is quite happy to say that this is not the case with the Dort cars. Service parts and an understanding of the mechanism of the car are quite necessary to the sale of Dorts in any part of the world.

Poxson is quite optimistic over the prospects. He says that the tide turned with him in several countries early in the year, and he anticipates a very good demand before the year ends. Even at the period when the demand for American cars was at the lowest, orders for Dorts were coming across the water because of the service idea.

Association for Purposes of Constructive Co-operation

The automotive industry seems to have been a target for legislative bodies recently. A new branch of automotive manufacturers has found the possible benefits of association. The Motor Vehicle Signal Manufacturers Association was formed to oppose something, but its future holds possibilities for constructive action.

THE prevalence of manufacturers' associations composed of companies engaged in a similar line of business indicates a growing realization of the interdependence of the units of modern industrial organization. Such associations, when they comprise the strongest elements in a particular trade, hold tremendous potential power for accomplishing constructive purposes. They hold similar power, of course, for accomplishing selfish ends, but the ultimate business futility as well as the moral injustice of combining for such entirely selfish purposes is being understood more fully every year. The current efforts of the Federal Trade Commission will probably tend to widen that understanding still further.

Clyde Jennings has pointed out in recent articles, however, the necessity for constant and intelligent watchfulness on the part of manufacturers as regards ill-conceived and unhealthy legislation, both national and local, tending to work injustice to both automotive manufacturers and consumers of automotive products. This does not mean lobbying for selfish legislation, but making certain that the laws which get on the statute books are intelligently framed so as to allow a healthy and permanent growth for all parts of the industry; a growth which will result in the ultimate benefit of the consumer as well as of the manufacturer.

The manufacturers of another branch of the automotive industry banded together last Monday for such constructive purposes and will add their efforts to those already being exerted to push constructive legislation and prevent narrow laws being passed. This new association is to be composed of the manufacturers of rear-end signals for cars and trucks, and its name will be the Motor Vehicle Signal Manufacturers' Association. The association was formed directly as the result of an unfortunate ordinance which was almost passed by the City of New York, and indirectly as the result of the realization by a large number of the manufacturers of the potential benefits of co-operative effort.

The ordinance in question is an interesting example of what may be done by legislative bodies as much through ignorance as through malice. The story of its origin and change is of interest because the same sort of thing is likely to occur in connection with other branches of the industry.

The ordinance as introduced read in this way:

> " . . . In order to avoid rear end collisions every motor vehicle, except motorcycles, shall, in addition to the red light, visible in the reverse direction, herein provided for, be equipped with a rear end traffic signal which shall indicate both by day and night that the said motor vehicle is about to slow down. The said light or signal shall be so operated from the foot brake or clutch that the operation of the foot brake or clutch shall result in the light or signal clearly showing that the vehicle is about to slow down.
>
> "No lamp, device or signal shall be used unless the same shall have the written approval of the commissioner of licenses, but no type of lamp, device or signal shall be approved by the commissioner which shall cost more than $10 complete."

When it is recognized that a large percentage of the signals manufactured operate electrically, that many of them contain the words "stop," "right turn," "left turn," etc., instead of "slow down," and that only one signal on the market comes within the terms of the ordinance as to both price and construction with the terms of the ordinance, the unfairness of the situation becomes obvious.

The danger of the ordinance being passed came to the attention of one New York signal manufacturer, who immediately took the matter up with the alderman responsible for the ordinance. As soon as the matter was explained to the alderman he admitted the injustice of the ordinance, said that he didn't know anything about signals, but had seen one like that described in the ordinance and had thought it was a good one. He offered to present an amendment at the hearing.

The signal manufacturer who had visited the alderman got in touch with a number of fellow manufacturers before the hearing. When the hearing was held a group of signal manufacturers attended and presented their case, and the ordinance was amended in such a way as to strike out the limiting provision and allow the use of practically any signal now manufactured.

Thus the necessity for such efforts as are so ably being put forth by the association was brought forcefully to the attention of the signal manufacturers. The result was the initial meeting for the formation of an association, which was held on April 25. At this meeting there was a good attendance from manufacturers within striking distance of New York, while letters were read from a number of more distant manufacturers expressing their approval of the association plan and stating their desire to co-operate in every way.

At this preliminary meeting the first steps for forming the association were taken. The name, Motor Vehicles Signal Manufacturers' Association, was approved and a committee was appointed to draw up by-laws and to make definite suggestions for future procedure.

It was the idea of those present to include in the membership of the association all the signal manufacturers in the country, and to ask those associated with the International Signal Manufacturers' Association, a

Pacific Coast organization, to associate themselves with this new body, whose activities may be expected to assume a broad and constructive scope.

The desire was also expressed to bring this new association into active touch with the work of the Motor Vehicle Conference Committee, so that the new organization's efforts might assist and work in harmony with those of the other organizations affiliated with the Conference Committee.

E. J. Livingston, 160 Fifth Ave., New York City, was appointed temporary chairman of the organization and his office designated as the temporary headquarters.

Another meeting of the association will be announced in the near future. To this meeting all signal manufacturers will be invited to send representatives, that the organization at its very beginning may comprise the best ideas of the entire industry. The representative nature of the attendance at the organization meeting and the constructive ideas voiced by those present indicate that the new organization will be able not only to further its own plans ably but also to effectively assist the other members of the Motor Vehicle Conference Committee.

A Non-Metallic Gear Material

UP to a few years ago practically all noiseless gears were made from rawhide or hard fiber. Both of these materials are unsuitable for timing gears, because they swell and distort when immersed in oil. Recently a number of non-metallic materials have been developed which have sufficiently high mechanical properties to permit of their use in toothed gearing and are non-sonorous and impervious to oil and alkalis. One of these materials, known as Condensite Celoron, contains two basic elements, Condensite (a phenol-formaldehyde condensation product) and fabric. The following particulars regarding the material and its use for camshaft gears have been furnished us by the manufacturers:

The material is as strong as cast iron, is not affected by moisture or oil, possesses a high dielectric strength, is chemically inert, insoluble, infusible and resistant to most acids. It can be kept in storage indefinitely without deterioration and is not attacked by rodents. When properly applied and lubricated it will often outlast cast iron and brass.

One of its distinctive features is its greater resiliency, or, rather, its greater resistance to shock, as compared with cast iron. Condensite Celoron is self-supporting and generally neither bushings nor flanges are required. If strain is severe the use of end plates is advisable, but teeth need not be shrouded. Pinions made from Condensite Celoron run successfully against gears of cast iron, steel, brass or bronze. The face of the pinion should always be equal to or less than that of the mating gear. Condensite Celoron pinions should never be run with gears having cast or badly worn teeth. In the case of timing gear trains with three gears, it is customary to make the center one from the fabric material, but oftentimes if this gear requires a great deal of machining or has an offset hub, it is better from an economic standpoint to have the two outside gears non-metallic.

Condensite Celoron has a tensile strength parallel to the laminations of 12,000 lb. per sq. in. and perpendicular to the laminations of 8000 lb. per sq. in. The compressive strength parallel to the laminations is 17,000 lb. per sq. in. and perpendicular to the laminations, 35,000 lb. The transverse strength is 17,000 lb. per sq. in. Other physical properties are: Brinell hardness, 30 to 40; specific gravity, 1.4; weight, 0.05 lb. per cu. in.; water absorption, ½ to 3 per cent in 24 hours. Up to a temperature of 300 deg. F. this material shows no material change in physical properties.

Condensite Celoron may be machined the same as metal. It cannot be molded, but when in the uncured state may be formed into special shapes. It will take a high polish. In turning, the piece should be turned to size whenever possible with one cut, but when two cuts are found to be desirable, the finishing cut should remove at least ⅛ in., as it is not always possible to turn a piece with a uniform diameter where a lighter cut is taken. The material should be turned at a peripheral speed 25 per cent faster than cast iron. A coarse feed and a wide-nosed tool should be used. The tool should not be raked but plenty of clearance should be allowed. No lubricant is necessary. The turning tool is dulled very quickly and should be frequently sharpened.

Drills should be run at high speeds, sizes ¼ in. and under, from 2500 r.p.m. to 10,000 r.p.m., and larger sizes in proportion. A drill in Condensite Celoron cuts smaller than itself and if the drill is properly ground, the hole will be clean and true, but about 0.003 in. undersize. If it is necessary to have the hole of the same size as or a little larger than the drill, the drill should be ground slightly off center.

Condensite Celoron may be sawed with either a band or circular saw. In milling it with standard milling cutters, high speeds and coarse feeds should be used. Whenever possible, all material should be removed in one cut. The use of a reamer is not recommended. Where accurate work is necessary, the holes should be drilled and then bored. The material is manufactured by the Diamond State Fibre Co.

Government Research in Road Construction

(*Continued from page* 906)

the rear of the three and are so located between the tracks of the forward wheels. Each wheel is independent of the others, and its whole weight rests on the road.

This wearing machine is constantly hauled back and forth over the experimental road section by means of a stationary engine and a steel cable. There is some lateral play to the wheels and the wearing surface is practically 12 in. wide. These tests are intended mainly to determine the wear-resisting qualities of different paving materials used in the cities where there is still a great deal of heavy horse traffic on steel tires. The experimental road comprises 48 different sections, including 21 of brick, 19 of granite and 8 of concrete. Photographs of the sections are taken at intervals and photos of the same section are mounted side by side, to permit ready comparison of wear. Fig. 21 shows five of the sections in four different stages of wear.

WITH the increase in the use of farm tractors the market for large stationary farm engines—engines of 10, 15 and 20 hp.—has declined materially. Formerly silo-filling, for instance, required an engine of this size, but now the tractor engine usually serves the purpose. The market for small farm engines, on the other hand, is not appreciably affected, as the farmer cannot afford to run the tractor half a mile or more every time he wants to do some corn-shelling or run the lighting plant.

View the Labor Problem in Perspective

Temporary conditions may delude the manufacturer into thinking the labor problem solved. It is not. In this article, Mr. Tipper tells what some workmen are thinking on the subject. Their views indicate future actions and conditions. The problem must be tackled. Now is the time.

By Harry Tipper

A GROUP of manufacturers were discussing business conditions and grumbling at the difficulty of getting enough business to make ends meet.

During the conversation, which ranged all the way from the hopes centering in the new government to the cancellation of contracts, some one introduced the question of labor.

"How do you find the labor situation?"

"That's all right, there is no trouble about labor, except that we haven't enough work for the men we have. Everything else is fine. These fellows are sticking on the job now. They don't want to lose the work they have with all this unemployment. They're getting down to business and cutting out all the foolishness we had last year.

"No, I guess our troubles in that direction are passed, we don't expect to get into the same jam we had last year. Any way, business does not look like a rush for a long time; meantime these fellows are learning that a good job is worth sticking to."

"Did you go on with the conference system your industrial relations man started last year?"

"No! We cut all that stuff out. Most of it was a waste of time, any way. Talking about a lot of things that ought to be decided in a few minutes. Going over a lot of trifles. Why those fellows spent all kinds of time mulling over why this man was fired, what should be done about light and ventilation in the dark part of the machine shop. I got pretty sick of it; believe I would have stopped it, any way. When the plant closed down I just took advantage of the situation to cut it out. I fired all the industrial relations department except Jones, he was a good man, so I put him under the production manager—he's working shop discipline and method."

"Well! I guess you're right. The old-fashioned way of handling a shop was best. You just told the men what to do and they did it.

"All this talk about the worker's point of view is new stuff, mostly started by the armchair theorists who never ran a shop in their lives. Probably wouldn't know what one looked like. What do you expect on raw material prices next month?"

So the matter was dismissed, the advantage obviously with the manufacturer and the half-hearted attempts at new human organization all disbanded when the employer's dominance has been regained.

This conversation occurred as I was on my way to some of the industrial cities in the Middle West. I thought I would check up and find out what the worker had to say about it. So I talked with some of the mechanics I noticed outside the employment offices, some of those I found on the cars coming home from work, and some of those who did not appear to be working, nor looking for work at the moment.

To these workers the labor problem was not solved at all; it is never solved. It is the big problem of their lives. When they have work the families eat and enjoy comforts, when work is scarce they lose first the comforts and then part of their food ration. They did not know why work was plentiful last year and scarce this year. They did not know how long the present job would last, or if they would get a job.

Some of them were so foolish as to believe that the manufacturer was responsible, in a way, for the scarcity and many of them were frankly suspicious of the Capitalist class, figuring that they got all the best of it all the time.

The more belligerent men were thinking of the time when they could seize the advantage once more, the less belligerent were afraid and deeply afraid of the immediate future in the matter of eating and sleeping. One or two believed thoroughly that the manufacturer was playing to put them deliberately in a starving position.

Many of these opinions were without any evidence or foundation, they were undoubtedly incorrect—but their inaccuracy does not affect their existence and the fact that there is a labor problem.

Unemployment is one of the phases of the labor problem. Lack of work when a man is healthy and ready to work is a disturbing factor of great moment and lays the foundation for much future trouble.

Ignorance as to the reasons for unemployment is another item in the labor problem, one which leads to many beliefs and opinions that will affect the future action of these men on their jobs and in their political opinions.

Organization is a growth; once begun it will continue to grow unless it is replaced by better types. The organization of trade unions was begun a hundred years ago, out of the fear of starvation, the suspicion of the employer and the demand of the worker for protection. Those same conditions to-day will form organizations of workers just as effectively as they did years ago. Unless these matters are dealt with, the labor problem still exists, although the pain and trouble is not visible for the moment.

Any manufacturer who is neglecting the human side of industry because he can control his workers for the moment, is as shortsighted as the man who determines his policy by the last six months and the next six months.

When the machinery is idle and there is no problem of

getting the work out, an opportunity exists to put the plant in shape for real work on a better basis. When jobs are scarce and the employer is not forced to listen to his workers, by the conditions, there is an opportunity to study the human necessities and lay the ground work for a better co-operation and a larger measure of human efficiency in future work of the establishment.

It will not be done by arbitrary methods of procedure. The old-fashioned way has no more to recommend it than the old-fashioned machine. It is just as clumsy, slow and inefficient in its results.

It is absurd for a manufacturer who prides himself on his up-to-date and efficient methods of manufacture, to deal with human beings as the employer of forty or fifty years ago. The production problem includes the labor problem. The increased production efficiency, the lowering of production costs depends largely upon the improvement of the incentive, skill and stability of the worker, who controls this production operation.

Study of mechanics will not overcome the inefficiencies of the human being. Arbitrary prejudice, opinion and decision will not solve the labor troubles. The sore spots still exist and the active agitators are still rubbing salt in these wounds. When men are idle they have a lot of time to listen. Are they listening to the employer or the agitator? Is the employer unconsciously handing the salt to the agitator by his method of handling the question? In a great many cases he is. It is the action of the manufacturer, which appears to be arbitrary and unfair that forms the text of most of the oratory of the agitator. To the man who does not know why he is out of a job, the whisper that the employer is still making money is enough to arouse his suspicion. To the man whose wages are cut, the statement that the concern has a big cash surplus they made last year is rubbing salt in his wound.

The salt is formed by the ignorance of the man plus the secrecy of the manufacturer, and it is a salt that will keep any wound open for years. There is a labor problem and there is a large opportunity how to study it while the trouble and interruption are not so visible or important. There is more available time for study and more available opportunity for experiment. The fact that there is no trouble does not justify the statement that there is no problem.

The problem must be tackled now or later, and what is done now will have a great influence on the character of the later developments.

Walter Raleigh says of language that "out of one hundred ways of saying a thing ninety-nine are wrong."

Out of a hundred ways of doing a thing, humanly speaking, ninety-nine are wrong and lead to misunderstanding, suspicion and fighting.

Six-Wheel Bus Now Used in Paris

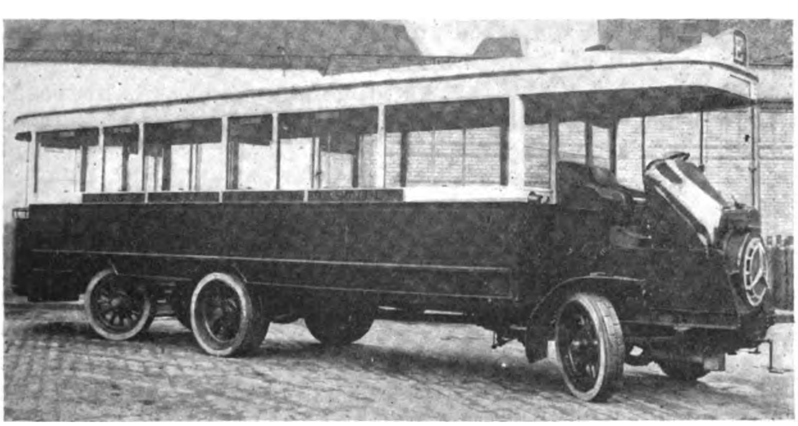
EXPERIMENTS are now being carried out in Paris with a six-wheel single deck omnibus steering through the front and the rear pair of wheels, and driving through the center pair. The advantage of the new type is that an increased wheel base and additional carrying capacity are obtained with the same turning radius as for the normal two axle machine. The experimental buses are being run on the Madeleine-Bastille route, which comprises the most crowded boulevards of the city.

No changes have been made in the engine, which is a four cylinder type placed under the driver's feet; the live axle is also practically the same, and the third axle is a duplicate of the front axle. Suspension is by means of three pairs of semi-elliptic springs.

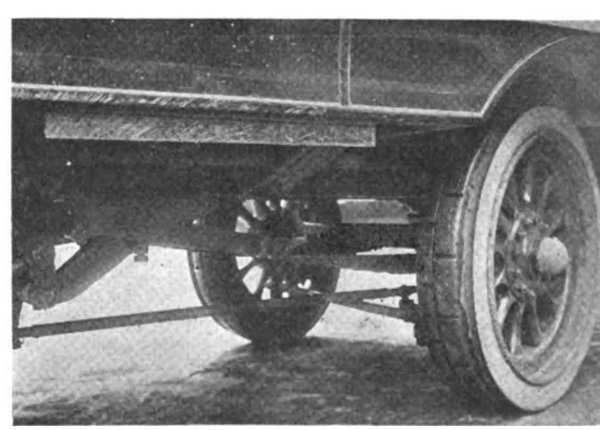
This type of bus is not entirely new, although this is the first time it has been used in Paris for passenger work. Before the war the French engineer Gros designed a similar type of six wheel bus, which was built by the De Dion Bouton Company and experimented with on the streets of Paris. Since the armistice the bus company has been making use of a three-axle chassis for tankers bringing gasoline and benzole from the refineries to the bus depots.

All Paris surface lines, comprising trolley cars and buses, went under the direct control of the municipal authorities on January 1st. The municipality is not running these lines itself, but is farming them out to an operating company, which is interested, to a certain extent, in the financial success of the concern. There will be no competition between electric trolley and gasoline omnibus lines, but cooperation between the two, each type being extended according to the requirements of traffic.

AMONG publications recently issued by the Director of the Air Service, Washington, are the following: Instructions for Installing 85-A Mixture Control in Zenith US-52 Carbureters, Performance Test of U.S.X. B.I.A. with 300 HP. Hispano-Suiza Engine and Performance Test of U.S.X.B.I.A. with 300 HP. Hispano-Suiza Engine Showing Improvement in Performance with Propeller X-19677.



Six-wheel motor bus now being experimented with in Paris. Front and rear steering give short turning radius



Rear axle on Paris bus is duplicate of front axle. Only the center axle has driving wheels

Systems and Individual Development

AT a time when great emphasis is being given to systems and organization routines, it is well to recognize the fact that the multiplication of routine forms and systems inevitably results in a proportionate increase in overhead costs. There has been a tendency during recent years to reduce as far as possible the necessity for personal judgment and mental activity on the part of office workers; to establish rules and forms of procedure to so large an extent that the necessity for the exercise of intelligence on the part of the clerical worker is reduced to a minimum. This has been done on the principle that by such means the possibility of error is correspondingly reduced.

Looking at the matter from the opposite angle, however, it becomes evident that as the necessity for the exercise of intelligence on the part of the individual worker decreases, the necessity for supervision, both of the worker and the system increases. Or to state the same proposition in other words, as the intelligence of the individual worker is increased, the necessity for supervision is decreased.

In a recent editorial, the British journal, *Engineering Production*, says that "as a general proposition it may be stated that the Cinderella of commercial occupations is the clerical department. . . . The temptation to employers has been to replace efficiency with mere numbers—clerical labor being cheap—with the result that clerical staffs are frequently too large and unwieldy." This tendency is natural when overemphasis is placed upon systems, since more persons are always needed to operate the systems. The possibility of great gains accruing to the management through an attempt to increase personal development and to encourage the assuming of responsibility by individuals is worth serious thought.

It may take a little more time and effort to properly train and develop the individual in any given case so that he is capable of assuming a larger degree of responsibility for his personal efforts. But once accomplished the result is beneficial and permanent. Efforts to make system replace personal responsibility to a maximum degree result in trouble the moment the administration of the system lags. And even systems must be operated by human beings.

Physical Properties of Rubber

MANY people have wondered why the shock absorbers fitted to airplane landing gears should be made of rubber cord instead of steel. The great strength and elasticity of steel are well known, and it seems at first sight impossible that a material of comparatively low elastic limit like rubber could store a greater amount of energy in elastic deformation than the much stronger steel. Such, however, is the case, and the use of rubber for airplane shock absorbers is based on a sound principle. The amount of energy which a certain amount of a given material can store by elastic deformation depends upon both its elastic limit in tension and its elongation when the elastic limit in tension is reached, and this latter factor is, of course, much greater for rubber than for steel. The matter of the energy storing capacity by elastic deformation has been the subject of experimental investigation and it has been found that whereas tempered spring steel will store 95.3 ft. lb. per cu. in., vulcanized rubber will store 14,600 ft. lb. In view of this fact and the many endeavors in recent years to improve the riding qualities of automobiles it is a wonder that rubber has not been used for suspension purposes except in an indirect way.

Another peculiarity of rubber about which little is known is that it contracts when heated and expands when cooled, in which respect it differs from almost all other substances. In stretching rubber and allowing it to contract there is, moreover, a hysteresis effect. That is, the rubber does not exert the same tension during contraction as during extension while deformed the same amount. By plotting the curve of extensions and tensions for a complete cycle, a hysteresis loop is obtained, the area of which is a meas-

ure of the energy loss due to hysteresis. This hysteresis is one of the causes of heating in rubber tires and undoubtedly the chief cause in the case of solid tires. In pneumatics of the fabric type the heating is very largely due to the friction of one layer of fabric over another. Anything which decreases the hysteresis of rubber will improve the efficiency of tires from an energy conservation standpoint. It has been found that a slight overcuring has a beneficial effect in this respect, but, unfortunately, such overcuring is not good for the endurance of the rubber. It is readily conceivable that the fillers with which rubber is compounded have an influence on the hysteresis effect and thus influence the energy loss due to the tires.

Is Volumetric Efficiency of Prime Importance?

WHEN gasoline was cheap and the automobile was still regarded as a sporting vehicle or rich man's toy rather than the utility as we know it to-day, there were insistent demands for more power, with relatively little consideration for economy. Taxation, based largely upon engine size, and other factors then led, especially in Europe, to an effort to get the utmost power possible out of an engine of small bore. This, in turn, brought about many improvements in design intended to secure the maximum volumetric efficiency, and gave us in fact the modern high-speed passenger car engine.

To-day we still think in terms of maximum power, though economy in fuel is of quite as much, if not of greater, importance. It is generally conceded, in fact, that the average passenger car engine operates from 80 to 90 per cent of the time it is in use under loads of one-fifth to one-half maximum. In other words, we design for and talk about getting maximum volumetric efficiency and then proceed to use the engine thus designed under throttled conditions where, of course, the volumetric efficiency is purposely limited.

Every engine builder and car manufacturer can furnish from his files data on the full-load performance of his product, but few, indeed, appear to appreciate what a small fraction of the time the engine they build operates under full-load conditions, and fewer still have investigated the characteristics of the engine under light loads or appreciate how inefficient it then becomes, especially from a thermal standpoint.

As a matter of fact, there seems to be but slight appreciation of the truth that the engine which accelerates well and handles smoothly is not necessarily the more powerful; though the layman, if not the engineer, will often refer to such a car as being more powerful than one with a larger engine which in reality develops a greater maximum power when operated under the rare conditions which enable the potential power to be realized.

Much depends, of course, upon the manner in which the fuel is prepared prior to ignition in the engine. Of two engines identical, let us say, except in carbureter equipment and manifolding, including provision for heating the charge or the fuel, the one with the dryest or most readily combustible charge will give more satisfactory operation from the standpoint of acceleration and general handling and appear to be the more powerful, though it actually gives less maximum power when once it is wide open and the manifold cleared of fuel deposited on the walls. The first-mentioned engine will give far greater satisfaction in the hands of the user, and with rare exceptions will do all that the second engine will do under service conditions. Beside this, it will remain freer from carbon, will suffer less from fuel dilution of the lubricant, and probably travel much further per gallon of fuel consumed than the engine in which these desirable characteristics are sacrificed simply to secure a slightly greater maximum power.

In other words, the day when the utmost possible in volumetric efficiency was desirable regardless of other characteristics is past—perhaps it might better have never come. Some engineers still refuse to consider any vaporizing system which thoroughly heats the charge and thus decreases to some extent volumetric efficiency. With present-day fuels, at least, we feel that this is a serious mistake. Better by far sacrifice whatever relatively small amount of power is lost by heating the charge a sufficient amount and gain the benefits mentioned than sacrifice these for a slight gain in maximum power. It may even pay to use exhaust gas or some other diluent to prevent detonation with the hotter charge than to sacrifice the advantages gained. However this may be, let's forget the maximum power bugaboo, and aim, rather, to promote fuel economy and better performance under the average conditions of operation.

Ignorance Hurts as Much as Malice

LEGISLATION adverse to the interest of the automotive industry is not always designed with malice aforethought. It is often the result of ignorance of the true facts of the case on the part of legislators. This is illustrated by the New York City alderman who introduced an ordinance to compel all motor vehicles in that city to carry a rear-end signal device and so worded the ordinance as to exclude all except one signal on the market.

When other signal manufacturers protested, this alderman readily proposed an amendment so that other signals would be included. He said he really didn't know there were many different signals, and, having bought one of this particular kind and found it satisfactory, had molded the ordinance in accordance with its working.

This sort of thing provides ample justification for the efforts of automotive manufacturers to have the industry intelligently treated by legislative bodies, and emphasizes need for constant watchfulness.

It is undoubtedly true that ignorance of the real facts on the part of legislators can harm the industry fully as much as a conscious attempt to load it with burdens not properly its share. An honest attempt to get justice by the presentation of such facts has no relation to the pernicious lobby.

Credit Situation Improving Rapidly

Collections Easier, Parts Makers Find

Volume of Business Continues to Grow—Many New Orders Booked for Delivery

NEW YORK, April 26—Business in the automotive industry which began to forge ahead in January will show an improvement this month over last. The increase over March will not be so great, however, as it was in March compared with February. May remains something of a problem. Orders already on hand make it certain trade next month will approximate that for April, but whether it will continue to increase remains in doubt. There is a pronounced feeling that progress from now on will be slower than for the past quarter.

Conditions in the industry were discussed at a group credit meeting of the Motor and Accessory Manufacturers Association here to-day, and the experiences of the members showed a remarkable similarity.

The outstanding fact expressed is that collections are better than they have been since late last summer. Notes given last August are being paid and notes made more recently are being met, in most instances, upon the due dates. Cash has again made its appearance. Credit conditions are much easier than they have been in months. Collections showed considerable improvement last month, but the gain in April has been much more pronounced.

Old Orders Released

In general there has been a decided improvement among the parts manufacturers in the amount of new business, the number of releases on old orders, and in collections. Individual experiences differed somewhat, but the trend was all in the same direction. Additional passenger car companies are constantly coming into the market for supplies. The pulse of the truck end of the industry has begun to stir.

Parts and accessory manufacturers who depend on jobbers and retailers for a substantial share of their business reported that this trade is remarkably good and that it is now on virtually a normal basis.. Orders are substantial and payments prompt. Jobbers and dealers seem to be doing a greater volume of business in proportion to the capital invested than the manufacturers of complete vehicles.

April has brought a very large number of releases on old orders and they have come from virtually all the passenger car companies, small as well as large. This indicates that the business recovery has filtered through the entire industry. Some of the companies mentioned were Haynes, Jordan, Grant, Hupp, Briscoe, Peerless, Stutz, Lincoln, Rolls-Royce, Cadillac, Kissel, Dodge, Oakland, Barley, Maibohm, and Studebaker.

Ford and Franklin seem to be leading in the list of companies offering new business. Others mentioned in this class included Chevrolet, Oakland, Wills-Lee, Lincoln, Chandler, Mercer, Hudson, Dodge and Hare's Motors.

Truck companies which have come into the market include International, Ruggles, Brockway and Acme.

Orders Held to Minimum

Complaint was general that passenger car companies are ordering on a strictly hand-to-mouth basis and that they expect deliveries before it is humanly possible to make them. Stock chasers have again taken the field. Parts makers have little idea of the future requirements of their customers and it is difficult for them to keep stocks of materials on hand to this reason.

One particularly gratifying statement in regard to collections was that they have shown marked improvement in the South, where they have been almost hopeless for months.

HAYNES PRODUCTION HIGHEST IN HISTORY

KOKOMO, IND., April 25—A. G. Seiberling, general manager of the Haynes Automobile Co., has issued a statement in which he says the company is producing 33 1/3 per cent more cars than ever before in its history and employing approximately 16 per cent more men than ever before. In many departments day and night shifts are being operated.

Auto-Lite Prepares for Rush

TOLEDO, April 25—The Electric Auto-Lite Co. announces that business prospects for May are 20 per cent better than for April. As a consequence the company is gradually taking on additional employees and now has approximately 750 on the payroll.

H. C. S. on Normal Basis

INDIANAPOLIS, April 25—The factory of the H. C. S. Motor Car Co., of which Harry C. Stutz is president, reports that production now is on a normal basis and that at no time has it gone below 60 per cent of normal.

France Sells Parts; Plan Dumping Here

Private Company Takes Over Camp from Government—Stocks Run to Millions

(By Cable to AUTOMOTIVE INDUSTRIES.)

PARIS, April 25—The first American reconstruction camp at Verneuil, the largest motor transport organization in France, has been sold for 55,000,000 francs ($11,000,000 normal exchange rates) to a private company with a government interest in the profits.

The camp contains few automobiles, but an immense stock of parts, including 9000 boxes of Ford parts and 45,000 solid tires.

It is intended to sell the parts on commercial lines and a large part of them will be reimported into the United States.

So far as is known, this is the first sale in France of American automobile parts which are likely to come into competition with home industries. A large number of motor trucks and passenger cars have been sold and reimportation of them has been begun. An American company also has bought up all the American army automobile tires left in France and tire dealers in New York and other places are suffering severely because of the competition from these tires.

It is such competition as this which could be made much less harmful if a clause were inserted in the anti-dumping bill which will be passed at the present session of Congress compelling payment of duty on the difference between the price at which these goods were purchased and the price in the open market here. Under the present law such goods are being reimported free of duty.

C. of C. HONORS INDUSTRY

INDIANAPOLIS, April 22—The automotive industries were given considerable recognition as a factor in the industrial life of this city when the committee appointments of the Indianapolis Chamber of Commerce were made public. Harry C. Stutz, head of the H. C. S. Co., and D. McCall White of the Lafayette Motors Corp. were named on the manufacturers' committee. John B. Orman, secretary of the Indianapolis Automobile Trade Association, was placed on the membership committee, while Walter C. Marmon was named on the reception and appreciation committee.

Willys Extends Factory Schedule

Outlines 450 a Day for May Production

Will Increase Working Force 30 Per Cent—Chrysler Reiterates Belief in Company

TOLEDO, April 23 — Following the greatest drive-away of motor cars in the history of the Willys-Overland Co., and a meeting of 600 dealers and bankers in five neighboring States with factory officials, John N. Willys announced that the company was planning to increase its working force by 30 per cent in May and its production by 50 per cent.

There are now approximately 6500 men at work at the Toledo plant turning out about 300 cars a day. This force will be increased to nearly 9000 next month.

In the great selling exhibition staged at the factory yesterday 525 cars were driven away.

Willys is brimful of optimism following his recent trips into the South and Western States. He is planning to visit New England, the Denver district and the Pacific Coast territory on his next sales trips.

The dealers were assured of the financial position of the company at the present time by the officials and received the word that no new models or change in the executive staff would be made.

Sales Manager A. C. Barber was in charge of the dinner meeting at the Willys-Overland administration building dining room. At the meeting there were addresses by President Willys, Executive Vice-President Walter P. Chrysler and Vice-President Charles B. Wilson.

Will Stand for Quality

Wilson declared that Overland was to stand for quality from now on and that a great effort was being put forth to build up pride of workmanship in the factory. He said every employee had signed the petitions headed:

"We are doing our best every day to make the Overland car a good investment."

"Our first problem following the after-the-war depression was to examine the cost of our car. If we are wasteful in the building of a car," declared Vice-President Wilson, "you can bet it is tacked onto the selling price. We want to deliver a car that is equal in quality to any in America. We have passed the old extravagant period of the war and are back to a real competitive basis now."

Chrysler said the executives had been troubled by the deflation of business and financial conditions but said they had them whipped now.

"I believe the Willys-Overland has arrived again," he declared. "And don't any of you salesmen tolerate the statement that the automobile business is depleting itself. To-day it's the barometer of the business world. A few years ago steel measured business, but to-day the automobile and its accessories is the dominating feature of business. It has staged the comeback first and is now employing great forces of money, resources, and men.

"Our new President has placed the automobile into his first message to Congress because he realizes that transportation is the heart of business.

"I want to disperse these rumors, too. The very closest relation that can exist between two men characterizes the relation between John N. Willys and myself. And it's going to exist. I am here to make a success of this business.

Out For Clean Business

"We are out for clean business, a better product, and plain common sense."

Willys told the dealers that financially the company was gaining every day. He said economy had been built into the new organization, that he wasn't broke and confirmed what others had said about no change in personnel of executives.

"The last six months have been very troublesome," he declared. "We have learned many lessons. One which I have

Financial Worries Over, Willys Declares; Has $7,000,000 Cash and Surplus Sold

TOLEDO, April 22—President John N. Willys said today that great accomplishments had been made financially by the Willys-Overland Co. in the last few months.

He said the Executive Vice President Walter P. Chrysler had managed to cut overhead expenses so as to save $4,000,000 annually to the company.

"Our assets at the present time are $135,000,000," he reported. "A year ago we owed to bankers approximately $46,000,000 and they thought we were in good shape. Last fall we were owing more than half that and they thought we were broke. But now we have reduced to $21,000,000. They have said they will carry us until Nov. 1.

"We have liquidated our stocks. We have $7,000,000 in cash on hand now.

"Our floating loans and accounts payable during 1920 have been cut $13,000,000.

"We can face the future with optimism without departing from conservatism.

"Our business for many weeks has shown a steady, and now shows a rapid, improvement.

"Distributors' and dealers' inventories—nearly 6,000 in number—are in better condition than they have been for years."

Walter P. Chrysler reported that commitments for materials totalling $105,000,000 at the beginning of the depression had been reduced to $15,000,000 during the strenuous period of falling prices.

A. C. Barber, sales manager, reported that the sales incident to the drive-away yesterday in which 525 cars went out had brought in $545,180 in cash to the treasurer's office this week.

Car Tariffs Yield $786,628.75 in 1920

WASHINGTON, April 25—Duties on imported automotive products during the calendar year of 1920 amounted to $786,628.75 according to the statistical report completed this week by the Bureau of Foreign and Domestic Commerce. It is particularly important at this time because of the pending fight on tariff matters. The report shows that 30 per cent tax levied on 811 automobiles valued at less than $2000 each amounted to $197,992.50. Forty-five per cent assessed on 93 cars valued at $2000 or over brought $133,842.60 into the Federal Treasury. The same rate applying on 380 imported bodies amounted to $36,628 in duties. With the 30 per cent rate of duty applying on 240 chassis, $256,546.80 was yielded, and on other finished parts, not including tires, $71,499.30.

The reciprocity agreement with Cuba brought only $108 into the Federal Treasury on these items.

Few Motorcycles Imported

With the 25 per cent rate applying on motorcycles, the Government obtained $1992.75 in duties and $1875.25 on other unfinished parts of motorcycles, not including tires.

Levying 20 per cent on 78 airplanes imported into this country brought $35,-605.60. The same rate applying on metal parts of airplanes yielded $29,250.

Tariff Main Topic at U. S. C. C. Meeting

Industry Represented by Eight Organizations at Convention—Outline Business Plans

ATLANTIC CITY, April 26—The automotive industry is well represented at the annual meeting of the Chamber of Commerce of the United States which opens here to-night. The following organizations are entitled to delegates at the convention:

National Association of Automotive Mutual Insurance Companies, New York.
National Automobile Chamber of Commerce, New York.
National Automobile Dealers Association, St. Louis.
National Automobile Underwriters, New York.
National Association of Collapsible Tube Manufacturers, Chester, Pa.
Automotive Equipment Association, Chicago.
Motor and Accessory Manufacturers Association, New York.
Automotive Wood Wheel Manufacturers Association, Chicago.

In addition to the official delegates many leaders in the industry have come here to listen to the discussions. The general theme of the convention will be, "More business methods in government; less government management of business." The most important questions to be discussed are tariff, taxation and foreign trade.

In the discussion of the tariff, four questions will be considered. They are:

1—Should the tariff not be framed with due regard to export trade sales or for the protection of manufacturing in the United States?

2—Should the fact that the United States now is a creditor nation alter the American tariff policy with respect to protection?

3—Should the United States tariff offer trading or bargaining possibilities for international commercial treaties to encourage export trade?

4—Should the United States tariff be liberal in its provisions in view of the American desire for liberality of tariff on the part of other countries?

Other subjects of interest to the automotive industry will be:

Adjustment of laws relating to foreign trade so as to give merchants and firms a competitive opportunity with the nationals of other countries.

Discuss Highway Commission

Creation of a Federal highway commission to lay out and direct construction and maintenance of an interstate system of highways.

Modification, amendment or repeal of all legislation that restricts the operation of natural economic laws.

Reduction of freight rates if it can be done without impairing railroad credit or efficiency.

Readjustment of wages, valuation, cost of production and the cost of living.

Preparation of legislation calling for an aeronautical code and the necessary machinery for its enforcement.

C. C. Hanch, chairman of the tax committee of the National Automobile Chamber of Commerce, will present the tax program of that organization upon which virtually the entire industry is standing. The delegates to the convention will be asked to vote on whether there should be an increase in the income tax, a sales tax or a resort to loans.

J. Walter Drake, chairman of the foreign trade committee of the N. A. C. C., will present a resolution calling for retaliatory action of the United States against countries which impose discriminatory tariffs.

Highway Plans to Get Attention of Congress

WASHINGTON, April 25—"Concentration of Federal aid money upon the most important State roads which have an interstate character is the next logical step in co-operation with the several States in highways improvement," is the assertion of Senator Charles E. Townsend, chairman of the Senate Committee on Post Offices and Post Roads.

"That Congress undoubtedly will give comprehensive attention to the good roads subject in the present session is predicted by the quite exact reference set forth in President Harding's message. That the Federal agency of administration should be elevated to the importance and vested with authority comparable to the work before it is a proposition which is certain to meet with general approval from those who have truly at heart consistent good roads progress.

"Highways now concern five branches of our government, and there should be a distinct authority which can deal with all departments and possess an independence of procedure. No longer can this work be accomplished effectively through the bureau of a single department. Transportation is the life of the nation, and travelable highways facilitate the daily activities of millions of American families."

PROPOSE NEW AIR LINE

INDIANAPOLIS, April 22—The city council has promised J. C. Wright of Pittsburgh to co-operate in a plan for "the establishment of an aerial mail route from Washington to Chicago. Cities proposed for the route are Cumberland, Md.; Pittsburgh, Columbus, Dayton, Indianapolis and Chicago. The plan is proposed to have one mail plane start from each end of the route at 7 a.m. daily, and said to be possible to reduce by 14 hours the present mail time between cities on the route.

CLIFTON DINES DIRECTORS

NEW YORK, April 22—Col. Charles E. Clifton, president of the National Automobile Chamber of Commerce, gave his annual dinner to the directors of that organization at the Biltmore last night. The affair was very informal and there was a general discussion of the problems confronting the industry.

Industry to Push Foreign Trade Plans

N. A. C. C. Committee Will Be Named This Week to Co-operate with Hoover

NEW YORK, April 23—The special committee of the National Automobile Chamber of Commerce, which will co-operate with the Department of Commerce in devising plans for effective promotion of foreign trade in American-made motor vehicles, probably will be appointed this week. The co-operation will result in two kinds of foreign-trade service—promotive and intelligence.

Before starting promotive work for the sale of motor vehicles, the committee will confer with experts of the Bureau of Foreign and Domestic Commerce familiar with the countries in which the campaign is to be launched. Through these conferences the promotive work could be made to conform with the actual requirements of the various countries.

The intelligence service is to consist of world-wide inquiry to ascertain foreign demand and the collation of specific trade information. This service would enable the manufacturer to decide on a broad foreign-trade policy. The N. A. C. C. committee will decide what specific information is essential to the American manufacturers, and when this information is obtained it will be distributed among American motor vehicle manufacturers.

J. Walter Drake, chairman of the foreign-trade committee of the N. A. C. C., believes that this co-operative arrangement will be advantageous not only to the automotive industry but also in the solution of general problems of the United States export trade.

Secretary of Commerce Hoover has requested an additional appropriation of $250,000 "for promoting commerce." He would establish twelve new divisions to cover various commodities. One of the twelve would be automobiles and accessories.

The plan of Hoover is to have two experts on each industry, who will alternate in the field and serve in the bureau at Washington. These industrial divisions would pass on commercial problems of the trade connected with foreign commerce, utilizing the mass of foreign-trade information now available for the industry, and keeping up to date the market investigations undertaken during the last five years.

TO BUILD $1,200 SPORT PLANE

SEYMOUR, IND., April 22—Assembly of aircraft and the training of pilots will be started here by the Western Airline Syndicate, which has leased a three-floor building and 25 acres of ground. The company is capitalized for a quarter of a million dollars. The big production will be devoted to a light sport plane selling for $1,200.

Bethlehem Receiver to Sell Off Trucks

Sale of Pottstown Plant Held Up for Time—336 Vehicles to Go

PHILADELPHIA, April 22—On petition of Clinton E. Woods, receiver for the Bethlehem Motors Corp., asking instructions from the court, Judge Thompson, in United States District Court of the eastern district of Pennsylvania, this afternoon issued a decree granting the receiver authority to sell the completed trucks on hand and in the field, amounting to some three hundred and thirty-six vehicles at the Allentown, Pa., plant of the company and elsewhere, at private sale at prices he deems desirable, and also to sell under similar circumstances such excess inventory at the Allentown and the Pottstown plants not necessary for the maintenance of the service station.

This application of Receiver Woods to the court was in the receivership in equity case of William G. Keck, trading as Keck Bros. & Co., complainant, vs. the Bethlehem Motors Corporation and followed a meeting of a majority of the creditors and their counsel yesterday at the Allentown factory of the company. At this meeting resolutions were passed that Receiver Woods apply for the authority from the court not only to sell the trucks and the excess inventory, but also to sell the Pottstown plant, devoted to the manufacture of the engines, including the real estate, machinery and equipment.

The creditors' committees at this meeting represented both the banker creditors and the merchandise creditors. Creditors' counsel at to-day's session in court showed for one group, however, that it would not be advisable at this time to sell the Pottstown plant, and no decree was granted in this respect. The bankers' committee of creditors represents the larger claims, aggregating about $1,700,000.

It was shown at the creditors' meeting on Thursday that should the Pottstown plant be sold the Allentown factory, where the frames, springs, chassis and bodies are produced, could be operated by the receiver at approximately $6,000 to $7,000 a month, instead of from $12,000 to $13,000 as at present. It is regarded by some of the creditors as probable that application will be made later for a decree to sell the Pottstown plant. The Allentown factory will continue to operate for the present.

MADISON FAILS OF SALE

ANDERSON, April 22—Auctioning of the effects of the Madison Motors Corp. produced little interest. One bid of $34,000 was received for the factory. It was not accepted. The building and eight acres of land are appraised by the receiver at $70,000. Automobiles and automobile parts and supplies sold out readily enough at prices fixed on condition and age.

The Madison Motors Corp. quit business several years ago. It was organized by Cecil Gibson, organizer of the Gibson company, state distributer for the Overland line. Gibson no longer is connected with the company. Fred C. Dickson, receiver for the Madison Motors Corp., is in Wisconsin, and at his office no announcement was obtainable as to winding up affairs following this sale.

Passenger Cars Share Truck Fee Increases

HARRISBURG, PA., April 21—Objections made by motor truck interests in the State and such organizations as the Philadelphia Chamber of Commerce, apparently have caused the State Highway Department to agree to several important changes in the Buckman bill seeking to regulate motor traffic and which the department hitherto has been supporting.

Reducing the proposed increases with respect to trucks and raising the fee for passenger cars from forty to fifty cents per horsepower is suggested. It is understood that present truck fees will, however, be raised by about one-half their present rate. The original increase contemplated was all the way from 80 per cent to 200 per cent. Paul C. Wolff, Pittsburgh, representing, as secretary, the Pennsylvania Motor Federation, opposed the change in lighting regulations embodied in the bill.

The new light standards had been suggested by the Illumination Engineers' Society of the United States. The department plans to establish light testing stations throughout the State. It is reported that comparatively few of the present lights meet the legal standard.

Texas Tractor Sales Placed at $6,000,000

DALLAS, TEXAS, April 23—More than 3000 power tractors for farm and road use are being distributed to users in Texas by the twenty implement dealers in Dallas, according to estimates of men who keep closely in touch with the tractor trade here. The average value of those tractors is $2000 one of the implement men said, which makes a total of $6,000,000 for the tractor business in the State for the year.

LUBRICATING OILS REDUCED

NEW YORK, April 23—The Vacuum Oil Co. has announced a substantial reduction in the prices of its lubricating oils of all grades and in all size packages. The reductions range from $5 to $10 a barrel and from 10 to 30 cents a gal. in cans. The company reduced its prices as of April 20 to give its dealers who had price guarantees to May 1 on carload or other large quantities, protection against loss covering the unsold portion of such shipments remaining on hand. A refund will be made to all such customers of the net difference between the prices.

Mississippi Growth to Come with Trucks

Valley Association Gives Highway Transportation Important Part in Convention

NEW ORLEANS, April 25—The big outstanding feature of all the six great public conferences which will make up the annual convention of the Mississippi Valley Association at New Orleans, May 2, 3 and 4 this year, will be transportation, and the leading subject of discussion will be motor truck transportation in the Mississippi Valley, and how it can be made to coordinate and cooperate with water transportation, and, through the inland waterways, with deep-sea transportation out of the ports of the valley.

The first and largest of these conferences will be on highway-water-rail transportation; the second will be on agricultural transportation, highway building for motor trucks, thereby to give the farmer closer connection with his home market, and, through long-distance transportation, with foreign markets; the third will be on reclamation and conservation, with a large part of it devoted to highways and to motor truck lines and the parts they play in the reclamation of lands and the conservation of resources; the fourth will deal with the development of new trade routes, primarily at sea, but secondarily, in their connection with trade routes by highway, water and rail in the Mississippi Valley.

The employment of labor by the state in building highways and in keeping in repair those already constructed, will occupy a large part of the interest in the fifth public conference, and the sixth will deal with foreign trade, especially in connection with the exports of articles manufactured in the Mississippi Valley.

Probably never in the history of a convention of this kind has the automotive vehicle figured so largely. Delegates from 30 states of the Union and from 27 foreign countries, largely Latin-American, have made reservations for the convention, the call for which was sent to more than 10,000 firms, corporations, companies and individuals in the United States alone.

Export Financing Important

The question of the financing of exports from gulf ports, to which inland waterway transportation is now fairly well organized, will be taken up. This has been the great obstacle to the export of automobiles, trucks and tractors, manufactured in the Mississippi Valley, through the gulf ports, and the results of the conference should be of vital interest to every automobile manufacturer and distributor in the upper Valley, since water transportation from those manufacturing centers to the gulf ports is now lower than rail transportation to these or to any other ports in this country.

President an Ally; Will Keep Him So

Graham Tells Philadelphia Truck Association of Harding's Interest in Welfare

PHILADELPHIA, April 22—Members of the Motor Truck Association of Philadelphia listened to messages of unusual importance from men high in the industry when they gathered at the Hotel Adelphia for the April meeting. They heard George M. Graham, vice-president of the Pierce Arrow Motor Car Co., tell how, in an interview, President Harding had expressed deep interest in the problems of the overtaxed industry and showed that he is an ally of the business and will be kept so. They listened to R. E. Chamberlain, assistant general manager of the Packard Motor Car Co., discuss "What An Ideal Dealer Should Be," and they were entertained and interested by the address of J. D. Eggleston, motor transportation engineer of the Paige Motor Car Co., on "Analyzing Motor Transportation."

In his topic, "Making the 1921 Grade," Graham said in part:

"The speed already developed in the motor car business, especially considering past conditions, entitles the industry to be optimistic for the future. As to present business conditions, I blame the manufacturer for the slump we experienced on account of his over-optimism; for too great and rapid expansion and for not protecting his own credit and that of his dealer. But his revenue went to his partner, good old Uncle Sam, by way of the revenue bill, which took away most of his profits.

"Nevertheless, he has gone along pretty well. Throughout the war conditions were pretty difficult—what with restrictive legislation and being eliminated from foreign business.

"But conditions are changing. . . . I was one of a committee to see President Harding recently. He was interested in our problems and what we want and can do. We called his attention to the need of regulation of license fees of all States, to keep roads in repair, but not to build new roads.

Industry Needs Credit

"We told him our industry needs credit and we pointed out our export conditions. I pointed out that two-thirds of the motor vehicles, or in excess of 6,000,000 cars, are owned in homes where the yearly income is $4000 or less. Yet this is the most over-taxed industry existing and is one of the few with a sales tax. No such tax is imposed on steamships or locomotives. Mr. Harding used the phrase that the motor car is a 'purveyor of transportation.' We found him an ally and will keep him so."

In outlining the qualities of an ideal dealer, Chamberlain asserted that everyone in the automobile business was at fault for his own difficulties, adding that salesmen have not kept up to the mark and will have to correct this attitude. Retail establishments, he continued, for the most part are not as strong financially as they should be, but are stronger than they were a year ago.

After reviewing causes and conditions of the business hesitancy, Chamberlain said that the truck industry had been hit harder than the passenger car business, but that he considered both fundamentally sound. He added that the average truck dealer is not as good a business man as the average merchant.

He told of methods used by the Packard company which gave the factory an index of where distributors were lax.

Bonus Leading Factor in Deciding Taxation

WASHINGTON, April 26—Because Senator Penrose, chairman of Senate Finance Committee in conference with the Taxation Committee of the National Automobile Chamber of Commerce stressed the fact that the bonus legislation held the key to the tax problem of the automotive industry, it is significant to note that the National Industrial Council has opposed the proposed plans for monetary rewards to soldiers. The Council has distributed an analysis of the schemes and pointed out their effect on the nation's tax bill. Senator Penrose directed attention of the automotive industry to the need of retaining various methods of imposts if the bonus bill was enacted.

Two proposals are now before the Congress, known as the Fordney and McCumber bills. It is proposed to defer the execution of the plan until Jan. 1, 1923, but it will be necessary to make arrangements for a levy immediately. The McCumber bill offers five separate plans of which No. 1 and No. 2 are more or less acceptable to Senate leaders. The cash payments under the first plan are to be spread in quarterly installments over a period of two years or, in Plan No. 2, over twenty years in loans less repayments, or on account of deaths, or the maturity of what is for all practical purposes an endowment insurance.

If every veteran accepts the cash plan, it will cost the taxpayers $1,547,904,395. Should every veteran accept the certificate plan, with no borrowings, and making allowance for annual payment on account of debts, the total amounts in 1943 would aggregate $5,251,364,907. The other three plans range in total payments from three to four billion dollars.

RACING ASSOCIATION FORMED

PHILADELPHIA, April 22—The National Motor Racing Association, an enlargement of the Philadelphia Motor Racing Association, has been incorporated under the laws of Delaware and will stage races throughout the Middle Atlantic States during the season of 1921. The association now has approximately 70 members, including automobile, motorcycle, airplane drivers and motor boat pilots.

Good Quotes "Luxury" in Reply to Dealers

Says Cars Not Necessity in Dictionary Sense—Dealers Quote Harding's Message

CEDAR RAPIDS, Iowa, April 22—Despite a storm of protesting letters against his proposal of a wheel tax designed to collect $200,000,000 from owners of passenger carrying automobiles, Congressman James W. Good has reaffirmed his opinion to the Linn County Motor Trades Bureau that that form of vehicle is a luxury.

"Webster defines the word necessity as a thing that is indispensable and certainly no sane person will contend that he cannot live without an automobile," says a letter to the automotive men of Good's home town. "In talking with highway commissioners in Washington at present, I find there is substantial agreement on their part that Federal aid for highways should continue and that the money necessary should come from an additional tax on automobiles. Nothing will stimulate the industry more than good roads. I cannot think of a more just tax to aid in road building than to tax the automobiles that use the roads."

The Linn County Motor Trades Bureau lost no time in replying to Congressman Good's letter, taking particular exception to his use of the word "necessity." It pointed out that President Harding in his message to Congress on April 12, said "the motor car has become an indispensable instrument in our political, social and industrial life." The Cedar Rapids dealers further emphasized the fact that the automobile industry is now the most taxed of the five main levies through income taxes, sales taxes, taxes on repair parts, State license and registration fees, scattering municipal and personal property taxes.

"We take the stand that all businesses should be taxed on the same basis and even now the automobile is the target of special levies both national and State," says the letter. "Now you propose on top of these five main levies to add another excessive burden to the automobile industry. We say quite frankly we believe you should give this further consideration."

OBENBERGER FILES SCHEDULES

MILWAUKEE, April 23—Liabilities of $858,972.79 are admitted and assets of $1,778,329.13 are claimed in the schedules filed by the John Obenberger Forge Co. of Milwaukee in bankruptcy court to-day. An involuntary petition was filed against the corporation on March 25 with the consent of the company, which has been in charge of a creditors' committee since December. The first meeting of creditors will be held May 2, at 10 a.m., in the government building here. J. F. Gerdis is receiver.

N. I. V. A. Establishes Farm Power Bureau

Will Combat Anti-Tractor Propaganda Through Publicity—Propose Federal Tests

CHICAGO, April 23—While the reports of actual business in hand now were not encouraging and manufacturers' representatives were reluctant to make any predictions of what the future would bring forth or when there would be a renewal of buying, a spirit of optimism pervaded the spring convention of the Tractor & Thresher Department of the National Implement & Vehicle Association held in this city yesterday. Most of the tractor manufacturers were represented.

No one was quite happy over conditions as they stand, but there have been a number of factors entering into the situation, principal among them being that of transportation and freight rates. Too, the mental attitude of the farmer has figured largely and whether the realization that the winter wheat crop—the first to be harvested, will be a bumper one and will cause a change of outlook, was a matter largely of conjecture. As yet, the farmer, sensing the importance of the approaching crop, has shown no disposition to come into the market.

Temporarily the buying power of the farmer has been destroyed. Unable to dispose of his crops or his cattle at a profit, from the standpoint of his expenditures, he is practicing the utmost rigid economy along all lines. Little blame was attached to the country banker for credit refusal with conditions as they are to-day. There is no need, according to the expressed opinions, to sell him on the tractor idea, for he is already sold. But he has no money to lend to finance tractor sales or any other kind of sales. In a recent survey of conditions among eighty-five banks in Central Illinois the fact developed that whereas a year ago the banks had on deposit $2,000,000, this year the deposits had dwindled to $430,000 and borrowings by the banks were approximating $2,300,000.

Farmer Attitude General

The situation in Kansas may be taken as indicative of the general attitude of the farmer. Despite the fact that the crops there promise to meet every anticipation and more and despite heavy rainfalls which have been experienced in that section, the farmer remains in a lethargic state of mind. He is not affected, and has not relaxed his position to the extent of coming into town to buy farm machinery.

Little was said at the meeting of means to meet the situation or of steps to remedy it unless it be in the statement of Finley J. Mount, the chairman of the department, who urged less talk and more hard work, or in the statement of other manufacturers that salesmen must become salesmen again and relinquish the position of mere travelers.

To cope with the misrepresentation by interests opposed to the tractor industry that has been made, and to present correct information to the farmer, to agricultural colleges and others through farm papers, country weeklies and other mediums, the association has established the Power Farming Bureau with headquarters in this city and it is felt that this department will do much toward setting the doubting farmer right when the time comes for him to invest in farm machinery. This department received the hearty co-operation of the manufacturers representatives present at the meeting.

At least one tractor demonstration will be held this year, the time and place to
(*Continued on page* 934)

N.A.D.A. to Get Hearing on New Revenue Bill

WASHINGTON, April 23—Notification was given to C. A. Vane, general counsel of the National Automobile Dealers' Association, that the organization's request for a formal hearing on the revenue bill had been granted. The notification was from Senator Boise Penrose of Pennsylvania, chairman of the Senate committee on finance.

Dates for the hearing will be announced later. It is the intention of the Senate committee to take up a number of general revenue propositions in connection with the new fiscal program and thence to proceed to the direct question of taxes and discuss the revenue law of 1918 section by section under the general titles of the former act.

Vane is now studying the tax situation here and will make a report to the directors of the N. A. D. A. at the meeting in Detroit, May 9. At that time the directors will determine whether the executive committee of the association will appear before the Senate committee, whether the entire board will go before or whether a number of the leading distributors of the country will be asked to go to Washington and present the tax case from the dealer's standpoint.

TIMKEN RESUMES OPERATIONS

COLUMBUS, April 23—The Columbus branch of the Timken Roller Bearing Co. started operations April 20 after a shutdown since October. Word was received by Charles N. Replogle, manager, to start operations in the screw, machine, grinding and inspection departments, and about 250 men were put at work. It is hoped to increase the number gradually to about 2500.

PILOT INCREASES FORCE

INDIANAPOLIS, April 23—Pilot Motor Car Co. has increased its working force 50 per cent during the past week. Orders are coming in in fair shape, according to Superintendent Van Etten, but in spite of a supposed surplus of labor, the company is finding it difficult to secure high class skilled labor.

Studebaker Control Not to Be Changed

Erskine Denies Schwab and Durant to Enter Board—Business at Best

NEW YORK, April 26—The fact that Charles M. Schwab and W. C. Durant recently have been heavy purchasers of stock in the Studebaker Corp. has given rise to renewed reports in financial circles that they are to become directors of the South Bend company. It is denied by both of them, however. President Erskine of Studebaker announced at the annual stockholders meeting that no changes in the management of the company were impending.

Studebaker stock continues its spectacular course on the stock exchange and is fluctuating between 86 and 89. Much of the movement in it is believed to be purely speculative, although the company is doing the best business in its history and is shipping cars at the rate of more than 7000 a month. Net profits for the first quarter of the year are estimated at more than $1,000,000 after taxes, and for the second quarter they are expected to greatly exceed this amount.

Another report in regard to Durant is that he has been buying into Continental Motors. This was said to be responsible for recent heavy purchases of stock in that company. Officers of Continental Motors declared, however, that there is no basis for this rumor, although the company is submitting estimates and doing considerable work on the motor for Durant's new car.

Reports that Walter Flanders soon would join the Durant organization also were denied at Durant's office here.

CAMPBELL RESIGNS COMET

KANSAS CITY, April 25—Robert H. Campbell has resigned as vice-president of the Comet Automobile Co. of Decatur, Ill., to become vice-president and production manager of the Farmers Mfg. Co., which has taken over the business of the Coleman Tractor Co. of this city. The new corporation intends to continue production of the Coleman tractor which will be redesigned. Officers of the company in addition to Campbell are: President and general manager, Frank Hamilton; vice-president, O. M. King; secretary and treasurer, James E. Dunn.

COLLINS DEFERS RETIREMENT

DETROIT, April 26—R. H. Collins, whose impending retirement from the General Motors organization was announced last week, has decided to remain as president of the Cadillac Motor Car Co. for the next few months. He undoubtedly will stay until the Cadillac company is settled in its new plant. Collins tendered his resignation to President DuPont of General Motors last January, but it has not been acted upon.

Minnesota Business Returns in Cities

Country Districts Out of Running Until New Crop—Trucks Good

MINNEAPOLIS, April 25—Week by week the automobile dealers are showing that business is on the gain. The returning prosperity is evident on the floors of most of the city agencies and branches. However, this business is largely from the cities of the State. The country districts are still out of the running so far as orders go. The money situation has not improved enough to allow the rural dealers to handle cars extensively.

A branch manager who has returned from the Cuyuna iron range reports that the automobile business is extra good in that part of Minnesota. This trade also is in the towns and cities. The truck business continues good with contractors who require more transportation facilities for jobs that are being let for road work and other construction activities.

Part of a résumé by the Northwestern National Bank reads: "We have a legacy of debts from the old year to contend with; bank reserves are frequently low, particularly in small country banks which depend exclusively upon a farmer clientèle; loans are apt to be of a size out of proportion to deposits. Although the accommodations given to member banks are still at a high point, the trend of late has been fairly encouraging, the total on March 31 amounted to $60,892,000 as compared with $58,184,000 a year ago, and $14,346.000 on March 31, 1919, at which latter date liquidation was moving along in a manner more nearly normal.

"Liquidation will continue gradually during the next few months. It is reasonably certain, however, that in lines of business which depend primarily upon the grain farmers, and in communities where credit has reached the dead line, there will be a lull until new money comes in. The varying conditions in the different sections are to be discerned in the shades of expression to be found in reports made to this bank. 'It is going to be tough until fall,' 'There will be no material change until we get a crop,' 'We cannot look for improvement until we get a crop!'"

FORD FLOUR MEETS DEMAND

DETROIT, April 22—Wheat raised on the Henry Ford farm in Dearborn and ground in the Dearborn Ford flour mill, now is being sold in the Ford stores at Highland Park, River Rouge and Dearborn. The flour is sold in 25 pound bags labelled Ford flour, and sells for $1.19 a bag.

The Ford mill at Dearborn, which was completed last fall, is one of the most modern in the country. It is located directly alongside of the Ford grain elevator where grain from the Ford farm is stored and cleaned. The mill is operating on such a basis as to supply the stores as fast as the flour is being sold. The wheat grown on the Ford farm is handled exclusively by Ford machinery and equipment. The ground is plowed and the wheat cut by Fordson tractors, and the grain hauled to the mill in Ford trucks.

Battery Companies Find Trade Outlook Improved

CAMDEN, N. J., April 23—Announcement was made by President Lloyd at the annual meeting of stockholders of the Electric Storage Battery Co. and the Willard Storage Battery Co. that since March 1 there has been a marked improvement in business and that the future looks promising. The new plants at Crescentville, which will cost in the neighborhood of $2,000,000, are nearing completion.

President Lloyd declined the request of the stockholders for information on the gross sales of the company. He said it would be unwise and against the best interests of the company to make the figures public. This stand was indorsed by the stockholders.

Lloyd said that an investment of nearly $1,000,000 recently had been made in the English Battery Co. All the directors were re-elected and the annual report was approved.

Propose Car Training in Indiana Schools

INDIANAPOLIS, April 22—Suggestions that the Indiana State Board of Education consider the needs of the automotive industry in trained automotive engineers, highway engineers, transport engineers and educated mechanics have been made to Elwood Haynes, of the Haynes Automobile Co., recently appointed to the Board of Education by Governor McCray.

The Indiana Automotive Trade Association, through its president, N. H. Cartinhour, appealed to Haynes, that as far as possible and as far as compatible with the best general interests of education, that courses of study in Indiana schools be broadened to permit the training of men for the automotive industry. Haynes, in answer to Cartinhour, pledges his "support of such an education as will conserve the best interests of the State," adding that the work is so new to him that he is uncertain of what its policies may be.

UNITED CUTS BODY PRICES

CLEVELAND, April 23—The United Automotive Body Co. has announced a reduction in prices ranging from 10 per cent to 25 per cent on all its Ford commercial and passenger bodies. The company has opened additional branch assembly plants at Detroit and Pontiac, Mich., to serve more efficiently the sales organizations of motor truck manufacturers located in these cities.

Motor Truck Sales Increase in Texas

Diversification of Use Brings New Demand—Freight Lines Buy Equipment

DALLAS, TEX., April 23—During the past two months 200 motor trucks ranging in value from $1000 to $6000, and most of them in the $2000 to $4000 class, have been sold and delivered by dealers in Dallas or through them. This, despite the period of depression, the dealers believe, is an indication that the motor truck has firmly entrenched itself in the minds of the industrial and agricultural world.

Of the total number sold during the past two months one third of them were delivered in the immediate Dallas territory and quite a few of them went to farmers who are using them in getting produce, butter and eggs to the city, cotton to the gins, wheat to the mills and corn to the cribs.

From Dallas quite a number of trucks find their way to the cattle country. Ranchers use them with trailers for hauling a car load of hay at a time from the railroad to the ranches, sometime seventy-five miles away. They use them for hauling calves and even cattle, alive to the railroads.

The Dallas dealers report also that many of the motor freight lines in the thickly settled sections of the state, are buying new trucks for handling increased business. They are also finding that many counties which have not already done away with horses and mules for the purpose of hauling road materials, bridge materials, and doing other things, are getting the motor truck habit along with the motor road building habit. In addition to these things the usual number of manufacturers and merchants are buying trucks for their delivery and other business.

Sales of passenger cars are picking up considerably, the show here performing an important part in restoring demand.

MULLINS TO STAY IN SALEM

DETROIT, April 22—Reports that the Mullins Body Co., Salem, Ohio, which has been beset by labor troubles, would move to Detroit, were confirmed in part to-day by company officials, though it was said labor troubles in Salem were nearing adjustment and in all probability the situation would be overcome and the plant would remain in that city. Officials said, however, arrangements had been made for plant space in Detroit, and for shipping machinery and equipment to Detroit by express on short notice when the trouble became acute a few days ago.

While the labor situation has not cleared entirely and the company still is in position to move to Detroit quickly, it was said there was every indication in Salem to-day that such a radical step would not be necessary.

Townsend Submits New Highway Bill

Embodies Features Recommended by Harding and Indorsed by Automotive Bodies

WASHINGTON, April 26—Senator Townsend, chairman of the Senate Committee on Post Office and Post Roads, has prepared a new highway bill after conference with organizations interested in highway development, which emphasizes practically all good roads features recommended by President Harding in his recent message to the Congress. The measure will be presented to the Senate late this week when the drafts are completed. The legislation represents the compromise of principles and methods, but it is regarded as the most acceptable at this time and one calculated to pass without formidable opposition.

The Senate bill contains many of the important features of the original Townsend bill, which was indorsed by the National Automobile Chamber of Commerce, the National Automobile Dealers Association, the Federal Highway Council and kindred organizations. The new draft creates the Federal Highway Commission, continues Federal aid to states with drastic maintenance clauses and other marked revisions intended to abolish abuse in the distribution of Federal funds.

The $100,000,000 fund which is appropriated for Federal aid each year is continued for two years, but provisions have been inserted which restrict the distribution of the money. Not more than 3 per cent is to be expended for the administration of the Federal Highway Act for carrying on necessary highway research and investigational studies independently of any co-operation with the State Highway Departments and other research agencies. It is provided that the commission shall, after making these deductions, apportion the remainder of the appropriation for each fiscal year among the states as follows:

Basis of Ratios Changed

"One-third in the ratio which the area of each state bears to the total area of all the states; one-third in the ratio which the population of each state bears to the total population of all the states, as shown by the latest available Federal census; one-third in the ratio which the mileage of rural delivery routes and star routes in each state bears to the total mileage of rural delivery and star routes in all the states, at the close of the next preceding fiscal year, as shown by certificates of the Postmaster General, which he is directed to make and furnish annually to the commission. Provided, That no state shall receive less than one-half of one per cent of each year's allotment. And, Provided Further, any amount apportioned under the provisions of this Act unexpended at the end of the period during which it is available for expenditure under the terms of this section shall be reapportioned, within sixty days thereafter, to all the states in the same manner and on the same basis."

The bill further provides: "That the commission shall establish an interstate system of highways, composed of primary interstate roads which shall, by the most practical routes and with due consideration for the agricultural, commercial, postal and military needs of the nation, afford ingress into and egress from each state and the District of Columbia. Such interstate system may include highways to and from important water ports, and highways connecting at the border with the main highways in countries adjoining the United States; but shall not include any highway in a municipality having a population, as shown by the latest available Federal census, of five thousand or more, except that portion of any such highway along which, within a distance of one mile, the houses average more than two hundred feet apart.

Must Provide Maintenance

In order to carry out the recommendations of the President, the Senate Committee has inserted a proviso to the effect that no project shall be approved by the commission in any state until the state has made adequate provision for the maintenance of the highway selected by the commission in that state. It will be noted that this provision fulfills the suggestion of President Harding in his message to Congress.

Because of the conflicts which have occurred between state highway officials and the Federal authorities, it is provided that in the case of any state failing to carry out the provisions of this agreement after construction or reconstruction of the highway, it shall be notified that after sixty days the commission will proceed to have the highway placed in a proper condition of maintenance and charge the cost against the Federal funds allotted to the state. This clause makes maintenance compulsory to the states, and is expected to do much towards overcoming neglect.

This program was reached after a conference here Monday with the Senate Postoffice Committee, in which Pyke Johnson represented the National Automobile Chamber of Commerce. A. G. Batchelder, executive secretary, and M. O. Eldridge of the American Automobile Association; P. M. Williams and H. G. Shirley of the Federal Highway Council; C. A. Vane, National Automobile Dealers Association, were spokesmen for the automotive and associated industries. Representatives of the farm organizations and American Association of Highway Officials were present.

ITALY EXEMPTS BRITISH CARS

OTTAWA, ONT., April 22—Italian customs authorities have been empowered to authorize the unrestricted importation without license of automobiles of British origin shipped from Great Britain, this applying to those of Canadian manufacture as well as those of the United Kingdom.

Bartlett Is Named Splitdorf Executive

Succeeds R. W. Sutherland As Managing Vice-President—Other Officials Change

NEWARK, N. J., April 27—M. W. Bartlett was elected vice-president and general manager of the Splitdorf Electrical Co. at a meeting of the directors here to-day. He will succeed R. W. Sutherland.

Bartlett is no stranger to the Splitdorf organization. He went with the company in 1911 as secretary and remained until 1919. During the war he handled all its export sales and built up a very substantial business. He resigned in 1919 to become Eastern manager of the Wire Wheel Corp. of America in charge of sales to manufacturers and dealers east of Buffalo, as well as export sales. He is popular in the Splitdorf organization and the directors are confident the company will show marked progress under his direction.

C. W. Brunnell was appointed sales manager of the Splitdorf company at the meeting to-day. He resigned from the Edison Lamp Works to accept the position. During his connection with the Edison company he developed all the sales of incandescent lamps for cars.

D. R. Walls was elected advertising manager to succeed P. A. Tanner.

Sutherland has not announced his plans for the future. He has been with the Splitdorf company since the Alvord interests obtained control in 1912, and has held various positions of responsibility.

Lower Price Rumor Malicious, Says Dodge

DETROIT, April 26—C. W. Matheson, general sales manager of Dodge Bros., denounced the report of a contemplated cut in Dodge prices as "a malicious rumor evidently started by competitors." "The price of the Dodge car will not come down until the manufacturing costs drop, and they are higher to-day than ever," said Matheson. "You can say there will be no cut now and none in the future insofar as we can see. We are building 450 cars daily and shipping only on orders, and we are selling them faster than we can build them."

Matheson also took occasion to deny a statement attributed to another member of the Dodge organization that the company would put out a new sedan May 1.

CHICAGO CUTS GAS TO 20

CHICAGO, April 28—A drop of 3 cents in the price of gasoline in Chicago and the Middle Western States was announced this week by the Standard Oil Co. of Indiana. This means a cut from 25 to 22 cents at the filling stations, and from 23 to 20 cents on tank wagons.

Hannum Appointed Oakland President

Saginaw Products Head Succeeds F. W. Warner, Voluntarily Retired—More Changes Likely

NEW YORK, April 26—George H. Hannum, general manager of the Saginaw Products division of the General Motors Corp., has been appointed general manager of the Oakland Motor Car Co. to succeed F. W. Warner. Hannum has played a leading part in the development of the parts group of General Motors and is regarded as one of the ablest executives in the organization.

While Warner has retired from the direction of the Oakland company, he remains a vice-president and director of the General Motors Corp. No announcement has been made either by Warner or the corporation regarding his future activities. It is evident from the fact that he remains an officer of General Motors that he will fill some place in the organization. It is understood that Warner's retirement from the Oakland plant was purely voluntary. Several other changes in the Oakland personnel are expected to follow his resignation from the company.

Reorganize Indiana Sales

INDIANAPOLIS, April 25—Reorganization of the retail plan under which the Oakland Motor Car Co. has operated in Indiana for some time is practically complete. State distribution of Oakland cars is to be taken over by the E. W. Steinhard Co., effective April 25, according to information obtainable to-day. Public announcement of the change is expected soon.

General Motors Accepts Collins Resignation

NEW YORK, April 28—General Motors Corp. announces that the resignation of Richard H. Collins as president and general manager of the Cadillac Motor Car Co., which was tendered on Jan. 14th, has been accepted.

Herbert H. Rice, formerly treasurer and now one of the vice-presidents of the General Motors Corp. has been appointed as successor to Collins and will take charge of the Cadillac in the near future.

The possibility of Collins' retirement has for some weeks been the subject of conjecture in financial and automotive circles.

N.I.V.A. Establishes Farm Power Bureau

(*Continued from page* 931)

be left with the Tractor show and demonstration committee. This is made up of J. B. Bartholomew, Avery; E. J. Gittins, J. I. Case Tractor Machinery Co.; G. B. Sharpe, Cleveland Tractor Co.; Harry Bates, Bates Machinery & Tractor Co.; J. A. Everson, International Harvester Co.; G. L. Gillette, Minneapolis Steel & Machinery Co.: Donald McDonald, Avery Co., and A. H. Gilbert, Rock Island Plow Co. There will probably be four demonstrations. The question of a show was touched upon and this matter will be left with the committee.

The consensus of opinion relative to state laws requiring tractor tests was that in any state where such laws were contemplated and recommendation should be made providing for the exemption from tests of tractors which had been tested in other states under similar laws. It was felt, at the same time, that, to avoid the multiplicity of state laws, which now seems to be on the decline, it would be better to enact a Federal law.

Willys Production to Be 450 Daily

(*Continued from page* 927)

taken home is that when one tries to run all the business in the world one only passes through about one such depression as we have experienced.

"I am selling out my interests in many of the other companies which I have taken to in the last few years and will give all my time to Willys-Overland."

Willys complimented Chrysler and said that although he was probably the highest salaried man in the automobile industry he was the cheapest man on the payroll because of the economy he had forced into the building of cars.

It was the most enthusiastic meeting of dealers here in many years. The bankers who were present at the meeting were particularly pleased with the showing.

Ford to Establish 50 Mexican Branches

HOUSTON, TEX., April 26—According to W. M. MacDonald, manager of the Houston branch factory of the Ford Motor Co., arrangements are being made for the establishment of fifty agencies of the Ford car in Mexico. MacDonald says the company is after the Mexican business and to establish connections in that country three men representing the Houston plant are in Mexico calling on the trade. These men will spend the next three months in the Mexican Republic and it is their intention to visit every part of the country they can reach to open markets for the Ford products.

RALEIGH BUILDS TWO MODELS

BRIDGETON, N. J., April 25—The Raleigh Motors Corp. is now building a four and a six-cylinder passenger car. The six is to sell for $2750 and the four for $2050. Details of the six cylinder model disclose the use of many standard parts such as Herschell-Spillman engine, Spacke axles, Westinghouse starting and lighting, Stromberg carbureter, Gemmer steering gear and Stewart vacuum system.

Renault Speeds Up on New Light Car

Goes Into Full Capacity on 10 H. P. Model Selling at 19,500 Francs

PARIS, April 14 (*By Mail*)—The Renault factory went into full production at the beginning of April on the modified 10 hp. popular car planned immediately after the armistice. There was considerable delay in getting this model on the market, and the price fixed in 1910 underwent many increases. Since the first series went through the shops several changes have been made in the design, and it is the new and definite type which is now in full production.

There have been no changes in the engine, which is a four-cylinder, 75 by 120 mm. The wheelbase is 111 in. and the tread 56 in., compared with the narrow tread used by some other French manufacturers of cheap cars. New and more powerful brakes are fitted. Both these are on the rear wheels, and are concentric internal expanding type.

Nickel plated fittings are now standard, as well as Michelin detachable steel disk wheels.

With the new type Renault carbureter it is declared that gas consumption is 32 miles to the American gallon.

Five body styles are standardized and produced in the former aviation department of the Renault factory. Storage batteries for starting and lighting are carried under the valence between running board and chassis frame. This space is also made use of for tool lockers. With four passenger body and complete equipment this car is listed at 19,500 francs, this price including the French luxury tax.

Renault officials declare that orders for 700 of this model have been received within two weeks, and that the factory is three months behind on deliveries.

France to Clear Out Two More Car Camps

PARIS, April 16 (*By Mail*)—Two more American automobile camps are being offered for sale as a whole. They are the camp at Bassens near Bordeaux, and remains of the Franchises camp, near Langres, in the Huate Marne. Individual sales have been carried on for some time at both these camps, but it has now been decided to clear out the material as a single lot. The Bassens camp contains 223 Holt tractors, 87 F.W.D. tractors and trucks, 208 5-ton Liberty trucks, 38 White trucks of various types, 52 Riker 4-ton trucks, about 30 Packards, and small numbers of Nash, Pierce-Arrow, G.M.C., Republic, Garford, and Mack trucks.

At the Franchises camp, near Langres, there are 85 Liberty trucks and about $2,000,000 worth of American automobile spare parts.

Sales of Equipment Show Gradual Gains

March Business Tops February 20 Per Cent—Dealers Maintain Normal Stocks

NEW YORK, April 23—Sales of automotive equipment in the New York district for March showed an increase of 20 per cent over February in retail selling and 22 per cent in wholesale, according to an investigation conducted by the research department of the Class Journal Co. Tire sales at retail showed an increase of 18 per cent and at wholesale 24 per cent.

The investigation showed a general tendency to maintain normal stocks of supplies, and in some cases, particularly among those handling equipment as a side line, there was a tendency to enlarge. In tires a movement toward more extensive use of cheaper grades was found, the feeling among the buying public being that higher-priced lines should be reduced.

Uniformity of complaint was found in the tire trade against the selling of reimported A. E. F. surplus tires as new stock. It is thought these tires will prove defective, owing to deterioration of quality through aging, and that the ensuing dissatisfaction will have an injurious effect on all tires bearing these brands.

Reports received by the research department indicate that sales of equipment began to pick up about March 1 in New York, Chicago and Minneapolis, and about March 15 in Boston. Sales are found to be still slow in Cleveland, Pittsburgh and through the South.

On the whole, business was found to be behind last year's figures in the equipment line in New York, the decrease ranging from 12 to 20 per cent. Practically all of the supply business was shown to be in the hands of regular equipment dealers, the sales in hardware, department and sporting-goods stores being negligible, except where distinct departments were opened.

NASH TO BUILD ADDITION

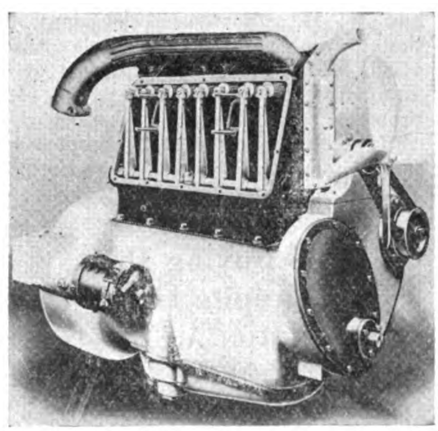
KENOSHA, WIS.. April 22—At the quarterly meeting of the directors of the Nash Motors Co. held here to-day it was announced that the company planned to build an addition to its plant in Milwaukee. The addition will be 100 x 600 ft. and three stories high, and will be large enough to provide for a large increase in the output.

WILCOX IN RECEIVERSHIP

MINNEAPOLIS, April 25—The H. E. Wilcox Motor Co. has gone into the hands of a receiver. Judge W. F. Booth of the Federal Court named Frank E. Satterlee, president and manager of the F. E. Satterlee Co., wood and iron working machinery and mill supplies. The petition was filed by the Standard Foundry Co. with claims of $9,545.08. Accounts outstanding against the company were said to total $50,000. Frederick E. Murphy, J. C. Compton and M. C. Barnum were named appraisers to estimate assets of the company. Creditors were given 45 days to make returns. Back wages of $5851.17 were ordered paid employees. The receivership was instructed to operate the repair department of the Wilcox factory to give service for 2000 Wilcox truck owners in the Twin Cities. The receiver's bond was put at $50,000. The company agreed to the receivership and admitted the claim of the complainant company.

Roamer Makes Record With Rochester Engine

DAYTONA, FLA., April 25—A regular stock Roamer chassis powered with the new four-cylinder, horizontal valve Rochester-Duesenberg engine and driven by L. F. Goodspeed, chief engineer for the Barley Motor Car Co., created what is claimed to be a world's record for a stock chassis by making the measured mile in 34.26 seconds, or at the rate of 105.08 m.p.h.



The Rochester Duesenberg

Designed by Fred S. Duesenberg, the engine was originally 4 x 6 in. and as such was raced all over America. Last year the Rochester Motors Corp. took over the production as a commercial proposition. The first engines turned out were powerful but not flexible enough for every-day use. The motor was redesigned and the size increased to a bore of 4¼ in. and a stroke of 6 in., and the power increased over 50 per cent above that of the earlier motors built. Flexibility was greatly improved, the motor was made quieter and generally refined down. The first motors to come through production were tested by engineers of the Barley Motor Car Co. in January of this year, and they decided to try some in their standard, stock Roamer sport models. The success of these led to the speed trials just held.

ROBERT J. DUBARRE DIES

MILWAUKEE, April 25—The death is announced of Robert J. DuBarre, assistant manager of sales of Geuder, Paeschke & Frey Co., manufacturers of galvanized sheet and steel ware.

Fordson Production on 200 Daily Basis

Wide Distribution Brings Gradual Increase in Production—Car Orders Exceed Schedule

DETROIT, April 22—Two hundred Fordson tractors are now leaving the assembly line at the River Rouge plant every day. The plant reached a daily production of 200 on March 24 and a few days later hit 225. Since the first of April, however, the output has averaged 200 daily, which schedule will be continued. Up to April 7, 2557 Fordsons had been built. There has been a proportionate increase in the number of men employed since production at the tractor plant was resumed in February.

Distribution has been scattered throughout the East and Middle West, with 305 Fordsons having been sent to Canada in the last two weeks. These were shipped to the Ford Motor Co. of Canada, and from there to the Ford branch at Toronto for distribution. Large numbers of Fordsons were sent to Connecticut, Pennsylvania, Wisconsin, New York, Indiana, Ohio and Illinois.

The big plant at Highland Park is increasing production of passenger cars and trucks daily, and while the schedule of 90,000 was fixed as the maximum for April, up to April 10, 107,719 cars and trucks had been requisitioned for the month. During the first three months of 1921 the demand for Ford cars and trucks greatly exceeded production, officials declare, and on April 1, with a total production during the three months previous amounting to 127,074 cars and trucks, the company had 102,000 unfilled orders on its books.

LOOK FOR MAY TRUCK BOOM

SPRINGFIELD, OHIO, April 21—"We are operating with the force we have maintained for the last few months filling orders as they come in," said A. K. Stewart, general manager of the Kelly-Springfield Motor Truck Co. "We are holding our own and prospects are better than they were. It is expected that there will be an increased demand for motor trucks in May." The force is gradually being reorganized, preparatory to meeting the improvement in business expected. James L. Geddes, chairman of the board of directors, who has been ill at his home for several weeks, is now able to be out for a few hours each day.

TO BUILD NEW STEAM CAR

CHICAGO, April 25—The Crossland Steam Motive Corp. of this city has been licensed by the Crossland Pfaff Engineering Laboratories to manufacture a steam car to be called the Crossland. The car is to have a wheelbase of 131 in., will sell for $3600, and will have a two-cylinder steam engine operating under a pressure of 600 lb.

Stockholder Action on Goodyear Delayed

Ratification of Refinancing Held Over to Monday—Quick Recovery Expected

AKRON, April 27—Postponements of the special meeting of Goodyear Tire & Rubber Co. stockholders, called to approve the refinancing program, follow in rapid succession. The latest ones were from Monday until to-day and from today until next Monday.

President F. A. Seiberling and Vice-President C. W. Seiberling have returned from New York where they spent several days in consultation with the bankers. F. A. Seiberling has declined to comment in any way on the passing of the company's control from his hands into those of the bankers. Representatives of the financial syndicate which has put over the $85,000,000 refinancing program will direct the affairs of the great tire plant for the 20 years which the new securities will run. The subscription books for the 8 per cent first mortgage bonds already have been closed and the issue oversubscribed.

It is understood here that no decision has been reached concerning who will succeed Seiberling as president of the company, or who will fill other positions in which it is expected changes will be made. It is not improbable that a financial man will take the helm until conditions are on a more satisfactory basis.

While it has been announced in New York that the Seiberlings will be ousted, it is hoped here that no such drastic step will be taken and that the new control will be more supervisory than active. The banking interests are expected to designate at least one vice-president for the company as well as the treasurer to prevent a repetition of what they regard as reckless expenditure which was considered largely responsible for the present plight of the company.

Akron bankers and rubber manufacturing experts, after a careful study of the refinancing program, have expressed the opinion that the company will be able easily to work out of its present financial position during the 20 years allowed by the life of the bonds. The increased capital charges added by the bonds, and prior preference stock if the total amount of bonds required remains at $85,000,000 together with sinking fund charges, will approximate $14,000,000.

Goodyear records show that the company's net earnings since 1913, up until last year, amounted to a total of $70,067,490, out of sales aggregating $576,109,108. The net earnings for the three years previous to 1920 were larger than during other years. In 1917 net earnings for the first time exceeded $10,000,000 and were about $14,000,000. In 1918 the earnings increased to $15,000,000 and rose to $23,000,000 in 1919.

Goodyear did a total business of over $200,000,000 last year, but due to contractual obligations and writing down of inventories, reported a deficit instead of a profit. The company is now working on a basis of 20,000 tires daily, as compared to normal production of 23,000 tires a day, and at this rate will do a business this year of more than $140,000,000.

Three Automobile Men on Hoover Committee

WASHINGTON, April 25 — Three representatives of the automotive industry have been invited to assist Secretary of Commerce Hoover in the reorganization of the Department of Commerce along lines that will make it useful to industry in the development of foreign and domestic trade. Thirty-six leaders will meet here Friday for conferences and business paper editors will gather on Monday for the second of monthly meetings with Secretary Hoover.

J. Walter Drake, chairman of the Foreign Trade Committee of the National Automobile Chamber of Commerce; John J. Raskob, chairman, finance committee, General Motors Corp., and W. H. Stackhouse, president, National Implement and Vehicle Association, will discuss the problems of the automotive and allied industries. It is proposed to change the personnel of the conferees in order to keep in touch with special men in all industries as the problems in their particular field arise.

Gasoline Buying Drops Despite Lower Prices

WASHINGTON, April 21—Price cuts failed to make any material difference in volume of gasoline consumption as the Bureau of Mines refinery statistics for February show that the daily average of gasoline production fell off by one million gallons but the stocks increased by 108,000,000 gal. The lessened demand was also reflected in increase of 18,000,000 gal. of lubricating oils in reserve with a decreased production of 185,000 gal.

The figures show that there were 680,540,351 gal. on hand at the end of February. Exports amounted to 52,497,051 gal., shipments to insular possessions 4,536,619, and domestic consumption 225,195,372 gal. The daily average consumption was 10,079,609 gal.

FEDERAL SPARK PLUG MOVES

WESTFIELD, MASS., April 26—The spark plug manufacturing plant of the Federal Corp. has been sold at auction to George N. Gray, representing the Shawmut National Bank of Boston on foreclosure of a mortgage. A statement was issued by the company that the business would be continued in a new location here and that a large manufacturing firm located in the eastern end of the State would come here and locate in the present plant of the Federal corporation.

Milwaukee Industry Has Turned Corner

Bank Review Shows Business Decidedly Better—Heavy Cuts in Inventories

MILWAUKEE, April 25—"The automotive trades seem to have turned a corner in the last month or two," says *Business and Financial Comment,* the monthly review of local financial and commercial conditions issued by the First Wisconsin National Bank of Milwaukee. "The month's sales for all Milwaukee industries were decidedly better than for the previous month. The gain was especially apparent in the automotive parts and equipment industries. Forward business shows a tendency to increase. Future purchasing commitments are still conservative. Few manufacturers are buying more than they need in the immediate future. The lessening of heavy inventories still goes on.

"In the automotive trades, sales last month were about 75 per cent better than the previous month, but probably a third under the same period of 1920. Inventories are still above normal and greater than a year ago, and consist mostly of raw material. As soon as it is possible to use up steel already bought and to take advantage of lower steel prices, the industry should better its situation materially.

"Manufacturers of rubber tires and products report a gradual improvement in orders. The mild winter and the approach of the season when motor cars are in greater use have promoted the unloading of tire stocks and the resumption of operations on a limited scale for replacement.

"As a rule, lines which use iron and steel products have been waiting for prices to reach a point of stabilization. The Steel corporation's latest reductions should go far to reassure buyers and stimulate business in machinery, farm implements, motor cars and trucks, public utilities and construction lines.

"It has been the experience of periods similar to this in the past that lower prices on iron and steel products promote industrial revival."

FORD BRANCH ON THREE SHIFTS

DES MOINES, April 21—The Des Moines Ford branch is working at full capacity and has three forces of 400 men each employed at full time. The plant is turning out daily 165 coupe and sedan bodies, 160 cars, and 100 tractors. Cars and tractors are being distributed in Iowa while the bodies are shipped into Southern and Western territory, according to W. K. Edmunds, branch manager. That the low priced car is the only one which is meeting with a ready sale in Iowa under present financial conditions, is shown by the fact that in the March registrations of Polk County, in which Des Moines is situated, nearly 80 per cent were Fords.

Crop Prices Slow Carolina Business

Manufacturing Sections Show Brightest Sales Prospects—Rural Buying at Standstill

CHARLOTTE, N. C., April 25—The avalanche of motor car sales precipitated under the stimulation of war prices when cotton sold at 40 to 46 cents a pound, and tobacco 95 to 125 cents, stopped abruptly last September. From September until February very few cars even of the cheapest makes were sold, but in the five weeks beginning March 1, there has been an unexpectedly heavy improvement in sales, particularly in cities of 10,000 population or over, of which there are eleven in North Carolina.

The western half of North Carolina is one of the best areas for motor car sales in the Southeast, if not in the entire South. On the other hand, the eastern half of North Carolina is perhaps the poorest sales area to be found, even the cities showing very little business. The State of South Carolina is completely dormant, no sales taking place in the country areas and few in the larger cities with the possible exception of Columbia, where the presence of Camp Jackson, into which flows $1,000,000 per month from the Federal treasury, has created business.

Retail sales in Charlotte are not so good at present as in some of the other towns in the western part of the State, due largely to the slowing down of cotton mills in the city and unemployment. This situation is more seriously reflected in Charlotte as many of the factories have headquarters here, and the city is more responsive to the industrial pulse than are the smaller cities in the western part of the State.

As is the case throughout the entire South local Ford dealers are practically out of cars and for some time have been picking up carloads from dealers in the territory and driving them 100 to 150 miles to the city. Through the territory many of the Ford dealers have stocks on hand.

Supply of Cars Not Heavy

With several local distributors there is not a heavy supply of cars on hand for the two Carolinas, whereas with some makes there are 90 days' supply in the territory. The Nash distributor has not over a 15-day supply. Oakland through the territory has a 30-day supply, as has Studebaker. Buick with its large dealer organization throughout the two states has not a 30-day supply. As with many others its sales in March were greater than those in December, January, and February together. Willys-Overland has a small stock in the territory. The low supply of several distributors is due largely to them not having taken cars from the factories since August. There are hundreds of dealers in the territory who have not taken a car from a distributor since August 1. These dealers are still in business carrying on a repair and garage business and endeavoring to sell the cars they have been stocked with since August.

The situation in eastern North Carolina and all of South Carolina, where business is at a standstill, can be grouped for trade considerations. It is difficult to realize how completely and continuously business has been suspended in this area. There are still no sales in such towns as Wilmington, Newbern and Elizabeth City where the average is not 10 per cent normal. There is no available money with which to buy cars, although there are hundreds of buyers if means to finance the purchase were at hand. The banks will not handle car or truck paper.

Tobacco Heaviest Hit

Before the slump in these places last September the dealer bought all of the cars he could secure. The tobacco prices were largely responsible for this. When the market broke in September car sales stopped as quickly. In Greenville, where a dealer of a medium-priced car sold 200 in 1920, that dealer has not sold a car since August. There are reports that the Ford dealer in Littleton has sold only two cars since January. There was only one car sold in Anderson County from December until April 1.

In the South Carolina area where long staple cotton is grown, which sold last year at $1.25 per pound and is now at 20 cents, business is at a standstill. Such towns as Chesterfield, Darlington, Marlborough and Florence in this area have suffered badly.

The conservative motor car dealers in Charlotte are not anticipating much business this year. There will be a pick-up in September and October when the crop is harvested but nothing approaching that might be designated as normal business in contrast to abnormal business of two years ago. It will be the crop of 1922 that should bring the normal fall purchasing. The crop of 1920 must be sold and the revenue from it will go to the bankers and merchants. It will not pay all their debts. It will not be until the crop of 1922 that the farmer will have surplus money for purchasing. Business will be improved by the money from the 1920 crop getting into circulation when it is sold.

No Truck Market Since August

There has been no truck business in this territory since August. What is true of all the Gulf states applies equally to the Carolinas, namely, that too many dealers took on truck lines in 1919 and to-day have $8,000 or $9,000 tied up in trucks which can only be moved with difficulty in perhaps a year. In not a few cases this money tied up in trucks is responsible for the hard pressed condition of the dealer to-day. Ford dealers are generally stocked with tractors which are not moving except in a few cases. Some dealers have 10 to 15 in stock, which is hampering their activities financially.

METAL MARKETS

CONDITIONS in the steel market have undergone very little change as the result of the Corporation's price revision. The "independents" are working on orders placed at the prices named by them before they raised their quotations to bring them up to those of the Corporation. The latter has benefited by its price announcement only to the extent of releases on tonnages that had been suspended pending just such a revision. Neither the Corporation nor the "independents" have booked any representative fresh business. From the very outset, the new price levels were looked upon as a sort of stop-gap. Taking stock of prevailing conditions, the powers that be in the steel industry recognized the fact that they would achieve very little by genuine price reductions at this time. Neither the railroads nor the building industries are in shape to place orders at this moment at any price. The chief demand is from the automotive industries. Many of the steel manufacturers, especially the sheet makers in the Youngstown district, are apprehensive lest the demand from the automotive industries become more halting in July. Meanwhile, they believe apparently that what automotive business is to be had can be booked at the prevailing prices and that there would be nothing gained by cutting these. A significant point in this connection is that the new price for sheet bars is $39, while that for billets is $37. Most steel men prefer orders for sheet bars to orders for billets and it is more than doubtful whether it costs more to roll sheet bars than billets. Sheet bar tonnages are usually far more satisfactory than those of billets. So that the only explanation why sheet bars should sell at this time at $2 above the price of billets is that the bulk of sheet bar production is intended for automobile sheets, and the traffic in these can stand the $2 premium over billets. From the steel producer's point of view this attitude is perfectly logical. In fact, it is based on a very fair appraisal of the class of orders that emanates from the automotive industry these days. Not a pound of steel is being bought that is not needed to maintain the actual schedules, and producers of steel are apparently of the opinion that price cuts would have to be much deeper to be fraught with immediate results in the shape of much larger orders. Before they can make such cuts, wages and freight rates must be pared.

Pig Iron—Foundry No. 2 and malleable are selling at $24 and upward, with the nominal quotation $25, valley. One Cleveland interest has made sales at as low as $26, local delivery. Lower wages are to be put into effect in some of the Midd'e West automotive foundries next Monday and spasmodic interruptions to production as the result of strikes are feared.

Steel—Both unshipped balances on account of old orders and new business in cold-rolled and cold-drawn steel bars are being billed at 3.10c. base, which makes the differential over hot-rolled, the latter based at 2.10c., $20 a ton. Several thousand tons of orders from automotive sources are hanging over the market. The sheet market is relatively steady.

Aluminum—The market continues quiet and more interest waits on a clearer picture of what tariff prospects are.

Lead—American Smelting & Refining Co. has reduced lead quotations $2 a ton to $4.35 New York and East St. Louis.

FINANCIAL NOTES

Stewart-Warner Speedometer Corp. declared a quarterly dividend of 50 cents a share payable May 15 to stockholders of record April 30. Previous quarterly dividends were at the rate of $1. The business of the corporation is reported to be running close to normal and better than anticipated. A quarterly statement of earnings is expected in a week or ten days.

Dunlop Tire & Rubber Co. will pass under voting control of the Dunlop Rubber Co., Ltd., by the exchange of 2,000,000 shares of the latter for 3,000,000 shares of the American voting trust. It was also reported that $8,000,000 would be required for initial working capital for the American company.

Kelly Reamer Co., Cleveland, has increased its capital stock from $60,000 to $250,000 and all shares offered were taken by present stockholders. The company has just held its annual meeting in the new factory building, the board of directors being returned to office.

Prather Wheel Mfg. Co. of Detroit has been incorporated with a capital of $1,000,000 by Frank M. Prather and Frank Eack. Prather is the inventor of a resilient wheel truck which it is proposed to build.

India Tire & Ruber Co., Akron, paid on April 1 a quarterly dividend of 1¾ per cent on its prefered stock and 2 per cent on its common stock.

H. H. Franklin Mfg. Co. has declared the regular quarterly dividend of 1¾ per cent on its preferred stock payable May 1.

INDUSTRIAL NOTES

Cincinnati Grinder Co., Cincinnati, has placed the sale of its line of grinding machine on an exclusive basis with the Marshall & Huschart Machinery Co. in the Chicago district; Motch & Merryweather Machinery Co. in the Cleveland, Cincinnati, Pittsburgh and Detroit district; Henry Prentiss & Co. in the New York and New England district, and will also maintain its own grinding specialists in the respective territories.

William F. Hudson, president of the Flexo Co. of America, is placing orders for materials to make up 30,000 Flexos (extensions for Ford trucks), and is also buying material for the Hudson Motor Truck Co. of America, which will turn out a line of trucks of 2½ tons up.

Black & Decker Mfg. Co. has moved its Atlanta branch office to 1508 Candler Building, where Thomas W. Peters, southern branch manager, will make his headquarters. The Detroit office has been moved to 27 Watson Street.

United States Rubber Co. directors have again chosen Samuel P. Colt, chairman; Lester Leland, vice-chairman; Charles B. Seger, president. The executive committee consists of James B. Ford, Walter S. Ballou, Nicholas F. Brady and James S. Alexander.

Hall Syndicate, Inc., Philadelphia, organized to manufacture and sell the Hall flexible wheel, Hall felt liner and other products, has opened sales and show rooms at 1838 Market Street here and in Camden.

Milwaukee Auto Engine & Supply Co., Milwaukee, manufacturers of the Milwaukee timer for Fords, reports operation at 100 per cent capacity. April is the biggest sales month in the company's history.

Kelly-Springfield Tire Co. has opened its plant at Cumberland, Md., and started manufacturing. The plant cost $11,000,000 and took three years to build.

Southern Motor Mfg. Assn., Ltd., Houston, has just completed another factory unit, which will be used as a paint and trim shop for Ranger cars.

Continental Car Co. of America, Louisville, Ky., has increased its capitalization to $1,000,000, to provide for extensive improvements to the plant.

American Tire Corp. promoters are under investigation by the Federal grand jury to determine the legality of the sale of the company's stock.

Ewing Bolt & Screw Co., one of the late additions to Detroit industries, has started operations in its plant at River Rogue.

Rome Wire Co., Rome, N. Y., has completed a weatherproof wire mill and has started operations.

Woodworth Mfg. Corp. has moved its factory from Niagara Falls and located at Binghamton, N. Y.

Reed, Tilley & Co., Inc., has removed to the Robertson-Cole Building, New York.

Masters Motor Co. will move its main plant from Saginaw, Mich., to Erie, Pa.

Interlocking Tires Sues for Balances on Stock

AKRON, April 22—Thirty-six separate actions against as many stockholders of the defunct Interlocking Cord Tire Co., of Akron and Mogadore, have been filed in the common pleas courts of Summit County by Elihu Harpham, receiver of the company, for recovery of the balances due on their unpaid stock subscriptions. The actions constitute the forerunner of 480 similar actions to be started, according to Harpham, for an aggregate of $290,000, claimed to be due on subscriptions for stock negotiated before the appointment of the receivership.

The thirty-six actions already started are for amounts ranging from $100 to $4900, and for a total of $21,417.

Immediate payment by shareholders of the unpaid balances due on their stock subscriptions is necessary in order to liquidate the company's affairs and to satisfy creditors whose claims exceed $200,000 according to Harpham.

RECEIVER CONTESTS CONTRACTS

TOLEDO, OHIO, April 25—H. R. Greenlee, receiver for the Erie Tire & Rubber Co. of Sandusky, has filed recommendations in Federal Court for the disposition of contracts on which part of the materials contracted for have been delivered. In all cases the materials were contracted for when war prices prevailed and before the receivership began. Some consignments were received and paid for at the inflated prices. The balance of them are being held pending instructions of the court.

ROCK ISLAND CUTS PRICES

ROCK ISLAND, ILL., April 22—The Rock Island Plow Co. has cut prices on all its products 10 per cent. The cut is effective immediately. Tractor and tractor tools cut 15 per cent a month ago are not affected by the new order.

BANK CREDITS

Written exclusively for AUTOMOBILE INDUSTRIES *by the Guaranty Trust Co., second largest bank in America.*

NEW YORK, April 28—After the firmness of the previous week, the money market again eased last week. Call money, after renewing at 7 per cent on the first two days of the week, declined to 6½ per cent and finally to 6 per cent on Friday. The range for the week was 6 per cent to 7 per cent, the same as the previous week. "Outside" money was said to be available at 5½ per cent. There was little change in the time money market, where the demand was light, and quoted rates were unchanged from the previous week, with 6½ per cent bid and 7 per cent asked.

The week-end statement of the Federal Reserve System showed a continuation of the improvement which has been taking place since the first of the year. The ratio of total reserves to deposit and Federal Reserve note liabilities combined increased from 53.7 per cent to 54.1 per cent, the highest ratio since the first week of September, 1918. This was largely a result of the further increase in gold reserves of $11,192,000. Federal Reserve notes in circulation also declined $11,827,000, and at $2,856,700,000 are $548,231,000 below the high of Dec. 23, 1920. Bills discounted secured by U. S. Government obligations increased $13,479,000, while total bills on hand declined $5,828,000. Total earning assets declined $13,048,000, and total deposits $5,592,000. The ratio of gold reserves to Federal Reserve notes in circulation, after setting aside 35 per cent against deposit liabilities, increased from 65.2 per cent to 65.8 per cent.

Changes in the condition of the New York Federal Reserve Bank harmonized with those of the entire System. Gold reserves increased $8,721,000, while total bills on hand, total earning assets, total deposits and Federal Reserve notes in circulation declined. As a result, the ratio of gold reserves to Federal Reserve notes in circulation, after setting aside 35 per cent against deposit liabilities, increased from 69.5 per cent to 70.6 per cent. The week-end statement of the New York Associated Banks was also favorable, although excess reserves over legal requirements declined $6,847,860. Loans declined $68,630,000, and net demand deposits $42,558,000.

The foreign exchange market was featured last week by an unusually narrow range of quotations. The range for Sterling, for instance, was $3.92 to $3.94½, the latter being the highest quotation since July 17, 1920. On Monday of this week Sterling touched $3.95. The narrowness of the range of quotations, if continued, may be taken as an indication of a crystallization of opinion as to the actual state of affairs in Europe. About mid-week there was weakness in practically all the continental exchanges, with a slight recovery on Saturday. Marks declined from 1.60½ to 1.50½ on Saturday.

MEN OF THE INDUSTRY

Otis R. Cook was elected vice-president and director of the Howe Rubber Co., New Brunswick, N. J., at the annual meeting. Cook has purchased a substantial interest in the company and will take over all sales May 1 and handle them through his own selling organization. Headquarters will be in the Cook Building, Cleveland. H. H. Grobe will be general sales manager of the new company, coming with Cook from Kelly-Springfield, where the latter had been vice-president, director and general sales manager for ten years to Jan. 1, 1920. He resigned at that time to build the Cook Building in Cleveland, which is now completed. Cook succeeds E. A. Sattler with the Howe company.

W. M. Letts, managing director of Willys-Overland-Crossley, Ltd., of Manchester, England, sailed for home on the Olympic Wednesday after a brief visit to New York for conferences with the Willys executives. He is much gratified at the business done by his company in the face of discouraging conditions in England, and believes the outlook for the coming year is even more encouraging. Industrial affairs in England have run virtually the same course as in the United States, but there had been signs of improvement up to the time the miners' strike began and Letts is hopeful of a steady upward trend as soon as the labor difficulties are definitely settled.

H. D. Babney, who recently resigned as secretary of the National Association of Motor Truck Sales Managers, has been appointed assistant secretary of the Automotive Electric Service Association, with headquarters in New York, which was organized at Rochester last July by representatives of authorized service stations. The chief purposes of the organization are to encourage co-operation between its members and the manufacturers whom they represent and to encourage the use of only genuine parts for repair or replacement service. D. W. Burke, of Detroit is the president.

W. S. Doty, formerly of the Cleveland Tractor Co., has joined the Globe Motors Co. organization, Cleveland. He has acquired a substantial financial interest, will act as treasurer and have charge of operations. His connection with Cleveland tractor was as auditor, assistant secretary and assistant treasurer, in the order named. Doty's automotive experience also includes two years with the Torbensen Axle Co., two years charge of the general offices of the Denneen Motor Truck Co. of Cleveland, and several years as a retailer and distributor.

Edward J. Post has been appointed manager of the Chicago branch of the Oshkosh Truck Sales Co. of America, which has taken over the international selling rights of the Oshkosh Motor Truck Mfg. Co. of Oshkosh, Wis., and N. O. and S. S. Gilbert for many years identified with the motor truck business in Chicago, have been appointed mid-west distributors. Offices have been opened at 1509 South Michigan Avenue, Chicago.

Arnold Joerns Co. of Chicago has been appointed advertising representative for the King Motor Car Co. by A. Weber, president and general manager. The Joerns company has opened a Detroit office in the Kresge Building in charge of Robert Davis. Weber has announced also that a well-known Chicago man, who has been in charge of King distribution there, will join the factory staff as assistant to H. Alperin, sales manager.

D. Henry Bonner, recently in charge of the branch house organization of the Ford Motor Co., has been made sales manager of the Four Wheel Drive Truck Co., Clintonville, Wis., manufacturers of the F. W. D. truck. Bonner was associated with Ford for over seven years in various capacities. He was superintendent at Cambridge, Mass.; assistant manager at Rochester and assistant manager at Pittsburgh.

Hilton W. Sofield, former vice-president and general manager of the Keystone Truck Co. of Philadelphia, as well as builder and designer of the Keystone truck, has reentered the automobile field after a nine month retirement. Sofield has incorporated a new company, known as the Penn Motors Corp., to manufacture popular size trucks.

E. D. Shearman of Jamestown, N. Y., has been elected a director and secretary of the Collier Motor Truck Co. of Bellevue, Ohio. Shearman was one of the original organizers of the Salisbury Wheel & Axle Co. of Jamestown, and was its general manager until it was sold to eastern interests in 1919.

H. A. Wagner, formerly general manager of the Reliance Motor Truck Co., Appleton, Wis., has resigned from that concern but has not yet announced his future plans, although it is expected that he will continue in the motor truck industry, with which he has been so long identified.

T. G. Graham, formerly with the Goodyear Tire & Rubber Co. of this city, and more recently factory manager for the Inland Rubber Co. of Chicago, has been named factory manager for the Mason Tire & Rubber Co. of Kent.

George H. Stebbins has been appointed factory superintendent of the Continental Car Co. of America, Louisville, Ky. Stebbins was formerly with Ford. Irving Miller has been appointed secretary of the company.

E. J. Welch, assistant advertising manager of the Goodyear Tire & Rubber Co., has resigned to become identified with the advertising and publicity department of the Hudson Motor Car Co., of Detroit.

E. E. Stanford, purchasing agent of the Westcott Motor Car Co., Springfield, Ohio, has been elected vice-president of the Victor Products Co., also of Springfield.

R. L. De Voe has been appointed general sales manager of the Dawson Mfg. Co., Chicago, manufacturers of grease cups and equipment.

Lockwood Manufacturing Passes Back to Parent

KANSAS CITY, April 26—The Lockwood Mfg. Co., operating under receivership since April 9, this year, was sold, April 23, as a going concern, for $122,-100. The purchasers are W. C. Sommerville, president, and Walter L. Wilson, vice-president and treasurer of the Baker-Lockwood Mfg. Co., Inc., Kansas City—the Baker-Lockwood company being the "parent concern" from which the Lockwood interests withdrew in January, 1920. The obligations of the Lockwood company are said to have been about $400,000, and assets, including raw materials, goods in process, completed merchandise, machinery, and equipment, about $300,000

Albert Newman, vice-president of the Commerce Trust Co., Kansas City, was appointed receiver April 9 and continued operations, buying materials for manufacturing, producing goods, and shipping. There has therefore been no cessation in the activity of the Lockwood company, and it will now continue. The purchasers have not announced their exact plans with reference to it.

Minnesota Bases Fee on Factory Sales Price

ST. PAUL, April 25—The Minnesota legislature adjourned April 20 after finishing up the legislation required to make the Amendment No. 1 road law for building and maintenance of trunk highways in Minnesota workable. The automobile license fee was settled after long debate and consideration of many amendments at 2 per cent of the sale price of the car f.o.b. the factory, with down gradations proportional to the age of the car to be registered. This tax is expected to give some $6,000,000 a year.

Although it was the general understanding that this tax was to be in lieu of all other automobile taxes when the people voted for the amendment last November an opening was made by the leggislature for a wheelage tax, which, is already in operation in St. Paul and Duluth. At the final elimination it was found that the new law permits a tax of not more than one-fifth of the State tax, or 20 per cent. The law also now provides that the State ultimately will refund bonds already issued by the counties with approval of the State highway commissioner for building trunk roads, and will pay the interest thereon.

HAYNES STEVENSON DIRECTOR

INDIANAPOLIS, April 21—Elwood Haynes was elected a new member of the board of directors of the Stevenson Gear Mfg. Co. at the annual meeting of the stockholders here. Other members of the board who were re-elected follow: G. E. Stevenson, G. R. Stevenson, E. C. Jones, of Indianapolis; T. J. Stephenson of Anderson; Simeon McQuiston of Kokomo, and R. T. Wingo of Detroit. The directors decided at the meeting to build a subsidiary plant at Detroit. The company has perfected a machine for multiple gear cutting.

TO FORM OLD TIMER SECTIONS

NEW YORK, April 25—Directors of the Old Timers' Club at a meeting here decided to encourage the formation of sections in various parts of the country. The membership is rapidly increasing and the directors decided to promote annual reunions at the national shows and through local sections at other shows. The membership will be brought together for discussion of automobile projects which it will be fitting for the organization to support.

Calendar

SHOWS

Sept. 28 - Oct. 8 — New York, Electrical Exposition, 71st Regt. Armory, Electric Equipment, Machinery and Vehicles.

FOREIGN SHOWS

May 28, 1921 — Czecho-Slovak International Automobile Exposition of Cars, Trucks, Tractors, Motorcycles and Equipment. Prague.

May 28-June 8 — International Automobile Exhibition, Basle, Switzerland.

June, 1921—Reykjavik, Iceland, Agricultural Exhibition—Agricultural Machinery—Icelander Agricultural Society, Reykjavik, Iceland.

September—Buenos Aires, Argentina, Passenger Cars and Equipment. La Pabellon de las Rosas. Automovil Club Argentino.

September—Buenos Aires, Argentina, Cars, Trucks, Tractors, Farm Lighting Plants and Power Farming Machinery. Palermo Park; Sociedad Rural Argentina.

September—Luxemburg, Luxemburg, Agricultural Sample Exhibition.

Oct. 5-16—Paris, France, Paris Motor Show, Grand Palais, Administration de l'Exposition Internationale de l'Autòmobile, 51, Rue Pergolèse, Paris.

Nov. 4-12 — London, British Motor Show, Society Motor Mfrs. and Traders.

CONVENTIONS

May 4-7 — Cleveland. National Foreign Trade Council.

May 6—Detroit, N.A.C.C. Advertising Managers Meeting, Detroit Athletic Club.

May 17-19—Buffalo, Convention of Factory Service Managers, Auspices of Service Committee, N.A.C.C.

May 23-26 — Chicago, A.S.M.E. Spring Meeting, Congress Hotel.

May 24-28—West Baden, Ind., Summer Meeting Society of Automotive Engineers, West Baden Springs Hotel.

July 4-9 — Mackinac Island, Mich., Summer Meeting Automobile Equipment Association.

Oct. 12-14, 1921 — Chicago, Twenty-eighth Annual Convention National Implement & Vehicle A'ssn.

RACES

May 31 — Indianapolis, International Sweepstakes.

June 18—Uniontown, Pa., Speedway Events.

July 25—Grand Prix, Le Mans.

S.A.E. Sports Program Covers Many Events

NEW YORK, April 23—The sports program which has been arranged for the semi-annual meeting of the Society of Automotive Engineers at West Baden on May 24 to 28 will be one of the most ambitious ever planned by the organization. It will include everything from tug-of-war to croquet, with appropriate prizes. Golf, tennis and trapshooting tournaments are planned, as well as two baseball series. The women who attend the convention will be entertained by card parties, clock-golf, croquet and tennis. In addition to these there will be a dancing contest.

The reduced-fare plan which has been arranged with the railroads differs from the one in effect at the annual meeting last January. A reduced-fare certificate will be mailed by the society to its members about May 1. This must be presented when transportation to West Baden is purchased in order to secure a 25 per cent reduction. Round-trip tickets only may be purchased under this plan, no stop-overs are allowed, and the same route must be used in both the trip to West Baden and return. A map which will be mailed with the certificates will show the area in which this reduced-fare plan applies.

Light Cars Popular with Spanish Buyers

WASHINGTON, April 21—Reporting on automobile trade conditions in the Cadiz, Spain, consular district, American Consul B. Harvey Carroll has advised the Bureau of Foreign and Domestic Commerce that there are approximately 700 automobiles and trucks in active use in the district. The United States, England and France export to that market and a few cars of Spanish manufacture are also sold. Those of American manufacture are the most popular and outnumber all others used in the district.

Prices for automobiles vary from 7300 ($1460) pesetas for a light type runabout car to 30,000 ($6000) pesetas for the heavier touring cars. Cars of light type are the most popular owing to the poor condition of the roads off the main lines of travel and narrowness of the city streets.

Gasoline is expensive—1.30 pesetas per litre at the time the report was made, March 30, for a product of inferior quality. Lubricating oil for automobiles retails for 4.50 pesetas the litre. Gasoline may be bought in the Cadiz consular district in Cadiz, Jeres de la Frontera, Sanlucar de Barrameda and at Algeciras. Trade conditions in the automobile market are described as being in a chaotic state.

Truck Sales Managers Urge N.A.D.A. Benefits

DETROIT, April 25—The Motor Truck Sales Managers' Association has prepared for truck manufacturers a form letter which will be sent to dealers urging them to affiliate with the commercial vehicle division of the National Automobile Dealers' Association. The letter states that the N. A. D. A. is the best investment on the market to-day and that membership in it is certain to bring substantial business profits. The letter outlines some of the activities of the association and points out that the commercial vehicle division, devoted exclusively to truck dealers, gives advice in regard to employment, taxes, legislation, advertising, highway construction and trade information in addition to various other helpful activities.

E. A. E. A. TO HELP BOOST SALES

NEW YORK, April 25—The Eastern Automotive Equipment Association, composed of jobbers in the states along the Atlantic seaboard from Maine to the District of Columbia, decided to-day to conduct an educational campaign to assist dealers in merchandising car and truck equipment. A campaign of dealer helps and selling ideas will be worked out and placed in the hands of the jobbers' customers.

Stockholder Action on Goodyear Delayed

(*Continued on page* 936)

The net earnings naturally will be larger under the reorganization plan and new banking control, for complete revision of the company's office and factory personnel has made for materially increased individual and collective efficiency. At the same time overhead expenses have been reduced, non-essential and non-productive activities have been stopped, and the company is down to the cold business of making tires.

No funds will be needed for plant extension or new equipment. Wages and salaries have been reduced 15 to 30 per cent. Also, instead of issuing stock against surplus funds, as has been done in the past, these surpluses will become available for the funded debt.

The company will also, it is expected, curtail its advertising appropriations. Last year Goodyear became known as the world's largest advertiser, with an advertising appropriation originally of $5,000,000 but later increased and nearly doubled. The company is now reaping the reward of this extensive advertising campaign and is showing a more rapid return to normal production than any other tire company in Akron. With automobile factories back on a basis of 60 per cent normal, and with Goodyear furnishing a large percentage of all original tire equipment, the company is not only working on production tickets for heavy tire specifications from manufacturers, but on steadily increasing orders for Goodyear products from all parts of the world.

Goodyear's sales in 1919 were $169,-000,000, and for the first six months of 1920 reached $104,000,00, having reached the figure of nearly $1,000,000 a day when the slump came in the tire industry. With the company gradually climbing back to its normal production, it is a conservative prediction that Goodyear sales for the ensuing fiscal year easily will approximate $140,000,000.

VOL. XLIV. NEW YORK—THURSDAY, MAY 5, 1921 No. 18

Taxes and Tariff Major Topics at U. S. Chamber Meeting

Largest business body is well under way on its newly found mission of interpreting business idea for guidance of government activities. Sales tax is not indorsed. Business-like solution of tariff problem.

By Clyde Jennings

MUCH headway was made by the Chamber of Commerce of the United States in its new program of serving as an intermediary between business and government at the ninth annual meeting at Atlantic City, held last week. Perhaps it would be better to say that the Chamber now hopes to interpret for Government the opinion of business as to how Government can best aid business. It was in keeping with this objective that the slogan of the meeting was:

More Business in Government;
Less Government (management) in Business.

Herbert Hoover suggested a third line to this slogan, which he stated something like this:

Better Government Assistance to Business.

This added phrase was much applauded, but it was evident from expressions made at other times during the meeting that the hope of the business man for more intelligent assistance to business from Government is based very largely in Secretary Hoover. Business men are frankly suspicious of other Government efforts to assist business, but they whole-heartedly approved of Secretary Hoover when he appeared before them, and of the pledges and views expressed in his talk to them in the general session held on Thursday evening.

The two big topics presented to the members of the Chamber present at the Atlantic City meeting were:

Taxes.
Tariff.

The idea was to arouse an interest in these two topics from the business man's point of view, which is probably a very different thing than the political view. The Chamber, very frankly, was cautious in taking up these topics because they are so completely involved in politics. The big idea behind the proposal to interest the Chamber in these topics was to transfer them from politics to business. Apparently an intense interest was aroused in this new view of both topics.

On Thursday afternoon there was a separate meeting of each of the nine groups, in which the time was evenly divided between Taxes and Tariff, and an effort was made to obtain the sentiment of those present by a ballot on certain questions relating to the subjects. This idea was so new to the Chamber practice that the compiler of the questions failed to make them clear, and also the various chairmen of the groups did not understand the suggested practice. The result was that the ballots were not authoritative and were only mildly informative. The explanation appears to be that in turning so large a vehicle as the Chamber toward a new goal that there was considerable disarrangement of the internal machinery. At

the last general session of the Chamber, President Defrees apologized for the conduct of some of the group meetings.

The study of taxes became the intense problem of the meeting, chiefly because of the insistence of the sales tax proponents that this particular form of tax be indorsed by the Chamber. All through the general and group meetings the sales tax appeared to be highly popular with those present. Any mention of it was applauded, while a speech by R. G. Rhett, which was one of the most logical arguments made in the meetings and which was well presented, opposing this form of tax, was received in silence.

It was apparent throughout the meeting that the taxation policy advocated by the National Automobile Chamber of Commerce was the idea of many of those present. This is, briefly:

> **A cancellation of excise taxes and excess profits taxes and a lowering (at least) of income surtaxes.**
>
> **The establishment of a sales tax, if governmental expenses cannot be reduced to a point where the taxes remaining will pay the bills.**

This tax policy includes the belief that those governed should have much to say about how much money should be spent for different departments of the Government and how quickly war obligations should be paid. There was no question as to the popularity of this program with those present, but when the resolution on taxation was read by the Resolutions Committee it did not specifically support this plan. The sales tax proponents obtained recognition and urged the adoption of their resolution.

A compromise was effected by an apology for the way in which the tax question had been handled throughout the meeting and for the previous referendum by the Chamber. It was admitted that the questions in this referendum were so vague as not to give definite information. It was promised that, if the sales tax proponents would not force the issue on the floor, a new referendum would be taken as quickly as possible in the plainest possible terms. The objection to a vote at that time was that there was no way of determining what proportion of those present at the meeting were entitled to vote for their organization, and what proportion of actual delegates were still present.

New Tariff Plan

The tariff proposal, which was second in interest and regarded by many as first in importance, was handled quite differently. The subject was outlined in these three questions, which were submitted to the various groups:

1. Should the tariff be framed with due regard to export trade as well as to the protection of manufacturing in the United States?
2. Should the economic needs of foreign countries and the fact that we are now a creditor nation alter our tariff policy with respect to protection?
3. Should the United States tariff offer trading or bargaining possibilities for international commercial treaties to encourage our export trade?

The solution offered by the Tariff Committee of the Chamber was so different from any previous consideration of the tariff problem that it created much interest. Because it was so different, the Resolutions Committee decided not to indorse it at once, but to suggest continued study by the Chamber's committee. The Board of Directors accepted this report, which was described at some length by H. M. Swetland before the Civic Development Group. This explanation, in part, follows:

"Tariff legislation has so far presented its apology for its interference in the right of any people to market their products in any country, either under the plea of raising funds for the government or the encouragement and protection of domestic industries. No doubt sufficient logic can be found for either argument to stimulate legislation, but in these days the production of $300,000,000 from tariff duties is almost insignificant in our governmental departments and protection to our industries, with rare exceptions, is a reflection on the efficiency of our productive capacity as compared with the production of other countries.

"Then we must not lose sight of the further fundamental that any duty paid on any commodity increases the price of that commodity to the consumer, and this consumer, therefore, pays the $300,000,000 revenue and also affords the protection demanded for production.

"Probably the greater necessity for tariff on imports lies in the protection afforded American labor. Unless we are willing that our living conditions of labor shall descend to the lowest level of foreign production, we shall need a protective tariff for many products. This will be most necessary on commodities requiring a large percentage of hand labor. This country can now compete in the markets of the world on commodities produced largely from automatic machinery and in large quantities. Gradually our industries, due to American inventive genius, will evolve into the sphere of greater and more economical production, lessening the necessity for protection and opening our products to the wider markets of the world.

"These fundamentals must be borne in mind in any consideration of any phase of tariff policy. For many generations this country has decided in favor of duties on imports. This decision has been largely sustained by a consideration of the living conditions of labor in this country as compared with other countries. In the activities of this meeting we must accept the tariff as an established fact and give our attention to certain fundamentals affecting this policy.

"**First Question:** Shall we frame our tariff with due regard to export trade as well as the protection of our industries? This is a simple problem in mathematics. Dr. Page, chairman of the Congressional Tariff Commission, will tell you that approximately 95 per cent of our manufactured products are consumed in this country.

"We will all readily concede that a low tariff will tend to increase our imports and to increase our exports, and that a high tariff will tend to decrease our foreign trade, both imports and exports. Having regard for export trade involves, therefore, a lower tariff rate, and the question becomes, will the increase in our 5 per cent export be balanced more or less by our imports affecting 95 per cent of our production?

"If we find our productive capacity lessened by the lower tariff, we have, then, also decreased our earnings, which, in turn, lessens our purchasing power. From this it seems clear that the determining factor is the ratio of our exports to our home consumption and that tariff should be formed with due regard to export trade.

"Illustrating these principles, we may observe the automotive industry, which, twenty-five years ago, was classed as an infant industry and has been developed under a protective tariff to one of our greatest lines of production. It has now reached the level of great quantity production and many large units are commanding trade from all parts of the world. The industry as a whole now appreciates the fact that a lower tariff is now necessary if foreign trade is to be extensively cultivated, and this industry has recently appealed through its Chamber of Commerce to have the import duty reduced nearly one-half.

"**Second Question:** The economic needs of foreign countries? The answer does not involve a philanthropic principle or motive, but requires the usual selfish business consideration. The argument is that these nations cannot buy from us unless they pay in goods.

"If we, as a creditor nation, sell to a debtor nation, they can only pay in goods, cash or credit. A greater extension of credit will increase the rate of exchange in which our price in their money becomes prohibitive. A two-thousand-dollar commodity in this country, sold in Germany under present exchange, would bring $28,000, based on normal rates. They cannot buy for cash, as such procedure would quickly drain their treasury of gold. It remains that we must take commodities in exchange for our goods. If these commodities compete directly in our markets with our own production we will have reduced our production solely for the benefit of the debtor nation. Plainly this procedure would lack any economic value to us. Therefore any exceptional lowering of duties to the people of a debtor nation must be confined to such articles as are not in direct competition with the products of our own people.

"In **Question Three** we have opportunity to pacify to some extent the objection raised in Nos. **One** and **Two.** If we may bargain we may meet conditions. Bargaining forms the basis of all our commercial activities. If all our sales and purchases were based on predetermined inflexible prices not open to discussion and investigation of changing conditions our total activities would be greatly lessened. This principle applies with even greater force to interchange between nations.

"No reason exists why a need for our special productions in a foreign country should not be exchanged for a necessity from them on a fair basis. Valuations must, of course, be considered and tariff regulations equitably adjusted to a lower level by treaty between the two countries. The difficulty of working up lists of characteristic products from all countries and the confusion of collection of different rates on a particular commodity are urged as objections. But such lists are readily available and an advance in clerical intelligence in our ports of entry will not detract from the general efficiency. Such bargaining power would probably put an end to French discrimination against our products and the Latin-American rates against our canned goods. European countries have long made their customs the basis of commercial treaties.

"The retention of our present rigid regulations will constitute a continuing barrier to the full development of American commerce. The advent of the report of the Tariff Committee of the Chamber of Commerce of the United States, which has been injected into the group meetings for consideration by order of the Board of Directors since the program was printed, demonstrates the potential possibilities of the Chamber. The readiness with which the directors received the unanimous report of the committee and not only referred it to the various group meetings but also passed it to the committee on resolutions, marks the report as of unusual importance and proves the readiness of the Directors to act promptly on a matter that offers constructive development. The Committee foresaw the necessity for prompt and permanent tariff legislation. They realize the inadequacy of permanent tariff rates to meet the changing business conditions which must follow a reconstruction period such as afflicts our country at the present time.

"The Committee fully comprehended that every business interest in this country will be affected by the findings of Congress on tariff legislation. They recalled the many periods in the past when commercial interests of the country have stagnantly awaited the final decree. They appreciated the progress made in recent years to give careful consideration of the nation's business by the establishment of the Congressional Tariff Commission. It is hoped that the business interests of the country may also be heard in an effort to assist in a constructive permanent tariff policy. To that end the committee has submitted the following report:

> *To the Board of Directors of the Chamber of Commerce of the United States:*
>
> Your Committee on Principles of Tariff Legislation report follows:
>
> FIRST: It is recommended that permanent tariff legislation should be so framed as to permit adjustment of individual rates or particular schedules of rates within prescribed limitations, and authorize changes therein from time to time without a general revision of the tariff, and thus afford reasonable latitude in the application of tariff rates to any commodity, or group of commodities, in order that there may be flexibility in the adjustment of said rates to the varying fluctuations of industrial and trade conditions.
>
> SECOND: It is recommended that such permanent tariff legislation should provide for and create a Tariff Adjustment Board, appointed by the President and confirmed by the Senate, with such emolument and tenure of office as will remove them from political influence and personal interest; that this Board shall be separate and distinct from the present Tariff Commission, the duties of which should be modified to require a report of its investigations to the Tariff Adjustment Board in addition to the reports it now makes.
>
> THIRD: It is recommended that in framing such legislation the principles hereinafter stated should control and that it shall be the duty of Tariff Adjustment Board to apply the Tariff Acts of Congress and fix just and reasonable rates within said limitations to meet changing conditions, in accordance with said principles, viz:—
>
> (a) Promotion of the interest of the American Public as a whole.
> (b) Reasonable protection of American industries that are subject to destructive competition from abroad, and that are, or compromise to be, of benefit to the country as a whole, or to any considerable section thereof.
> (c) Maintenance and encouragement of export trade.
> (d) Meeting discriminations, direct or indirect, against the products of this country.
> (e) The prevention of dumping of foreign goods into this country to the injury of our markets.
> (f) Due consideration of the relative standards of living, earnings, and efficiency of labor in this and in other countries.

"In operation under the plan submitted by the Committee, Congress will pass a law levying duties on a list of commodities within certain limitations and the tariff board provided for in the report will determine the specific rate. This rate may be changed by the board as frequently as necessary to meet changing conditions. It can be modified to meet bargain conditions desirable to treaty agreements. Within the prescribed limitations it offers the flexibility necessary to extensive trading with other nations.

"To some extent this plan follows the working of the Interstate Commerce Commission. This body is authorized to determine a just and equitable charge for railway service. The tariff board will execute the new tariff law with fairness to the parties interested. Legislation will determine the basic policy as to high or low, as to protection, as to revenue, with specific limitations. The tariff board will specify rates.

"Beside elimination from Congress a most obnoxious opportunity for the lobbyist it dignifies our legislative activity and relegates the clerical labor of legislation to experts who devote themselves exclusively to this work.

Full opportunity for hearings will be given by Congress on questions of principle or policy and by the board on questions of specific adjustment.

"If this measure offers relief from stifling complication and tends to a more elastic and comprehensive adjustment of our tariff it must not be ignored from the fact that it offers a radical departure from present practice. If we are bound to make and unmake tariff rates as we always have by periodic tinkering, with its consequent depressing effect on all our industries, then Congress is the one department of our government lacking susceptibility to modern progress and evolution.

"We should concern ourselves however more particularly to the merits or demerits of this plan. Does it not at least contain the elements of an improved plan for the manipulation of one of our most serious and most complicated activities? If so, it is plainly our prerogative, and we may say our duty to give it most careful consideration, determine how it may be improved and then give it wholesome support."

There was one other tariff thought that was well received. This was a suggestion by Secretary Hoover that all imported articles should be valued on the American market standards, rather than on the point of origin. The speaker used the illustration that corn might be worth $1 a bushel in this country, 80 cents in England, 50 cents in France and 30 cents in Japan, and when the bushels from the various countries were shipped into this country they would pay as duty 20 per cent of the value in their own country, rather than 20 per cent of the value of the corn with which they were to compete.

Of course there were other big thoughts in the meeting. Two of these were received with entire accord by all speakers, whether formal or impromptu. These were:

> **Stabilization of the entire world trade is necessary before trade in any country can reach a normal basis. Just now the indemnity problem and the status of Russia are the big factors.**
>
> **That the successful organization of the Foreign Trade Financing Corporation is the hope of the export trade of this country.**

The Wage Problem

There was a highly interesting and instructive session of the Fabricated Production Group devoted to the relation of wages to production and sales. Some very interesting charts were displayed by Magnus Alexander and others. The employers quickly seized upon these and statements were frequently made that it was going "to be necessary for employers to grasp the situation with a strong hand and adjust operating expenses."

But only one speaker in the discussion mentioned as important the methods of reducing wages. Clarence Howard, in the informal discussion, briefly advised employers that in all dealings with their employees The Golden Rule should be their guide. Howard made it plain that in his dealings, the feelings of the employee were more important to him than statistics: that statisics were of value only when they were understood by the employee as well as by the employer.

The Business Man's Creed

The new objective of the Chamber is very well stated in the preamble to the resolutions, which is described as the "basic philosophy of the American business man." This statement will probably do much to explain to the members who were frankly at a loss to understand the changed character of the meeting. The statement follows:

> This chamber believes that the relation of government toward industry and commerce is primarily that of preserving equality of opportunity. Laws and administrative acts should touch business enterprise with great care and only to preserve a fair field to all.
>
> A wholesome standard of living is essential to general contentment. That standard depends upon the intelligence, work and thrift of the individual citizen. Hence, restriction of production must necessarily undermine that standard. We therefore condemn avoidable strikes, lockouts and all combinations that needlessly limit output or curtail distribution on the part of workers, owners or managers of industry.
>
> The foundation of all enterprise is primarily that of service to the community, and this service is most effective under private initiative. The community's variation of that service, and its reward for it, are most fairly expressed when secured by individual initiative, under conditions of free competition. The value of and the reward for such service cannot be safely apportioned by the arbitrary decisions of government agencies.

An Automotive Director

Automotive interests fared exceedingly well in this meeting. A. J. Brousseau of the International Motor Co. was elected a director to represent the Fabricated Production group. The highway resolution favored by the automotive industry was adopted by the meeting. The industry strongly favored a resolution for the sales tax, but was well satisfied with the decision of the Chamber to have a new referendum on this question. The automotive speakers were well placed. C. C. Hanch, chairman of the N. A. C. C. taxation committee, spoke before the Foreign Commerce Group on this subject; C. A. Vane of the National Automobile Dealers' Association spoke on the same subject before the Civic Development Group, and J. Walter Drake, chairman of the N. A. C. C. Export Committee, spoke before the Fabricated Production Group on Tariff. This is more recognition than this industry has previously been accorded and there was a very strong feeling that the automotive industry would soon come into its proper station as the second greatest industry in the country.

An aeronautical resolution, which was submitted to the Resolutions Committee, was referred for further study.

The New S. A. E. Handbook

THE Society of Automotive Engineers has recently sent copies of the revised edition of Volume I of the S.A.E. Handbook to all of its members. Although the data contained in the revised edition are in general the same as those in the old edition, some new matter has been added, as for instance, complete physical characteristics of S.A.E. Steels, the report of the Nomenclature Division on automobile nomenclature and the report of the Research Division on passenger car performance tests.

The S.A.E. Standards and Recommended Practices consist of material, dimensional and test specifications, terminology, rules for procedure in the maintenance of parts, and provisions as to various closely related matters, which, according to the consensus of opinion of qualified experts, can be generally adopted with great advantage, and in no way interfere with or impede progress in the design and production of automotive apparatus and power units included in the field of activities of the Society.

The S.A.E. Standards and Recommended Practices have made possible economies in designing, in purchasing, in production and in maintenance, and relieved automotive engineers of much detail and routine work, permitting them to concentrate upon the more important engineering problems.

Commercial and Engineering Standards Discussed at Gear Makers' Convention

Several recommended practices are adopted. Cost accounting methods receive further consideration. Work on gear standardization proceeding. A standard form of gear tooth which can be made by several methods is proposed. Universal roller chain sprocket now under way.

By P. M. Heldt

AN important outcome of the fifth annual convention of the American Gear Manufacturers Association, held at Cincinnati April 27-30, may be the development of a standard tooth for spur gears which can be cut by any of the well-known methods, thus making interchangeable the gears produced by rotating form cutters, gear planers and gear hobbers. What led to the suggestion of the development of such a tooth form was the recommendation, contained in the report of the Spur Gear Committee, that the 14½ deg. involute tooth, as commonly used in the interchangeable system embracing 12 teeth to a rack, be adopted as standard for industrial gearing. It was the intention to make this a so-called adopted standard, and if it had been accepted it would no doubt have been proposed to the American Engineering Standards Committee as an American standard. The objection was raised by E. W. Miller of the Fellows Gear Shaper Co., that in order to make this form of tooth a standard, it would be necessary to closely define its form, and this the recommendation failed to do. He further objected that the 14½ deg. tooth as commonly used in the interchangeable system was not a true involute shape and that the description "the 14½ deg. involute tooth" therefore was really incorrect. Mr. Miller, moreover, made the point that there was a strong tendency away from this tooth form, and that it was not a good plan to standardize anything the stability of which was uncertain, as once a thing has become a standard it is a difficult matter to recall it. Mr. Miller did not object to the adoption of the 14½ deg. involute tooth as commonly used in the interchangeable system as recommended practice, and the recommendation was passed by a rising vote, but as the vote was not nearly unanimous the matter was referred back to the committee for further consideration.

In the course of the discussion Mr. Miller made the remark that it was quite possible to find a form of tooth that could be cut by any of the commonly used methods of gear cutting, the rotary cutter, the gear shaper and the gear hob, and he was not sure but that this tooth form was superior to any of those now in use. This statement aroused a great deal of interest among the members, all of them practical gear cutters. One member made the statement that it would be of little advantage to the gear cutting industry if the milled tooth, the planed tooth and the hobbed tooth had to be standardized separately, as these different types were already interchangeable among themselves, and the standardization work would not really advance the industry, but if pinions and gears made by all methods could be made interchangeable it would be of distinct advantage to the gear industry. No definite action was taken on the suggestion, but as the recommendation regarding spur gear tooth form was referred back to the committee it is to be presumed that it will be taken up at the next committee meeting, which is to be held in Buffalo within a month.

The meeting was held at the Sinton Hotel and was well attended. It was opened by the usual address of welcome and by President Sinram's address. The secretary's report showed that the association now has a membership of 90 companies, represented by 109 executive and 55 associate members, making a total of 164 individual members. The Baush Machine Tool Co. of Springfield, Mass., was elected to membership in the course of the meeting. An invitation was extended to the membership to attend the forthcoming meeting of the National Manufacturers Association, to be held at the Waldorf-Astoria Hotel, New York, May 16-18. J. B. Doan, president of the American Tool Works and also president of the local section of the Metal Trades Association, made an address in which he covered some phases of the machinists' strike in Cincinnati last year.

Roller Chain Transmission

During the afternoon session of the first day, April 27, G. M. Bartlett, chief engineer of the Diamond Chain & Manufacturing Co., read a paper on the Ideal Chain and Sprocket Drive. Mr. Bartlett explained that transmission by link chains is a relatively new development and is still in its infancy. It was first used extensively for bicycles, and later the development of the passenger car and motor truck gave it a great impetus in the direction of the transmission of increased powers. The design of sprockets for the chains to run on is complicated by the requirement that the sprocket must fit the chain when it is worn, and the pitch is consequently lengthened, as well as when the chain is new. Wear of the chain has been allowed for in the past by enlarging the spaces between sprocket teeth, with the result that only one roller of the chain is in contact with a tooth at a time. In a new form of sprocket tooth which is now being evolved by a joint standardization committee of the A. G. M. A., the Society of Automotive Engineers and the American Society of Mechanical Engineers, this difficulty is overcome, as the chain rollers of both new and worn chains can be in contact with a number of sprocket teeth at a time and the tendency of the sprocket teeth to wear hook-shaped is eliminated, contact of the rollers of a worn chain occurring further out on the teeth of the sprocket. Mr. Bartlett's paper was illustrated with lantern slides, and we expect to publish extensive extracts of it in a future issue.

Erik Oberg, editor of *Machinery*, brought to the convention a message from Secretary of Commerce Hoover. At a recent conference with business paper editors, Secretary Hoover announced his intention to make the depart-

ment a department of domestic as well as of foreign commerce, and to this end he desires the co-operation of the various branches of industry. The machine-tool industry, to which the message had been presented on a previous occasion, were of opinion that they could easily gather statistics of their own production themselves but that they would like the department to give increased attention to the gathering of statistics of the fundamental industries, such as the steel industry.

J. H. Dunn, chairman, made the report of the Uniform Cost Accounting Committee. He told the members that the object of this committee was to show them how unreasonable cut-throat competition could be eliminated by intelligent costing. There are now more than a hundred cost committees of industrial organizations in existence. It is generally recognized now that the manufacturers themselves will have to solve their own cost problems, as hundreds of thousands of dollars have been wasted by the employment of cost experts or efficiency experts. The National Lime Association has had a uniform cost accounting system in use for two years and figures that it has saved the members a million dollars already. Mr. Dunn laid emphasis on the fact that if the members of the Association should use a uniform cost accounting system they would not necessarily have all the same costs, as the overhead charges and the equipment of the different factories were different. At a previous meeting the Association adopted a uniform cost accounting system, but this was considered too complicated and cumbersome for the smaller concerns to put into use, and to meet this criticism the committee had prepared an abbreviated form in which several items in the longer form were combined under one head. In connection with its report the committee also presented some illustrations of how costs on gear jobs work out by the "direct labor cost," the "machine-hour overhead rate" and the "overhead prorated against direct labor cost" methods.

Mr. Wilson brought up the question whether it was right to let the production carry the entire overhead charges under such abnormal conditions as we are experiencing now. He did not think it was fair to charge the entire overhead if that suddenly jumped ahead 300 per cent or more, and suggested that the normal rate of overhead should be charged and the rest be absorbed in a special account. This would prevent the cost from suddenly increasing to abnormal values; and, moreover, the department did not become confused in preparing estimates.

Method of Apportioning Selling Cost

Another question that was discussed at some length was whether selling costs should be apportioned on the basis of manufacturing costs or on the basis of selling price. One speaker reasoned against the latter method in the following terms: Suppose your selling department secures one order at a profit of 10 per cent and another at a profit of 60 per cent; would it be fair to charge them with extra cost for getting the more profitable business? Upon motion of Mr. Kebler the report of the Committee on Uniform Cost Accounting was adopted, with the recommendation that the members be urged to put the system into use.

At the session on Thursday morning, April 28, F. B. Waterman, chairman of the General Standardization Committee, made a report for the A. G. M. A. Sectional Committee of the American Engineering Standards Committee and also a report for the General Standardization Committee. In the latter he mentioned the fact that five subcommittees would make reports containing suggestions for recommended practices and two would report progress.

The first subcommittee report was that on spur gearing and was presented by the chairman, F. E. Eberhardt. All recommendations related to industrial gearing and therefore do not concern the automotive industry directly. It was proposed to standardize the 14½ deg. involute interchangeable system, and proportions for the tooth elements were given. It was also proposed to standardize 20 deg. stub teeth for use where great strength or small numbers of teeth are required, and proportions for this form of teeth were also given. Rules were also given for the width of face, thickness of rim for spoked gears and diameter of hub. After prolonged discussion, as outlined in the first part of this article, the report with amendments was adopted by a majority vote, but was referred back to the committee for further consideration. One point that came up in the discussion was whether there was any necessity for standardizing 20 deg. pressure angle teeth for industrial gearing. In this connection J. B. Foote of the Foote Bros. Gear Co. made the statement that in the experience of his firm from 15 to 20 per cent of the orders for industrial gearing call for 20 deg. pressure angle teeth and the tractor industry uses such teeth exclusively. It was also brought out in the discussion that with the gear planing method it is necessary to provide a slightly larger clearance than is customary with gears formed with rotary cutters. John Christensen suggested that for large gears there should be certain standard numbers of teeth, so that more extensive use could be made of stock patterns.

Bevel Gear Recommended Practice

F. E. McMullen, chairman of the Bevel and Spiral Bevel Gear Committee, made a report for that committee which was adopted as presented. This report contains diagrams and tables for use in determining the dimensions of tooth elements and explains how the tabular values are arrived at. The report follows:

"Bevel gear teeth are treated in the same manner as spur gear teeth with the exception that the back cone radii (Fig. 1) are used instead of the pitch radii of spur gears. In Fig. 2, the pitch circles of a gear and pinion are drawn together with the base circle of the pinion determined by the pressure angle "a." Involute tooth contact cannot take place below the base circle, since the involute curve has its inception at the base circle, and any projection of the gear or pinion addendum beyond the base circle of the pinion at the beginning and end of the theoretical arc of action is useless in so far as tooth action is concerned.

"The problem is first to find the gear addendum which at the beginning of the arc of approach extends to the base circle of the pinion, labeled in Fig. 2, Maximum Theoretical Addendum. The values in Table I are obtained on this basis by solving the oblique angled triangle for various ratios and pressure angles. Examination of this table will show that the tabular values between ratios 3-1 and 8-1 do not change greatly, and for the sake of simplicity, we have assumed that there is no change in preparing the bevel gear tooth proportion tables.

TABLE 1

Maximum Theoretical Addendum of Bevel Gear Pinion

Back Cone Radius = 1 in.

Ratio	14½ Deg. In.	20 Deg. In.	14½ Deg. Spiral In.	20 Deg. Spiral In.
1–1	0.0899	0.1623	0.1159	0.2043
2–1	0.0699	0.1295	0.0909	0.1655
3–1	0.0659	0.1226	0.0859	0.1571
4–1	0.0645	0.1201	0.0841	0.1541
5–1	0.0638	0.1190	0.0832	0.1527
6–1	0.0635	0.1184	0.0828	0.1519
7–1	0.0632	0.1180	0.0825	0.1514
8–1	0.0631	0.1177	0.0823	0.1511

"A percentage has been added to the theoretical values, the purpose of which is to provide an ease-off. Reference to Fig. 3 will show graphically that unless this percentage is added, the tooth load on the gear at the beginning of approach will lie along the very top edge of the tooth, a condition to be avoided.

Full depth	2.157	2.157
Circular thickness	1.571	1.570

Pressure angle, 14½ deg.

"The shapes of the teeth specified in Table 2, of 14½ deg. straight tooth gear proportions, are shown in Figs. 4 and 5. The circular thicknesses given in the table were obtained from these layouts by giving consideration not only to strength but also to the width of the top land, and insure a width sufficient to prevent a complete carbonization and consequent brittleness in case hardening.

"The values given in the tables are for 1 d.p. throughout. For any other pitch, it is necessary to divide the tabular values by the given diametral pitch. No table is offered for the 20 deg. pressure angle, straight tooth gears, as the standard proportion where the addendum is one-half of the working depth has proved satisfactory where the number of teeth is not less than 12.

"For ratios below 3-1, either additional tables will be required or a formula offered to provide individual treatment of each case. The reason for this is apparent from a study of Table 1, where it will be noted that the tabular values change greatly among the lower ratios; in fact, the percentage change is so great that at least four tables will be required to properly cover the ratios from 1-1 to 3-1 for each pressure angle.

Spiral Bevel Gears

"Table 3 gives the tooth proportion for 14½ deg. spiral bevel gears for ratios between 3-1 and 8-1. The values are

Pressure angle, 14½ deg.

obtained in the same manner as for straight tooth gears with two modifications. The working depth of spiral bevels is 85 per cent of that of straight tooth gears or standard depth for the normal pitch and the bottom clearance is 0.07 x the C. P. instead of the usual standard of 0.05 x the C. P. Figs. 6 and 7 show the tooth shapes of teeth based on the proportions given in Table 3.

Members and guests lunched together on Thursday and after lunch listened to an address by Senator George Wilder Cartwright from California, a member of the Senate's Industrial Relations Committee, on The Price of Success in America. During the afternoon members and guests took part in an automobile ride through the city of Cincinnati and surroundings, visits being made to the plants of the local members and to a number of machine tool plants. The cars for the occasion were furnished by the Cincinnati members and friends in the machine tool line.

On Thursday evening there was a meeting of the Cincinnati Section of the American Society of Mechanical Engineers, and as the two papers to be presented had to do with the subject of gear cutting, an invitation to attend has been extended to all delegates to the A. G. M. A. convention. O. B. Zimmerman, chief engineer of Gould & Eberhard, read a paper on Modern Methods of Gear Cutting, and Earle Buckingham, a paper on the Maag system of gearing. Practically all of the technical men at the gear convention attended the meeting, and some of them took part in the discussion.

Disagreement on Herringbone Gears

At the Friday morning session of the A. G. M. A., J. B. Foote presented the report of the Labor Committee, of which he is chairman. This was accepted as presented. A. F. Cooke presented the report of the Herringbone Gear Committee and asked that the report be referred back to the committee, as a disagreement had arisen between members thereof. The report recommended the use of diametral pitch hobs up to and including 1¼ in. diametral pitch, of a 20 deg. pressure angle measured on the axial section of the hob, of a 22½ deg. spiral angle of short teeth with 0.8/d.p. addendum and 1/d.p. dedendum and of a minimum width of active face of 16/d.p. The width and depth of groove in the center of the blank was given in the form of a table for gears cut with hobs at right angles to the axis of the gear, and in the form of formulæ for gears cut with planing or shaping tools. A table was also given of the angles to which the hobs should be set, a table of enlargements for pinions and a chart of strength of herringbone gears. A. A. Ross, a member of the committee, said that they were anxious to get the views of the members regarding the selection of 22½ deg. for the spiral angle. Although, in an effort "to get something accomplished," a motion was made by a member not connected with the committee that the report be adopted as read, on the protestation of another member of the committee that not even the committee members were agreed, it was voted to return the report to the committee for further consideration.

E. J. Frost, chairman, made a report for the Inspection Standardization Committee. This covers the same points as the report printed in the March 17 issue of AUTOMOTIVE INDUSTRIES, but the recommendations on some of these points were changed somewhat. Thus in connection with cylindrical holes it was recommended that cylindrical holes up to 3 in. in diameter should be inspected with "will and will not go" plug gages, the "will go" end to be the same as the smaller limit and the "will not go" end the larger limit given on the customer's drawing. Holes between 3 and 12 in. in diameter, bar gages should be used, in which there are two bars approximately at right angles to each other, held together by a handle pressed into a hole in the middle of each bar; one bar being the "will go" and the other the "will not go," the nature of the piece being inspected, principally the length through the bore determining the length of the handle, and whether the bars shall be close together, or at opposite ends. Larger holes than 12 in. in diameter should be inspected with measuring rods, or inside micrometers set to vernier calipers, or standard measuring machine. No wear should be allowed on gages beyond the limits on customer's drawings.

It was recommended that in case of disputes concerning matters having to do with inspection an arbitration committee of three should be appointed—one by the buyer, one by the seller and they to appoint the third member. The report of the committee was accepted as presented, with a number of changes over the printed text as indicated by Mr. Frost.

The next business to come up before the meeting was an amendment to the constitution whereby the number of members of the Executive Committee was to be increased from 8 to 12. It was explained that when the Constitution was adopted the Association had only the nine charter members, while now the membership had grown to more than ninety. The amendment was adopted unanimously and the convention then proceeded to the election of the new members of the Executive Committee. J. H. Dunn, John Christensen and C. R. Weiss were appointed tellers. The following twelve were elected members of the Committee: F. W. Sinram, E. J. Frost, Wm. Ganschow, J. B. Foot, C. E. Crofoot, Geo. L. Markland, Jr., R. P. Johnson, W. H. Diefendorf, Henry E. Eberhard, A. F. Cooke, F. D. Hamlin and B. F. Waterman.

At the same time that the number of executive committee members was increased it was decided to increase the number of vice presidents from one to two. Under the constitution of the Association the members of the executive committee elect the officers of the organization. F. W. Sinram was re-elected president, R. P. Johnson of the Warner Gear Co., Muncie, Ind., first vice-president, B. F. Waterman, second vice-president, and Frank D. Hamlin was re-elected secretary and treasurer. It was hinted that Mr. Johnson would act as an understudy to President Sinram during the year and would succeed him at the next annual meeting. Vice-president H. E. Eberhard, who was retired at his own request, was given a vote of thanks by the convention for his four years' services.

Next Meeting at Rochester, N. Y.

It was announced that an urgent invitation had been received from St. Louis to hold the next semi-annual convention in that city. The association, however, had already decided previously to meet in Rochester, N. Y., where they had been invited by officials of the Gleason Works. Under the heading of new business a motion was made that the association reduce its number of meetings from two to one per year. In support of the suggested change it was stated that it would work in the interest of economy, and also that, while the holding of two meetings per year might have been advisable when the association was young and had all of its work before it, much had been accomplished since then and it was no longer necessary to meet so frequently. The sponsor of the motion favored the fall meeting if his plan should be adopted. Another member was in favor of the spring meeting, for the reason that the committees could do much better work during the winter than during the summer, and therefore would be in better position to go before the Association with their reports in the spring than in the fall. Quite a number of members, however, voiced the opinion that interest in the work of the Association would flag if the frequency of meetings were reduced and it was voted to continue both meetings.

J. C. O'Brien, chairman of the committee on worms, worm gears and spirals, had been sick for some time and was not at the convention. In his absence W. H. Phillips gave a review of the state of the work of that committee. Ralph L. Dodge presented the report of the gear steels committee of which he is chairman. This report contained specifications of a series of steels recommended for gears. These are generally identical with the S. A. E. steels and are designated by the S. A. E. numbers. A No. 1100 steel had been in contemplation by the S. A. E. Iron and Steel Committee but was finally dropped. This steel therefore was also dropped from the A. G. M. A. list. It was suggested to issue two specifications which are intermediate between S. A. E. specifications, the A. G. M. A. 2350 and the A. G. M. A. 6150. Both of these have a carbon content of 0.45-0.55 per cent. Mr. Diefendorf wanted the S. A. E. No. 2320 included in the list, as it was widely used in gear manufacture, but he met with no support. E. J. Frost thought that a range of 10 points in the carbon content was entirely too great and expressed the view that steels at the extreme ends of the specification could not be properly heat treated at the same temperatures. In his plant they tested all steel for carbon content and never let bars with that wide difference go through. Mr. Dodge admitted that the range was rather wide for high carbon steel but said he did not consider it too wide for low carbon steel. That part of the report relating to the steel specifications was adopted as presented.

Standard Sprocket Tooth Under Development

C. B. Hamilton presented a progress report for the Hardening and Heat-Treating Committee dealing chiefly with the composition of gear bronzes. It had been proposed to change the name of this committee to Metallurgical Committee, and this proposal was adopted. A progress report of the Sprocket Wheel Committee was presented by C. R. Weiss, chairman. This committee is cooperating with corresponding committees of the S. A. E. and the A. S. M. E. Shortly after the fall meeting of the Association a meeting of roller chain manufacturers was held at the Engineers Club, New York, at which the new U. S. sprocket tooth form was agreed upon. This tooth form is still to be ratified by the S. A. E. and the A. S. M. E., and it is expected that it will be ratified at the spring meetings of these societies. Standard sizes of roller chain have already been adopted by the S. A. E. and will most likely be adopted also by the A. S. M. E. at its spring meeting. As soon as this is done the Sprocket Wheel Committee of the A. G. M. A. will be in position to issue information concerning standard chain sizes, details of cutters for standard sprockets and diameters for sprocket wheels. Two new members have been added to the committee recently, George M. Bartlett of the Diamond Chain & Mfg. Co. and Stanley P. Rockwell of the Whitney Mfg. Co.

The report of the Keyway Committee contained recommendations for the depth and width of keyways in shafts, the width to be made one-quarter the diameter of the shaft and the depth one-half the width. To avoid the need for carrying a very large number of sizes of key stock a table was incorporated in the report giving the sizes of keystock recommended for shafts from ⅜ to 12 in. in diameter, inclusive. All sizes of key stock are square. For taper keys a taper of ⅛ in. in a foot was recommended, which is very close to the British standard taper for keys, 1:100. The report also contained the S. A. E. square, spline and taper fittings.

B. F. Waterman thought that in the larger sizes the keys should be of rectangular instead of square section, of smaller depth than width. He said that many gear manufacturers had issued catalogues containing rules for width and depth of keyways, and suggested that all members having such keyway tables send a copy of same to the Keyway Committee. C. B. Hamilton, Jr., thought the table contained too many sizes of keys and suggested that some be eliminated. One member objected to the limits of 0.001 in. on the broached holes of the S. A. E. fittings. The report was referred back to the Committee.

John Christensen reported for the Committee on Composition Gearing. This Committee has completed its standardization work except as regards the strength of composition gears, and in this connection arrangements have been made with the Engineering Department of Purdue University whereby the latter will conduct a series of of tests on such gears.

A banquet took place at the Sinton Hotel on Friday evening, the speakers being Edward S. Jordan, president of the Jordan Motor Car Co., and Charles Woodward, vice-president in charge of personnel of the Hydraulic Steel Co. Mr. Jordan's subject was "Looking Ahead." He said few automobile companies are producing one-half as many cars as last year. During the past six months only 191,000 cars were built, as compared with 900,000 during the same period a year earlier. He was convinced that the present flurry would last only for a short time and that people generally would not pay the present prices. The man who expected to liquidate his inventory at the old prices would eventually discover that his overhead will net him as large a loss as if he took the loss on the inventory now. Mr. Jordan said there was a great upheaval going on in the automobile industry right now and many men were changing places, but he did not look for any consolidations.

Mr. Woodward spoke on the Human Element in Business. He dwelt upon the futility of the doctrine of the equal distribution of wealth and emphasized the great economic wastage due to the difference between what men can do and what they will do. If the difference be placed at 25 per cent of the former value, the wastage amounts to five billion dollars a year. Referring to the experiences of his own company, Mr. Woodward said, "Confidence is one of the big things you want to build in your workmen. One of the greatest troubles of our present system is that the superintendent insists on doing the thinking for his men, and until this condition is remedied no real progress can be made in the solution of the problems confronting capital and labor."

Loose Leaf Gear Handbook

At the final session on Saturday morning the report of the Library Committee was presented, by B. F. Waterman in the absence of chairman E. W. Baxter. This committee has in hand the preparatory work on a handbook on gearing which is to contain much of the so-called "useful information" that has heretofore been published in the catalogues of the individual members. A scrap book containing much of the material to be included in this handbook was shown. The question whether the volume should be in the form of a loose leaf book or a bound book was again taken up, and it was decided that a loose leaf book would best meet the requirements. The Metallurgical Committee, among others, expects to have valuable data from time to time which it will be possible to incorporate quickly in the hand book if it is of the loose leaf form. It would probably take years to get all the material for the complete handbook together, while a start could be made on a loose leaf handbook in the near future.

During this session two papers were presented, one by A. R. Mitchell of the Andrews Steel Co. on Industrial Gears from the Users Standpoint, and the other by J. B. Foote of the Foote Bros. Gear Co. on Worm Gearing. We expect to print extracts from Mr. Foote's paper in a later issue of AUTOMOTIVE INDUSTRIES.

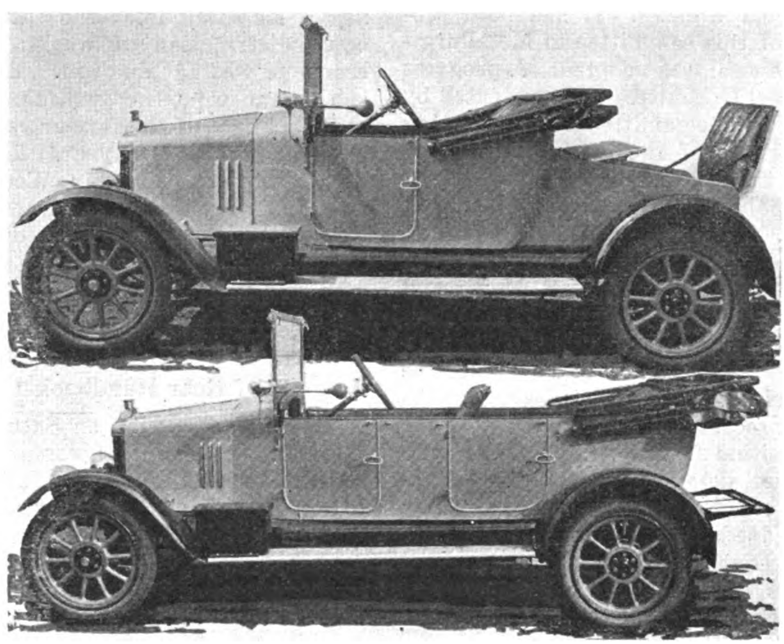
One Example of British Light Car Practice

The Standard, one of the early designs of light car produced in England is typical of one class of vehicle which has become very popular there. Has high speed 10 hp. engine, 108 in. wheelbase and 48 in. tread and weighs, with four passenger convertible body, 1820 lb.

By M. W. Bourdon

ALTHOUGH in certain of its features the Standard light car possesses pronounced individualities, it can be said to exemplify a type of chassis which, especially since the war, has increased amazingly in popularity among British purchasers. In its various stages of development the Standard has kept step with the light car movement in Great Britain. This movement began to make itself seriously felt at the end of 1913, a previous spell of popularity of small, two-seated cars having proved evanescent. The modern light car has its foundations in the various chassis introduced in 1913 with small, four-cylinder engines rated at 10 hp., having a capacity of under 1100 cu. cm. (approximately 67 cu. in.) and a normal crankshaft speed of about 3000 r.p.m.

The original Standard was one of these early light cars, having at that time a four-cylinder, water-cooled block engine of 62x90 mm. (approximately 2 7/16 by 3½ in.). The chassis had a wheelbase of 90 in., and obviously was not intended for nor fitted to accommodate other than a two-seated body, to which occasionally a dickey seat was added.

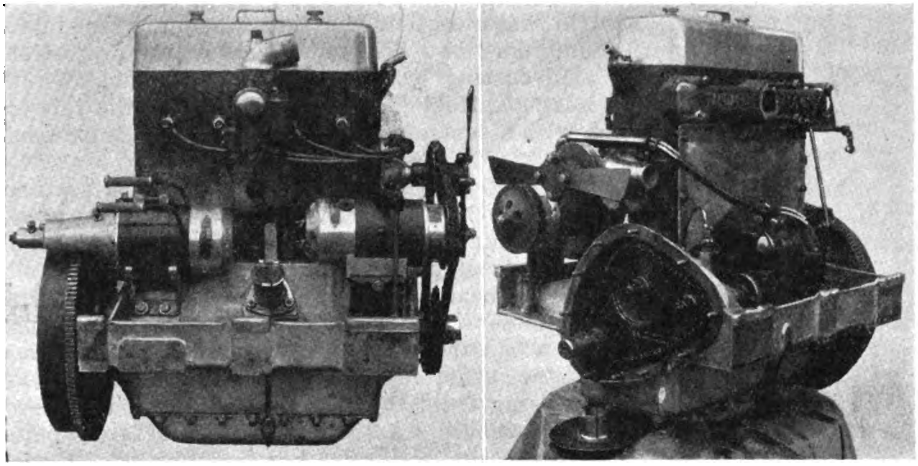


(Above)—Standard light car with two-passenger body and double dickey seat. (Below)—Standard four-passenger light car.

The 1921 Standard, apart from its engine, shows very few departures in fundamentals from the original of its type made in 1913. The chassis has, however, grown considerably, for it now has a wheelbase of 108 in., the track being 48 in., and the stock bodies include a four-passenger model as well as a two-passenger with a two-seated dickey. With this selection of body work, it is a type which is making a very forcible appeal and becoming exceedingly popular with a class of buyer looking for certain standards of comfort and passenger accommodation, with economy in running costs.

The following particulars of the Standard chassis (which has been worked up to an output of approximately 70 per week) will make it evident that the British light car is quite a different proposition from the type of vehicle known as a light car in the United States. Originally it was quite a microscopic automobile, while even now it is still smaller, particularly in engine capacity, than those cars designated "light" in the United States. The 3-litre type of engine and chassis, which to outsiders appears only just to be coming into its own in America, obtained a good foothold in England at least ten years ago, and at the present day this type is looked upon as something far removed from a light car.

The Standard has a four-cylinder, valve-in-head engine, with a bore and stroke of 2.7x4.3 in., which gives a cylinder capacity of approximately 97 cu. in. The valves have their seats directly in the detachable cylinder head, and are actuated by overhead rockers and push rods. Plain, spherical ended followers are used; they are set into cast iron guides and have cupped upper ends for the solid push rods, which apply through cupped extensions to spherical studs screwed into the undersides of the rockers. The accompanying illustration shows the design of the rockers and rocker shaft. The latter is carried in three bearing brackets and is bored and threaded internally at one end to receive the union for a connecting pipe to the engine lubrication system. Oil is delivered into the stationary shaft at this end and is led through a counter bore to a deep groove running along the upper surface of the shaft. The lubricant then serves for the rockers, not only their pivot bearings, but also their push-rod ends, the rockers being drilled to convey oil to a thick felt washer located around the spherical stud between the rocker and the push-rod cup.



(To the Left)—Right side Standard light car engine. (To the Right)—Half front view Standard light car engine with chain cover removed. View shows supplementary water outlet at front end of cylinder head.

All moving parts of the overhead valve gear are, therefore, lubricated under pressure, the excess of oil exuding from the rockers finding its way back to the crankcase through the space—enclosed by an aluminum cover—up which the push rods pass on the left side of the cylinder block. The latter is an iron casting separate from the crankcase, which is a three-part unit of aluminum, the lowest section forming an oil sump. The upper section of the crankcase is formed with a webbed bracket extension on each side, enabling the engine to be carried directly in the main frame.

The crankshaft, having a flange to which the flywheel at the rear end is secured by four bolts, is carried in three white-metal bearings from the upper half of the crankcase. It is drilled for forced lubrication to the main bearings and crankpins, while leads from the main circuit are also taken to the three camshaft bearings. From the big end of each connecting rod 3/16-in. diameter copper tubing carries the oil to the piston pins; the latter are hollow, of 1 in. diameter and are a driving fit in the bosses of the aluminum pistons, which are of the straight-sided, split-skirt type, with three rings on the crown and one inside the skirt. To prevent axial movement of the piston pin, aluminum end caps are fitted. The big ends have two bolts each, and their anti-friction metal is carried in bronze shells spaced by thick, solid shims.

A single silent chain passing over three sprockets serves for the distribution, the third sprocket being that of the magneto drive shaft, which, together with the magneto itself, is carried by an aluminum bracket capable of being moved bodily toward either side for chain adjustment. This sprocket shaft is carried by two phosphor bronze bushings with a space between them into which oil is led from a branch pipe, a second branch delivering lubricant to toothed side of chain.

For lubrication purposes a gear type pump is used, driven by dogs on the rear end of the camshaft. The pump casing embodies a compartment for a small filter on the suction side, an exterior copper pipe from this chamber leading from an elbow located outside the sump and having attached to it a long, cylindrical filter projecting into the oil.

From the delivery side of the pump oil passes into a duct formed in the crankcase casting to the underside of a plunger which serves (1) to form a relief pressure valve when it is raised by oil pressure to uncover a port through which excess of lubricant returns to the crankcase and (2) to operate a vertical rod connected to an oil circulation indicator arranged on the dashboard. No spring has been found necessary to back this plunger valve, its own weight serving to maintain the oil pressure in the circulation system at the desired maximum.

From the relief pressure chamber (which is simply a hole drilled from above in the thickened rear wall of the crankcase) the lubricant passes to the rear end main bearing and thence to an exterior pipe on the left

(To the Left)—Standard light car single plate clutch removed as unit from flywheel, to which it is secured by three bolts. (To the Right)—Center of Standard rear axle showing rear end propeller shaft joint and oil sump at front of axle casing center

of the crankcase with the leads to the other journal bearings and to the camshaft. From the front end branches run to the overhead rocker shaft, the silent chain and the magneto shaft bearings. The last-mentioned lead has in its length a cock which, when moved to a horizontal position, diverts the oil passing through, and allows it to issue through a small hole to indicate that the lubrication system is operating at this end of the engine.

The crankcase sump, which is separated from the crank chamber by a perforated gauze strainer, contains approximately three quarts of lubricant, and is provided with two means of indicating the oil level, the first an overflow cock with an extension handle brought up to a point near the filling elbow, and the second a float-operated plunger pin projecting alongside a graded plate. It will be observed from this that both oil circulation and oil level indicators are duplicated.

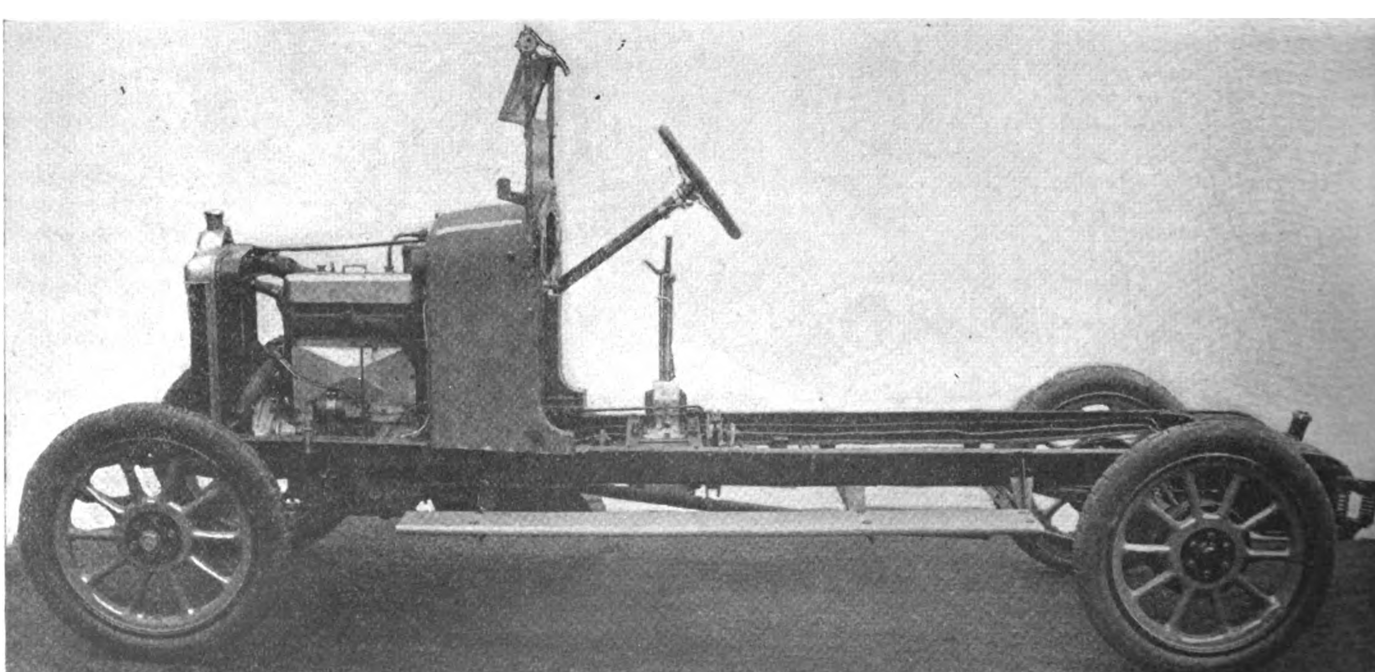
The carbureter, a horizontal type Zenith, with vacuum feed from an eight-gallon tank, has no provision for heating the ingoing air, but to assist vaporization the carbureter flange on the cylinder head is integral with the water outlet, and the entering mixture, before passing left and right within the head casting to the valve pockets, must pass round either side of the central water outlet, the latter being surmounted by an aluminum elbow held to the seat on the projection of the head casting by a single central stud and nut. The exhaust manifold is a separate unit on the left of the head, with a central outlet and flange for the exhaust pipe.

Water circulation is by thermo syphon, but a feature to be observed is that, while the main outlet to the radiator is through an elbow on the right of the cylinder head, there is a supplementary outlet of ⅜ in. bore at the front of the head casting, with a separate connection to the radiator tank. This arrangement appears to eliminate "pockets" in the water jacket; without the supplementary water outlet, head distortion and its accompanying evils arising from the formation of local hot-spots has been experienced. A simple two-bladed fan is belt-driven from a pulley at the front end of the crankshaft, this belt also serving for the dynamo, which is arranged on the right of the cylinder block on a bracket having lateral adjustment, the dynamo being secured to it by two vertical studs and a yoke. On the same side is the separate starting motor with a Bendix drive to the flywheel. The spark plugs are also on the right-hand side, being screwed into the cylinder head casting horizontally.

As may be inferred from the foregoing, the engine is a separate unit from the gear-set, the flywheel running exposed and enclosing the single plate clutch, to which the gear-set is coupled by a short shaft with a flexible disk joint at each end.

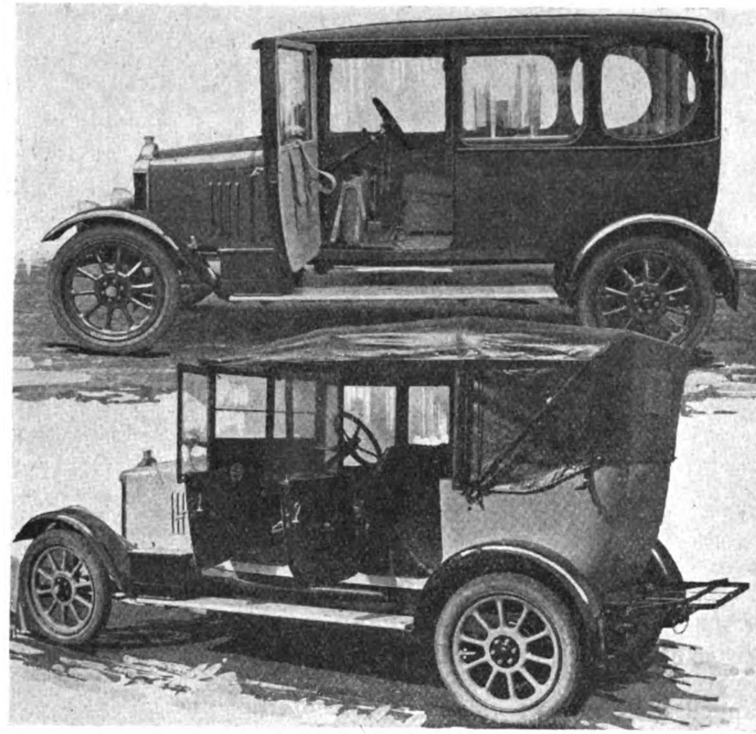
The single plate clutch is one designed and made by the Standard company, and has six direct-acting exterior springs separately adjustable. The driving plate floats axially upon the clutch shaft, having a hub boss internally splined to convey the drive to the shaft. Clutch withdrawal is effected by three exterior multiplying levers, each with adjustable studs taking effect upon thrust pins which abut the inner driving plate at their forward ends. This driving plate and the rear cover plate, which forms the second driving member, are faced with fabric rings, the driven plate being a steel unit.

The three-speed gear-set is slung by four bolts from two angle plates which form cross members of the frame. The gear shift lever shaft is carried in a bracket exten-



Left side Standard light car chassis.

sion of the lid of the box, the lever being on the right-hand side of the frame. All the gear shafts, with the exception of the reverse intermediate pinion, run on ball-bearings, though the pilot bearing is a phosphor bronze bush. There is nothing departing from usual practice in the general design of the gear-set, except, maybe, that its casing is a single unit with top and bottom cover plates and having its main shaft bearings housed in bolted-on cast-iron extensions. In assembling, the pinions are threaded over their shafts, the latter being entered through the bearing cap holes at either end. There is an external brake behind the gear-set, with deeply flanged shoes of aluminum with fabric liners. To the rearward extension of the drum is attached the front fabric joint of the open tubular propeller shaft, which has a similar joint at its rear end. The final drive is by overhead worm gearing with a straight worm (ratio 3.83 to 1), while the rear axle is of the semi-floating type with ball-bearings throughout.



(Above)—Standard chassis with sedan bodywork. (Below)—Standard four-passenger car with top raised and doors and side panels open.

The axle casing has an aluminum center with tapered steel extensions. To provide additional oil capacity the central casing has a forward extension or sump, in which a large filling orifice is arranged, in addition to one immediately over the worm. To prevent oil leakage from the central casing cast-iron flanged sleeves are provided at each side of the differential, backed by springs which tend always to keep the flange of each sleeve in good contact with internal webs of the casing provided to form a backing at each side for the ball thrust bearings. The rear wheel hubs are secured by nuts to the outer splined ends of the drive shafts, the hubs having flanges into which are screwed the studs holding the detachable wheels in place; over these studs and the hubs are threaded the brake drums, the studs thus taking both driving and braking torque. The rear wheel brakes are of the internal type, with a pair of cast-iron shoes, cam-operated, the open side of each drum being enclosed by a sheet steel cover plate to exclude dust and dirt.

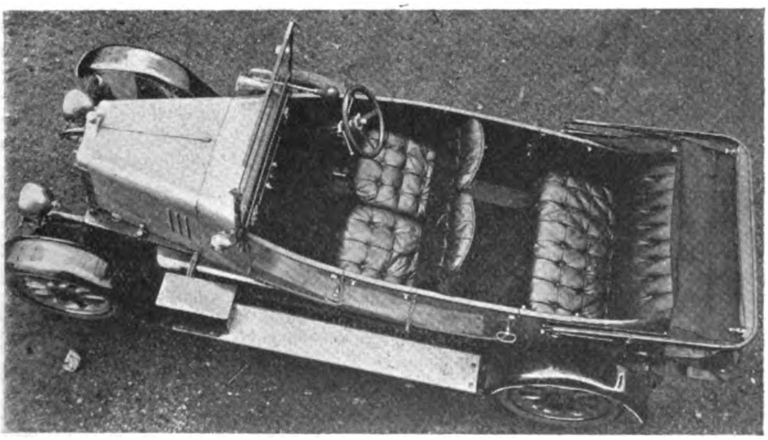
The front axle is of an H section steel stamping, through the single ends of which the pivot pins pass with plain bushings in the jawed swivel axles. A ball thrust bearing to carry the weight and having an adjustment is located below an aluminum top cap.

Semi-elliptic springs are used fore and aft, those at the back being underslung and supplemented by a pair of helical springs at the rear end of each, these coil springs displacing the usual shackle. Drive and torque are taken through the front halves of the rear spring.

The steering gear is of the worm and full worm wheel type and has nothing out of the ordinary in its design, unless it be that the steering column has the ignition and throttle rods running parallel alongside, with ball-ended levers extending below the wheel.

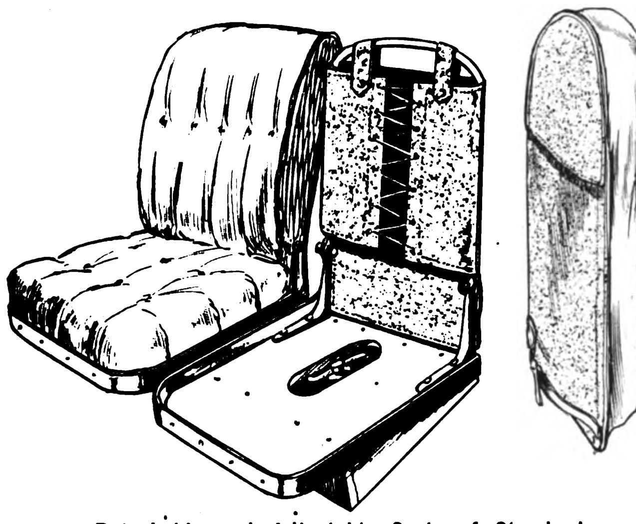
The frame consists of two flat-top, pressed-steel members narrowed at the front; cross members are numerous and varied, three of them serving also as stepboard supports, the remainder, beyond those already mentioned for the gear-set, including the one under the radiator, another with gusseted ends behind the axle and a cross tube, running between the rear dumb irons with extensions to carry the spring swivel plates.

In the four-passenger Standard bodywork are two special features, one of which is also found in modified form in the two-seater. In the first place, the separate front seats of the former are separately adjustable fore and aft and detachable. An accompanying sketch showing these seats is almost self-explanatory, but it may be said that there are no springs in the upholstery of the back rest, the flexibility in the hinged frame being considered sufficient to warrant the elimination of upholstery springs. The laced band allows for adjustment of the back rest to meet the ideas of individual owners, the loose upholstery having an inverted pocket which drops over the top of the frame and a strap below to prevent movement at that point. The seat cushion itself is square in plan, so that it can be turned about to bring any side to the front, and is upholstered with springs, as usual. It is of the same depth on all sides, the slope of the baseboard being sufficient to give the needed inclination from front to back.



Bird's-eye view of Standard four-passenger light car.

Two threaded sockets are fitted to the floorboards for each seat, and into each of these passes a T-headed adjusting and locking bolt through a slot in the baseboard of the seat. Thus a wide range of fore and aft adjustment is provided and a limited range without actually displacing the bolt.



Detachable and Adjustable Seats of Standard Light Car

The other special feature of the body is the provision of detachable and transparent side panels in place of the usual curtains. The panels have light, leather-covered metal frames, and those over the doors are arranged to open with the latter. The front one on the left, for instance, has a flap by which it is secured to the vertical frame of the windshield by two turn-buttons and a metal-edged slot which moves over a slide block on the door as the latter is opened; at the top rear corner is a spring catch which automatically secures the panel at this point when it is closed to the temporarily fixed panel alongside the front seats; in opening the door, this top corner lags somewhat and then clears itself from the catch.

The panel alongside the front seats has the rear door panel secured to it by an integral leather strip, which forms the hinge of the panel over the door. A similar slide block and snap catch are provided for this panel, and also for the corresponding one on the other side of the car. At each side of the rear passengers is a curtain of black material which folds back with the top. To prevent draughts from passing in between the side panels and the top, a separate "weather strip" is provided which can either be left in position when the top is folded or detached by releasing the snap buttons securing it in place. The two-seater body has a similar transparent panel over its door on the left, but the corresponding panel on the other side is a fixture for the time it is in use.

Provision is made for storing the side panels when out of use by forming a compartment behind the rear seat, which can be reached by lifting the hinged back upholstery, as shown in an accompanying illustration..

This special top, with its detachable side panels opening with the doors, is proving a great sales feature of Standard cars, for the arrangement not only overcomes the drawbacks of the usual side curtains when passengers are entering or leaving the car—there is no need to fasten or unfasten turn-buttons or snap catches—but the passengers are shielded from wind and weather almost as completely as in a sedan. There can be no question that a considerable proportion of sales are influenced to an appreciable extent by the fact that the top and the side panels provide, in the few minutes required to erect them, practically all the benefits of a sedan or coupé body.

The following are some particulars of the chassis and complete cars:

Weigh tof chassis, 1270 lb. Weight of two-seater, 1700 lb. Weight of four-seater, 1820 lb. Overall length, 142 in. Overall width, 60 in. Tire and wheel size, 710 x 90 m.m. (28 x 3½ in.). Ground clearance, 9½ in. Gear ratios. High, 3.83 to 1. Middle, 6.76 to 1. Low, 12.95 to 1. Reverse, 17.27 to 1. Maximum road speed, approximately, 50 m.p.h. Road speed on high at 1500 r.p.m., 32.6 m.p.h. Fuel consumption at 25 m.p.h., average speed on normal British roads, 29 miles per gallon

The Tracking and Steering of Trailers Analyzed by a Graphic Method

Part I

An engineering investigation of factors bearing upon the steering and tracking of various trailer outfits. Free trailing more suitable for short hauling outfits; and steady steering for slow hauling.

By Marius C. Krarup

THE Trick to Trek in the Track of a Truck or a Tractor with a Trailer or a Train, such might have been the alluring caption of alliterative design placed over this page, but for fear of deluding prospective readers into the belief that the subject lends itself charmingly to light and literary discussion. There would be disappointment. The burden of the unassuming theme is purely utilitarian. Its interest depends a good deal on the fact that various systems for tracking are in use and that each of them is advocated with some show of favoritism based on conviction. A choice exists, and one may be called upon to express it in one's own behalf in the form of a purchase. The choice may even come up in a larger way calling for Congressional committee work and voting, for the subject has a military angle with a throw-back relating to motor trucks and exports.

On examination it may be found that each system has its special uses. One may be compatible with considerable speed, another preferable for slow vehicles. Then there is the weighing of an advantage which can be enjoyed only in exceptional circumstances, against a disadvantage which is normal.

The system permitting the closest tracking also permits the shortest turn, it is usually assumed, and ability to turn sharply when necessary is the main object in view. Hence find the closest tracking system, it may be said, and be done with it. But perhaps the assumption should not be accepted without reservation, since there is no tracking in a turn on the spot, for example. A "once over" of the subject in print and diagrams cannot help facilitating conclusions. Here and there among the trite and true something slips in which is good to think with and over when decisions must be made.

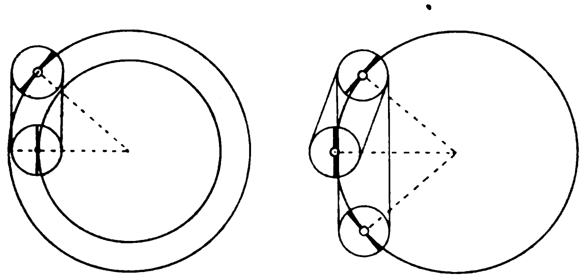

Fig.1 Fig.2

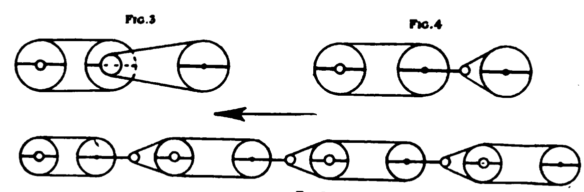
Figs. 1 and 2—Simplest forms of trailing, Fig. 1, and tracking, Fig. 2. In any ordinary automobile or truck the rear wheels, though they are the driving wheels, trail freely in the general direction of the front wheels. When the latter follow a circular path, they follow a smaller circular path. The vehicle, with all four wheels under steering control, tracks on one circular path, once it is there. It can make as short a turn as the ordinary vehicle with its wheels turned only half as much in relation to the vehicle body as the front wheels of the ordinary vehicle are turned. Or its wheelbase can be doubled and it will still run on the same circle with its steering angle the same as that of the free-trailing vehicle. The principle of steering leading wheels to one course and following wheels to another course to make both pairs describe the same course is the paradoxical principle employed for obtaining all tracking effects, with variation only in the mechanical means.



Figs. 3, 4 and 5—Fig. 3 shows the symbolic figure representing a tractor cab or short truck with a semi-trailer hitched to it by means of a fifth-wheel coupling approximately in line with the rear wheel axle of the tractor unit. Rear wheels trail freely after the front wheels and the semi-trailer wheels freely after the rear wheels. No tracking is attempted. Fig. 4 represents a truck or automobile pulling a two-wheel trailer. The trailer tracks more or less closely after the rear truck wheels, because the pintle hook swings to the left, in relation to the trailer, when the truck turns to the right. Fig. 5 represents a tractor with a train of three four-wheel trailers, which may have either fifth-wheel steering or automobile steering linkage. All rear wheels trail freely, but front wheels of next unit track after them approximately. The total effect is far from tracking, but trains of trailers are used only for very favorable conditions, excluding sharp curves and grades.

Perfect tracking is secured by rails and flanged wheels but by no other means in common use, although the flange can be on the rails or may be separate and adjustable. The railway method of mounting four or eight wheels as a unit restricts the freedom of each wheel somewhat but not vitally. For each wheel that skews the rail one way, on a curve, there is another that skews it oppositely. But on relatively soft highways skewing is in lesser degree permissible, and each wheel should be free to roll tangentially to its curve.

Tracking produced not by the road itself but by a mechanical connection whereby a leading wheel steers a following wheel is faulty at the outset, because steering of the rear wheel is begun too soon, starting at the same

moment as the steering of the wheel in front of it, instead of in the same place. Tracking in the space of the wheelbase is necessarily sacrificed for a brief interval after each steering gesture. The rear wheels of the ordinary automobile, motor truck and tractor begin at once to cut into the curve described by the front wheels when these are turned. The tracking of a trailer is therefore often understood as tracking with the rear wheels of the leading vehicle, but the rear wheels of the trailer will cut into the tracking curve unless they are also steered. If tracking with the steering wheels of the tractor is forced, the interval of non-tracking at the beginning of each turn is lengthened and aggravated, but it is conceivable that the front wheels of the trailer can be made to track with the front wheels of the tractor and the rear wheels with the rear wheels of the tractor, if the wheelbases of the two vehicles are alike, and this possibility is attractive enough to look into. The plan of over-steering the front trailer wheels in order to make the rear trailer wheels track better is in fact one of the two represented in practice. Something of this kind must be done to solve the rather intricate problem of making a steering gesture now and getting the desired result a second or two later. Putting the problem in these terms, one perceives readily that geometry alone offers no clean-cut solution. Both in thought and in practice compromise must have the last word.

The other plan represented in practice is to steer all the trailing wheels. With a vehicle having all four wheels steered, the rear wheels start a turn by crossing the front wheel tracks, joining them again where these begin to curve. A train of such vehicles, with all steering gears connected, would zigzag throughout at the beginning of every turn and until all train units were on the curve. The initial steering gesture would meet prohibitive resistance. But by connecting from the frame of one vehicle to the steering gear of the next, a workable combination is obtained.

Fundamental Facts in Trailing

Figs. 1, 2, 3, 4 and 5 serve to illustrate some of the fundamental facts pertaining to trailing and tracking.

Without simplifying the plan views of vehicles and of the tracks they make, one cannot make much headway in looking into the details of the subject, or inducing others to look into them. Each vehicle is therefore represented in the accompanying diagrams by a partly symbolic figure suggesting the nature of its steering elements rather than picturing them, and each pair of wheels is condensed into one wheel midway between those of reality and making a single track. The indispensable dimensions of the vehicles are represented, however. On this plan a much larger number of diagrams than there is space for in these pages may readily be made and tried out, representing different tracking methods, different turning radiuses and maneuvers for each combination of vehicles.

Fig. 6 illustrates the turning of a truck with a wheelbase of about 13 ft. at a right-angled corner, the front wheels turning with a radius of 27¼ ft. and the rear wheels with a radius of 24 ft. It is seen that the turn can be made without any portion of the vehicle getting farther from the curb on either street than 13 ft., leaving 17 ft. clear for other vehicles on streets 30 ft. wide. Little or nothing could be gained by turning at a sharper angle, involving an average reduction of speed. If a trailer of the same wheelbase were attached, the outfit could not make the same turn without encumbering both streets more or else being made to track with its rear wheels close to the rear wheel tracks of the truck, at least at the point where the corner *C* projects. The principle employed for delaying the turning of the trailer

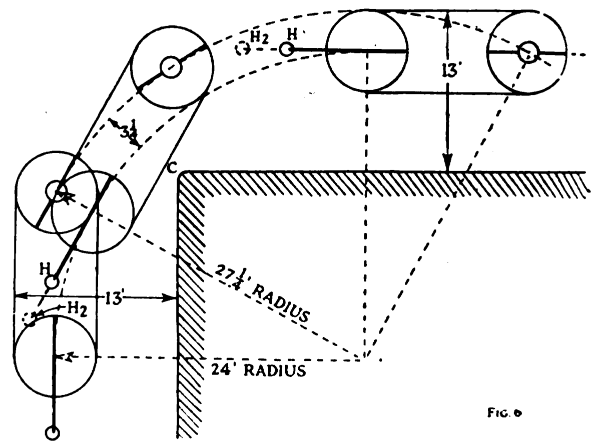


Fig. 6—A truck of 13-feet wheelbase turns a corner with one steering gesture and entirely on its own side of the road. The radius is 24 feet for rear wheels and 27¼ feet for front wheels. It is shown that a hook, H or H2, for attachment of a trailer, determines by its location how much trailer front wheels will be steered to the outside of the curve. And it is indicated that the overhang of the hook, in relation to the rear axle, must be very large to make trailer front wheels track after the truck's front wheels. To obtain this result, four-wheel steering of the trailer may be employed.

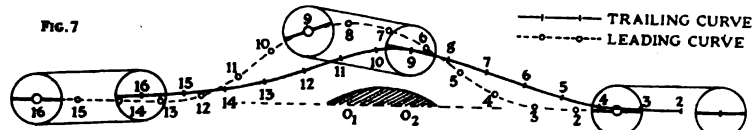
unit, and thereby obtaining the desired tracking, is indicated by the location of the hook *H* to which the drawbar of the trailer is attached. The greater its horizontal distance from the rear wheel axle, the farther the drawhead of the trailer is thrown to the left, turning the trailer front wheels in the same direction, when the tractor unit begins turning sharply to the right. If the tractor unit has a considerable overhang, as in many trucks, the hook may be at such a distance as that represented by *H2*, and the trailer front wheels are thrown to the left with notable velocity, involving a considerable overcoming of inertia and creation of momentum with reactions on the tractor unit taking effect in its materials and at the points of contact of its rear wheels with the ground, but these factors can be minimized by starting a turn gradually, which is, however, equivalent to making a less sharp turn and encumbering the road more. The principles are seen most clearly by contemplating a turn made as sharply as it is considered desirable to have turns made, in which respect the example of the truck alone is perhaps the ruling one or the ideal kept in mind.

Causes of Snaking

It is seen that turning the trailer front wheels in the opposite direction of the truck's turn immediately after a steering gesture results in snaking for a short period after each gesture, but the undesirable effects are minimized if the turn is evenly sustained and is made slowly. On the road, however, the driver frequently finds occasion, unless he anticipates every steering gesture required by the traffic or the nature of the road, to turn the front wheels of the tractor unit at an angle just as large as that which would produce a short right angle turn if sustained, and very shortly afterward he must make an opposite gesture whereby the snaking is prolonged; and his speed is likely to be considerably higher than at a deliberate turning of a corner.

Fig. 7 represents wheel tracks of a vehicle having free-trailing rear wheels and Fig. 8 those of approximate tracking in its simplest form. In both cases the path of the front wheels is chosen arbitrarily. Advantages and disadvantages for both methods appear plainly in these graphs, and it may be particularly noticed that the suc-



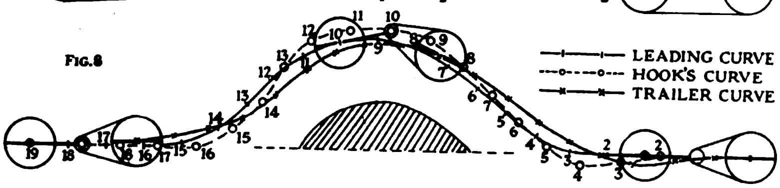


Fig. 7—Tracks of vehicle, with free-trailing rear wheels, making a turnout to avoid obstacle or hole in the road. Fig. 8—Tracks of leading and trailing wheels held in relation for approximate tracking and making a turnout, unnecessarily wide, around obstacle or hole in the road, and the path of the coupling hook which compels the tracking. The symbolic figure may represent a vehicle with four-wheel steering or the rear wheels of a truck drawing a two-wheel trailer. It is noticed that with tracking arrangement the trailing wheels travel more nearly the same distance as the leading wheels, but that the path of the hook is longer than either wheel path. The latter is true only for composite curves. By drawing the curves on a large scale and measuring distances between construction points on both leading and trailing curves, a comparison may be established giving interesting information on accelerations and retardations as well as the work of the drawbar spring, to equalize the varying inertia.

cession of at least four steering gestures, as required for a turnout on the straight road, causes more pronounced snaking than a single and sustained turning movement.

Certain conclusions are thus foreshadowed at the very first view of subject, to the effect that close tracking is suited mainly for slow hauling and that **the degree of forcible tracking employed for faster forms of transportation should be determined mainly by choosing the longest turning radius which is practically satisfactory and the smallest degree of forcing of the trailer wheels by which this radius can be realized.** A comforting mechanical possibility, yet to be exploited, lies in simple provisions for adjusting the tracking qualities to the nature of the service and the desired speed. A careful driver can naturally be trusted with a close-tracking outfit better than one who does not understand its effects after each steering gesture. An adjustment would consist in shifting the hook or pivotal connection of the two vehicles, on the principle that the farther it is from the rear axle of the tractor unit and the nearer to the front axle of the trailer the more the front trailer wheels will be forced outwardly from their natural trailing curve.

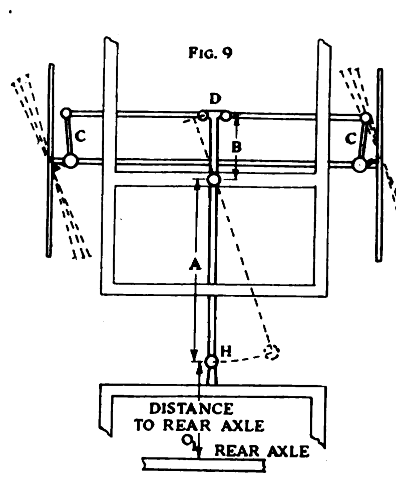
If the trailer is equipped with automobile steering linkage, double means are at hand for forcing the tracking. The overhang of the hook in relation to the truck axle may be reduced, and any desired effect in the steering of the trailer front wheels can nevertheless be obtained by varying the proportions in the elements of the linkage. In Fig. 9, the set of the arms *C, C,* in conjunction with the nature of the joints at *D* (or equivalent means used for moving the tie-rod laterally) takes care of the slightly different angles at which the two wheels must be turned on account of the axle being fixed—as in the use of the same system for automobiles and trucks—but the degree of turn effected by a given movement of *H*, the hook, is determined by the relative as well as the absolute dimensions of *A, B* and *C.* If the wheels are turned more than the drawbar, an effect of forcible steering, in addition to that caused by the overhang of the hook, is obtained, and a share of the stresses of various kinds due to such steering is shifted from the truck to the trailer, as compared with producing the same steering angle by means of axle steering (fifth-wheel) and a longer overhang of the hook. Evidently the equivalence of the systems does not extend beyond the limitation of the turning angle to which automobile steering linkage is subject, which is about 30 degrees, while axle steering has no inherent limitation of this sort, but aside from this reservation a formula for figuring the equivalent of one system in the other, for the same distance between the vehicle axles, can be reasoned out directly from a contemplation of the action and leverages involved, and it takes the following form:

$$O_2 = O_1 \times \frac{B}{C} \times \frac{O_1 + A \pm (B - C)}{O_1 \times \frac{B}{C} + A}$$

where O_1 is the distance of the coupling hook from the rear axle in the case of the automobile-steered trailer and O_2 the corresponding distance at which the hook must be placed in the case of the axle-steered trailer. The plus-minus refers to whether the draglink is behind or in front of the trailer front axle. If the distance between vehicle axles is to be longer or shorter, O_2 is simply to be lengthened or shortened in the same proportion. Applying the formula, one sees that if $B = C$, then $O_1 = O_2$. If O_1 is 4 ft., A 5 ft., B 1 ft. and C 9 in., then O_2 should be 4 = 24/31 ft. to make the steering effects the same in both cases.

(To be continued.)

IN calculating the cost of tractor work, the interest on investment, depreciation and storage charges per year should be divided by 45 (that being the average number of days' work of farm tractors per year) and to this added the cost of fuel, oil and wages per day. The cost of tractor plowing figured out to about \$2.50 per acre in 1920 and to from \$3 to \$3.50 for breaking. The U. S. Bureau of Agriculture recommends that interest charges be figured on one-half of the cost price of the tractor only, as the book value of the tractor decreases from year to year.



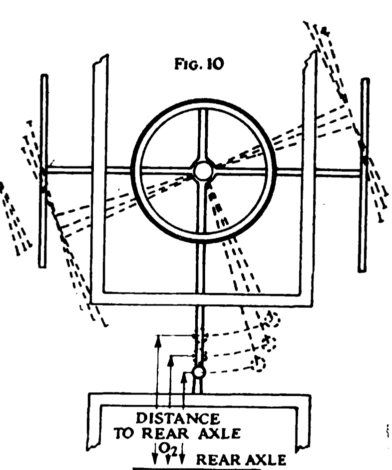


Fig. 9—Diagram of automobile steering linkage (same as Ackerman or wheel steering) for trailer. Fig. 10—Diagram of fifth-wheel or axle steering for trailer. In conjunction the diagrams are meant to show that diagrams suggesting axle steering can represent automobile steering as well, as with the same distance between axles identical steering effects can be obtained from the two systems. With a given relative movement of the hook H, in Fig. 9, different turns of the wheels can be obtained according to the leverages employed in the linkage. The same variations can be produced with axle steering, as indicated in Fig. 10, by increasing the overhang of the hook in relation to the rear axle of the leading vehicle, and thereby the movement of the hook. The formula for equivalent designs is given in the text.

Calibrating Carbureter Jets in Quantity by Actual Flow Measurement

Apparatus used by Zenith Carbureter Co. consists of a tank with constant head, device for holding jet, electrically controlled timing elements, and graduates for measuring volume of flow in unit time. Each operator can test 160 jets per hour by the use of one calibrating machine.

By J. Edward Schipper

ONE of the most important operations in the Zenith factory is that involved in testing fuel jets. The orifices in the jets are so small that ordinary methods of inspection are not applicable. The function of the orifice or hole is to meter the fuel and it is believed that the best way to find out whether or not these jets will measure out the desired amount when assembled in a carbureter, is to determine by actual test how much liquid under given pressure will be measured out in a given time. The accompanying view of the jet testing machine (Fig. 1) shows the apparatus used for this purpose. All Zenith jets are tested by this method. The machines consist of a large tank in which a float controls the inlet of the water (with which the jets are tested) in such a manner that the level is maintained at a given point A, Fig. 1. From this tank, four pipes extend downward and terminate in special valves B, under which the jets being tested are clamped. When the valves are opened, water flows through the jets into special glass graduates C which can be readily emptied by turning valves B at their lower ends.

The clamping of the jet is done by a lever, and a spring at the rear of the machine presses each lever into the valve, thus clamping the jet. Pedals D are provided for releasing and opening these clamps. In order to measure with accuracy the time during which the flow is taken into the graduate, a small sheet brass box, E, Fig. 2, is used. This can be swung under the jet and diverts the flow into a waste pan F. When this box is swung under the jet the water flows to waste, then the box is withdrawn for one

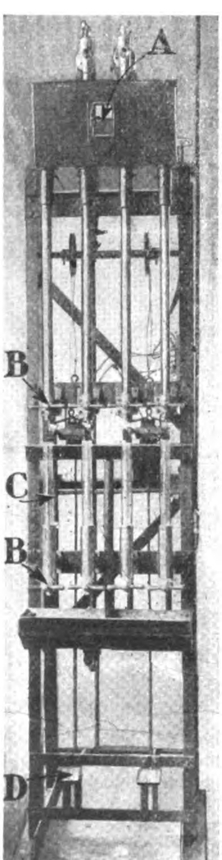

Fig. 1

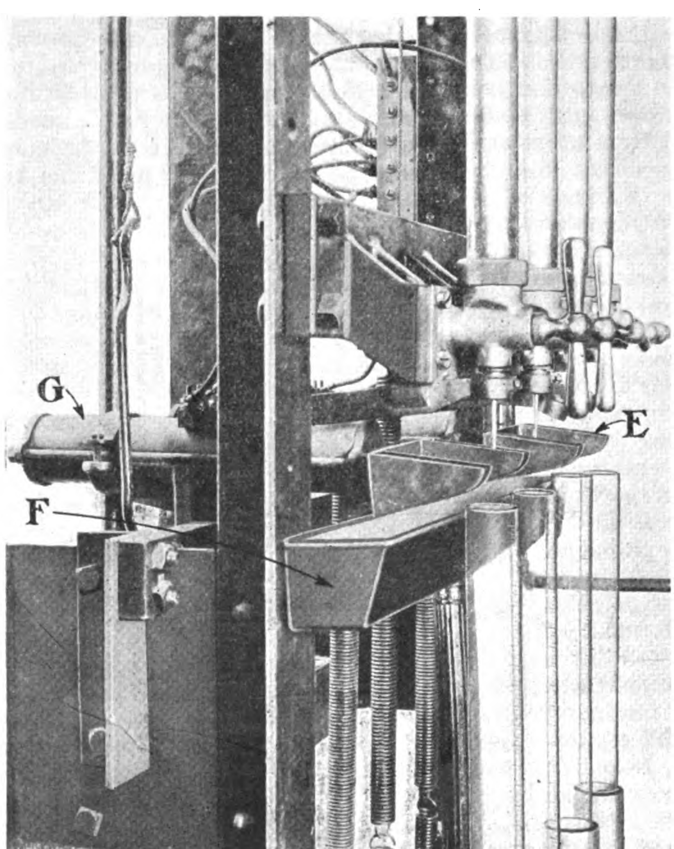

Fig. 2

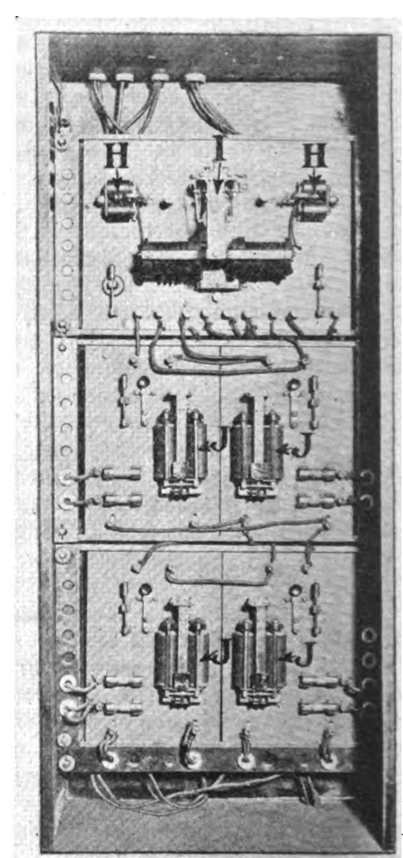

Fig. 3

Three views of the apparatus used in production tests of fuel jets used in Zenith carbureters

minute during which the water flows into the graduate. The movement of the box is controlled electrically by the use of armored solenoids G, two boxes being connected together and operated by the same solenoids, one solenoid for pushing the box under the jet and the other for withdrawing it.

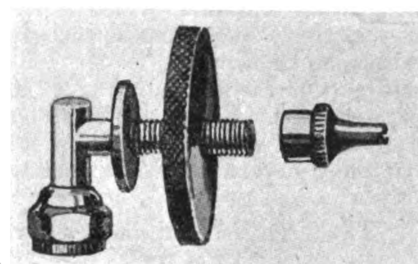
To control the time, the electrical apparatus shown in Fig. 3 is used. A master clock mounted in another part of the building, and having a standard pendulum, is used. The pendulum makes one oscillation per second, so that two contacts are used, one on each side of the pendulum; these contacts are connected to the telegraphic relays H which control the two solenoids of the distributor I. The armatures of the solenoids reproduce accurately the movements of the master pendulum, but with enough force to actuate, through suitable gearing, a distributor I, which sends impulses to one or the other of the four large relays J. These relays, in turn, actuate the solenoids of each testing machine.

On each machine the flow is sent to the graduates for one minute and diverted to the waste pan for one-half minute, thus making a cycle of ninety seconds. One-half of the machine is made to lag behind the other half by 45 seconds, for convenience in operation. One operator can, with each machine, test four jets in one and one-half minutes or 160 per hour.

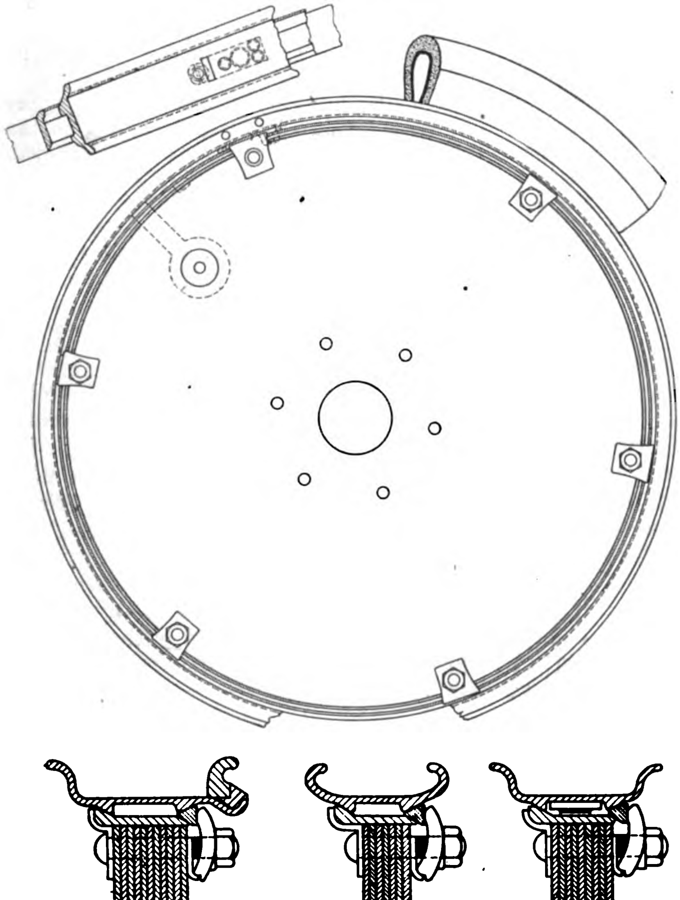
Laminated Wood Disk Wheels

WHEELS with laminated wood disks are manufactured by the Dayton Automotive Wheel Co. The disks are built up of thin, rotary-cut plies of wood glued together under pressure with waterproof glue. The grain of each layer runs in a different direction from that of the layer next to it. This process of lamination is said to make the complete disk very strong, non-warpable and resilient. The weight of these wheels is substantially the same as that of a spoked wood wheel, but the resistance to transverse shocks is said to be much greater.

In order to render inflation of the pneumatic tire convenient, a patented angle connection is furnished, which goes onto the tire valve stem and permits the tire to be inflated from the outside face of the wheel. The design of the wheel is such that the disk can readily be fitted to any standard hub and rim. The accompanying illustration shows the disk used in connection with a Firestone demountable rim. At the center the disk is clamped between the two hub flanges. The wheel is designed for use with demountable rims only and is not a demountable wheel. Among the advantages over spoked wheels claimed for this wheel is that road shocks are distributed over the whole wheel, instead of being localized at the felloe.



Angle valve connection for Dayton wheel



The Dayton wood disk wheel

Changes in the Bates Steel Mule

THE Model F Bates Steel Mule, made by the Bates Machine & Tractor Co., has succeeded the Model D. It is equipped with a Midwest engine. The fuel tank is hinged at the dash board, so that it can be raised when working on the engine valves. Different turning brakes are used than on the Model D. The braking system is now made so the operator can hold either crawler still and pivot around it with the other crawler. Other changes include the adoption of a water type air cleaner and a different make of carbureter. The rating is changed to 18 hp. on the draw bar and 25 hp. on the belt, and the weight is changed to 4850 pounds. A platform has been added and a few other modifications made to make the driver more comfortable.

The Model G is a heavy design built for industrial work exclusively. A power driven winch can be attached to the front end for logging and other work. The weight of the tractor is approximately 6500 lbs. and it has a rating of 25 hp. on the draw bar and 35 hp. on the belt.

As on the Model F, all working parts are encased against dust and run in an oil bath. Wheels, transmission and crawlers have roller bearings exclusively. The clutch is a hand operated, dry disk type. The driver's seat is made to swivel so that it can be pushed out of the way when the driver is standing on the platform. The pedals for holding either crawler still are located on the platform at the rear of the tractor. Hauling speeds are 2½ and 3½ m.p.h. and the reverse speed is approximately 2 m.p.h.

A BRITISH standard specification has been issued by the British Engineering Standards Association for benzol for motor fuel, commonly known as "benzole." The specification includes a definition of the term "benzole," and notes on its physical and chemical properties.

Use of Pneumatics Limited on Trucks of More Than 3½-Ton Capacity

This is general opinion among prominent truck and tire builders expressed in reply to recent questionnaire submitted by AUTOMOTIVE INDUSTRIES. There is wide difference of opinion upon almost every phase of the pneumatic tire question, especially as regards the attitude of the public.

THERE is considerable difference of opinion among authorities as regards the possibilities for usefulness of pneumatic tire equipment for trucks. Probably no question in the automotive field has aroused more discussion during recent years. A survey which has just been completed by AUTOMOTIVE INDUSTRIES brings to light some interesting opinions along this line, although much of the data collected serves chiefly to emphasize the great variety of opinion extant upon the subject.

Five questions were submitted to the leading truck and tire manufacturers of the country, and the replies brought not only considerable specific information but also some interesting discussion of the general topic. The questions were as follows:

1. What percentage of your 1920 output was fitted with pneumatic tires and what number of trucks would this represent?
2. On what capacity trucks were the pneumatics fitted?
3. What in your opinion is the largest capacity truck on which the pneumatic can be satisfactorily used?
4. What is the present attitude of the buying public with regard to pneumatics for trucks of capacity of 3 tons and up?
5. Is there likely to be gradually less use made of larger capacity vehicles and greater use of an increased number of medium capacity trucks?

There seems to be rather general agreement concerning the limitations of pneumatic equipment for trucks of more than 3½ tons. Only 11 per cent of those replying considered such equipment to be practicable on 5-ton jobs, while a number of these considered it advisable only under certain conditions. The answers as regards the maximum capacity on which pneumatic equipment is practicable showed the following results, the percentage figures indicating the proportion of those replying who considered the given capacity as the largest practicable for pneumatic equipment:

2½ tons	30%
3 tons	21%
3½ tons	19%
2 tons	17%
5 tons	11%
1½ tons	2%

These figures indicate that a majority of truck manufacturers believe 2½ to 3 tons to be the largest capacity on which it is feasible to use pneumatic equipment, while a considerable percentage place the limit at 3½ tons. The replies received, however, indicate that to a certain extent the opinion of the manufacturer is influenced by the limitations of his personal experience and by the type of truck which constitutes the bulk of his own production. This factor of error almost inevitably enters any such survey to a greater or less extent, but should be considered in analysing the results.

One company which has had a wide experience states: "We still believe that 3½ tons is probably the maximum size on which pneumatics can be particularly successful at present. As a matter of fact, we would not advocate the use of pneumatics on 3½-ton jobs unless the nature of the service was carefully analyzed and sufficient assurance obtainable that tires would not be badly overloaded and that operating conditions were such as to enable this equipment to justify its higher cost."

This comment is especially interesting since it comes from a company which has been extremely active in pneumatic tire propaganda.

Another interesting opinion states, in answer to this question: "As a general proposition, 2 tons, although for certain special applications pneumatics are satisfactory up to 3 tons."

There were numerous objections advanced to the use of pneumatics on the larger sized trucks, the most important of which are included in the following quotation from one letter:

1. "Excessive overloading. The pneumatic tire will not stand up under an excessive overload."
2. "Under inflation. A great many users fail to appreciate the necessity of high inflation pressures so that the tires fail in the same manner as when overloaded."
3. "Small cuts in tires, caused from sharp stones, etc., are neglected until they cause failure."
4. "Very few repair shops have proper equipment for repairing pneumatics, so that in many cases the user cannot get proper repairs even though he may be perfectly conscientious in the matter."

The general conclusion that might be drawn from the various statements and the statistics presented is that pneumatic equipment is generally accepted as desirable on trucks of less than 2-ton capacity; that a good proportion of manufacturers consider it feasible in most cases on 3 to 3½-ton jobs; but that a comparatively small number are sold on pneumatic equipment for trucks of greater capacity.

It is not possible to estimate accurately the percentage of trucks which were pneumatically equipped, since a majority of replies merely stated the percentage of their output which was pneumatically equipped without giving the output. A study of the percentage figures submitted, however, shows that out of 71 replies

10	equipped pneumatically under	9%			of total
10	equipped pneumatically between	10%	and	24%	of total
16	equipped pneumatically between	25%	and	49%	of total
11	equipped pneumatically between	50%	and	74%	of total
6	equipped pneumatically between	75%	and	89%	of total
18	equipped pneumatically between	90%	and	100%	of total

One of the tire companies states:

"Our deliveries of tires to truck manufacturers during the past year have run 75 per cent pneumatics and 25

per cent solids. However, the bulk of these pneumatic tire deliveries were of the so-called passenger tire sizes, that is, 35 x 5 and under.

"Our own estimates have been that about 50 per cent, at least, of all the trucks built were equipped with pneumatics."

Estimating as closely as possible on the basis of the data received, it would appear that about 60 per cent of the trucks of 2½ tons or less capacity were pneumatically equipped during 1920. This is, of course, only a rough estimate and would indicate that the figure of 50 per cent for all trucks is not far off, although it is probably high.

Attitude of the Buying Public

The replies as regards the attitude of the buying public indicated that very little analysis had been made of the problem from this angle. All degrees of enthusiasm for pneumatics were attributed to the public by different manufacturers. The three opinions in answer to this question cited here will visualize the varying ideas on this subject.

One truck maker who produces 1-ton, 2½-ton and 3-ton trucks says:

"Present attitude of the buying public toward pneumatic tires is that they are a good thing, and that more of them will be used as time passes. Undoubtedly pneumatic tires will be used on a larger percentage of motor trucks up to 3½-ton size in 1921 than ever before, and 1922 will certainly see a great increase in the use of pneumatic tires over 1921."

A somewhat modified view is taken by a manufacturer on a 1½-ton speed truck and a 3½ model. He states:

"From our experience we judge that the truck-buying public is in a fairly receptive mood toward pneumatic tires on heavy duty trucks, but until the truck manufacturer himself removes the question in the minds of the buyers as to the ability of the tires to stand up and prove their economy, we doubt if a very large active demand will be created."

While a third truck producer, who also makes three models, 1-ton, 1½-ton and 3½-ton respectively, takes an almost directly opposite view. He says:

"Personally I feel that the pneumatic tire proposition has been boosted very highly and has been overrated. . . . As far as I can see, I believe that pneumatic tires for heavy trucks is not looked upon as favorably to-day as it was a year or a year and a half ago."

This latter manufacturer is supported by another who states that he "must advise that we find a very decided reaction against the use of pneumatics of size larger than 38 x 7," which corresponds to the rear of a 1½-ton truck. And still another maker takes a still different ground with this statement: "We believe that they feel very favorable toward pneumatic fronts, however, they are very much against pneumatic tires for the rear."

With these typical and varying opinions from which to choose, it is impossible to state any decided trend as indicated by the replies on this point. The only trend which might be implied is that the public is equally divided in its opinion, and that there is no majority opinion among truck users on the subject at the present time.

More Light Trucks

The probability of an increase in number of light trucks to replace one heavy truck is not agreed upon very generally, although a majority of those replying to the questionnaire think the trend will be in that direction. Too much importance cannot be attached to this fact, however, since a majority of truck manufacturers produce medium and lightweight trucks.

The chief factors in bringing about the decrease in heavy trucks, according to the general opinion, are likely to be restrictive State legislation, excessive taxation, and inability or refusal to build roads adequate to stand up under heavy-truck traffic.

It is evident, however, that these factors can be controlled to a large extent. They are not inevitable developments, and will be influenced by the ability of the heavy truck to prove itself an essential factor of transportation. One producer says, for instance:

"The railroads are freely admitting that the motor truck is a logical solution of the short-haul problem and with this as only one incident, we believe, shipping by truck is on the increase rather than on the decline. This is naturally going to increase the wear on the highways and it seems to us that the solution is to build the highways to last."

Another statement is:

"Regarding the possibility of the future limitations in the use of heavy capacity vehicles with solid tires and the substitution of a larger number of pneumatic tired vehicles, I am of the opinion that such a result is hardly likely unless it is forced by unwise and ill-considered legislation. In that event, I believe the result will not be the deplacement of the larger vehicles by a proportionate number of smaller vehicles but will result in the curtailment of the old transportation by motor vehicles until such restrictions have been removed."

One heavy truck producer believes that "the reason so few words are spoken in favor of the heavy truck is because so few manufacturers are building heavy trucks." He goes on to say:

"Were we to keep silent and permit legislators to condemn the American public to the continuance of the short-sighted and extravagant policy of building flimsy roads and restricting freight transport to multitudes of light trucks, our business would not necessarily suffer, inasmuch as we build trucks down to 1½ tons."

An opposite point of view is taken by others, however, one of whom states on this point that "5-ton trucks and over will in several years be eliminated from our highways and the smaller trucks, preferably the 2½-ton size will be the common carrier." And this view is endorsed by another statement, as follows: "I am strongly of the opinion that eventually the greater majority of motor trucks will be pneumatically equipped and that the maximum capacities will be kept down to a reasonable point somewhere between three and five tons."

These replies have been quoted as being typical of the opinion expressed on both sides of the problem. None of the replies took up this phase of the question from the cost of transportation standpoint, considering the factors of speed and light weight, as opposed to large carrying capacity. The possibilities differ greatly, of course, in each particular case, yet the general transportation needs of users would seem to be at least an important factor in determining whether or not heavy trucks will increase or decrease in number. This is specially true when it is considered that truck users are also citizens and are likely to exert some influence in connection with legislation and highway building.

THE British Research Association for Liquid Fuels for Oil Engines Industry has been approved by the Department of Scientific and Industrial Research as complying with the conditions laid down in the Government scheme for the encouragement of industrial research. As the association is to be registered as a non-profit-sharing company the promoters have applied to the Board of Trade for the issue of a license under Section 20 of the Companies' (Consolidation) Act of 1908.

About Curled Hair for Car Upholstery

The bases, colors, uses and manufacturing processes of curled hair are briefly described in this article. The advantages of curled hair as an upholstery filler are pointed out, and the tools used are discussed.

By C. A. Podesta*

THE basis of all curled hair made is horse hair, cattle hair and hog hair. Horse hair comes from horse tails and manes, and there is a wide difference in the value and usefulness of tail hair and mane hair. Horse tail hair is stiff and straight, and its longer staple is used for hair cloth which goes into the lapels of coats for stiffening purposes, in which case it is woven with cotton thread; in some instances it furnishes its own woof and warp, in the making of a pure hair cloth with which to cover upholstery. It is also hackled or drawn into various lengths of brush hair, and is particularly suitable for this use because it lies straight and withstands the elements as well as oils and alkali soaps.

Probably the most important use of horse tail hair is as a basis for curled hair. Its stiffness when in spiral form gives it a great range of resiliency, and its ability to withstand constant depression and subsequent release, as well as its immunity to the deteriorating influences of the elements, makes it particularly good as a long lived upholstery filler.

Horse mane hair is less valuable than horse tail hair, because it is much softer, and its range of resiliency is much less. On the other hand, its affinity for other types of hair when mixed therewith makes it a good binder when used with cheaper, shorter hairs in various curled hair mixtures, and although of less value and less downright worth, it performs its function as above described well. Horse mane hair, because of its soft contact when used in curled hair, has recommended itself to a great many people as an upholstery filler, and has been in particular demand by our Government in the making of Navy mattresses.

Cattle tail hair, or the hair coming from the tassel at the end of the cattle tail, furnishes a most desirable curled hair material, in that it is longer lived than horse hair, possesses a wider range of resiliency, develops less breakage and is neither as hard as horse tail hair nor as soft as mane hair but rather a happy mean between the two.

Hog hair is obtained at the time of the slaughter of the animals and is thoroughly cured and sterilized before being used in the manufacture of curled hair. Hog hair is less valuable than horse and cattle hair only because of its shorter staple, and is used in various formulæ to assist in the reduction of price. If one were to take a piece of horse hair of the exact size and length of the hog hair, he would find them both of equal value, and the horse and cattle hair are therefore only more valuable than hog hair because of their greater length and the possibility of placing more convolutions in each long hair than one can in a short hair, thus increasing the range of resiliency in a mass of curled hair.

The three principal colors in which curled hair is manufactured and sold are black, grey and white. The hair of all animals necessarily grows promiscuously as regards color, and it becomes necessary to separate the white and black, leaving the balance of the colors to be known as "blend," "gray" or "colors," each of these names being used by people in various parts of the world to designate the mixed remainder. The mixed remainder necessarily represents the largest proportion of curled hair materials, and it therefore becomes necessary at times to dye some of these materials in order to have a sufficient volume of black, and sometimes a mixture of both is used.

White, on the other hand, is always a natural white, and is sometimes bleached for some fastidious user who fancies that white is the best grade of hair and is willing to pay a larger price for white according to its degree of apparent purity. White hair is invariably cattle tail hair, although some unconscionable sellers have told the trade that it is horse hair. By actual test we have found that only 3 per cent of the world's output of horse hair is natural white, and the labor involved in separating this small percentage from a large mass of materials would not be warranted.

The manufacture of curled hair consists in assembling various raw materials into a mass called a formula, thoroughly mixing them and spinning the mixture by hand and machinery into a rope, after which it is doubly twisted like a tourniquet and bound up in this form; it is next placed in a vat with chemicals designed to thoroughly sterilize it, and boiled for several hours with a view to setting the twist that has been placed in it, after which it is bundled and put in a room to season. The degree of rebound in curled hair is controlled largely by the length of time that it remains in rope form in the seasoning room.

Curled hair forms an ideal upholstery filler, and its use adds prestige to any car, for the reason that there is no substitute that will give the effect and result that curled hair gives between springs and tapestry or leather. Trimmers choose to use the newer type of woven curled hair, which consists of loose curled hair fastened to burlap cut to dimensions. Most of the cushion and back plaits are filled with woven curled hair, and it is possible to fill them with loose curled hair if desired, irrespective of whether the body is trimmed in leather or cloth, and it is conceded that this class of trimming is long lived and gives the desired comfort of riding.

Many types of stuffing tools are being used both for woven and loose curled hair, the most common type for woven hair being a flat metal stuffer in two parts which clamps the hair between them. When plaits are filled with loose hair this same implement is used, except that both parts are rounded a little. When cloth trimming is used, a high grade hair must be used, and because of the filling quality of this grade of curled hair, only a small quantity is necessary to give the desired result.

Curled hair possesses the three fundamental virtues necessary to make a perfect upholstery filler, namely, soft contact, resilience and self ventilation, and for this reason vegetable and metal substances have never successfully displaced it.

Many Benefits in Scientific Analysis of Truck Markets

One naturally would expect more efficient salesmanship and greater profits in sales in a well-studied territory, but the Packard plan which is here described has developed by-products that are especially interesting.

By N. J. Ocksreider*

UNDER the new conditions of business throughout this country, which call upon the manufacturer for production and selling on a far closer margin than has been required in the "sellers' market" of the last few years, there is nothing of greater importance than the elimination of guess work, both in selling and in production. This is nowhere more vital than with the motor truck. In spite of its many proven advantages and the great economies that it has brought about, it is not yet through the struggle necessary to establish itself firmly in the minds of many who should be buyers.

The truck market in the last few years has suffered intensely from the "by-guess and by-golly" system, both in selling and production. Some parts of America have been flooded—others have been starved. There has been very considerable waste all along the line. This has resulted in abnormal costs and frequent dissatisfaction and has had a powerful influence in producing the unfavorable conditions of the last few months. The elimination of these evils must be one of the first steps in putting the motor industry on a firm foundation for expansion under the conditions that we have just begun to meet.

Some time ago the Packard Motor Car Co. decided that it would pay to get the real facts about the market. A system has been worked out, after various experiments in restricted territories, and is now being generally supplied. It gives us at the beginning of each year full information on sales possibilities in each district. It is also kept up to date throughout the year and gives accurate control of the selling campaign from day to day.

Record of Trucks

Roughly speaking, we get from this system the number of trucks operating in each territory, the proportion of our own and of each competitor's trucks in the territory as a whole and in each line of business, the probable need of replacements for each truck owner, and the probable expansion in business. As a result of these things it is possible to make a very close estimate of the business that can be done in that territory in the ensuing twelve months.

The light that this system has thrown upon market conditions has been a surprise even to ourselves in many cases. It has shown over and over again how little we actually knew about any particular market and about the performance of the salesmen in it. It has revealed sales possibilities that were never suspected.

As an example, there may be cited a case in one of the big Eastern cities where three men were covering adjoining districts. On previous performance, two of these men could be considered stars—the third man hardly even a good salesman. But the third man was outselling both of the others and it began to look as if they had slumped and he had developed sudden brilliance. When the market was analyzed, however, it was found how that, although the three territories were about the same in size and population, there were differences in commercial interests which made the third man's territory about a 400 per cent better market than either of the other two. It also showed that the man who had been making the high records was actually placing only about 4 per cent of the trucks that went into his territory, while the two men who seemed to have been "falling down" were, in fact, selling 20 per cent of all trucks placed in their territory. As a result of the analysis, one man took over the territory where two had been and two took the territory which the one had handled. Within three months sales in the districts involved had increased more than 50 per cent.

The advantages obtained from this system have already been great. It is being expanded rapidly, and successful experiments have been made and showed that an even more direct and detailed survey of territory will be valuable.

Our system in the majority of districts is based on the registration figures for trucks in that territory. In starting an analysis a card (Table "A") is made for each truck user in the territory, giving his address and

his trade, also his classification, the make and size of all trucks that he uses and the date his vehicles were installed. The next step is the construction of a "TRUCK REGISTRATION MASTER TABLE" (Table "B"), showing in every trade the Packard standing in comparison with each of our competitors and with the total of the trade in that city.

In the larger territories we have found it worth while to list no competitors who had less than 50 trucks running, but in smaller territories it is often desirable to establish a minimum showing 25 or even 10 trucks. In

Table C

working from this table, inspection of the totals at the right shows immediately which competitors are the most active, and by running across the sheet it can be determined in which trades we are having the most success. The totals at the bottom of the table show those businesses which offer the best opportunities for the truck salesmen.

In making up this Master Table we have found it desirable to allow a total of 34 classifications, and of these groups several minor divisions are listed. The general classifications used are as follows:

- **Automotive**—Manufacturers and dealers.
- **Artisans.**
- **Bakers**—Manufacturers and dealers.
- **Brewers and Bottlers**—Manufacturers and dealers.
- **Building Material.**—Producers and dealers.
- **Chemicals**—Manufacturers and dealers.
- **Confectionery**—Manufacturers and dealers.
- **Contractors.**
- **Department and Small Retail Stores** (Except exclusive food and furniture stores).
- **Farms** (Excluding dairies).
- **Federal, State, County, City and Public Service Institutions.**
- **Feed and Cereal Products**—Producers or dealers.
- **Food, Prepared**—Manufacturers and producers.
- **Fuel**—Producers and dealers.
- **Furniture**—Manufacturers and exclusive dealers.
- **Grocers**—Producers and dealers (except farms).
- **Hotels and Amusements.**
- **Ice.**
- **Laundry and Dyers.**
- **Leather**—Manufacturers and exclusive dealers.
- **Lumber**—Producers, manufacturers and dealers.
- **Manufacturers, Machinery**—Manufacturers and dealers.
- **Manufacturers, Miscellaneous**—Manufacturers and dealers.
- **Marine.**
- **Meats**—Producers and exclusive dealers (except farms).
- **Metals.**
- **Milk and Milk Products**—Producers and dealers (including farm).
- **Paper and Printing**—Producers and dealers.
- **Passenger Transportation.**
- **Petroleum Producers, Refiners and distributers.**
- **Rubber**—Producers and dealers.
- **Textiles and Furs**—Producers and wholesale dealers.
- **Trucking.**
- **Unknown.**

For convenience in checking through the selling campaign there is also made up a table of competitive installation by trades (Table "C"). In compiling this the most active competitors are selected from the Master Table and it is then determined how many owners of vehicles each of these competitors has in each line of trade. This table shows those trades in which the most serious competition may be expected, because competitors have established a standing with a comparatively large number of the firms engaged in such trades.

As will be shown later, one of the most important functions of such an analysis is in making estimates for the next year's business, and for this purpose it is desirable to make a table showing the size of the fleets used in various lines of business (Table "D"). Finally, a statement showing the different size of trucks used in different territories is prepared (Table "E").

As an example of the concluding step in the operation, the following summary is taken from a survey actually made in one of the medium-sized cities:

Business	1 Truck	2 Trucks	3 Trucks	4 Trucks	5 or More Trucks	Total Owners
Farms	12	6	C	0	1	19
Stores	9	7	2	4	16	38

Table E

Truck Market Summary

	Capacity in Tons ¾	1½–2	3	4	5	6	Total Heavy	Total Light
Packard	..	518	324	159	368	3	1,372	..
First competitor	510	437	228	..	209	..	874	510
Second competitor	37	273	11	..	2	..	286	37
Third competitor	..	29	71	42	73	..	215	..
Fourth competitor	..	76	38	5	24	..	143	..
Fifth competitor	..	60	1	..	69	..	130	..
Sixth competitor	..	51	23	..	33	1	108	..
Seventh competitor	..	63	23	2	7	..	95	..
Miscellaneous	1,279	940	337	14	161	12	1,464	1,279
Total	1,826	2,447	1,056	222	946	16	4,687	1,826
Per cent sizes to total all makes	..	52.3	22.5	4.7	20.2	0.3		
Per cent sizes Packard	..	38.5	23.4	11.3	26.5	0.3		

Potential Market for 1921

Total trucks over ¾-ton		4,687
Total Packard		1,372
Per cent Packard representation		29.2%
Annual replacement of all makes	at 25%	1,171
New owners	at 10%	469
Additional equipment	at 15%	704
	50%	2,344

Assuming that Packard will maintain its present per cent of representation, the allotment for 1921 should be 29.2 per cent of 2344, or 684 Packards.

From the table above the allotment by sizes should be:

38.5%	are 1½-2 ton or	261
23.4%	are 3 ton or	166
11.3%	are 4 ton or	76
26.5%	are 5 ton or	180
.3%	are 6 ton or	1
100.0%		684 Total

On this basis, allowing for no increase in business, the allotment for 1921 should be:

261 Size EC Packard
242 Size ED Packard
181 Size EF Packard

684 Total

Even this analysis, valuable as it is, has not seemed to us sufficiently complete, and we have been experimenting in one large market territory with a system even more intensive. This system has covered an entire State and has proven of such value that it is now being rapidly extended.

This second plan differs from the analysis based on registration in the fact that a direct house-to-house canvass is made to discover possible purchasers of motor trucks, whether or not they are now operating any. Canvassers cover both city and country, and by inquiry and personal conversation get the desired information. They frankly explain their mission and usually have no trouble in obtaining the facts desired. They make no effort to sell, but turn the reports over to the Sales Department, which handles prospects in the routine way.

In making this survey an area with a population of about 700,000 was divided into 15 districts and an analysis man was assigned to each district. At present about one salesman is used for every two analysis men and the salesmen's records show that they have great ease in marketing, due to the information they have on hand before they approach a prospect.

The information turned in is listed and handled by the same methods as are used for the registration survey.

As a result of this market analysis the chief advantages that have been gained on the selling end have been as follows:

First: The analysis makes possible a far more intelligent assignment of territory to salesmen, as in the case already cited. We have found some salesmen who had four or five times as many prospects as they could handle, others with too few to keep them busy. The analysis has resulted in far more efficient work from both classes.

Second: Our list of prospects is far more accurate and alive. We know quite definitely what men are, or should be, in the market, and we know exactly who in each territory should receive literature on any particular point.

Third: Learning the comparative value of different trades as markets. We have found that there are some trades which, from the nature of their business, have comparatively little use for the particular types of vehicles which we produce. We find that there are other trades for which our products are particularly useful. In several cases where we found that we were making no progress in certain trades we have been able, by a study of that trade, to develop special types which have not been previously used and which have been of great value.

Fourth: Keeping our mailing list thoroughly up to date and thoroughly alive. Working from accurate knowledge, we can carry on sales promotion that is effective without being overburdened.

The advantages of knowing territories in which different makes of trucks dominate are obvious and need not be enlarged upon. The advantages of being able to apportion direct-by-mail and other overhead expenses on the basis of business that will actually be done, instead of on the basis of rough estimates, is also obvious. Excessive guesses as to possible sales invariably lead to excessive expenditures for handling those sales.

Balance of Men and Prospects

In the same line comes the advantage of having our selling organization in each territory properly adjusted to possible sales in that territory. We know very closely how many salesmen can profitably be employed, how large an office staff will be required to support them, how much should be spent on advertising, on mail campaigns and on other adjuncts. This information makes it possible to unify and balance the entire organization.

An incidental advantage, but one of considerable importance when it was considered that trade-ins are involved in nearly half of the sales, comes from knowing market possibilities of second-hand trucks. Our lists show who in our territory are using each of the competitive makes of trucks and, therefore, give us a very definite knowledge which enables us to place vehicles of those makes with a minimum sales effort.

One of the greatest advantages that has come to us from this system is accurate knowledge of our strength compared with that of our various competitors in each trade field. In the fields where our competitors have succeeded in taking the lead this is particularly valuable. The analysis covers situations of this kind and shows us when it is desirable to take vigorous steps to meet a particular competition and how to properly direct our campaign.

The Neglected Fields

A recent example of this occurred in a city which had been considered a highly successful territory. The full quota alloted to that city was being absorbed steadily and without effort, and it had been very difficult to make the men there see that any advantage could come from a market analysis.

But when the analysis was completed it showed that there were 14 per cent of the trades in that city in which our products would have been useful, but to which we had not sold a single unit. It showed, also, that 60 per cent of all our units operating in that city were in a single trade. The advantage in almost every other line of business was held by the same one of our competitors. It was obvious that the salesmen had found a line of least resistance in the one trade where they were strongest and had been overplaying that part of the market. Special efforts were immediately directed toward other trades, with the result that during last summer and fall, while sales of all our competitors were falling off, we increased our sales between 15 and 20 per cent above normal and reversed our position in several lines of business.

The Production Advantage

From the production point of view the information received from accurate market analysis is equally valu-

able. About the most expensive of evils in manufacture is guesswork. A bad guess in regard to the amount of product that will be needed, whether it is too low or too high, greatly increases all the cost of production. If the guess is too high, then the end of the fiscal year will find overstocked inventories and seriously unbalanced shop operation. If the guess is too low, there will be a definite loss of sales and a very considerable expense involved in trying to scrape up materials and speed production to meet the unexpected demands.

Of course, a perfect production schedule is impossible. Many unexpected factors are sure to come in to alter any schedule laid down in advance. But the more nearly we can come to the actual facts the smaller the evils will be and the greater will be the reduction in cost and price that can be effected.

Although the cost of these evils falls on the production department, the evils themselves are directly due to the sales force, since it is the sales manager who has to lay down figures for the production. The usual method of reaching production schedules by stewing out a series of guesses from all parts of the selling field does not need discussion. The thing that has surprised us was to find out how great the errors were in these guesses.

Cost of Undue Optimism

There was one of our distribution points, for example, which estimated that it would sell 125 trucks during 1920. From the first it fell steadily behind its expectations, and an analysis of the market was ordered. This showed that in the city the company was selling about 10 per cent of all the trucks being placed and that up to 1920 it had sold a total of only 120 trucks. Our potential market, on the basis of the analysis, was only for from 60 to 65 trucks. The distributer had, in effect, by asking us to produce 125 trucks, demanded that we should produce a surplusage of 60 unsalable trucks, costing us, roughly, $200,000.

Of course, such serious errors are not frequent, but the error in estimates is almost always on the side of overproduction. There are also errors just as serious in regard to the type of truck that will be demanded, and these have an almost equally bad effect on the production situation. Taking these factors together it is safe to say that under the old guesswork system the variation from the actual needs ran from 50 per cent to as high as 100 per cent. The effect on the finances of a company which produces 50 per cent more goods than it can sell would, of course, be disastrous. But the general dislocation of production machinery that is sure to result when these excesses have to be corrected is extremely serious. Under the market analysis system there are, of course, still errors varying from 10 per cent to as high as 33 per cent—the difference is from 40 per cent to 66 per cent, an average increased accuracy of about 50 per cent.

What this saving amounts to in cash can be figured out roughly, and it runs close to 10 per cent of the actual cost of production. Saving on inventories, for instance, runs all along the line from the moment the outside purchases of all kinds enter the plant. It is a rough general rule that in manufacturing plants the total value of inventories is something over one-third of the annual turn over. When this is true the interest tied up in these inventories amounts to 2 per cent of the turn over. On this basis the loss on the one item of interest paid on the capital tied up in inventories, is equal to about one-fifth of the total profits. The reduction of inventories, of course, is only one of many obvious savings.

These are the advantages that have come from the system of market analysis based on registration of trucks, which is the one generally used. There have been certain additional advantages from the more intensive method prescribed. The chief of these is in more complete listing of prospects and selling, but this is only one of several.

The detail survey plan, for one thing, has brought in a great deal of information in regard to prospects for cars as well as for trucks. It has also proven a splendid training school for salesmen, so much so that the salesmanager in charge of this territory declares that as a source of material to fill selling positions, the plan has been worth everything it has cost. The system also results in opening new territory and putting trucks into parts of the country where they had never been used before. The analysis men keep in touch with all work that is going on, such as road and sewer construction, and from them we learn the prospects and have our salesmen at work even before the contracts are awarded. Finally, analysis men are educating farmers and business men who have always used horses or competing trucks. They are teaching them the fundamentals of value of transportation engineering which is nothing more or less than scientific truck selling.
